ABBREVIATIONS

The titles of subjects, which are printed first in bold type, have been abbreviated within each article to the initial letter or letters.

ac., acre(s).
agric., agricultural.
ambas., ambassador(s).
Amer., American.
anct., ancient.
ann., annual.
arron., arrondissement.
A.-S., Anglo-Saxon.
A.V., Authorised Version.
b., born.
Biog. Dic., Biographical Dictionary.
bor., borough.
bp., birthplace.
Brit., British.
C., Centigrade.
c., about.
cap., capital.
cf. compare.
co., county.
com., commune.
cub. ft., cubic feet.
d., died.
Dan., Danish.
dept., department.
dist., district.
div., division.
E., east ; eastern.
eccles., ecclesiastical.
ed., edition ; edited.
e.g., for example.
Ency. Brit., Encyclopædia Britannica.
Eng., English.
estab., established ; establishment.
F., Fahrenheit.
fl., flourished.
fort. tn., fortified town.
Fr., French.
ft., feet.
Ger., German.
Gk., Greek.
gov., government.
Heb., Hebrew.
hist., history.
horticult., horticultural.
h.p., horse-power.
hr., hour.
i.e., that is.
in., inch(es).
inhab., inhabitant(s).

is., island(s).
It., Italian.
Jap., Japanese.
jour., journal.
Lat., Latin.
lat., latitude.
lb., pound(s).
l. b., left bank.
long., longitude.
m., mile(s).
manuf., manufacture.
min., minute(s).
mrkt. tn., market town.
MS., manuscript.
mt., mount ; mountain.
N., north ; northern.
N.T., New Testament.
O.E., Old English.
O.F., Old French.
O.T., Old Testament.
oz., ounce(s).
par., parish.
parl., parliamentary.
pop., population.
prin., principal.
prof., professor.
prov., province ; provincial.
pub., published ; publication.
q.v., which see.
R., riv., river.
r. b., right bank.
Rom., Roman.
R.V., Revised Version.
S., south ; southern.
sec., second(s).
sev., several.
Sp., Spanish.
sp. gr., specific gravity.
sq. m., square mile(s).
temp., temperature.
ter., territory.
tn., town.
trans., translated ; translation.
trib., tributary.
univ., university.
urb., urban.
vil., village.
vol., volume.
W., west ; western.
Wm., William.
yd., yard.

The article ABBREVIATIONS contains a list of those in general use. See also ABBREVIATION (music) and ELEMENTS (chemical symbols).

D

Dramatic Unities, three rules of dramatic construction enunciated by Aristotle, observed by the Fr. dramatists, but ignored by Shakespeare, that (1) a play should represent what takes place within a period of eight hours, (2) there must be no change of locality, and (3) there must be no minor plot.

Dramburg (Polish, *Drawsko*), tn. in the prov. of Pomorze, Poland, formerly of Pomerania Germany, with cloth manufs. Pop. 6100.

Drammen, seaport of Norway, 33 m. S.W. of Oslo by rail, at the head of Dramsfiord, through which the broad Dramslv empties its waters into Oslo Fiord. Timber, floated down from the upland forests, and wood pulp are the staple exports, saw-milling and the manuf. of paper, and ship building and cotton spinning being the other active industries. Pop. 26,000.

Drane, Augusta Theodosia (1823-91), Eng. writer. Having been influenced by Tractarian teaching at Torquay, she became a Rom. Catholic (1850). In 1852 she joined the third order of St. Dominic, and was prioress of Stone Convent, Staffordshire, 1872-81. Her essay questioning the morality of Tractarianism was attributed to Newman. Other works are: *The History of St. Dominic* (1857), *The Knights of St. John* (1858), *Three Chancellors* (1859), *Life of St. Catherine of Siena* (1880), *Songs in the Night* (1876, verse). See B. Wilberforce (ed.) *Memorial of Mother Francis Raphael*, 1895.

Drang Nach Osten, expressive phrase given to the Ger. policy of forcing a way to a foothold in the E. through the Balkans. In the First World War they had by 1916 so far trans. the dream into a reality as to secure uninterrupted and unthreatened communication and commerce with Constantinople, over the two main arteries of Asiatic Turkey, and also with the cities of Damascus, Mecca, Jerusalem and Bagdad. In the Second World War Ger. armies reached and held the Balkans for sev. years. (See also BAGDAD; BAGDAD RAILWAY.)

Drant, Thomas (d. c. 1578), Eng. divine; the first Eng. metrical translator of Horace. He won fame by his sermons before the court at Windsor in 1569, and to the congregation at St. Mary Spital, London, in 1570, both pub. in the same year. He wrote verses in Eng., Lat., and Gk. (1564), his works including: *A Medicinable Morall* (1566), *Sylva* (1576), and a trans. of Horace, *his Art of Poetrie, Pistles, and Satyrs. Englished* (1567).

Draper, Mrs. Elizabeth (1744-78), is best remembered for her association with Sterne, an association which there is no doubt never went beyond sentimental flirtation. The daughter of May Selater and an Anglo-Indian official, she married

at the age of fourteen Daniel D. of the E. India Company's service, a man much older than herself. Coming to England in 1776 for her health she met Sterne and was flattered by the attention of the great man. When she returned to India, he wrote regularly to her, and began the *Journal to Eliza*, which, owing to Sterne's death early in 1778, never reached her. In 1772 she left her husband, returned to England, and settled at Bristol. She was buried in Bristol Cathedral. The full story of her life is told, and her letters are printed, in the *Life of Sterne*, by 'Lewis Melville' (L. S. Benjamin) (1911).

Draught (from A.-S. *dragan*, to draw), current of air, in particular one which is induced or artificially forced to support combustion. *Natural D.* is produced by a chimney, through which the heated gases rise by reason of their lesser density, thus inducing a current of cool air through the fire. *Forced D.* may be produced by driving air at more than atmospheric pressure through the fire by means of fans. In locomotive boilers the D. is increased by turning the exhaust steam into the chimney, thus increasing the velocity of the current of air.

Draughts, generally conjectured to be one of the most anct. of table games. A game of this kind was known to the Gks. and Romans, and various monuments represent the anct. Egyptians as engaged in a similar amusement. It became common in Europe during the sixteenth century. The game is played by two persons on a board similar to that used for chess, i.e., square board containing sixty-four squares, checkered in black and white alternately. Each player has twelve 'men' in the form of circular discs, one set being black and the other white. These men are arranged on the three rows directly before each player. They may be placed either on the black or the white squares, but the extreme left hand square on the board before each must always be occupied. Lots are cast to decide which colour each player shall have, and black plays first. The players then change colours after each game. The men move diagonally, one square at a time, so that play continues entirely on squares of one colour. If a man comes next to a man of the opposite side he is unable to move past unless there be a vacant square on the other side of his adversary's man, in which case he must jump over this man and occupy the vacant square, removing his enemy's man from the board. If, after taking a man in this way, it is possible for him to jump another man, taking this one also, he must do so in the same move. In the rare event of a player neglecting to take when the opportunity is given him, his adversary may either take the piece with which the capture would have been made (a pro-

ceeding known as 'huffing'), or compel him to revoke his last move and perform the capture. He may also, if he wish, allow the move to stand. If a player gets one of his men into his adversary's back line, this man becomes a 'king,' and is 'crowned' by having another man of the same colour put on top of him. The king may move either backwards or forwards, whereas the ordinary men can move only forwards, but this is the only privilege he has. He captures in the same way as ordinary men, except for this one difference. If a player touches a piece, he must move it if possible. The game is won by a player removing all his adversary's men from the board or by his placing them in such a position that they cannot move.

Hyderabad, and E. to the Bay of Bengal. It includes also N. Ceylon, and scattered tribes are found in other parts (see Cust and Constable's linguistic and racial maps). The more important languages in the D. group are Telugu, Tamil, Kanarese, Malayalam, Tulu, and those of ruder tribes, such as Gōndi, Kōta, Kurux, Kul, and Rajmahal. The tribes of the N. have gradually become Hinduised and their language has been considerably modified by the Aryan forms of speech. The Brāhūis of Baluchistan, however, still speak a D. dialect. The D. languages seem to have formed a quite distinct group, independent of the Aryan or Indo-Germanic. There are about a dozen different tongues comprised in the group,

DRavidian TYPES OF INDIA

Left to right: Scytho-Dravidian (Tamil), Aryo-Dravidian (Hindu), and Mongol-Dravidian (Bengali)

See J. Sturges, *Guide to the Game of Draughts*, 1800; A. Anderson, *Game of Draughts* (revised by R. McCulloch), 1888; F. Tescheleit, *Master Play of the Draught Board*, 1926; Lees' *Guide to the Game of Draughts* (revised by J. W. Dawson), 1930.

Drave (Ger. *Drau*), riv. of Austria and the second largest trib. of the r. b. of the Danube. Rising in the Tyrol at an altitude of over 4000 ft., it flows 449 m. before its final confluence with the main riv., 13 m. E. of Osjeck. With an E. or S.E. course it traverses Carinthia, Styria, and Slovenia by way of Maribor (Marburg) forming later in its course the boundary between Hungary and Yugoslavia. It was through the long valley of the D. that the Huns and Slavs reached the Alps. Of the many affluents the largest is the Mur on the left. Steamers can go up only as far as Bâros (95 m.).

Dravidians (Sanskrit *Drāvida*, or *Drāmīda*), name of a large group of Indian peoples (non-Aryans) and their family of languages. Their main ter. lies chiefly in S. India, extending upwards from the peninsula N. to the Arabian Sea, about 100 m. below Goa, thence along the W. Ghat to Kolhapur, N.E. through

differing from each other radically and not merely in dialect forms, and yet derived from a common D. source. Tamil, Malayalam, Kanarese, and Telugu are the chief literary languages. Inflections are expressed by 'agglutination,' or affixing particles to primary roots or bases, but these additions do not blend with the roots as in the case of inflectional languages. Nouns are of two classes, high-caste and casteless (for rational and irrational beings respectively); gender being distinguished only in the former. A peculiarity is the double form for the first person plural of the personal pronoun, for including or excluding the person addressed. There are no relative pronouns, relative participles being used instead. A separate negative conjugation, usually with only one tense, exists for verbs. D. tongues were spoken by some 57,497,000 people according to the census of 1901. The D. were probably the aborigines of the Deccan. They are among the most primitive of Indian types the Todas of the Nilgiri Hills representing a very low stage of civilisation. They are mostly very dark-skinned, with wavy, black hair (not woolly), and are possibly descendants

of the Negritos of Malaysia. Their religion consists partly in nature-worship, partly in creeds adopted from more civilised tribes. See E. Hultsch, *S. Indian Inscriptions, Tamil and Sanscrit*, 1809-95; R. Caldwell, *A Comparative Grammar of the Dravidian Languages* 1856, 1875; G. A. Grierson, in *Linguistic Survey of India*, iv. 1904; A. H. Keane, 'Race and Speech' in *East and West*, 1905; W. R. R. Rivers, *The Todas*, 1906; E. Thurston and K. Rangachari, *Castes and Tribes of Southern India* (Gov. Press, Madras), 1909; G. Slater, *The Dravidian Element in Indian Culture*, 1924; L. K. Ananta Krishnalyer, *The Mysore Tribes and Castes*, 1928-31; W. Koppers, *Ethnologische Probleme Vorderindiens*, 1946.

Drawback, see CUSTOMS DUTIES.

Drawbridge, in anct. times an invariable adjunct of a castle. It was a bridge hinged at one end and free at the other, so that it could be drawn up or let down as required. The original form was the lifting D., used to span the moat of a castle; this form is used now to provide a passage over canals, etc. The swing-bridge is a D. which revolves in a horizontal direction.

Drawing, the art of representing in line forms seen or imagined. It can be done in many mediums on a suitable surface. The medium can be pencil, pen, brush, graver, burin (tool used for engraving on copper). The surface can be paper, wood, linoleum, copper, stone, etc. D. can be placed under two broad headings, (1) free drawing and (2) mathematical drawing.

(1) This involves the use of *free expression* and, in its finest examples, a high degree of skill and æsthetic taste. In advanced D. the representation of a third dimension needs an understanding of light and shade and reflected light, also a knowledge and appreciation of lineal and aerial perspective. Lineal perspective is the diminution in size of objects as their distance increases. Aerial perspective is the change of colour (and, or, lack of distinctness), of objects caused by atmospheric conditions, as their distance increases. The application of D. to surfaces such as wood, linoleum, copper, stone, etc., need further technical skill and are dealt with under the headings of wood-cut, lino-cut, engraving, etching, lithography, etc. A thorough knowledge of D. is the only true basis for the painting of pictorial subjects. (See also CARICATURE.) G. M. Ellwood, *Pen Drawing*, 1927; A. Gladstone-Jackson, *The Right Way to Human Figure Drawing and Anatomy*, 1948.

(2) Mathematical D. is essentially utilitarian and needs *practical* skill and, in advanced work, involves knowledge of physical laws and construction detail. The ability to use D. instruments such as rulers, scales, compasses is required. In architecture, the ability to prepare accurately measured and scaled plans, elevations, sections and isometric drawings is essential. A knowledge of perspective (lineal) is also useful. Mathematical drawing is used in connection with aircraft construction, shipbuilding, loco-

motive building, automobile construction and many other industrial undertakings. See also ENGINEERING DRAWING.

Drawsko, see DRAMBURG.

Drayton, Michael (1563-1631), Eng. poet, b. at Hartshill, Warwickshire; entered the family of Sir Henry Goodere, near Tamworth, as a 'proper goodly page' and seems to have settled in London about 1590 or 1591. Biographical details are lacking. There is some evidence that Anne, daughter of Sir Henry Goodere, afterwards wife of Sir Henry Rainsford, was 'Idea' who inspired D.'s first pastorals, *Idea, the Shepherd's Garland* (1593) and his first sonnets, *Idea's Mirror*, *Amours in Quatorzains* (1594). Another patroness was Lucy Harrington, who became Countess Bedford. To her before her marriage D. dedicated his *Legend of Matilda and Endimion and Phoebe* (1595), *The Legend of Robert* (1596) and *England's Heroical Epistles* (1597) and also dedicated to her. Between 1597 and 1602 D., by that time in high repute, was doing theatrical hack-work for Henslowe (q.v.) and among his other and earlier associates were Dekker and Munday and, somewhat later, Webster and Middleton. In his *Idea, the Shepherd's Calendar*, he sang his love sorrows and in *Idea's Mirror* (originally 52 sonnets but later expanded to 100) 'Idea' is again used to designate the lady of his adoration. D.'s historical poems began with the *Legends* of historical personages, *Piers Gaveston* (1593), *Matilda* (1594), and *Robert Duke of Normandy* (1596). In the heroic poem *Mortimeriados* (1596) his theme was again the political troubles of Edward II.'s reign. Written in rhyme-royal stanzas, this, his first poem of length and importance, appeared as *The Barons' Wars* in the revised ed. of 1603. Written in *ottava rima* in its remodelled form, it is a rather tedious narrative of episodes in the Wars of the Roses and loses by comparison with Marlowe's dramatic treatment of the subject in *Edward II.* But there are passages of noble rhetoric on the liaison of Mortimer and the Queen, culminating in a sumptuous description of the chamber in Nottingham Castle where the lovers are surprised by Prince Edward. The inequalities and rudeness of style in this narrative disappear in D.'s *England's Heroical Epistles* (1597), historical poems written on the model of Ovid's *Heroides* and containing some of his very finest lines. Equally national in spirit is his ballad of *Agincourt*, first pub. with his odes in *Poems Lyrical and Pastoral* (1606). Few, however, read with pleasure his ponderous *Poly-Olbion*, which, according to Francis Meres, he had begun in 1598, and which he himself aptly describes as a 'Herculean toil.' For in it he undertook a 'chorographical description' of everything of antiquarian and topographical interest throughout Great Britain. This vast work, barren and wearisome to a degree, at least demonstrates the unsuitability of the Fr. classical metre (couplets of Alexandrines) for Eng. verse. Yet D. could write a poem of the grace and charm of his *Nymphidia* (1627), a mock-

heroic fairy poem which is the inspiration of many of Herrick's lyrics; the pastorals *The Shepherd's Sirena* and *The Quest of Cynthia*, love idylls, and one splendid sonnet, 'Since there's no help, come let us kiss and part,' which Rossetti proclaimed 'almost the best in the language, if not quite.' Among his last poems were *The Muses Elizium* (1630) and a few *Divine Poems* on O.T. themes, in decasyllabic couplets. The editing of *The Works of Michael Drayton* in five vols. with introductions and notes, etc., by K. Tillotson and B. H. Newdigate, and completed in 1941, is a masterpiece of minute and comprehensive scholarship. See also O. Elton, *Michael Drayton: a Critical Study*, 1905; B. H. Newdigate, *Michael Drayton and His Circle*, 1941.

Drayton-in-Hales, see MARKET DRAYTON.

Dreadnought, Brit. battleship, 490 ft. long, of 17,930 tons, with speed of 21 knots. The first of this since famous class was launched and completed at Plymouth (1906), the designs having been accepted in 1905. It gave its name to a class of modern battleship, and was in fact a synonym for an ironclad or battleship carrying ten 12-in. guns, and a number of 12-pounder quick-firing anti-torpedo-boat guns and propelled by steam turbines. See also BATTLESHIP.

Dreaming, may be defined as the manifestation of a conscious process during sleep. During sleep conscious activity is, under ordinary circumstances, entirely in a state of suspense; the sensory nerves no longer perform their usually active duties, the action of the heart becomes slower, the brain is at rest, and during this period gets rid of the waste tissue and is restored to fresh activity. Our faculties, however, need not all be in an equal state of inactivity; it is possible to perform a number of quite ordinary actions whilst in a state of sleep, e.g. soldiers have often marched for some considerable distance whilst, to all intents and purposes, in a deep sleep. We dream, then, principally because the suspension of mental activity is not complete. It has been held that sleep is never so profound as to be dreamless, but this is a theory which cannot be proved. On the other hand, it has been held that we dream only during those periods of falling asleep and awakening during which our mental activities are in a semi-conscious state. This, again, is a theory which cannot be actually proved, but may to some extent be disproved, since it is well known that manifestation of dreaming has been noticed in cases where the subject was in a deep sleep. Further, in many cases sleepers suddenly awakened have aroused themselves with difficulty from a dream. That all our powers of judgment are inactive during a dream cannot be held as true, since on occasion we find that we desire to prolong a dream of peculiar happiness, whilst we can arouse ourselves from one which terrifies us by its horror. Dreams whilst resembling in many ways the process of conscious activity, on the other hand differ characteristically from the experiences of our

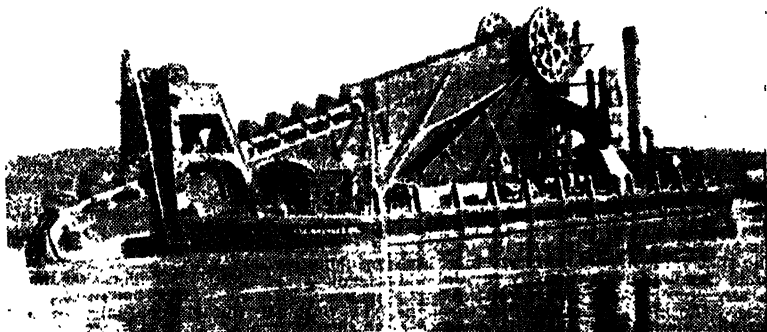

waking life. Time, space, and order are not to be found during our dreams, though on examination they are seen to possess an inner coherence. Also the events which occur to us during these periods leave a great impression on our mind for the time being, although we may on awakening remember little or nothing of the experiences undergone during sleep. That the activities of the day, or the immediate time preceding, have influence on our dreams is undoubted. Incidents trivially passed over during our waking experience form often the basis of a dream, details forgotten in the routine of the day will occur time and time again during sleep. Problems in mathematics have been solved, legal decisions given, and even sermons have been produced during sleep, whilst we may here quote the famous example of Coleridge's *Kubla Khan* as a poem which was composed during sleep and which was written immediately on awakening. All creative writers draw on the material of dreams, often undisguisedly. Experiments have been made in order to test the effect of the senses in dreams, and it has been proved that dreams can easily be related to the immediate sensory cause. Certain drugs, such as opium, and hashish, have peculiar effect upon the character of dreams whilst the physical state of the body can often give peculiar effect also to the dreams. The nightmare, or 'anxiety dream,' may be due to the presence of undigested food in the stomach, other uncomfortable dreams may be caused by inability to breathe properly, or by an uncomfortable position in sleeping. The state of the brain is also an important factor. Dreams are in some cases not only thought out but actually acted by the dreamer: cases of this kind, such as sleep-walking, the performance of acts during sleep which the sleeper has no recollection of after waking, sleep-talking, are all phenomena of this state of mind. Amongst the ancients people dreams were regarded as of divine origin, the interpretation of dreams took an active part in the life of the nation, and the 'seer' was regarded with awe by the people of the nation. The whole matter of the interpretation of dreams was put on a scientific basis in the twentieth century by the work of Sigmund Freud (*q.v.*) and his followers. The dream is regarded by Freud and the psychoanalysts of all schools as the royal road to the 'unconscious' mind, the correct diagnosis of the state of the latter being the first step in mental therapeutics. See S. Freud, *An Interpretation of Dreams*, 1900; R. Hine, *Dreams and the way of Dreams*, 1913; and J. W. Dunne, *An Experiment with Time* (a non-psychoanalytic explanation of dreaming, 1927). See also PSYCHOANALYSIS.

Drebbel, Cornelius van (1572-1634), claimed, erroneously, to have been the joint-inventor with Santorio of the thermometer, but was famous among his credulous contemporaries rather for his empirical inventions, such as a boat for rowing under water, in which the pas-

senger could read without artificial light, than for his real discoveries. A pensioner of Emperor Rudolph II. and tutor to Ferdinand II.'s son, he owed his release from imprisonment in Austria (in consequence of a revolution) to James I. of King. He passed the rest of his life in England. Besides his water thermometer he discovered a bright scarlet dye, afterwards used with effect in the Gobelin's manufactories, and devised improvements in the microscope and telescope.

Dredging Machines, machines for cleaning and deepening the entrances to and channels of rivers, canals, docks, and harbours, by removing the mud or rock from the bottom. There are several kinds

projects downwards through a well in the float, and being held by a chain which runs around a 'topping lift' which enables the ladder to be lowered or raised to the depth required. This ladder is usually placed in the centre of the float, although there are *double ladder machines*, the two ladders being side by side, and *side ladder machines*, in which the ladders project over the sides of the float so that they may be used close to dock-walls, etc. In all cases, however, an endless chain of buckets passes round the ladder which is fitted with tumblers at each end. The top tumbler is moved by a system of steam gearing, so causing the buckets to rotate. Meanwhile the machine is moored by bow

BUCKET-LADDER DREDGER

Lyne Improvement Commission

of dredgers, which can be divided into three main classes: (1) *The grab dredger*; (2) *the bucket-ladder dredger*; and (3) *the suction dredger*.

(1) *The grab dredger* is used only where the amount of mud is small, or where time is of not too great importance. It consists of a pair of heavy iron jaws hinged together at the top, and slung by chains over a crane, which is usually mounted on a float, although it may be worked sometimes from the shore. The 'grab' is lowered to the sea bottom with the jaws held open by means of side chains. As the hoisting chain is slackened so under its own weight the 'grab' sinks into the mud. The side chains being then slackened and the hoisting chain drawn upwards, the two jaws close together and so bring up a quantity of mud with them. By means of the crane, then, the 'grab' is hauled up and swung so that the mud may be discharged into a barge; the jaws being opened again by means of the side chains.

(2) *The bucket-ladder machine* consists of a long ladder, one end of which is fixed high above the deck. The other end

and stern cables with further cables over both bows and quarters, and as the buckets revolve so cutting mud up from the bottom, the chains on one side are hauled in while the others are slackened. So the D. M. is gradually drawn right across the bank to be cut. When this has been done, the D. M. is hauled a little further forward, and the process repeated by hauling in the chains on the other side, so that the machine is drawn back across the bank. As the buckets are turned over by the top tumbler they naturally discharge the mud into a shoot. Usually this shoot projects over the side, and so the mud is discharged into 'hopper' barges, fitted with trapdoors on the bottom held up by chains, which on being suddenly released drop the cargo. Sometimes the D. M. are built with a hopper well, so that they carry their own mud and deposit it. They are then known as hopper dredgers. It is evident, however, that such hopper dredgers lose time when compared with the others, for they have to proceed to the 'dumping ground,' whereas the ordinary dredger is continually dredging and filling other 'hopper'

barges. Not only that, but time is wasted in picking up the moorings each time, and this is not always an easy matter.

(3) *The suction dredger* is fitted with a centrifugal pump, with a flexible suction pipe, which is dropped to the sea bottom. Through this the sand or mud is pumped up and discharged either into other barges or into its own hopper well, if it is provided with one. See E. C. Shankland, *The Dredging of Harbours and Rivers*, 1931.

Dred Scott Case, The, most important decision of the U.S.A. Supreme Court, handed down in 1857, and one of the contributing causes of the Civil War. Dred Scott was a Missouri slave, taken by his owner in 1834 into Illinois (where slavery was prohibited), and later into Minnesota (then part of the Louisiana Purchase). Dred Scott had married and had two children while on free soil, but he and his family were later taken back to Missouri.

In 1848 he sued for his freedom on the ground that his residence in a free state had given him the standing of a freeman. The Supreme Court of Missouri held that on return to Missouri the status of slavery re-attached to him and that he had no standing in court, but the U.S.A. Circuit Court before whom the case came in 1850 decided that as a citizen of Missouri Dred Scott had standing in court, but that he was still a slave.

The Case was argued before the Supreme Court of U.S.A. in 1855 and 1856, and the decision (not unanimous) that Dred Scott was not a citizen, that the Constitution guaranteed security in private property and that value of such property in a slave could not be constitutionally invalidated in any state, even by the Federal gov., roused the most intense feeling throughout the country and made it clear that slavery would not be abolished along constitutional lines. Chief Justice Taney had not only remanded Scott to slavery, but had gone out of his way to proclaim the Missouri compromise void and denied the right of Congress to make slaves or their descendants citizens. He practically said that the negro had no rights that white men were bound to respect.

Dreiser, Theodore (1871-1945), Amer. novelist and playwright, b. at Terre Haute, Ind., twelfth child of poverty-stricken and piously Catholic parents of Ger. descent. Educated at common schools, and at Indiana Univ. He was on the staff of the *Chicago Daily Globe*, 1892; dramatic editor and travelling correspondent of the *St. Louis Republic*, 1893-94; editor of *Smith's Magazine*, 1905-6; managing editor of *Broadway Magazine*, 1906-7; editor-in-chief of *Butterick* pubs., 1907-10. His first novel was *Sister Carrie* (1900), which was suppressed and denounced as immoral because in it unchastity received no punishment. His next was *Jennie Gerhardt* (1911). Then came *The Financier* (1912), and *The Titan* (1914)—two parts of a trilogy intended to portray the career of Charles Tyson Yerkes, the traction millionaire. Other works include: *A Traveller at Forty* (1913), *The Gentus*

(1915), *Plays of the Natural and Supernatural* (1916), *Twelve Men* (1919), *The Hand of the Potter* (1919), *Hey Rub-a-Dub-Dub* (essays and philosophy, 1920), *The Colour of a Great City* (1923), *An American Tragedy* (1925), *Moods* (verse, 1926), *Chains* (lesser novels and stories, 1927), *A History of Myself* (1931), *Thoreau* (1939), *America is Worth Saving* (1941), and *The Bulwark* (posthumously, 1946).

Drenthe, Dutch prov. S. of Groningen and Friesland. Area 1030 sq. m. Pop. 220,000. Cap. Assen.

Dresden, cap. of Saxony, Germany, 111 m. S. of Berlin by rail and 70 m. E.S.E. of Leipzig, in the pleasant valley of the Elbe. On the l. and s. b. lie Friedrichstadt and Altstadt (the old tn.), from which, however, most of the picturesque medieval houses had been swept away even before the First World War. In 1945, however, allied bombers reduced the buildings round the Altmarkt and Neustädtermarkt to empty shells. Friedrichstadt and Altstadt are connected with Neustadt and Antonstadt by a spacious bridge which replaced the beautiful Augustusbrücke (1727-31), demolished in 1906. The riv. is also spanned by the Carola, Albert, Marlen, Loschwitz and railway bridges. The industrial quarters greatly increased during the inter-world-war decades owing to the coal-mining in the dist. of which D. is the heart. Before the Second World War there were more than 8000 undertakings employing over 200,000 workpeople (the cigarette industry was the oldest), other manufs. including chocolate, photographic apparatus, machines, stone ware, glass, lead, and chemical preparations. The technical high school had nearly 3000 students. The national library contained nearly 700,000 volumes. D. was known to the world as a repository of fine art. Its one-time famous collection of pictures in the Zwinger (D.'s Museum and Art Gallery, erected in 1711-22 by Popelmann, architect to Augustus the Strong) including Raphael's priceless 'Madonna di San Sisto,' Correggio's 'La Notte' and 'Mary Magdalene,' 'The Adoration' of Paul Veronese, Titian's 'Tribute Money,' and paintings by Claude Lorraine, Rembrandt, Van Dyck, and Rubens, was begun by Augustus I., but its true founder was Augustus III., who in 1745 bought the unique Modena Gallery containing 2400 pictures by It. and Flemish masters. Thus, there was every justification for Herder's reference to D. as the 'German Florence.' It was from D. that rococo art spread in the eighteenth century, the Rom. Catholic Hofkirche (1739-51) and the Zwinger, which before 1939, housed sculptural, zoological and mineralogical collections, being excellent illustrations of this style. The Zwinger, however, was reduced in 1945 to a shell and its delicate charm broken and blasted in the air raids of Feb. 13-14 when so much else in D. was also destroyed, including a great part of the catholic Hofkirche. Fortunately the galleries of the Zwinger were empty, the pictures having been removed to safety early in the war, as also the unique col-

lection of porcelain (over 15,000 examples) in the Johanneum where also was the Historical Museum. In the Jap. palace (1715) were accommodated the national library and the collection of classical sculptures and antiquities. Besides the handsome Schloss or royal palace (1530-1535) in the Ger. Renaissance style, other noteworthy buildings included the magnificent Hoftheater (1871-78) designed by Semper, the domed and lanterned Frauenkirche (1726-34), the twin-spired Sophienkirche (the Protestant Court Church) (1351-57 and later) and a second royal theatre. The Schloss was left in ruins in the raids of 1945; the famous Opera House was left roofless and burnt-out. There was scarcely anything left of the Frauenkirche. The Sophienkirche was practically destroyed, though the steeple remained standing; the new Town Hall was left largely in ruins. The statue of Frederick Augustus of Saxony, however, still stood in front of the ruins of the Frauenkirche after the raids. The steeple of the Dreikönigskirche was left standing. When the Russian troops of Marshal Konev entered D. on May 8 (1945) they found the Prager, Augustus, Moritz, and Ring Strassen to be mere paved roads between ruins, their footways heaped with stone blocks. The centre of the city was dead. Six e.g. mi. of the inner tn. were in ruins. The destruction extended to some of the suburbs in the S. and W. and some 27,000 houses and 7000 public buildings were completely destroyed, among them half the churches and half the schools. D. before the war was further remarkable for its fine squares, its statues, including the Rietschl monument by Schilling on the Brühl Terrace, and its public pleasure gardens, especially the Grosser Garten. The well-known Conservatoire of Music, and the splendid orchestra in the court theatre, with which were associated such master-musicians as Weber and Wagner, served as public attractions for visitors, whilst in summer-time pleasure-steamers conducted them along the riv.'s banks. In the 1930's D. had the largest garrison in Germany. It is the headquarters of the Lutheran Church in Saxony. In 1270 Henry the Illustrious chose D. as his cap., and its prosperity increased rapidly when in 1485 Saxony fell to the Albertine line. But again and again the city has been devastated by fire and sword, as during the Seven Years' War (1756-63), and Napoleon's campaign of 1813, when he won his last great victory, in Dresden, at the cost of 15,000 dead and wounded and 12,000 prisoners to the allies and a loss of 10,000 to the Fr. In 1849, from May 3-6, there was desperate street fighting and the old opera house was burnt down. D. was occupied for a time by the Prussians in 1866. Most of the destruction in the Second World War happened in one night, that of Feb. 13-14, 1945, when there were two raids on the city, which was then full of refugees who had streamed in from the E. before the advancing Russian armies—in Aug.-Sept. 1945, 3,000,000 refugees passed through D. In the two attacks, and mostly in the first, 25,000

people were killed and 30,000 more injured. Thousands were trapped in cellars of burning buildings. According to the Gers. the tn. had no anti-aircraft defences. The rebuilding of D. will take 12 years. Such of the city's architectural monuments as can be restored will be rebuilt. The opera house was restored during 1945-46 and the Schloss and Hofkirche will rise again, but most of the inner tn. will have little resemblance to its past form, for restoration would in any case be impossible. Pop. 650,000.

Dressmaking, the art or occupation of making dresses. The name dress is usually applied to any outer, complete feminine garment except a coat and skirt; it is sometimes restricted to a bodice and skirt, made up separately and later joined together at the waist, as distinguished from a robe or gown, which is generally made in one garment. The pattern of dresses depends entirely on the prevailing fashion, but the general characteristics of dresses suitable for different occasions are, as a rule, very similar. Day, or walking dresses, are usually shorter than formal afternoon or evening dresses. Day dresses are made of firm and durable material for winter wear; and cotton, linen, or rayon, for summer wear. Formal afternoon dresses are made of fine woollens, velvets, or silks (natural or synthetic); while evening dresses are usually made in taffetas, satins, silks (natural or synthetic), tulle, lace, etc. The materials best suited for draping are the softer silks and woollens, etc., whereas taffetas, brocades, moire, tulle, etc., stand away from the figure and look well in very full skirts and well fitting bodices. Satin moulds to the figure, and has a sheen which emphasizes every movement, and should therefore only be worn by the slim or average figure. Some materials are specially treated to resist creasing; and a comparatively new material, known as nylon, has special qualities such as durability, strength, resistance to moth and mildew, and shaping qualities, under heat and moisture, formerly found only in woollen materials. On the other hand, nylon has a poor affinity for some present-day dyes. The present (1949) skirts for day wear have lengthened from the knee length of 1946 to midway between the knee and ankle, but in Paris the tendency is for shorter skirts, i.e. 16 in. from the ground. Ballerina, i.e. ankle length, or full length, skirts are usual for evening wear; and trains are sometimes worn at weddings or state occasions.

Apart from good work and careful planning over details, which is always essential in good D., success depends upon 'style', and good style is the art of catching and adapting the prevailing fashion to suit individual figures, to bring out all the best lines and cover any deformities or discrepancies in the figure without sacrificing the smartness of the garment. Accessories, too, are of the utmost importance. These must be suitable to the dress, for it is the ensemble that counts.

The general procedure in D. is practically the same whatever the prevailing

fashion may be. The type of dress, i.e. the occasion for which it is required, having been decided upon, suitable material should be selected, and the wearer's build, i.e., whether tall or short, slim or stout; age and colouring; must be carefully considered in relation to this. The rather short or stout figure should avoid big designs, horizontal stripes, yokes, several tiers, and fulls; whereas the tall slim woman can wear these styles which tend to detract from her height. When choosing material for evening wear, it should be seen under an artificial light. The width of materials vary, cotton and rayon fabrics being from 27 to 36 in., and woollen materials from 42 to 54 in. Children's dresses are usually made of washable light weight non-shrink material, with a mixture of wool and cotton or rayon, and this is 27 or 36 in. wide. Silks and velvets vary in width from 27 to 36 in. The amount of material required depends upon the style of the dress, and the cutter's ability to plan the pattern to the best possible advantage on the material. Day frocks take from 3 to 4 yds of 39 in. material, and formal afternoon and evening dresses can take from 5 yds. to anything up to 9 yds of material, dependent upon the fullness and style of the skirt, and the length.

The making of bodices and skirts is generally in the hands of two quite separate bodies of workers in large establishments. The pattern is first drafted according to an accepted set of rules in D., and particular care must be taken to ensure accurate balance as well as the correct measurements. Fit and style depend largely upon correct balancing, which varies with the carriage of the figure, the set of the shoulders, and the curve of the waist line, largely dependent upon the manner of life of the wearer and the style of corsets worn. Thus even if the measurements are taken accurately, if the dress is made for a well-set-up woman whereas the destined wearer is very round-shouldered, the result will be that the bodice is dragged at the back and the skirt considerably shorter behind than in front. For a well proportioned figure only one half of the pattern is required, as the two sides of the garment can be cut alike. In the case of one shoulder being higher than the other, or any one-sided deformity, it is wisest to cut the two sides separately. When the pattern is partially tacked together it should be tried on the client and the necessary alterations made. Throughout D., both in the cutting of the pattern and of the material, it is imperative that an ample margin be left, any superfluous turnings being cut off when the garment nears completion. The cutting of the primary pattern to fit the client is frequently omitted if the skill of the dressmaker is sufficient to cut the lining accurately at once. But when a primary pattern has been accurately fitted on the client, it should next be placed upon the lining, which has been previously doubled and laid on a flat surface. Care must be taken that the middle of the length of each piece is on the

straight-length thread of the material so that all the seams may fall slightly on the bias. The outline is then marked through, being either pierced with a stiletto or by a special piercing wheel, as well as indications of the special style, yoke, vest, or any ornament. When the lining has been cut from the pattern, the material itself is cut in a similar way from the lining with allowance for draping or folds. Where the style of the garment involves tucking, the tucks should be made before the material is cut. Each piece of material being laid quite flat over its separate piece of lining, the two are then tacked together and the double material, lining and stuff, tacked to the similar pieces which form the other side. When the back and fronts are attached at the back and under the arms the bodice should be tried on and any necessary alterations made, it being generally possible to effect such alterations at the shoulder side seams by putting the tacking stitches a little forward or back as may be required. Honing the bodice is rarely practised, but where bones are required they should be inserted at this stage. During the process of trying on, indications of necessary alterations are generally made on one side only, and by means of pins or coloured cottons, to save the client the fatigue of standing. The garment is then taken back to the work-room and similar alterations made on the other side. The seams are then closed, machined, and neatened, either by being scalloped out, or by oversewing, or by a binding of thin silk. The sleeves, which are cut and made up separately, are fitted on to the client at the same time as the bodice, and should now be fitted into the arm-holes, and if there is fullness it should be carefully arranged to give ease to the movements of the arms.

The quality of the work and the style of the garment depend upon the class of dressmaker and upon the price paid. Most firms have stock-sized dress models to fit the garments upon, and many clients have their dress stands made exactly to their own shape and measurements, and so avoid the fatigue of trying on the garment until it is completed. Nowadays, however, most dress trade consists of wholesale houses. Owing to the high cost of labour, the individual tailor and small dressmaker are disappearing. Even wealthy women buy ready-made clothes, designed by experts, which are made in a wide range of sizes, and can, with slight alterations, be made to fit almost any figure. Fashions change as often as the seasons, but during the Second World War there was little variation from the tailor-made costume and shirt blouse, and women's clothes became practically as uniform as men's. The skirt of a half century ago was cut in 'gores,' tight round the hips and flowing out at the feet; that gave place to the full skirt gauged at the waist, which in time was ousted by the 'directoire,' 'tub,' and 'hobble' styles. These were followed by the skirt cut in four pieces, a front piece, two side pieces and a 'panel' back, to

give the appearance of straight lines, which in turn gave place to the fashion in which, generally, the straight lines were maintained and a freedom of movement given by pleats in the front of the skirts. In 1917 the 'New Look' was designed, with nipped-in waist, small rounded shoulders (a change from the pronounced square or broad shoulders of the last 10 years) and full long skirts. Later designs were a modified form of the 'New Look' with simpler and more definite lines; but in the extravagant styles the lines became more exaggerated and there is a revival of the high-waisted kintyre style. Straight pencil skirts with back interest are being designed to be worn with jackets, and also feature in the extravagant models. Capes are in vogue again: deep and decorated pockets; maggyr sleeves; and deep collars and cuffs. Bodices or blouses are fairly close fitting and without trimmings and with or without collars. The front pieces of a skirt are slightly 'gored,' i.e. narrowed from the bottom up to the top on both sides, with the centre falling straight with the selvedge threads, though some skirts nowadays have the centre front on the bias and the sides cut on the straight of the material. The side pieces are cut narrow and slightly gored at the bottom; they fall better if one side is cut on the straight or selvedge edge, and one on the cross, the straight side of each being nearest the front. The back piece is cut very similarly to the front, and is joined on to the side pieces to give a panel effect. An average walking skirt measures about 2 yds. round the bottom, whereas the lower edge of an evening skirt is from 4 to 8 yds. The measure required for the length of the skirt will be different for the front; for the sides, where allowance must be made for the curve of the hips; and for the back. It is best to take the measurements for each separately. Skirts are generally mounted on a belt of the same material, or on a petersham band; and a placket hole provided by making an opening of about 10 in., usually by leaving the left-hand seam open, and closing it with press fasteners, hooks, or a zip fastener. The more elaborate draped skirts are generally made to be joined in one garment with the bodice, and so come under the heading of gown or robe. Habit skirts are usually only made by tailors, as are most sports skirts, which are made shorter and fuller than the ordinary skirt for walking.

In big firms the usual term of apprenticeship for learners is two years, after which the learner serves for some months as an 'improver' before she is rated as a regular hand. Where the 'branch' system is in force, the learners serve in groups as fitters and cutters, as bodice hands and skirt hands, and have thoroughly to master their particular branch. Private dressmakers generally keep assistants to do the stitching and finishing, but do the cutting and fitting themselves, handing the cut and fitted lining and material on to one of the hands with the design and, perhaps, a few words of instruction, after which she is supposed to be able to com-

plete it. In a humbler class of the trade the dressmaker only keeps one or two apprentices, and does all except the actual stitching and finishing herself. Sometimes the dressmaker provides the material and all the necessary items, and charges for the completed garment, but many clients like to provide their own materials and have them made up at a fixed charge. Besides regular dressmakers, there are a number of visiting workers, who come to their clients' houses and either make or renovate at a charge of so much for the day, irrespective of the amount of work done.

Women the world over still look to Paris for their inspiration in all matters of dress, although the importance of London is slowly but surely gaining a hold upon other countries. Vienna also ranks very high in the scale of fashion. Numerous periodicals are pub. which give the latest modes from the world's fashion centres, and for many years it has been the custom of the home dressmaker to copy and adapt these models for her own use. A great drawback in home-D. is that, unless she is prepared to take a thorough course of instruction in the art, the amateur needlewoman will find that there is practically always a lack of finish in her own productions which betrays their origin. For the women with leisure or inclination to take a course in D., or for those who are adopting it as a career, every facility is now offered in the numerous Domestic Science schools throughout the kingdom, in the polytechnics and technical schools of London and the provinces; in women's institutes, and other educational centres. The 'professional touch' can be acquired only when all the details of a dress are properly finished. The novice must learn first how to make her own patterns, how to choose and cut out the material to the best advantage from her patterns, and finally how to make up the material into a fashionable and well-fitting garment. Various stitches must be mastered, from the preliminary tailor's or ordinary tacking to the finished embroidery stitches. Seams, hems, and bindings are all given a variety of treatment, according to their sphere of utility: the making of button-holes, pleats, tucks, cording-, pipings, and facings, are all essential subjects in dress-making. The neat fitting of a collar, the insertion of sleeves, and even the right method of dealing with pockets are all part of the dressmaker's lore, requiring skill and care. The home-dressmaker needs to have the following tools to hand before commencing work: pins, needles, tacking and sewing thread, tape measure, set-square, tracing wheel, tailor's chalk, shears for cutting out, scissors; and an iron and board for pressing seams as the work proceeds. A dressmaker's stand is a useful asset; and a sewing machine is indispensable to the dressmaker. If the modelling method is used, then some soft cheap fabric for draping is necessary. If working from a Trade or bought Paper Pattern it should be pinned up and held against the wearer, and any adjustments made before laying out on the material,

and the directions given on the chart should be followed.

Fashions change so swiftly in modern times that works on all but the fundamental principles of dressmaking soon become out of date. A few books, however, which would be helpful to the student of D. are: Agnes M. Miall, *Home Dressmaking*, 1933, and *Making Clothes for Children*, 1946; Anna L. Hird, *Principles and Practice of Needlework and Dressmaking*, 1934, 1944; Gertrude Mason, *Pattern Making Book*, 1935; Margaretta Byers, *Designing*, 1939; R. K. Evans, *Dress: The Evolution of Cut and its Effect on Modern Design*, 1939; W. H. Hulme, *Women's and Children's Garment Design*, 1948; E. Lucy Towers, *Standard Processes in Dressmaking*, 1948.

Prevailing fashions can be noted in the current issues of numerous periodicals for women, such as *Vogue*, *Screen Fashions*, *Fashion Review*, and *Shopping*, etc. See also EMBROIDERY, FASHION, NEEDLEWORK, TAILORING.

Dreux, once the chief city of the Gallic tribe, the Durocasses, now the cap. of an arron. in the dept. of Eure-et-Loire, N.W. France, on the Blaise, 27 m. N.N.W. of Chartres by rail. Though it possesses the ruins of a medieval castle, once owned by the counts of D., its chief pride is the exquisite chapel built in 1816 within the castle precincts by the mother of Louis-Philippe, containing fine stained glass and sculptured tombs belonging to the Orleans family. Its sixteenth century Gothic hôtel de ville and a magnificent church of St. Peter with a twelfth century choir and fifteenth century nave are noteworthy sights of D. Pop. 12,200.

Drevet, Pierre Joubert (1664-1739), Fr. engraver, studied under Germain Audran at Lyons, and then under Gerard Audran at Paris. In 1696 he became engraver to the king, and an Academician (1707). His best portraits include those of Louis XIV., Cardinal Fleury, the Dauphin, Robert de Gotte, and Boileau.

Drevet, Pierre Joubert (1697-1739), son and pupil of above, surpassing his father. He was admitted to the Academy 1729. His portrait of Bossuet after Rigaud (1723) is considered his masterpiece. Other works are portraits of Lecouvreur, Bernard, Cardinal Dubois, and Pucelle. 'La présentation au temple' is the best of his historical subjects. His engravings are mostly after Coppel, Boullongne, Restout, and Rigaud. See A. Firmin Didot, *Les Drevet*, 1876.

Drew, Samuel (1765-1833), Eng. writer, known as the 'Cornish metaphysician.' After a wild youth he joined the Wesleyan Methodists (c. 1785), and became a local preacher. He early won fame by his *Remarks on Paine's 'Age of Reason'* (1799) followed by *Essay on the Immateriality and Immortality of the Soul* (1802); autobiographical sketch prefixed to *Essay on the Identity . . . of the Body* (1809) and he ed. the *Imperial Magazine* from 1819. See life by his son, 1834.

Dreyfus Affair, The, result of the anti-Semitic feeling in France, of which the real culprits in this case (Henry and Ester-

hazy) availed themselves in order to hide their own delinquencies. Capt. Alfred D. was the son of a rich Jewish manufacturer in Paris. He entered the army, became an artillery captain, and was attached to the general staff. In 1894 he was arrested accused of delivering documents to the Ger. Gov. He was tried by court-martial sitting in secret, was found guilty and condemned. He was degraded and transported to Cayenne, Ile du Diable. His condemnation roused throughout the whole of France a great wave of anti-Semitism, and the majority of the Fr. nation were prepared to believe anything evil of the Jews. But his conviction had only strengthened in the minds of his relatives the fact that he was innocent, and the military party in France, by their mere attempts to estab. the truth of the conviction, convicted themselves of conspiracy. The publication of the *bordereau* which D. was supposed to have sent to the attaché of another Power proved to his friends that it was a forgery. But still they held back; they desired full proof before they proceeded further. Colonel Picquart convinced himself that the sentence was unjust, and was sent to the hinterland of Tunis. In 1897 Capt. Esterhazy was accused of being the real author by Capt. D.'s brother. Esterhazy was tried by court-martial and acquitted. The next person to take up cudgels on behalf of D. was Emile Zola. To Zola as to all the Dreyfusards it had become apparent that the military staff would not allow justice to be done. Zola in an open letter to the president announced this fact in plain hard language. He was tried for libel, convicted, and fled the country. But his conviction was tantamount to a victory. Zola had achieved his object. As he said, with clear foresight: 'Truth is on the march and nothing can stop it.' In 1898 the case was taken up by Clemenceau, and one of the documents was found to have been forged. Henry, the chief of the intelligence dept., was placed under arrest, and immediately afterwards cut his throat, having confessed that he had fabricated the document. The struggle was now against the army, and for a short time the republic itself was in danger. M. Brisson's cabinet, however, transferred the case to the Court of Cassation, and another court-martial was held at Rennes, where D. was again convicted, but obviously his conviction was merely the last struggle of the military party, since extenuating circumstances were admitted and the sentence reduced. This was followed almost immediately by a free pardon. The only common-sense conclusion which could be reached was that Esterhazy and Henry were the real culprits, and that the army was too obstinate to admit an obvious fact. The proceedings against D. were finally quashed in 1906, and he was again restored to the army, being given the rank of major. Zola's feelings at the moment of his intervention are now known to us through the document, unpub. till 1948, *Impressions d'audience*, in the possession of Dr. Jacques Emile Zola, his son. The fresh element that is pro-

vided by these *Impressions* is Zola's realisation of the need for France of the symbol of Dreyfus in order that she might continue to believe in military glory. Zola, in fact, opposed to the vision of a 'warlike France' that of another France which, 'having become liberty, tries also to be justice.' See E. Zola, *Vérité*, 1903; J. Reinach, *Histoire de l'affaire Dreyfus*, 1901-11; A. Dreyfus, *Souvenirs et correspondance publiés par son fils*, 1936; L. M. Friedman, *Zola and the Dreyfus Case*, 1937.

Dreyse, Johann Nikolaus von (1787-1867), Ger. locksmith and inventor; worked in a musket factory in Paris (1809-14), and on his return founded an ironware factory in Sommerda. He manuf. percussion caps under a patent (1824), and invented improved firearms, notably the muzzle-loading needle-gun (1827), and the breech-loading one (1836). Adopted by the Prussian army (1840), its superiority was shown in the war with Austria (1866). The modern repeating rifle has replaced it.

Driffeld, Great, see GREAT DRIFFIELD.

Drift, see under GEOLOGY.

Drift Net, see under FISHERIES.

Drill, Papio (or *Cynocephalus leucophaeus*), is a baboon of the same genus as the mandrill, but it differs from this hideous creature in the absence of bright colours on its muzzle and nose. It is a terocious inhabitant of W. Africa.

Drill, see under BORING.

Drin, wild riv. of Albania, which flows from Lake Okhrida N., and then W. to the Adriatic Sea at Bolana. Length 173 m.

Drina, (1) riv. of Yugoslavia, 288 m. long, which rises in Montenegro and joins the Save W. of Belgrade. (2) prov. of the Yugoslav republic of Montenegro.

Drinker Respirator, see IRON LUNG.

Drinkwater, John (1882-1937), Eng. poet and dramatist, educated at Oxford High School and Birmingham Univ. Was for twelve years a clerk in an insurance office. Assisted in founding the Pilgrim Players, which later became the Birmingham Repertory Theatre under Sir Barry Jackson. His first poems were *Men and Hours*, pub. in 1911, and his first play, a one-act play in verse, in 1911. Then followed topical plays on war, *Rebellion*, in verse (1914), and *Swords and Ploughshares* (1914). But his greatest success was *Abraham Lincoln*, a play produced in 1919. His *Oliver Cromwell* followed in 1921, but did not attract such attention as the earlier play. This was followed by the plays, *Mary Stuart* (1922), *Robert E. Lee* (1923), the prose works, *The Pilgrims of Eternity*, on Byron (1925) a dramatic version of Thomas Hardy's *Mayor of Casterbridge* (1926), *The King's Reign* (1935), and the *Midsummer Eve* (1935). Autobiographical works: *All About Me* (1928), *More About Me* (1928), *Inheritance* (1931), and *Discovery* (1932). He also wrote a number of essays, including a striking study of his friend, Rupert Brooke (q.v.).

Driver, Samuel Reiles (1840-1914), Eng. divine and Hebrew scholar. After a brilliant career at Oxford, he became

Regius prof. of Hebrew, and canon of Christ Church, 1883. His pubs. include *An Introduction to the Literature of the Old Testament* (1891); commentaries and notes on *Leviticus* (1894), *Deuteronomy* (1895), *Daniel* (1900), *Genesis* (1904); *Modern Research as Illustrating the Bible* (1909), *A Hebrew and English Lexicon of the Old Testament* (with F. Brown and C. A. Briggs) (1906). D. was a member of the O.T. revision committee, 1876-84.

Driving (of animals). Many animals are used for traction in various parts of the globe, but the most common are the horse, the mule, the ass, and the ox; in very cold climates the reindeer and the dog are also utilised. Ever since man possessed domesticated animals he has made use of them in this manner; an element of sport has also been associated with D. from very early times. Thus the Romans were very fond of chariot races, as also were the Gks. The custom of D. for pleasure, without racing, is of modern development; such a pleasure would have been impossible before Macadam and Telford made such a revolution in the art of road-making. Spring carriages and level roads were a necessary corollary, but when these existed there sprang up a great number of D. clubs in Britain, of which the Bensington Driving Club, founded in 1807, was the pioneer. The most usual method of D. is with one horse; when two horses are driven, they are either abreast (the customary way) or in tandem; four horses are driven in two pairs, the foremost pair being the 'leaders,' the other the 'wheelers.' Practice is essential before a good driver can be made, but the quality known as 'good hands' is to a large extent innate and instinctive. The reins are held in the left hand between the thumb and forefinger and second and third fingers. The left hand should be held on a level with the bottom of the driver's waistcoat, at a little distance from the body. The upper arm should hang freely against the side, the forearm should make a right angle with the elbow joint, and be held horizontally across the front of the body. The wrist should be slightly bent inwards with the back of the hand facing the horses. When the reins are thus held an experienced driver will 'feel' the horse's mouth without irritating or checking it. The D. of a tandem or a four-in-hand is a more difficult matter, as two pairs of reins have to be manipulated. The reins are held in the following manner: those of the leaders are separated by the forefinger; those of the wheelers by the middle finger. Thus between the forefinger and middle finger are the reins of the off leader and the near wheeler. The reins are first of all gathered together in the right hand, in the same position as they will be in the left, before the driver mounts to his seat. In starting a four-in-hand it is essential that the leaders and wheelers should start simultaneously, and when started, the driver should, by adjusting their length with his right hand, ensure that he has each horse under perfect control. When rounding corners a 'loop' of one or two inches of the leaders'

reins is taken up by the right hand and placed under the left thumb. It is also necessary that a driver who has any pretensions to skill should be able to handle his whip to perfection. He should be able to strike with the thong, lightly or vigorously, any horse he wishes. When the leaders need the whip the wheelers should not be disturbed; a first-class driver can 'touch up' the off leader under the swinging-bars (under which the thong should always pass) without agitating the wheelers at all. In tandem D. skill with the whip is even more necessary, as a well-directed cut with the whip will check the leader as a rule if he should try to turn right round. Four-in-hand D. is not so difficult as tandem, as although there is more weight on the hands, there is much more control over the leader.

Drocourt—**Quéant Switch**, in the 1914-1918 war a key position of the famous Hindenburg Line. It was the Brit. objective in the battle of Arras of April 1917, but was not taken. In Sept. 1918, after extremely bitter fighting, the 'switch,' as the position was called, was taken by storm by the troops of General (later Lord) Horne, together with many tns. and vils.

Droeshout, Marten (Martin) (fl. 1620-1651), engraver of the seventeenth century, probably of Dutch extraction. He settled in England, working chiefly for booksellers and engraving portraits. His most famous production is the engraved portrait of Shakespeare, prefixed to the first folio ed. (1623) of his plays. This was probably copied from the original painting made by D.'s uncle, which was discovered in 1892, and placed in the Shakespeare Memorial Gallery at Stratford-on-Avon. Other portraits were of Villiers, duke of Buckingham, the marquis of Hamilton, Dr. Donne, John Fox, and Sir Thomas Overbury.

Drogheda (anc. **Droichead Atha**, the bridge of the ford); seaport, mkt. tn. and municipal bor. (till 1885, a parl. bor.) on either bank of the Boyne, 4 m. from its mouth in the Irish Sea, on the Great N. main line, 31½ m. from Dublin, in the coe. of Meath and Louth, Eire. The depth of water alongside the N. quay is 21 ft. at highest and 14 ft. at lowest tide. Considerable agric. produce is shipped to Liverpool and Glasgow, and the salmon fishery in the Boyne has its centre here. Recently the former flourishing linen and damask industries have been revived, and there are manufs. of various articles including soap, leather, beer, and flour. The St. Lawrence Gateway still remains of the anc. walls, and there are relics of the Augustinian abbey (1206) and the Dominican monastery (1221). When Cromwell captured the tn. in 1649, most of the garrison were butchered. In 1690, after the famous battle of the Boyne, D. surrendered to William III. Pop. (1939) 12,000.

Drohobycz, former tn. of Poland, cap. of the D. Region of the Ukrainian S.S.R., E. Galicia, and centre of a petroleum producing dist. The Austrians defeated the Russians here in 1915. Pop. 30,000.

Droit Administratif. That system of law which in France gives an over-riding authority to the state tribunals over the ordinary law. It exists also in other European states, but is not so marked a feature as in France. There is no precise equivalent in our language: but it is defined in general terms by the Fr. authorities as 'the body of rules which regulate the relations of the Administration or of the Administrative authority towards private citizens.' D.A. is in fact that portion of Fr. law which determines: the position and liabilities of all state officials; the civil rights and liabilities of private individuals in their dealings with officials as the representatives of the state; and the procedure by which those rights and liabilities are enforced. The modern D. A. of France has grown up and assumed its existing form during the nineteenth century, being the outcome of more than a century of revolutionary and constitutional conflict. The essential characteristics of D. A. are: the rights of the state are determined by special rules, i.e. as opposed to the ordinary law; the ordinary law courts have no jurisdiction in matters concerning the state, and administrative litigation is thus determined by the Administrative Courts; the coexistence of judicial courts and administrative courts results in a conflict of jurisdiction in which the latter courts prevail; and state officials are protected against the ordinary law. See A. V. Dicey, *Law of the Constitution*, 1885; G. Jéze, *Les Principes généraux de droit administratif*, 1904; Seissier, *La Responsabilité de la puissance publique*, 1906.

Droits of Admiralty, see ADMIRALTY, **DROITS OF**.

Droitwich, mkt. tn. and municipal bor., on a canal connected with the Severn, and also on branch lines of two railways, 6 m. N.N.E. of Worcester, in Worcestershire, England. It is famous for its brine springs or 'wyes,' which are mentioned in the Domesday Book. Pop. 4500.

Drôme, dept. in the S.E. of France, bounded on the N. and N.E. by Isère, on the E. by Hautes-Alpes, on the S.E. by Basses-Alpes, and the S. by Vaucluse, and on the W. by the Rhône. Its total area is 2533 sq. m. Between the Rhône and Isère lies the fertile and hilly dist. known as the Viennois, and including the region of the Valloire, called the 'golden valley.' The natural div. through which flow the upper courses of the D., Roubion, Jabron, etc., is quite mountainous, the highest peak having an altitude of 7890 ft. The main crops are wheat, potatoes, and oats. Fruit, including olives, figs, and walnuts, wine, cheese, live stock, and silk obtained from silkworms fed on native mulberries, are the staple exports, whilst the prin. import is coal. Native minerals supply many potteries and porcelain manufs. Besides Valence, the cap., the chief cities are Die and Nyons, which all give their names to arrons., and Montélimar, Crest and Romans. Pop. 287,700.

Dromedary, or *Camelus dromedarius*, species of camel which is distinguished by its solitary hump, *C. bactrianus* having

two. It is a large ruminant which occurs in Arabia and is never found wild; the hump is adipose (fatty), and the body is covered with hair. See also CAMEL.

DROMEDARY

Dromia, genus of crabs in the family Dromiidae. Its well-defined orbits into which the eyes can be retracted, the fourth and fifth pairs of trunk-legs are small and are held dorsally, and the carapace is shaggy. *D. vulgaris* is found on Brit. and Mediterranean shores.

Dromore, par. and tn. of N.W. co. Down, N. Ireland, on R. Lagan, 15 m. from Belfast. The present cathedral was erected after the destruction of the tn. in the insurrection of 1611, and has the tombs of Jeremy Taylor (1613-67) and other bishops. Linen is manuf. Pop. 2400.

Drone, see BEE.

Dronfield, par. and tn. of England in the co. of Derbyshire, 6 m. from Chesterfield, and 6 m. S. of Sheffield. It is situated on the R. Drone, in the midst of collieries. Iron and steel goods are manuf. Pop. 4500.

Dronte, obsolete name, of Dutch and Fr. origin, for the dodo (*q.v.*).

Drontheim, see THRONDIJEM.

Drop-forging, or die-forging, a process which has replaced the old drop-hammer used in swaging, die-work, striking up sheet metal, etc. Many of the operations performed at the smith's anvil can be more quickly and better done by such a machine as the die-forge. A white-hot mass of metal is placed in the die, and the blows of the hammer force it into the same shape as the die; the metal goes into the die as a shapeless mass, so that when hammered some of it is squeezed out of the side of the die and, if this is not checked, would prevent the die from closing, and so spoil the stamping. To obviate this possibility, the metal is placed on a die of the same shape as the object, but pierced right through; when hit by the hammer the forging is forced through the die, thus leaving the stripped fin or metal behind, and the forging is then proceeded with.

In the manuf. of automobiles, aircraft, and other machines having many small parts the forgings are stamped so accurately that very little metal is wasted by machining in the shops, thereby saving both time and money. See H. Hayes, *Drop Forging and Drop Stamping*, 1923; S. Johnson and J. Warby, *Drop Forging Practice*, 1937.

Dropsy, shortened form of *hydropsy*, an accumulation of serous fluid in the tissues or cavities of the body. Serum is the colourless liquid constituent of blood, and under normal conditions is exuded through the walls of the blood capillaries in order to build up the tissues; a part of the exuded fluid is returned to the blood-stream by the veins and some by the lymphatics. When from any cause serum is exuded in abnormal quantity or is not absorbed to a sufficient extent, collections of fluid are apt to form. D. is therefore not a disease itself so much as a symptom of disease. Half of the cases of general D. are due to heart disease, and many are due to kidney disorders. Other causes may be weakening of the walls of the capillaries, by which exudation is increased, or, in the case of local D., any obstruction of a vein which causes increased blood pressure. (*Edema* is D. of superficial tissues, limited in area; *Anasarca* is the term applied to generalised D. of the subcutaneous tissues. *Ascites* is an accumulation of serum in the abdominal cavity, generally due to diseases of the liver and spleen. *Hydrocephalus*, or water on the brain, is an accumulation in the brain-cavities. *Hydrothorax* is a D. in the pleural cavities, characterised by a large proportion of albumen in the fluid. *Hydropneumothorax* is an accumulation in the membranous sac enclosing the heart. The treatment of D. involves the employment of purgatives, diaphoretics (which assist perspiration) and diuretics, in order to promote increased excretion. In severe cases tapping is resorted to, when a small drainage tube may be inserted to draw off the fluid.

Dropwort, common name for the plant *Spiraea* (or *Ulmaria*) *Filipendula* of the order Rosaceae, occurring in dry pastures in Britain. Has small white flowers resembling those of meadow-sweet. Water-dropwort is the common name for a poisonous species of plant of the genus (*Enanthe* of the Umbelliferae order).

Drosera, plant of the Sundew family (*Droseraceae*) which comprises nearly 100 beautiful insectivorous plants, growing in boggy places in all parts of the world. The leaves are covered with glandular hairs, whereby insects are trapped and digested. In Britain there are three species, *D. longifolia*, a common bog-plant; *D. anglica*, found chiefly in Ireland; and *D. rotundifolia*, the common or round-leaved sundew. The latter is an acrid and caustic plant used in Italy in making the liquor called *Rosoli*. See INSECTIVOROUS PLANTS.

Droste-Hülshoff, Annette Elizabeth, (Baroness) von (1797-1848), Ger. poetess, b. near Münster, Westphalia, a writer chiefly of lyric and narrative verse and

considered one of the greatest nature poets who have lived. Her book of nature poems *Heidebilder* was pub. in 1844, and in 1852 a cycle of religious poems under the title of *Das geistliche Jahr, nebst einem Anhang religiöser Gedichte. Letzte Gaben*, pub. by L. Schucking in 1860 included her short story 'Die Judenbuche.' Her collected poems were pub. by Schucking (1878-79) and a critical ed. by K. Schulte Hemminghausen (1925-1930). See lives by Schucking, 1862; K. Busse, 1903; C. Heselhaus, 1943; Zottman, *Deutschlands grösste Dichterin*, 1896; and letters ed. by H. Cardauns, 1909.

Drouais, family of Fr. artists, the third being the most famous:

Hubert (1699-1767) was intimate with Nattier, Van Loo, and Oudry. His portraits include those of the painter Christophe, and of the sculptor Robert le Lorrain.

François Hubert (1727-75), son of above, painted children's portraits, and did much work in Louis XV.'s reign. Examples are portraits of Mme. de Pompadour, Mme. du Barry, Mme. Clotilde, Marie Antoinette. His 'Child playing with a Cat' (1768) is characteristic.

Jean Germain (1763-88), son of above, pupil of David and Bénédict. He won the Academy prize (1874) with 'Christ et la Cananéenne.' While in Rome he painted 'Marius à Minturnes,' 'Philoctetes . . .', and 'A Wounded Gladiator.' See Chausard, *Notice sur Drouais*.

Drouet, Jean Baptiste, Comte D'Erlon (1765-1844). Marshal of France, b. at Reims. Won fame in the wars of the Republic and the Empire. When Napoleon escaped from Elba, he seized and held the citadel of Lille for the Emperor. Commanded the first *Corps d'armée* at Waterloo. Left France at the restoration, but returned after the July Revolution; subsequently becoming marshal and governor of Algiers.

Drought, or **Drouth** (A.-S. *drugað*, from *drugian*, to dry), dryness, want of rain or water. The term is especially applied to such lack of rain and moisture as affects the earth and its fertility, preventing the growth of plants. 'Periods of more than fourteen consecutive days without measurable rain' were fixed by Symons (1838-1900) as the exact time that must elapse without rain to cause an 'absolute drought.' See Symons' *British Rainfall* pub. annually since about 1863, and his *Meteorological Magazine*. From about 1714 to 1750 severe Ds. in England brought calamitous results with famine threatened and a series of devastating epidemics. There is reason to believe that even more acute Ds. occurred in the Middle Ages, when at least twice the R. Thames could be crossed dryshod: there is said to have been no harvest in 1177. The cholera year of 1854 was very dry, and hardship, famine, and disease are often caused by D. In the 19th century England has had two major Ds., in 1821 and 1833-34; and a Russian position was reached also in 1947 although rainfall until the end of

July was heavier than normal, the following three months were dry and events suggested that improvement in the methods of conserving water are necessary. The Sahara and Kalahari deserts of Africa, the Gobi desert of Central Asia, Great Salt Lake district in N. America, and certain regions of India and China suffer from D. nearly all the year round. The regions which suffer from almost continual D. are often shut off by high mountain ranges from the influence of winds carrying moisture. The causes of D. are not yet fully understood, but impressive evidence has been produced pointing to an indirect association between periodic changes in the output of solar radiation (phases of the sunspot cycle) and the caprices of rainfall in the U.S.A. See C. E. P. Brooks and J. Glasspoole, *British Floods and Droughts*, 1928; I. R. Tannehill, *Drought: its Causes and Effects*, 1948.

Drowning. The cause of death by D. is asphyxiation, and the entrance of water into the lungs. After death the skin of a drowned person presents the appearance known as 'goose skin,' or *cutis anserina*, the face is exceedingly pale, a frothy liquid is found in the lungs and air passages, and water in the stomach; froth is also present at the mouth and nose. Complete insensibility supervenes in from one to two minutes, and death in about five minutes, though persons have been known to recover who have been immersed for a considerable length of time. The D. person rises to the surface by his own efforts a variable number of times, not necessarily the three of the popular fallacy. Dr. W. Hawes was instrumental in founding the Royal Humane Society (q.v.), which has been the means of rendering the principles of life-saving widely known. There are four methods which are in use for the restoration of persons apparently drowned. The method of Marshall Hall (the earliest, dating from 1856), and those associated with the names of Schäfer and Sylvester, are described under **ARTIFICIAL RESPIRATION**. In Howard's method the body is first of all placed face downwards with a roll under the stomach, and water and froth are expelled by pressure on the back and lower ribs. After being pulled over the roll, the patient is turned over, and the arms placed above the body with the hands near the head. The tongue is secured by a cloth or by forceps. The operator kneels over the body, places both hands on the lower part of the patient's chest, with the thumbs just under the lowest ribs. The operator then presses forward steadily, raising the ribs and bending himself forward, after which he throws himself slightly backward, repeating this about fifteen times a min. This method is easier than the Sylvester, and can be practised when the patient's arms are hurt; care must be taken that undue pressure is not exercised. In all these methods the operator should continue for as long as there is any hope, for an hr. or more if necessary. When the patient is coming round, teaspoonfuls of hot

water, brandy, etc., should be administered, and hot-water bottles applied. In olden times D. was a cap. punishment; it was abolished in England about 1620, in Scotland in 1685, in Switzerland 1652, in Austria 1776, and in Ireland 1777. For methods of rescuing persons who are D., see LIFE SAVING.

Droylsden, par. and tn. of Lancashire, England, 4 m. from Manchester. The manufs. of cottons and chemicals are important, and it has print-fields and dye-works. Pop. 14,000.

Droz, Antoine Gustav (1832-1895), Fr. novelist, b. in Paris, grandson of Jean Pierre D. (1746-1833) a medal engraver. Author of sev. popular and brilliant novels: *Monsieur, Madame et Bébé* (1866) *Entre nous* (1867) and *Le Cahier bleu de Mlle. Cibot* (1869), *Les Étiages* (1875) and *Tristesses et sourires* (1884).

Drug, any simple medicinal organic or inorganic substance, used as an ingredient of a mixture or by itself. In a more restricted sense, applied to narcotics such as opium or hashish. The narcotic control conventions are administered by an international authority, the Permanent Central Opium Board. Anxieties recently expressed by the Board serve to emphasise the apparent success of Brit. measures for controlling the use of dangerous Ds. Measures controlling the consumption in Britain of a range of dangerous Ds. were strengthened by regulations which came into force on Jan. 1, 1949. The regulations restrict the authority to dispense dangerous Ds., and impose on pharmacists the responsibility for satisfying themselves of the genuineness of all prescriptions which they dispense for a dangerous D. D. addiction does not present a serious problem in the United Kingdom, addicts numbering fewer than 400. The prin. Ds. of addiction are morphine and heroin. Few use cocaine and the number who do so is decreasing. The domestic manuf. of dangerous Ds. is controlled by a system of licensing, and supervision is exercised by Home Office inspectors over persons authorised to possess and use dangerous Ds.

Drugget (Fr. *droguet*), common felt or coarse woollen fabric, often printed on one surface. The heavier kinds are chiefly used for covering carpets (hence called 'crumb-cloths'), as a substitute for carpets, or as a lining or border. The lighter kind is used for table-covers. A strong dress-fabric of this name was formerly used largely for petticoats and workmen's aprons.

Druids, caste of priests among the Celtic inhabitants of anc. Gaul and Britain, about whom a considerable body of tradition has survived, no doubt largely modified and coloured by legend, especially in the case of the Irish D. Etymologists differ as to the derivation of the name itself; the long accepted connection with the Gk. *δρῦς*, oak, is now doubted. The Welsh and Breton *derwydd* and *drauid* are not original forms. The Latin form *druida* points to a Gaulish *druids*, Irish *draí*, which has been analysed into *draí*, very learned, knowing. Caesar gives

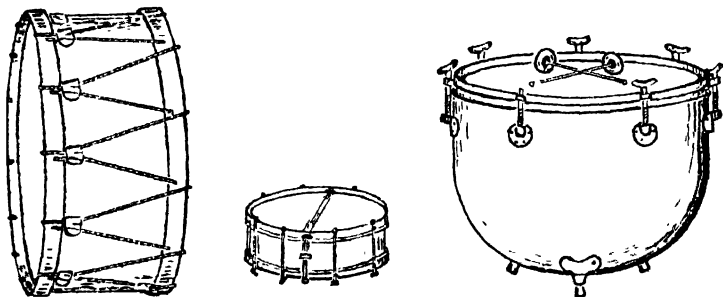

the first circumstantial account of the D.; he tells us that all nobles and men of dignity in Gaul were among the D.; that they were the law-givers and priests; that the caste was not hereditary; the chief D. was elected; they had the power of inflicting heavy punishment for disobedience to their decrees. They had a written language, believed in the immortality of the soul, and were learned in astrology and the natural sciences. It appears that Caesar may have overestimated their powers. Britain was the headquarters of the D., and but a yearly meeting was held in Gaul; the Gaulish novices came for training to Britain. Human sacrifices seem generally to be attributed to them, and they studied divination by the flight of birds and by the dying convulsions of their victims. The oak tree was sacred and all its fruits, hence, too, mistletoe; religious ceremonies were performed in oak groves. Pliny writes of them as practisers of medicine and sorcery, and of their cutting the mistletoe, robed in white, with golden sickles, and of the sacrifice of white bulls. Strabo tells of their golden collars and armlets; he describes them as bards and soothsayers. Tacitus gives us an account of their last stand, A.D. 61, on the is. of Mona (Anglesey), when the Brit. D. were exterminated and their sacred groves cut down, and the suppression of the D., which had been the object of Rome since Augustus, was accomplished both in Gaul and at any rate in England and Wales. The later hist. is confined to the Irish D. Anc. Irish literature has many tales concerning them, much overlaid with legend and with the traditions of the early Christian struggle with the supporters of pagan rites. Thus it is that the Irish accounts attribute to them sorcery and witchcraft. They are found with power of changing the weather; the arch-druid appears as a leaping juggler, tossing swords and balls in the air; when a famine occurred, the D. ordered the son of a sinless married couple to be sacrificed and his blood mixed with the soil; a D. by enchantment causes the death of King Cormac; they appear also as bards and poets. The legends of the struggle of the D. against St. Patrick and St. Columba are also interesting. See D'Arbois de Jubainville, *Les Druides et les dieux Celtiques*, 1906; P. W. Joyce, *Social History of Ancient Ireland*, 1903; D. Wright, *Druidism*, 1924; T. D. Kendrick, *The Druids*, 1927.

Drum, musical instrument of percussion. Although it is said to have been introduced into Europe about the time of the Crusades, nevertheless, instruments which strongly resemble it were known during the early days of the Rom. empire. Obviously one of the most primitive of musical instruments, it forms almost exclusively the sole musical instrument of savage peoples. The tom-tom, a form of D. played with the fingers, is the chief music of many primitive tribes, and this instrument is also known to have existed in Egypt considerably more than 1000 years before Christ. There are three

varieties of Ds.: (1) The common or side-D., (2) the bass-D., and (3) the kettle-D. The side-D. is, as its name implies, worn at the side of the player, and is played upon the upper side with two sticks. It is found nowadays almost exclusively as an accompaniment to fife bands. The bass-D. is almost entirely a military instrument, being very similar in construction to the side D., but larger. It is played with two sticks, both sides being used. The bass-D. has within recent years been introduced into large orchestral music by the more modern composers. The only instrument of real musical value, however, is the kettle-D. This instrument is composed of a cauldron-shaped shell or kettle of copper or brass,

100 to 200 ft. high, the longer axis always lying parallel to the former local glacial motion. They occur in America in Massachusetts, round Boston harbour, W. New York, S.E. Wisconsin, and the lake region, and in the parts of Europe and Asia lying N. of the terminal moraine of the Continental glacier. A good example exists between Belfast and Lisburn, Ireland.

Drum-major, since 1878 called the sergeant-drummer, the first or chief drummer in a regimental band, the officer who leads a drum-corps or band, directing its movements, and regulating the pace when on the march. He attends to the bugle calls and teaches the under-drummers. The D. ranks with the sergeants of the

MODERN DRUMS

Military bass drum; narrow shell side drum, shown upside down to expose the snares; and orchestral kettle drum and sticks.

over the mouth of which is drawn tightly a single head of skin attached to an iron ring. By means of screws it is possible to tune this D. within narrow limits. In a full orchestra two are usually found, one with a compass from F. to C, and the other from B \flat to F on the bass staff. The music is invariably written in the key of C. A variety of sticks covered with different materials can be used to produce a harder or softer impact. The kettle-D. is carried by the cavalry, this being the only use made of it in military circles.

Drum of the Ear, see *TYMPANUM* and *EAR*.

Drumcliff, par. of N.E. Sligo co., Ire, on D. Bay, 4 m. from Sligo. It has a carved Celtic cross and a round tower. Pop. 5000.

Drumlog (Gaelic, ridge of stone), moorland tract of Lanarkshire, Scotland, 17 m. from Lanark. An obelisk commemorates the defeat of Claverhouse by the Covenanters, or Cameronians (1679), near London Hill. See Scott's *Old Mortality* for a description of the battle.

Drumlins, or **Drumlings** (from *drum*, ridge), in geology, smoothly-rounded, oval hills of compact, unstratified, glacial drift or boulder-clay, apparently deposited and piled up beneath the Pleistocene ice-sheets. They are usually about $\frac{1}{4}$ m. long,

lieue. His official designation, from 1881, was sergeant-drummer or sergeant-piper (as the case might be), the reversion to the old name being made by the War Office in 1928. The rank is over two centuries old and is to be traced as far back as 1632, in which year it is mentioned by a music writer named Cruso; and seven years later there was a D.-M. on the strength of the Royal Scots and a few years later, on that of the Coldstream Guards.

Drummond, George (1687-1766), public-spirited Scottish officer. He fought against the Pretender at Sheriffmuir (1715). He was lord provost of Edinburgh for the first time in 1725, being chosen six times in all. D. was energetic in resisting the rebels of the '45 outbreak, joining Cope after the surrender of Edinburgh. He helped to found the Edinburgh Royal Infirmary, erected the Royal Exchange, 1753, and laid the foundation-stone of the North Bridge, 1763.

Drummond, Henry (1851-97), Scottish scientist and theologian. He travelled widely, *Tropical Africa* (1888), and *Travel Sketches in our New Protectorate* (1890) being the resulting works. His *Natural Law in the Spiritual World* (1883), and *The Ascent of Man* (1894) were attempts to reconcile evangelical Christianity and evolution: the first book was very

popular, but the second had less success. D. was a man of great personal fascination and wrote in an interesting and suggestive manner, but his reasoning in his scientific works is by no means unassailable.

Drummond, James (1816-77), Scottish historical and genre painter, studied under Allan in the School of Design. His first exhibit in the Scottish Royal Academy was 'Waiting for an Answer,' 1834. He became a R.A. (1852), and curator of the Scottish National Gallery (1868). Among his best works are 'The Vacant Chair' (1837), 'The Porteous Mob,' 'The Covenanters in Greyfriars Churchyard,' 'Peace,' 'War.'

Drummond, James (1835-1918). Eng. Unitarian theologian, educated at Trinity College, Dublin. He became a colleague of Gaskell at Manchester (1859-69), and then professor of theology at Manchester New College, London (1869), succeeding Martineau as principal (1885-1906), and moving with the college to Oxford (1889). His works include *Introduction to the Study of Theology* (1884), *Via Veritas, Vita* (1891), *The Pauline Benediction* (1897), *Life and Letters of Dr. Martineau* (with C. B. Upton, 1902), *Character and Authorship of the Fourth Gospel* (1904), *Paul: his Life and Teaching* (1911).

Drummond, M. James Erie, see PERTH, EARL OF.

Drummond, Thomas (1797-1840), inventor and administrator, entered the Royal Engineers in 1815, but in 1820 accepted Colonel Colby's offer to join him in an ordnance survey of Great Britain. It was in 1825 near Belfast that he first tested the power of his lime-light apparatus (Drummond light), being able to see it at a distance of 67 m., and four years later he adapted it for use in lighthouses. D. also invented an improved 'heliostat,' a mirror especially designed to facilitate the turning of rays of light in a certain direction. Appointed superintendent of the boundary commission in 1831, he became under-secretary for Ireland in 1835, when he discharged his duties so as to win universal respect. See also HELIOGRAPH.

Drummond, William (1585-1649), Scottish poet, b. at Hawthornden, obtained his M.A. degree at Edinburgh Univ., studied law and literature in Bourges and Paris, and spent the greater part of his life at his 'sweet and solitary seat' of Hawthornden, dividing his life between poetry, royalist pamphlets, and melancholy. It was with bitter resentment that he signed the abhorred Covenant in 1639. D. has been called the Scottish Petrarch because of his passionate sonnets (1616) inspired by the early death of his first love, Mary Cunningham, yet he is in no sense a national poet, for his inspiration and much of his sensuousness are drawn from Spenser, and his poems prove him to have been well acquainted with the works of Sidney and many It. poets. *Flowers of Sion* (1623) contains his 'Cypresse Grove,' a musical poem on death, which best preserves the quiet gloom of D.'s mind, and is free from extravagant conceits which sometimes mar his verse. Other of his

works are *Forth Feasting* (1617), and, in prose, *The History of Scotland, from the year 1423 until the year 1542* (1655), known also as *History of Scotland during the Reigns of the Five Jameses*. See D. Masson, *Drummond of Hawthornden*, 1873; A. Joly, *William Drummond de Hawthornden*, 1935. See life by Masson.

Drummond, William Hamilton (1778-1865), Irish poet and Unitarian minister. He wrote poems, *The Battle of Trafalgar* . . . (1806), *The Giant's Causeway* (1811), *The Pleasures of Benevolence* (1835), *Ancient Irish Minstrelsy* (1852); an Eng. metrical trans. of Irish ballads in J. Hardinans' *Irish Minstrelsy* (1831), polemical works, such as *The Doctrine of the Trinity* (1827), *Original Sin* (1832); and biographies of A. H. Rowan, (1840), Michael Servetus (1848), and others.

Drummossie Moor, see CULLODEN.

Drumright, city of Creek co., Oklahoma, U.S.A., with oil refineries. Pop. 4900.

Drunkenness, or Inebriety, may vary from a state of hilarity, mental excitement or exaltation to complete coma or unconsciousness, ending possibly in death. It may be an occasional lapse or an habitual and chronic state of alcoholism. It may be the cause of foolish and disorderly behaviour, or the symptom of deep-seated fatal diseases, or of insanity. It may lead to a fine for a condition of helplessness in the streets, or to a long term of imprisonment or capital punishment for brutal assault or a murder. Medically or physiologically D. is a condition of intoxication or poisoning due to the consumption of an excessive amount of alcohol, either in rapidly taken doses, or spread habitually over a period of time, with a cumulative effect. The outward signs of alcoholic intoxication, the thickening of speech, blurred or double vision, inability to maintain equilibrium, etc., are due to paralysis of various parts of the nervous system. Pathologically it includes acute alcoholism, in various stages leading to complete coma, delirium tremens, and chronic alcoholism, with its most usual results of various profound nervous disorders, impaired digestive powers, cirrhosis of the liver, etc. A proof of the effect of alcohol on the nervous system is found in the fact that in post-mortem examinations traces of it may be found in the cerebrospinal fluid when it has disappeared in every other organ. The modern treatment for D. is on psychological lines, the theory being that D. is usually an attempt to escape from, and is thus a symptom of, mental conflict. If the underlying cause can be cured the D. disappears. Viewed racially it may at once be recognised that D. is far more prevalent among the races of N., damp, and cold climates than in the S. Scandinavia, N. Russia, and Scotland are in marked contrast to Italy, Spain, Portugal and S. France. The comparison of national drink bills, based on consumption per head, is usually fallacious; it is the kind of alcohol taken, i.e. whether light wines or beers or ardent spirits, and the manner of consumption, i.e. as part of the daily diet or crowded into a few

hours, that makes the difference as far as the national health is concerned. The inter-relation of hereditary alcoholism is not thoroughly worked out. To some the result of past alcoholism should tend to an immunisation, racially if not individually. In the eyes of the law, D. does not affect a man's civil capacity; he may make contracts, wills, marriages, etc., as long as he is capable of knowing what he is doing and no undue advantage is taken of his state. So, too, as regards criminal responsibility, but in those crimes where a criminal intention is essential, his state may be taken into consideration. See further under CRIMINAL LAW. As an offence in itself, the law looks first to the effect: it is not an offence to be drunk *per se*, but only if it be accompanied by disorderly conduct in a public place or leads to a breach of the peace; or it is an offence to be drunk and incapable in a public place, or drunk in a licensed house, or when in charge of a vehicle of any kind or the like. Stringent laws regulate the offence of selling drink knowingly to drunken persons or to known inebriates, or of permitting drunken persons to remain on licensed premises. Finally, the law takes into account habitual drunkards in the technical phrase, inebriates. They may be voluntarily committed to abstain from visiting licensed houses for a maximum period of two years, which can be extended on application.

Drury, Dru (1725-1803), an Eng. naturalist. His cabinet collections of home and foreign insects were much prized, and his writings did much for the advancement of entomology. Linnaeus, J. E. Smith, Kirby and others thought very highly of D. His chief works are *Illustrations of Natural History* (1770-82), *Directions for Collecting Insects in Foreign Countries* (1800); *Thoughts on the Precious Metals* . . . (1801), *Ezotic Entomology* (ed. by J. O. Westwood with Memoir, 1837). Moses Harris drew the many plates and figures accompanying these works.

Drury, William Price (1861-1949), son of an Eng. naval officer, educated at Brentwood School, Essex, and Plymouth High School. Saw a considerable amount of service at sea on China and Mediterranean stations and elsewhere. From 1900 to 1901 he was a member of the Naval Intelligence Department. He is the author of *The Flag Lieutenant* (1908), a successful play produced at the Playhouse; *In Many parts: the Memoirs of a Marine* (1926); *Eight Bells* (1932); also a film: *The Further Adventures of the Flag Lieutenant*.

Drury Lane, thoroughfare of London, England, extending from Aldwych to Broad St., St. Giles', and High Holborn. It is named after Drury Place, a fifteenth-century house owned by the Drury family. It was in this house that Essex planned the rebellion of 1600. On its site in 1805 Astley built the Olympic Pavilion. D. L. with its theatre, has an historic past. Neil Gwynn was b. in Drury Court and followed her trade by the D. L. theatre. It was from this

thoroughfare that a serving man first raised the alarm on the outbreak of the plague. Other famous names associated with the dist. are Campbell, Donne and Lamb. See also next article.

Drury Lane Theatre, famous London playhouse in Covent Garden, one of the oldest existing in London, deriving its name from the old Cockpit or Phoenix Theatre (c. 1616), actually in Drury Lane, where Killigrew acted, before granted a patent by Charles II. (1663) for opening a new one. This was known as the Theatre Royal, and opened by Killigrew and his company called the 'King's Servants.' A fire destroyed this first house (1672), and it was rebuilt by Wren (1674). In 1682 the 'Duke's Servants' under Davenant joined Killigrew, and both companies played together at Drury Lane. There was a secession under Betterton to Lincoln's Inn Fields (1694), and by 1709 the theatre was closed. Collier took over the management in 1710, Lacey in 1744, soon being joined by Garrick. Among noted actors who performed here in the eighteenth century were Colley Cibber, Doggett, Wilks, Quin, Macklin, Pritchard, Kitty Clive, 'Peg' Woffington, and Mrs. Siddons. Garrick was manager from 1746-76, opening with Dr. Johnson's prologue (1747), and the triumphs of himself and his company renewed the prosperity of the theatre. In 1784 Kemble made his first London appearance as Hamlet, becoming manager in 1788. The house was pulled down in 1791, reopened by Sheridan (1794), but again burnt down in 1809. The present house, built by Wyatt, was opened in 1812, with a prologue by Lord Byron. The committee's advertisement for this prologue gave rise to the *Rejected Addresses* of J. and H. Smith. The interior was rebuilt in 1822, the present seating capacity being about 2500. Kean and Macready won fame here in the early nineteenth century. Famous for annual pantomimes held there under the management of Sir Augustus Harris and Arthur Collins, for musical comedy, and spectacular pieces, and melodrama, such as *Ben Hur* (1902), *The Whip* (1909), *Everywoman* (1913), *Cavalcade* (1932). In 1917 it was used by Sir Thomas Beecham for opera. See *Pepys's Diary*, 1663; E. Stirling, *Old Drury Lane*, 1881; J. Doran, *In and About Drury Lane*, 1881; W. Macqueen-Pope, *Theatre Royal: Drury Lane*, 1946.

Druses (Druzes) anct. race and religious sect of Syria, of much-disputed origin. They are variously said to be Arabs from the Yemen; of Chinese stock; and descended from the Kurds with whom Esarhaddon repopled Samaria after the second captivity of Israel. They are also regarded as Iranians. Their numbers are impossible to estimate with any degree of accuracy, but they have been assessed at 110,000. They live chiefly in the mt. regions of Lebanon and Anti-Lebanon and in the dist. of Hauran. They call themselves Muwahhidin ('Unitarians'), but are known to others as 'D.', a name probably derived from Ismail Darazi or Durzi (confessor of Hakim), their first

apostle in Syria. He was forced to flee for refuge to Lebanon, 1016, after preaching publicly the divine incarnation in Hakim, one of the seven cardinal beliefs of the sect. Others connect the name 'D.' with various Arabic words. Hamzé, a Persian disciple of Hakim, gave the Druse faith its settled form. They mingle teachings of the Pentateuch, the Christian gospels, the Koran, and the Sufi allegories, and believe in one God. They hold that the Diety has on no fewer than ten occasions been made manifest in human form, the last occasion being in the person of Hakim, the Nero-like Fatimite Caliph of Egypt (966-1021). One tenet of their faith is that the number of souls is definite, and that when one man dies his spirit assumes another fleshly cloak and lives a life conditioned by classes of Akals (Initiated) and Djahils (Un-initiated). Both classes look forward, as a prelude to the end of the world, to an Armageddon between Islam and Christendom, and celebrate their religion in mysteries. A most fanatical and warlike people, they have revolted against all their rulers—the Turks, the Egyptians, and in late years the Fr. They yet discourage proselytism and Mohammed is not accepted by them as an incarnation of the Deity. In the seventeenth century Emir Fakr-ed-din MAZD. II., a noted Druse leader and the most famous figure in the hist. of the race, annexed Beirut and Sidon, and menaced Damascus. He intrigued with the Christians, and was executed by the Turks (1635). In the eighteenth century the Turks and D. revolted against Egypt, and the famous Emir Beshir was exiled to Malta, dying at Constantinople, 1851. From 1840 to 1860 there was endless bitter strife between the D. and the Maronite Christians. After the Maronite Massacres of 1860, the Fr. interfered (1861) and in 1864 the European Commissioners drew up a new constitution for Lebanon under a Christian governor chosen by the Porte, Daoud Pasha being the first. He founded an educational establ. at Aboey. There was a fierce revolt in 1925 against the Fr., who held the mandate for Syria, and the revolt was crushed with extreme severity by General Sarrail. The D. fled to Hadithah, some 80 m. distant, where they now dwell in a city of tents by some deserted wells, through the clemency of Ibn Sa'ud, King of Saudi Arabia (Saudia). In the old days the D. were famous silk manfs., and they still carry on the trade, chiefly at Shilman; but the nomad section of the people under Attrash eke out a hazardous existence by gathering salt from the basalt gravel of Hadithah. A little corn also is raised by those still in Syria. Deir-el-Kamr is their chief city, but Baklin (near by) later became their headquarters. Kunarvat is the chief tn. of the Hauran dist. See S. de Saoy, *Exposé de la religion des Druses*, 1838; P. Wolff, *Die Drusen und ihre Vorläufer*, 1842; Earl of Carnarvon, *Druses of the Lebanon*, 1860; C. H. Churchill, *The Druses and Maronites under Turkish Rule*, 1840-60, 1862; L. Oliphant, *Hadfe*, 1887; Ger-

trude Bell, *The Desert and the Son*, 1907; J. F. Scheltma, *The Lebanon in Turmoil*, 1921; B. H. Springett, *Secret Sects of Syria and the Lebanon*, 1922; L. Stein, *Syria*, 1925; P. K. Hitti, *The Origins of the Druse People and Religion*, 1928.

Drusus, Marcus Livius, (1) Rom. tribune of the plebs in 122 B.C., but a supporter of the aristocracy. After passing a veto on a popular measure proposed by Gracchus, his democratic colleague, he proposed the same measure himself in order to prove to the people that the patricians were their best friends. The success of this policy earned him the sobriquet of 'patron of the Senate'. (2) Son of the preceding: Rom. tribune, 91 B.C. an aristocrat: pursued the same course as his father, but was baffled in the execution of his purpose, which was to broaden the constitution and admit the its. to citizenship; in consequence of which he formed a conspiracy but was assassinated. This led to the Social war.

Drusus, Nero Claudius (Germanicus) (38-9 B.C.), Rom. general, was the adopted son of the Emperor Augustus and the younger brother of Tiberius. Horace, in one of his odes, has celebrated D.'s campaign against the Rheti and Vindelici, who threatened the Gallic frontiers, but historically D. is remembered for the subjugation of Germany by his victories over the Usipetes, Sugambri, Chatti, and Suebi, and by the fact that he was the first Rom. general to reach the Elbe. Had not an accident caused his death in early manhood, it seems likely that his winning manners, strategical genius and brilliant success, which had combined to win him an extraordinary popularity, would have enabled him, had he chosen, to overthrow the empire.

Drusus Cæsar (c. 15 B.C.-A.D. 23), son of the Emperor Tiberius and Vipsania Agrippina, after being twice consul, and winning victories in Pannonia and Germania, was given the tribunician authority by his father, a sign that one day he would inherit the empire. But he died early in life, being slowly poisoned by the ambitious Sejanus, who had also seduced Livia, his wife.

Druses, see DRUSES.

Dryads, in Gk. mythology, the nymphs of the trees. Each *δρυς* (tree, especially oak) was the home of its own particular D., whose life was bound up with that of her tree (*Hamadryad*, *ἡμαδρυς*).

Dryas, of the order Rosaceæ, consists of two species of Arctic plants. *D. octopetala*, the mt. avens, grows in Alpine dists. of Europe, on Scottish and Irish mts., and in Yorkshire. The plant is procumbent, with simple leaves, a woody stem, and white flowers; after fertilisation the style grows feathery, and the fruit is oval and long-tailed. *D. depressa* has been found in Ireland.

Dryburgh (Gaelic *Dárbach-bruach*, bank of oaks) Abbey, beautiful monastic ruin in S.W. Berwickshire, Scotland, on the R. Tweed, 4 m. from Melrose. It was founded about 1150, probably by David I. Burned by Edward II. (1322), it was partly restored by Robert the Bruce.

Under Richard II. it suffered again (1385), and was reduced to ruins by Bowes and Latoun (1544), and by the Earl of Hertford's expedition (1545). The style is mainly Early Eng. and Transitional Norman. St. Mary's aisle in the N. transept has the tomb of Sir Walter Scott (1771-1832), and of J. G. Lockhart, his biographer. The yew near the chapter-house is at least as old as the abbey itself.

Dry-cleaning, operation for cleaning textile and similar materials and fabrics, and articles made of them (e.g. garments, curtains, etc.) without the use of water.

M. Struan, *Home Dry-cleaning and Laundrywork*, 1933.

Dryden, John (1631-1700), Eng. poet, b. at Aldwinkle, Northamptonshire. He was descended on both sides from anct. families, which had at this time strong leanings towards the Puritans and against the monarchy. He was educated at Westminster School under the famous Dr. Busby, and later proceeded from there to Trinity College, Cambridge. In 1649 had appeared his first contribution to poetry in the shape of a poem commemorative of the death of Lord Hastings. In 1654 he

DRYBURGH ABBEY

W. F. Mansel

It depends on the fact that oils and grease are soluble in certain organic liquids, such as petrol, acetylene tetrachloride, carbon tetrachloride, alcohol and acetone, and that when the greasy substance has been thus removed the residual particles of dirt may be eliminated by brushing, by the use of vacuum extractors, or by other mechanical means. The great advantage of D. C. is that it does not spoil the shape of the articles cleaned, and very rarely affects their colour in any way. Modern dry-cleaning plants operate on a large scale, and economy is effected by recovering the solvents after use. In early days, the process of D. C. was attended with serious risks of fire owing to the inflammable nature of the solvents employed, but the advance of chemical research has provided the dry-cleaner with excellent non-inflammable liquids; these are quickly replacing the solvents formerly employed. For home use, light petroleum, or 'petroleum ether,' is a good general solvent, but it very readily takes fire, so that it must be employed with caution.

took his bachelor's degree, and in the same year his father died, leaving him property worth about £60 a year. He seems to have remained at Cambridge during the following three years, although this is not quite certain. In 1657, at any rate, he seems to have taken up his residence in London, where, in all probability, he lived under the protection of his cousin, Sir Gilbert Pickering. In 1659 appeared his stanzas commemorative of the death of Cromwell. In 1660 he pub. *Astræa Redux* in honour of the Restoration, and followed this up by a panegyric in honour of King Charles's coronation in the following year. Without attempting any disguise, he proclaimed frankly that he was endeavouring to obtain as much money as he could, and in the preface to four of his plays he owned that he would force his genius to perform that which the humour of the public demanded. The taste of the public was not over choice, and yet D., in his first attempt to satisfy that public taste, overstepped even the wide limits of the decency of the Restoration age.

In fact, this general criticism may be made of all his plays, that in an age when decency was at a discount, he successfully managed, by the virulence of his indecencies, to exceed the limits of the time in almost every case. This is not altogether to be wondered at, since he was forcing his genius to perform something for which it was totally unsuited. The *Wild Gallant* (1663) was a failure, but D. learnt from his lack of success, and the *Rival Ladies*, produced in the same year, was more of a success. In the same year he collaborated with Sir Robert Howard in the composition of *The Indian Queen*, which proved a great success in 1664, and in the same year he married the Lady Elizabeth Howard. In 1665 appeared from D.'s pen alone *The Indian Emperor*, which was also a great success. In 1666 appeared his poem *Annus Mirabilis*, which commemorated the Dutch War and the Great Fire in the heroic stanzas of the Cromwellian ode. Between the appearance of this poem and 1681, D. appears to have confined himself entirely to stage plays. He wrote many during this period, and these plays may be divided into two distinct classes: the one following the general tendency of the day and attempting to make up by their ribaldry for their want of genius; the other, dramas founded upon striking incidents in the hist. and mythology of the world. In the former, for reasons already given, he was almost uniformly unsuccessful, in the latter his success was really popular. He was at this time under contract to Shelley's Theatre to write three plays a year, receiving in return about £400 per annum. He failed to fulfil the conditions, producing only about ten plays during the ten years during which he was under contract. Amongst the plays which he produced at this time (not all under the contract conditions) are: *Secret Love* (1667), *Sir Martin Mar-all* (1667), *An Evening's Love* (1668), *Tyrannick Love* (1669), *The Conquest of Granada by the Spaniards* (1670, 1671), *Marriage à la Mode* (1671), *The Assignment: or Love in a Nunnery* (1672). The extravagant boasting of the preface to the *Conquest of Granada* was the cause of the production of the *Rehearsal*, a play written in burlesque principally by the Duke of Buckingham. In 1670 D. had become poet laureate. In 1674 he attempted to turn *Paradise Lost* into rhymed couplets, having, it is said, the permission of Milton 'to tag his verses.' *Aureng-Zebe* was the last of his rhymed plays, and was pub. in 1678. In 1677 appeared *All for Love*, a version of the story of Antony and Cleopatra, but written from an entirely different point of view from that of Shakespeare. A comparison of the two plays leaves us entirely convinced that Shakespearean drama was the highest form, but it gives us also a very much greater opinion of D. than can be obtained from any of his other plays. Other plays which D. wrote subsequently to this are: *Edipus* (1678), *Troilus and Cressida* (1679), *The Spanish Friar* (1680), *The Duke of Guise* (1682), *Albion and Albanius* (1685), *Amphitryon*

(1690), *King Arthur* (1691), *Cleomenes, The Spartan Hero* (1692), and *Love Triumphant* (1694). D., after abandoning the rhymed couplet, adopted satire as the instrument of his genius, and pub. in 1681 *Abalom and Achitophel*, after having been mistaken for the author of a previous satire. This satire was written from the court point of view, probably with the idea of gaining favour for himself, and was certainly immensely popular. Ed. after ed. sold rapidly, and certain it was that D.'s satire was appreciated. He had not the faculty of delicate satire, but the blows which he struck were hard. His next satire was *The Medal* (1682), a poem written in savage commemoration of the medal struck when Shaftesbury was acquitted. He attacked and attempted to demolish Shadwell in the poem *Mac Flecknoe, or a Satyr upon the True-Blew-Protestant Poet, T.S.* (1682). In 1682 appeared *Religio Laici*, which attacked the Papists and still more bitterly urged on the persecution of the Non-conformists. On the accession of James II. in 1685, D. became a Catholic. By many his conversion has been held to be the result of sincere conviction, while, on the other hand, the majority hold that it was merely another example of his time-serving characteristics. Be that as it may, he wrote a poem, *The Hind and the Panther* (1687), in which he strongly advocated the faith of his new religion. The Revolution of 1688 found him still unchanged, and as a result of his Catholicism he lost his office of poet laureate, and had to fall back upon his pen for his living. In 1693 appeared some trans. of Ovid and Homer, and almost immediately afterwards he set to work on a complete trans. of Virgil, which appeared in 1697. This was followed by the famous second ode on *St. Cecilia's Day*. His last work, pub. a few months before his death, was the *Fables*, principally founded on the stories of Boccaccio and Chaucer. During the later part of his life he had been dependent on the trans. for his daily bread, and he also seems to have received presents from his friends. As a translator he rendered Virgil, Juvenal, Ovid, and Chaucer, and the best of his prose is the preface to his *Fables* of 1700, in which, in the year he died, he introduced some of his trans. to the public. Although deprived of his position as laureate, he still continued to be recognised as the greatest living poet, and he lived without fear of molestation from the gov. and respected by all. He died on May 1, 1700. By his conversion he became the literary parent of the greatest poet of the succeeding age, Pope. His genius is undoubted, and showed itself principally in his ability to imitate and to excel those whom he imitated. He had no great originality, yet his position as one of the greatest of our poets remains. He estab. little, yet he excelled all. In the heroic couplet, the decasyllable quatrain, and in blank verse, he displays equal mastery. But it was in the heroic couplet that he wrought his most striking effects. His couplet lacks the chiselled precision of form and epi-

grammatical brilliance achieved by his successor in verse satire—Pope—but has a richer and more vital content; and as a master of prosody D. ranks with the greatest of all Eng. poets. Like Johnson, D. was the literary dictator of his age; presiding at Wills' Coffee House in unquestioned supremacy among the contemporary wits. Among the collected eds. are: complete works ed. by Sir W. Scott (1808, 1821), revised by G. Saintsbury (1882-92); poems, ed. by W. D. Christie (1870), and B. Dobree (Everyman's Library, 1934); plays, ed. by W. Congreve (1717) and M. Summers (1931-1932); prose, ed. by E. Malone (1800) and W. H. Hudson (Everyman's Library, 1912). Bibliography by H. Macdonald (1939). See G. Saintsbury, *Dryden*, 1881; R. Garnett, *The Age of Dryden*, 1895; M. Van Doren, *The Poetry of John Dryden*, 1920, 1931; Sir W. Raleigh, 'John Dryden and Political Satire,' in *Some Authors*, 1923; T. S. Eliot, *Homage to John Dryden*, 1924; C. Hollis, *Dryden*, 1933; N. B. Allen, *The Sources of John Dryden's Comedies*, 1935.

Dry Farming. In those areas where the rainfall is limited it is necessary to adopt special measures in order to secure the fullest benefit from all natural sources of irrigation. Experience has shown that the twofold problem of trapping all the rain that falls and of securing that it shall not easily trickle away is best met by treating the upper surface and the lower soil in two different ways. The surface soil is broken up and treated in a manner that makes it specially permeable by moisture so that as much as possible of any rainfall shall be immediately absorbed; while the lower soil is kept in a clogged and clay-like condition that retains the water thus secured.

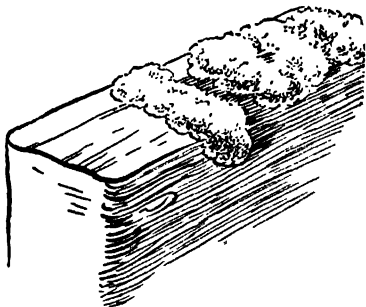

Drying Machines. devices for drying textile materials. Those for drying printed calicoes or long webs of similar fabrics usually consist of a series of revolving metal cylinders heated from within by steam. The machine commonly used in bleaching or laundry-works is formed of two drums or cylinders open at the top. The articles to be dried are placed in the inner one, which is made to revolve at high speed. The moisture is forced out by this centrifugal action through the perforated sides of the inner into the outer drum, whence it is drained off by means of a pipe. Open-air or hot-chamber drying usually completes the process. The ordinary 'wringer' or 'mangle' has two rollers mounted parallel one above the other, with an adjustment by means of which the distance between them can be varied. The black-man air-propeller is used for drying wool by drawing heated air through it. Slightly different apparatus is used in paper manuf.

Dryopes. Pelagic tribe who first settled round Mt. Eta, in Thessaly, Greece, in the dist. called after them 'Dryopis,' extending N. to the R. Spercheus.

Dryophis (Gk. *δρῖς*, a tree; *ὄφις*, snake), generic name of the whip-snakes, non-venomous reptiles, native to tropical America, W. Africa, and India.

Dry-point, see ENGRAVING.

Dry Rot, species of decay which attacks timber in certain instances. The chief fungi responsible for the destruction are *Merulius lacrymans*, *Polyporus destructor*, and *Polyporus hybridus*. Stagnation of warm, humid air, insufficient drying of the timber, and the felling of trees in the spring, when the sap is full, are all likely to lead to D. R. It has often been decreed that timber should be felled in

DRY ROT FUNGUS
Merulius lacrymans

winter only, so as to prevent sap fermentation. Submerging wood in water 'seasons' it by dissolving or at least changing, its putrescible material; whilst in modern times timber is preserved by being crosoted, burntissed (treated with zinc chloride), or kyanised (treated with corrosive sublimate).

Dual Alliance, secret defensive alliance made between Russia and France in 1892 and nullified by the Russian Revolution of 1917.

Duala, or **Douala**, tn. and harbour in Fr. Cameroons, W. Africa, the most important port of C. for palm oil products. Has a hospital, schools, three missions, shipyard and railway workshops. In the 1914-18 war it was captured by the Brit. forces on Sept. 26, 1914. Pop. (estimated) 3000.

Dualism (Lat. *duo*, two), philosophical term applied to any system of thought which rests on two co-existent and independent principles. It is the opposite of Monism. The earliest dualist was Plato, who held that good truly exists, but in combination with evil, which is non-existent. Aristotle believed form and matter to lie at the bottom of all things. Descartes arguing from his proposition 'Cogito, ergo sum,' maintained the absolute D. of consciousness or thinking (*res cogitans*), and extension (*res extensa*). In theology, D. assumes the separate existence of two underlying principles, good and evil, as in the doctrine of Zoroaster which postulates two contending deities, Ormuzd and Ahriman. In Christianity arises the difficulty of reconciling the omnipotence and perfect good-

ness of God with the existence of evil and pain. See A. Schweitzer, *Civilisation and Ethics*, 1923.

Dual Number, grammatical term denoting a form of a noun, pronoun, or verb, employed with regard to two things. Thus in Gk. the dual form of *γῖας*, giant, is *γίῳρες*, and the plural *γίῳρες*. The D. N. existed in Sanskrit, Arabic, and Heb., but in Latin we only find it in two words, *duo* two, and *ambo* both. The D. N. is rare in the Teutonic languages. In O.E. the dual forms exist in the declension of *ic*, I, and *du*, thou, only. They are, of the former, nom. *wił*, acc. *uncil*, unc. gen. *uncer*, dat. *unc.*; of the latter, nom. *gil*, acc. *incit*, inc. gen. *incer*, dat. *inc*. In Gothic, they are found in the declension if *ik*, I, and *pu*, thou, and in the verbs. For example, the second person imperative of *sōkjan*, to seek, has three numbers: sing. *sōkei*, dual *sōkjats*, plur. *sōkeip*.

Du Barry, Marie Jeanne Gomard de Vaubernier, Comtesse (1746-93) mistress of Louis XV., b. at Vancouleurs, Meuse. She entered a milliner's shop in Paris at the age of sixteen, and became the mistress of the dissolute Jean, Comte du Barry, through whom she met Louis XV. Her beauty and wit attracted the attention of the old king who before long made her his official mistress at court, after merely formal marriage with Jean's brother Guillaume. After Louis' death in 1774 she was obliged to live in retirement at Luciennes, and on the outbreak of the revolution she came to England to raise money (1792), but was arrested and beheaded on her return (1793). See Lives by C. Vatel, 1882-83; R. B. Douglas, 1896; K. von Schuhmacher, 1931.

Du Bartas, Guillaume de Saluste (1544-90), Fr. poet, b. at Montfort in Armagnac; followed the profession of arms; served Henry IV., and died from wounds received at the battle of Ivry. His poem, *La Semaine, ou Creation du monde* (1578) which was probably imitated from Tasso's *Sette Giornate*, went through thirty eds. in six years, and was trans. into six languages. He was greatly admired by Spenser. Indirectly he served to enrich the Eng. language by compounding words which were imitated by Sylvester (his translator), Chapman, and Sir Philip Sidney.

Dubbo, tn. in Lincoln co., New South Wales, Australia, situated on the Macquarie R. Coal and copper are found in the neighbourhood, and the tn. has flourishing manufs. Pop. 8400.

Du Bellay, See BELLAY, JOACHIM DU.

Dubica, fort. tn. on the r. b. of the R. Unna, Croatia, Yugoslavia. There were terrible battles here between Turks and Austrians in 1788. Pop. 5700.

Dublin, cap. of Eire, in the prov. of Leinster, in the co. of D., stands at the mouth of the riv. Liffey where it enters the Irish Sea. It lies in the lat. 53° 20' 3" N. and in long. 6° 17' 30" W., 334½ m. W.N.W. of London (via Holyhead route) and 138 m. W. of Liverpool. D. is enclosed by the Circular Road, 9 m. in circumference and the city is divided into

two parts by the Liffey, which is crossed by twelve bridges, six being iron (including a swivel) and six stone.

D. is an anct. city and like most other cities its hist. and development have been influenced by its riv. The name Dublin is a compound of two Irish words—*Dubh*—*Linn*—meaning 'Black Pool', while the old Irish name, *Baile-atha-Cliath*, which is in use to-day, means 'Town of the Hurdles' from a ford constructed of hurdles across the Liffey. The Danes or Ostmen first appeared in Ireland towards the end of the eighth century, and in A.D. 836 they sailed a fleet up the Liffey and captured the city. D. became the cap. of their colonies in Leinster, and thence onwards the cap. for each successive conquest of Ireland. The Danes were defeated at the battle of Clontarf in 1014 and their power broken for ever. In 1170 the Anglo-Norman invasion began, and in 1172 Henry II. landed in D. The Normans walked in the city, built the castle, rebuilt Christ Church upon the Dan. foundation, and built a second Cathedral, St. Patrick's, outside the city walls. In 1317 D. was again threatened with invasion by Edward Bruce, and part of the city was burnt down as a precautionary measure. The hist. of the years which follow is one of siege and internal disorders, long contests for supremacy between the great Norman families, and constant attacks upon the city by the native clans. Viceroy after viceroy came over, sometimes a prince of the blood, and finally, in an attempt to maintain control, episcopal viceroys were sent. So for a number of years the citadel was built by ecclesiastics, which accounts for the dozen abbeyes and some twenty churches in a tn. half a m. long and a quarter of a m. wide. During the wars of the Roses, D. made little progress: Richard, duke of York, was sent as viceroy; an Irish Parliament declared that Eng. law had no validity in Ireland, and the viceroy made himself into an independent king; famine, pestilence, and fire followed each other at regular intervals and industry came to a standstill. In the sixteenth century or Tudor times, the native clans having been conciliated to some extent, the cap. was comparatively free from attack and began to spread outside its walls. The Reformation reached D. in 1535 with the appointment of Archbishop Browne, the first Protestant to the See. The doctrines never took root in Ireland, but D. as the seat of gov. was forced to conform. Lands and monasteries were confiscated, churches were destroyed, and in 1591 'The College of the Holy and Undivided Trinity' was founded by Queen Elizabeth on the site of the monastery of All Hallows. In the reign of James I. the medieval walls began to disappear, and the extension of the city was rapid. The revolution of 1641 was followed by twelve years of war when the pop. of the city was reduced to 9000. Following the Restoration there again came a period of peace and D. once more, under the viceroyalty of the 'Great' duke of Ormond, began to expand, and

its numbers reached 40,000. James II. having abandoned two of his kingdoms to Wm. of Orange without striking a blow, decided to fight for the third: the Irish supported a king of their own faith, and so he entered D. in triumph. He proceeded to abolish the Eng. connection and the Protestant estab. Wm. and his general, Schomberg, landed in Ulster and marched on D., and in 1690 defeated James II. at the battle of the Boyne. Once again the city entered on a period of

buildings were badly damaged. With the estab. of the Free State Gov. in 1922, Leinster House, a fine Georgian mansion built for the duke of Leinster in 1745, became the seat of the new parliament.

The powers and privileges of the D. Corporation are derived from a series of Charters dating from 1171, while the Charters of A.D. 1200 and 1215 form the basis of all municipal legislation in Ireland. In 1109 the title of Mayor was introduced. Throughout the centuries the City Council

Irish Tourist Association Inc.

DUBLIN: O'CONNELL STREET AND THE RIVER LIFFEY

improvement: the Library Square in Trinity College was begun; street lamps were erected.

In the eighteenth century the focus of Irish politics was the Parliament House in College Green, resulting in a great influx of the aristocracy into the city, and the building of magnificent streets and squares N. and S. of the riv., and D. became one of the most important and fashionable caps. in Europe. After the failure of the rebellion of 1798 came the abolition of the Irish Parliament and the passing of the Act of Union in 1802. Then onwards the importance of D. began to wane. In the nineteenth century the gov. of Ireland was carried on from D. Castle. The old Parliament House was acquired by the Bank of Ireland, and in 1803 converted for that purpose. During the 1916 rising, and again during the 1922 civil war, some of the most important

has been abolished and reinstated many times. By Act of Parliament in 1930, a City Manager was appointed and by a subsequent Act many of the functions of the Council were vested in him. The City Council while retaining the right to strike the City rate, now acts to a large extent in an advisory capacity. The Council consists of forty-five members, nine of whom are aldermen, each of the nine electoral areas of the city returning five members.

Little remains to-day of the medieval D. but the few fragments of the city walls, and St. Mary's Abbey, the remains of St. Audoen's Church, and the Portiester Chapel, Christ Church Cathedral begun in 1171, though Anglo-Norman and Early Eng. in character, was very considerably restored and rebuilt in 1875. Likewise St. Patrick's Cathedral, dating from 1192, was restored in 1865. In St.

Patrick's Cathedral are monuments to the memory of Dean Swift and 'Stella.' D. Castle dates from 1205. It suffered severely in the sixteenth and seventeenth centuries when a large portion was destroyed by fire. In the eighteenth century the greater part was rebuilt much as it is to-day. The Record Tower is all that is now visible of the original structure. The Chapel Royal, designed by Francis Johnson, was completed in 1814. Amongst the earliest Renaissance buildings in D. was the Royal Hospital, Kilmainham, with its fine chapel and paneled dining hall (1680-82) by Sir Wm. Robinson, and Stephen's Hospital (1700) by Thomas Burgh. As a Georgian city, D. ranks with Bath and Edinburgh. Its golden age of architecture was in the eighteenth century and reached its zenith in the latter half. The new Parliament House was begun by Sir Edward Lovett Pierce in 1729, and the House of Lords (almost unchanged and now the board room of the Bank) was later added by James Gandon. The front of Trinity College (1755-59), the Chapel (1777), and Examination Hall (1777-91) by Sir Wm. Chambers, the Royal Exchange by Cooley now the City Hall (1769-79), the Four Courts (1776-96) begun by Cooley and finished by Gandon, the Custom House (1781-91) by Gandon, acknowledged to be one of the finest Renaissance examples in Europe, the Rotunda Hospital with its lovely chapel with Francini ceiling, the Blue Coat School (1773), are among the more important public buildings. There still remain many fine mansions of the period including Charlemont House, Powerscourt House, Tyrone House, and sev. city churches, etc., etc.

The classical architecture of D. was Palladian in character, but essentially Irish in quality. The tradition went on well into the nineteenth century, notable examples being The King's Inns (1802), St. George's Church (1813), the General Post Office, by Johnson (1811), the Pro Cathedral, Marlborough Street (R.C., 1816), Kingsbridge railway station (1845), Broadstone station (1850), National Library and National Museum (1885-90). The present century has produced few public buildings, but Gov. Buildings, Merrion Street, by Sir Aston Webb (1911), Gov. Offices, Kildare Street (1934), D. Airport (1937), are among the better known. The General Post Office (destroyed 1916), the Four Courts and the Custom House (destroyed 1922) have been reconstructed from the original designs.

The Wide Streets Commissioners, established in 1757, were one of the first Town Planning Authorities in Europe. They functioned until 1840, and were responsible for the spaciousness and stately layout of the city, its streets and squares. The boundary of their activities is bounded, roughly, on the W. and N. by the Circular Rd., and on the S. by the Grand Canal. Their influence lingered on and can be traced in the elegant suburbs of Ballsbridge, Penubroke, Rathmines, etc. In 1914 a competition was

held for a 'Plan for Dublin' and this was won by Prof. Sir Patrick Abercrombie. It was never put into effect, but apart from the necessary alterations which the passing of time demanded, it forms the basis of present-day planning, maintains the Green Belt, and determines the planning of the main arteries leading into the city. In the last twenty-five years the city has grown rapidly, its present pop. is 506,600 (co. 636,000) and considerable housing schemes have been carried out by the corporation and others. In the future it is hoped to provide for the housing needs in 'Neighbourhood Units' to the W., S., and N. of the city, and outside the Green Belt satellite tns. are envisaged.

There are two univs. in the city, the older one being D. Univ. founded by Queen Elizabeth in 1591, consisting of one College—Trinity College. It is partly a residential college situated in the centre of the city in College Green. It has fine buildings and an extensive Park. Its library, containing amongst valuable MSS. the famous Book of Kells, was designed by Thomas Burgh; the Engineering School is by Woodward (so much admired by John Ruskin). (See TRINITY COLLEGE (DUBLIN).) The second univ. is the National Univ. of Ireland represented by one of its three constituent colleges—Univ. College. It was founded in 1911, is non-residential and is housed in a building still incomplete, designed by Prof. R. M. Butler.

Prior to the eighteenth century large ships trading with D. lay to anchor in D. Bay. The modern port is the product of great skill and enterprise. The bar has gone and there is a safe channel for navigation 1000 ft. wide at its entrance, leading right to the heart of the city. At the N. entrance to the harbour is the Alexandra Basin containing 60 ac. of deep water with berthing accommodation for vessels from 24-35 ft. draught. Here also are the shipbuilding and ship repairing yards, and the graving dock and slips. There is further considerable accommodation for large vessels, over 1 m. along the N. side and 1½ m. on the S. side. Adjoining the quays there are large warehouses; silos and mills; and storage tanks for oil and petrol; general storage; and transit pens for cattle, etc. Passenger services connect the Port of D. with Liverpool, Glasgow, Isle of Man, etc. whilst merchant vessels from all over the world use the port.

Commerce and Trade.—The considerable port facilities and the fact that D. is conveniently placed for cross-channel traffic retain for it a large share of Ireland's overseas trade. There is a co-ordinated system of rail and road transport radiating from D. to all parts of the country, while the two canals—the Royal Canal and the Grand Canal, link D. with the country and provide a further means of transport for goods. D. Airport, Collinstown, is situated five m. from the centre of the city, there are direct air services to England, Scotland, and the Continent. There is also a service between Shannon and Dublin forming a link with the United States and other parts of the world. D.

is the headquarters of the prin. Irish banks and has a Stock Exchange. Its Chamber of Commerce is the oldest in the world and was founded in 1783. Whilst D. cannot be described in any sense as an 'industrial' city, it boasts of many flourishing industries to-day. Guinness' Brewery, the largest single source of employment in the country, is known all over the world. Distilling is another important export industry in D., as is also biscuit making. Woollen manufacturing is carried on, also clothing, confectionery, jam-making, motor-car assembly, agric. machinery, and the making of many other commodities formerly imported. Flour milling is well estab. and D. has some important engineering and founding industries. A large proportion of the export cattle trade is operated from D., its cattle market attracting buyers from many countries.

D. has many fine shopping areas, the fashionable thoroughfare being Grafton Street. The city is well provided with recreational facilities. There are five theatres, the best known being the Abbey Theatre, which is the National theatre, and there are numerous cinemas. There are many football and athletic grounds; there are racecourses at Leopardstown, Baldoyle, and Phoenix Park, both for flat racing and steeplechasing. The D. Horse Show, an ann. event, organised by the Royal D. Society (founded in the eighteenth century) is world renowned. In the Phoenix Park, the largest park in Europe, there is the Polo Ground, and also Zoological Gardens. The former Vice-regal Lodge, also in Phoenix Park, is now the house of the President of Eire.

D. is ideally situated, having many attractive seaside resorts, and the D. Mts., within easy reach of the City. Howth, Dun Laoghaire (formerly Kingstown) where the Mail steamers to Holyhead sail from, Dalkey, Killiney, Bray, etc., are among the better known along the coast, while there are many attractive spots inland, such as the valley of the R. Liffey at Lucan, Leixlip, etc.; and Poulaphuca, where the new Liffey Hydro-Electric Scheme has been built, is a well-known beauty spot. Glendalough, famous for its lakes and the remains of the eighth-century monastic settlement, the monasteries at Clonmacnoise and Mellifont, are all within thirty-five m. of D.

See W. Harris, *History and Antiquities of the City of Dublin*, 1766; J. T. Gilbert, *History of the City of Dublin*, 1854-59; 'The Dublin Civic Survey' in *Civic Institute of Ireland*, vol. 2, 1925; D. A. Chart, *The Story of Dublin*, 1932.

Dublin, city, co. seat of Laurens co., Georgia, U.S.A., with cottonseed oil mills, wood-working industries, etc. Pop. 7800.

Dublin Fusiliers, The Royal, formerly the 102nd and 103rd Foot. Both regiments had their origin in independent companies of Foot raised in India by the E. India Co. during the seventeenth century: they were regimented about the middle of the eighteenth century. The 102nd were previously the Royal Madras Fusiliers and the 103rd the Royal Bom-

bay Fusiliers. They were given their numbers on being transferred to the Crown after the Indian mutiny. In 1881 they were linked to form, respectively, the 1st and 2nd Battalions the Royal Dublin Fusiliers, which was disbanded in 1922. A distinguished member of the Madras regiment was Ensign Clive (later Lord Clive) the victor of Plassey. Both regiments took a leading part in all the Indian campaigns, and gained great distinction during the Indian Mutiny, 'Nell's Bluecoats' and the 'Old Toughs', as they were called, always being to the fore. In the S. African War they were especially conspicuous at Wagon Hill, near Ladysmith; indeed it was largely in commemoration of the bravery of the D. F. and other Irish regiments in the S. African War that the Irish Guards were raised. During the 1914-18 war the regiment raised eleven battalions, which served in France, Flanders, Gallipoli, Egypt, and Palestine.

Dubno, tn. in the Volhynia Region of the Ukraine, formerly Poland, 140 m. W. by N. of Zhitomir. The fortress of D. was captured from the Austrian garrison in the First World War in the general advance on the Pripiet and Sereth by Gen. Brussilov (q.v.) in 1916. Pop. 10,000.

Dubois, bor. of Clearfield co., Pennsylvania, U.S.A. It is an important manuf. tn., with iron works, machine shops, and coal mines. Pop. 12,000.

Dubois, Eugène (1858-1941), Dutch surgeon, discoverer of the skull of *Pithecanthropus erectus* (q.v.) in Java, 1891.

Dubois, François Clément Théodore (1837-1921), fr. musical composer, b. at Rosnay, Marne. He studied at the Paris Conservatoire, winning the Grand Prix de Rome with his cantata, *Italia*, 1861. He was choir-master of the church of St. Clotilde 1863-68, and then he accepted the same position in the church of Madeleine, of which he became organist in 1877. He became prof. of harmony at the Conservatoire (1871); prof. of composition (1891); and director, in succession to Ambrose Thomas (1896). His sacred music includes *Les Sept Paroles du Christ* (1867); for the theatre he wrote *La Farandole* (1883), and *Navière* (1895); for orchestra *Hylas* (1890), and *Notre-Dame de la mer* (1897), besides numerous other works.

Dubois, Guillaume (1656-1723). Fr. cardinal and statesman, b. at Brive, in Limousin. In 1687 he was appointed tutor to the young duke of Chartres (afterwards regent duke of Orleans), and contrived to win royal favour by arranging a marriage in 1692 between his pupil and Mademoiselle de Blois, the legitimized daughter of Louis XIV. He became an ambas. in London, and on his return (1701) secretary to his former pupil, and councillor of state (1713). By this time he had acquired tremendous influence over the regent, and practically held the reins of power in his own hands. He negotiated the Triple and Quadruple Alliances (1717, 1718) and forced Philip V. of Spain to dismiss Alberoni. D. secured for himself the archbishopric of

Cambrai (1719) and became cardinal in 1721. See life by L. Wiesener, 1891, and E. Bourgeois, *Le Secret au légent et la politique de Dubois*, 1909.

Dubois, Jacques, see SYLVIVS, JACQUES DUBOIS.

Dubois, Paul (1829–1905), Fr. sculptor, first studied law, then entered Toussaint's studio in 1856. 'Saint Jean Enfant' (1860), 'Saint Jean-Baptiste' (bronze) (1863), and 'Narcisse au Bain' (1867), were among his earlier works. 'Le Chanteur florentin' (exhibited 1865), 'Le Connétable de Montmorency' (1886), and the equestrian statue 'Jeanne d'Arc' (1895), are some of his finest productions. The beautiful 'Tombeau du Général Lamoricière' in Nantes Cathedral is one of his best-known works. After 1873 D. became known as a portrait-painter. 'Mes Enfants' being exhibited in 1876. He painted in Heuner's manner, and produced busts of Henner, Dr. Parrot, Baudry, and others. He became director of l'Ecole des Beaux-Arts, 1878.

Du Bois-Reymond, Emil (1818–96), Ger. physiologist and scientific historian, studied at Berlin and Bonn. He was prof. at the London Royal Institute for three years, with Faraday as his patron, and succeeded Müller in the chair of physiology at Berlin (1858). His researches in animal electricity and the functions of the nerves are especially famous, and he may be said to have created experimental physiology. Among his works are: *Untersuchungen über tierische Elektrizität* (1848–84), *Über tierische Bewegung* (1851), *Über die Grenzen des Naturerkennens* (1872) and *Vorlesungen über die Physik des organischen Stoffwechsels* (1900). See T. W. Engelmann, *Gedächtnisrede*, 1898.

Dubovka, tn. of Stalingrad Region of the R.S.F.S.R., an important port on the Volga, with fishing, fruit, and wine industries. Pop. 17,000.

Dubreka, or **Doubreka**, station of Fr. Guinea, W. Africa, under direct Fr. gov. since 1882. It has much trade with the interior, and good coffee plantations.

Dubrovnik (It. *Ragusa*), tn. in Dalmatia, Yugoslavia, at the foot of Mt. San Sergio, on the Adriatic, 50 m. S.E. of Mostar. The name means 'forest town'; it is indeed the most picturesque tn. on this coast, with its rising fortifications, its round tower dominating the tn. on the landward side, its double line of walls, the pride of D., and its many villas with gardens of cypress and palm, and its main street running along a narrow valley. The harbour is small, but the bay of Gravosa, 4 m. distant, affords safe anchorage for large vessels. D. is a many-towered, walled city, intersected by the Corso, which was once an arm of the sea, and containing many remains of great antiquarian interest, such as the fourteenth-century customs house and the Rector's Palace, late Romanesque; this latter being a masterpiece of Dalmatian architecture rebuilt in the fifteenth century by the architect of Sibenik Cathedral. An earthquake in 1667 killed some 4000 people besides doing much other damage,

though the tn. is still rich in features of antiquarian interest. D.'s chief products are oil, silk, leather, and liqueurs. D. was probably founded in the seventh century, and after changing hands many times was allotted to Austria in 1814. After the First World War it was given to the Yugoslavian state. It was the chief seat of S. Slavic literature. (See SERBIA.) Pop. 14,000.

Dubuque, city and port of Iowa, U.S.A., co. seat of Dubuque co., situated on the r. b. of the Mississippi. It is the seat of an Episcopalian and Rom. Catholic bishop. D. is the oldest settlement in the state, being now a manuf. centre, with saw-works, wagon and boiler-making, tobacco, etc. The lead deposits which are now abandoned were formerly worked by the Indians. Pop. 43,800.

Du Cange, Charles Dufresne, Sieur (1610–88), Fr. scholar and historian, educated at the Jesuit College of Amiens, later studying law at Orleans. His most famous work is *Glossarium ad scriptores mediæ et infimæ latinæ* (1678), completed later by Carpentier, Henschel, Faure (1883–87), followed by a similar *Glossarium . . . græcitas* (1688). He ed. many Byzantine historians: Pausanias Silentiarius (1670), Zonaras (1687), *Chronicon Paschale* (1688). Other works were *Histoire de l'empire de Constantinople sous les empereurs français* (1657), *Historia Byzantina* (1680), and *Les Familles d'outre-mer* (1669). See lives by H. Hardouin, 1849; L. J. Feugère, 1852.

Ducat, gold coin, which came into currency about A.D. 1100, and seems to have been named from a word in the inscription which the Apulian coins of 1140 bore: 'Sit tibi, Christe, datus, quem tu regis, iste ducatus' (Christ, thou rulest this duchy; to thee he is dedicated). The D. which Venice struck in 1280–84 later became known as the zecchino or sequin. Introduced in the fourteenth century to Hungary and Bohemia, and adopted in 1539 by the imperial diet of Germany into the monetary system of the empire, its currency later extended all over W. Europe. The value was about 9s. 4d., but Ds. varied in weight and amount of alloy. It, silver Ds. were worth 3s. 4d.

Duccio di Buoninsegna (c. 1260–c. 1340), It. painter, was the first of the Sienese painters to abandon the Byzantine style of painting, and who may justly be regarded as the founder of the Sienese school. It was he who began the decoration of the pavement of the Sienese cathedral with figures in 'chiaroscuro' (q.v.), and the famous altar-piece he executed for this cathedral between 1308 and 1311 is the only unquestioned work of his still remaining. Painted on both sides, this huge picture (14 ft. by 7 ft.) represents on the one face the Virgin and Child, and on the other twenty-seven episodes from the life of Christ. D. worked also for churches in Florence, Pisa, Lucca, and Pistoja, painting often on gold grounds and left his glorious invention of 'chiaroscuro' pictures in marble as a legacy to the Lorenzetti and his other disciples.

Dučkov, see DUX.

Du Chaillu, Paul Belloni (1835-1903), African explorer and author, b. at St. Petersburg, of Fr. Huguenot parentage, educated in Paris. He early went to the Gabun country, Africa, where his father was a trader. After spending some years in America, he undertook a botanic and zoologic expedition to the Ogowe basin (1855-59). His descriptions of the Abongo pygmies and gorillas (of which he was the first to secure specimens) of the interior in *Explorations and Adventures in Equatorial Africa* (1861), were discredited by many as mere exaggerations. Later investigations, however, proved the truth of his natural hist. discoveries. In 1863-65 he visited Ashango Land, and the Ngunye Falls, the resulting work being *A Journey to Ashango Land* (1867). D. C. explored N. Europe (1872-3), and travelled in Russia (1898-1902). Other works are: *Lost in the Jungle*, (1869), *The Country of the Dwarfs*, (1870), *The Land of the Midnight Sun* (1881), *The Viking Age* (1889), and *Tor the Viking* (1893), are attempts at proving the Scandinavian origin of the Brit.; his last work was *The World of the Great Forest* (1900).

Duchange, Gaspard (1662-1756), clever Fr. etcher and engraver, b. at Paris. He was a pupil of Jean Audran, and became one of the most noted engravers of his period. The 'Io,' 'Danab,' and 'Leda of Correggio' are three of his most celebrated works.

Duchesne, Père, see HÉBERT, JACQUES RENÉ.

Duchy of Lancaster, see LANCASTER, HOUSE AND DUCHY OF.

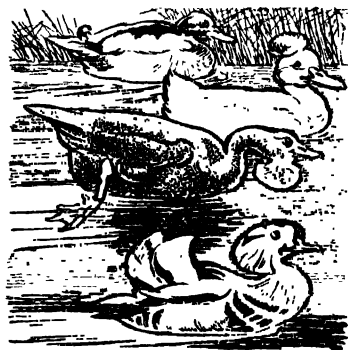

Ducis, Jean François (1733-1816), Fr. dramatic poet, chiefly noted for his adaptations of Shakespeare's plays for the Fr. stage. He succeeded Voltaire in the Fr. Academy, 1779. D. paved the way for Lemaître and the Romantic school. His collected works appeared in 1827. See J. B. Leroy, *Études sur Ducis*, 1835; J. J. Jusserand, *Shakespeare en France*, 1898.

Duck, name given to birds of the family Anatidae, which contains also both swans and geese; it should properly be applied to the female, the male bird being a drake, but it is frequently used to include both sexes. The species are aquatic and have short webbed feet and scaly legs; the bill is broad, depressed and rounded at the tip. There is a great variety exhibited in the coloration of the filthy odd species, and many are very handsome birds. They inhabit N. regions of the world, and as they frequent lakes and seas, their diet consists of such creatures as fish, frogs, and worms. *A. boscas*, the wild D. or mallard, is the species from which all domesticated Ds. have taken their origin.

For domestic use see under POULTRY; and articles on different species.

Duck-billed Platypus, **Duck Mole** or **Ornithorhynchus Anatinus**, Australian mammal which, with the two spiny anteaters, forms the primitive group, *Monotremata* or *Protothera* (q.v.). Except for the fact that the young are produced from eggs, and for the flat beak-like mouth, D. P. bears no resemblance to a bird. It

lives in long burrows on the banks of rivers. The eggs are laid two at a time in a small chamber at the end of the burrows. These eggs have a non-calcareous shell, but like those of birds and other egg-laying vertebrates, have a yolk. The young are believed to hatch very soon after the eggs are laid, and are at first naked and blind. In an early stage, the short fleshy bills are provided with teeth, and these are lost as the animal matures, and hard horny patches developing in each jaw take their place. The oval, flattened body becomes clothed with fur, which is well adapted to an aquatic existence, and the feet are webbed. The fore-limbs are provided with five powerful claws with which the animal burrows. The broad, flat tail is short, and the total length of the body is about 20 in. A horny spur on the hind foot, which is able to inflict a poisonous wound, occurs only in the male.

DUCKS

From top downwards: Mallard, Javanese Pong-duck, Australian musk duck, Chinese Mandarin duck.

Ducking-stool, strongly made wooden arm-chair, fixed to the end of a long wooden beam, in which offenders, such as scolding wives, shrews, and sometimes quarrelsome married couples, were seated, fastened in by iron bands, and immersed in water, the beam being placed at the edge of the pond, or riv. and working on the see-saw principle. In many dists. dishonest bakers and brewers were punished by this ducking system. The earliest record of it is at the beginning of the seventeenth century, and it was in use in England as late as the nineteenth century, the last recorded cases being a Mrs. Gamble at Plymouth in 1808, Jenny Pipes, 1809, and Sarah Locke, 1817, of Leominster, though the last's sentence could not be carried out as there was no water in the pond at the time.

Duckweed, Brit. name for the native species of *Lemna*, the chief genus of *Lemnaceæ*. The plants are perennials, and are found swimming freely in ponds and tanks. The Brit. species are known as *L.*

minor, *L. gibba*, *L. trisulca*, and *L. polyrrhiza*.

Duckworth, Sir John Thomas (1748-1817), Eng. admiral, served in N. America, and the W. Indies. In 1794 he won distinction in Howe's great victory over the Fr. off Ushant. In 1800 he became rear-admiral; commander-in-chief at Jamaica, 1802. D. defeated the Fr. off Saint Domingo (1806). He was sent to dictate terms to the Porte (1807), and failing in his mission retreated from the Turks, forcing the passage of the Dardanelles. From 1810-13 he was governor of Newfoundland; he was knighted in 1813.

Duclaux, Madame Agnes Mary Frances, nee Robinson (b. 1857), Eng. poetess and novelist. She married Prof. James Darmesteter, and, after his death, Prof. Duclaux, 1901. Her works include *The Crowned Hippolytus of Euripides*; with *New Poems* (1881), *Life of Emily Brontë* (1883), *An Italian Garden: A Book of Songs* (1886), *Collected Poems* (1902), *The Return to Nature* (1904), *Life of Emile Durkheim* (1907), *The French Ideal* (1911), *Madame de Sévigné* (1914), *A Short History of France* (1918), *Life of Victor Hugo* (1920), *La Pensée de Robert Browning* (1922), *Life of Racine* (1923), and *A Portrait of Pascal* (1927).

Duclos, Charles Pinot (1704-1772), Fr. author, b. at Dinan, Brittany, sent at an early age to study at Paris. His first pub. of importance was his *Histoire de Louis XI.* (1745) and this was followed by *Considérations sur les mœurs de ce siècle* (1751). He became a member of the Fr. Academy at the early age of 43, and when the post of historiographer of France became vacant by the retirement of Voltaire, D. was appointed to take his place. In the same year (1755) he was appointed permanent secretary of the Academy.

Ductility, property of some metals, such as gold, silver, copper, iron, etc., which renders them capable of being extended by hammering or drawing, without breaking. Glass also possesses the property when in a semi-molten state, and quartz, when in an intensely hot state, can be drawn out into such thin fibres as to be invisible. Wollaston showed that by forming a platinum core inside a silver wire, afterwards drawing out the silver wire, he could, by dissolving the silver coating, obtain a finer platinum wire than he could otherwise have done by drawing out the platinum directly. The wire was so fine that it could only be seen when an electric current was sent through it and made it glow.

Ductless Glands. The function of a gland is the secretion of an individual product, which in most cases passes out by means of a duct; in the case of the ductless glands, however, the secretion passes into the blood by means of capillaries or lymphatic vessels. Examples of ductless glands are the thyroid, parathyroid, thymus, spleen and adrenals. The thyroid gland in the embryonic condition is connected with the pharynx, but by degrees this sac becomes divided from it until at length it is a distinct body. When the internal secretion of the thyroid

becomes excessive, it may result in goitre, and when insufficient it may produce cretinism. *See also* BIOCHEMISTRY.

Duddingston, par., vil. and loch in Edinburgh, Scotland. The vil. is noted as having been the headquarters of Prince Charles before the battle of Prestonpans. The loch lies at the base of Arthur's Seat. Pop. par. 4600.

Duddon, riv. of England, which rises in the Wrynose, on the borders of Cumberland and Lancashire. At Broughton it widens out into an estuary of over 2 m. wide, eventually losing itself in the Irish Sea. Salmon and trout are found above the mouth.

Duderstadt, tn. of Hanover, Germany, with two beautiful fourteenth-century Gothic churches, fifteenth- to sixteenth-century town hall, and many other old buildings. Pop. 7000.

Dudevant, Madame, *see* SAND, GEORGE. **Dudley**, mkt. tn. and municipal co., and parl. bor., 18 m. W.N.W. of Birmingham on two railway lines, in a detached part of Worcestershire, England. The D. canal communicates with the Birmingham canal and the R. Severn. Its active industries of iron- and brass-founding, engineering, glass- and brick-making have sprung up because D. is the centre of a great coal-mining dist. Abundant limestone and fire-clay are found, and fossils of great interest have been discovered in the dist. There are ruins of an eighth-century castle, a free grammar school, and a training college. There are extensive caverns under the castle and the scanty ruins of a priory. The new tn.-hall is a war memorial. Pop. 53,500.

Dudley, Dud (1599-1681), Eng. iron-master, the originator of the use of pit coal for fuel in place of wood, thereby causing a profound change in the methods of iron-founding.

Dudley, John, *see under* NORTHUMBERLAND, DUKES AND EARLS OF.

Dudley, Robert, *see* LEICESTER, EARL OF.

Dudley, Sir Edmund, *see under* EMERSON, SIR RICHARD.

Dudley, Sir Henry Bate (1741-1824), earlier **Bate**, Eng. dramatist and journalist, b. at Penny Compton, Warwickshire. On completing his education he took orders and succeeded his father in the living of North Farnbridge, spending most of his time, however, in London, and leading a life of pleasure. He was one of the first editors of the *Morning Post*, estab. in 1772, his contributions frequently leading him into quarrels, and earning for him the nickname of the 'Fighting Parson.' He wrote eight plays, five of which were produced at Covent Garden, between the years 1774 and 1794. He was also the author of sev. pamphlets and sermons. D. also founded and ed. the *Courier politique et littéraire* (1777), the *English Chronicle* (1779) and the *Morning Herald and Daily Advertiser* (1780). *See* J. Fyvie, *Noble Dames and Notable Men of the Georgian Era*, 1910.

Dudley, Thomas (1576-1658), Brit. colonial governor of Massachusetts, b. at Northampton, England. In 1630 he sailed to America with Governor John

Winthrop, to settle in New England, D. himself being appointed deputy-governor. D. had great influence in Massachusetts, and was governor four times; he was one of the earliest promoters of Harvard College. He had little religious tolerance, being a stern Puritan. For an account of his Amer. voyage, see A. Young, *Chronicles of Massachusetts Bay*, 1846. His son, **Joseph Dudley** (1647-1720), colonial governor of Massachusetts, was born in Roxbury, Massachusetts, and graduated at Harvard College, 1665. He was sent to London to prevent the revocation of the Charter of Massachusetts by Charles II. He secretly used his influence against his mission, to his own advancement. His whole rule was unpopular and his actions dishonourable.

Dudley Limestone, see WENLOCK BEDS. **Dudweiler**, tn. of the Saar dist., Germany, situated on the Sulzbach, 4 m. N.E. of Saarbrücken. There are coal mines, iron works, and manufs. of fire-proof bricks. Pop. 24,000.

Duel and Duelling (Lat. *duellum*, from *duo*, two), in modern significance an arranged combat between two persons to avenge an insult, reflection upon the honour, or to settle matters of private dispute for which the law provides no remedy or such as is not deemed satisfactory. The person aggrieved is the challenger, and the preliminaries and all the arrangements of the combat are settled by the 'seconds,' the supporters of each party. The choice of weapons lies with the challenged party. The combat of two single persons to decide great questions dates back to prehistoric times; the tales of Hector and Achilles, of David and Goliath, indicated the practice, but the D. proper must be traced to a Teutonic institution, the judicial combat of 'wager of battle,' a form of legal trial of questions in dispute, which was regarded as an appeal to God to decide the justice of the quarrel or dispute. The custom spread over N.W. Europe and in 516 the Burgundian king Gundobald legalised the judicial D. Duelling was condemned by Pope Nicholas I. (858-67) and by many succeeding Popes. The judicial combat was only formally abolished by Act of Parliament in 1818, after the case of *Thornton v. Ashford*. In 1385 a judicial combat in the presence of Charles VI. of France between one Jacques Légris and Jean Caronge led to the defeat of the former and the subsequent discovery of the real guilty party, a blow to the popular belief in the justice of the D. from which it did not recover. Duelling thus came to its present form as a means of settling private quarrels, especially among the gently born or the military classes; it was most prevalent in France, especially from the time of Francis I. It had grown to such an extent, and so many men of noble birth were slain, that in 1626 Richelieu confiscated the property of duellists and banished them from France. Stronger measures were required, and beheading was resorted to. In Great Britain, duelling did not become fashionable till the Restoration. The historic

fatal D. between Lord Mohun and the duke of Hamilton is familiar from Thackeray's *Esmond*. In the eyes of the law, a challenge to a D. is a breach of the peace, a fatal result is a homicide, whether murder or manslaughter, and the seconds are accessories. Many historic Ds. have been fought, as those between Pitt and Tierney, Canning and Lord Castlereagh, O'Connell and D'Esterre, the duke of Wellington and Lord Winchelsea. In 1840 Lord Cardigan wounded Capt. Tuckett, was tried by the House of Lords and acquitted. At the present day duelling still occurs in France, but with rarely fatal or serious results. In pre-war Germany, apart from the fencing bouts (*Mensur*) of the various student corps or clubs at the univs., the D. was a matter of serious importance for military officers. Forbidden by law, an officer who refused a challenge, after a decision of a court of honour, must still fight or leave the army. See M. Sutcliffe, *The Practice, Proceedings, and Laws of Armes*, 1593; F. Bacon, *The Charge touching Duells*, 1614; J. Cockburn, *History and Examination of Duells*, 1677, 1720; S. Stanton, *The Principles of Duelling: with Rules*, 1790; A. F. Sieveking, 'Fencing and Duelling,' in *Shakespeare's England*, 1916.

Duet (from It. *duetto*, and Lat. *duo*, two), in music denotes a composition designed for two singers or two players. The term is not properly applied to a composition performed by one instrumentalist and one singer, for it is likely that the former will play a subordinate part (i.e. an accompaniment). Ds. may be written for similar or different instruments.

Dufay, Guillaume (c. 1400-1474), Flemish composer of church music. He learnt music as a chorister at Cambrai cathedral, and became a singer in the Papal choir in Rome.

Dufaure, Jules Armand Stanislaus (1798-1881), Fr. statesman. Under the premiership of Guizot he became councillor of state (1836) and minister of public works (1839). In 1876 he was made Premier, a position which he resigned in 1879 at the termination of MacMahon's presidency. See life by G. Picot (1883).

Duff, or Wilson Islands, group of eleven small is. in the Pacific Ocean, lying to the N.E. of Santa Cruz.

Duff, Alexander William George, see FIFE, DUKE OF.

Duff, Alexander (1806-78), Scottish missionary, b. near Pitlochry, Perthshire, and ordained first missionary to India, 1829. Estab. schools and colleges in India in which religious teaching was combined with science, literature, and other branches of W. learning. He first encountered some opposition, but this soon died down, and he was upheld by gov. officials. D. was one of the founders of the univ. of Calcutta, and helped to start the *Calcutta Review* in 1844, editing it till 1849, and pub. *The Indian Rebellion* in 1858. See life by G. Smith (1879).

Duff, James Grant (1789-1858), historian, b. at Banff, Scotland. In 1818 he was appointed to the important post of resident of Sattara, the centre of the

Mahratta confederacy. His *History of the Mahrattas* (1820) was written on his return to Scotland.

Duff, John Wight (1866-1914), Scottish prof. and author, b. at Dundee. From 1891-93 he was assistant prof. of Gk. at Aberdeen, and from 1893-98 prof. of classics and Eng. at Newcastle. A great scholar, he pub. *A Literary History of Rome* (1909, 1927), *Writers of Rome* (1923), *Minor Latin Poets* (with A. M. Duff, 1934), and *Roman Satire: Outlook on Social Life* (1936), besides various articles in journals and magazines on Gk. travel, trans. from Lat., etc.

Duff Cooper, Sir Alfred, see COOPER.

Duffel, Belgian com., situated to the S.E. of Antwerp, on the R. Nethe. Pop. 9100.

Dufferin, Helen Selina Sheridan, later **Blackwood, Baroness** (1807-67), song-writer, grand-daughter of Richard Brinsley Sheridan, and mother of the Marquis of D. and Ava. Her songs and verses were pub. anonymously, the chief being *Irish Emigrant* (1840) and *Terence's Farewell* (1855). See memoir by her son in her *Songs, Poems and Verses*, 1891.

Dufferin and Ava, Frederick Temple Hamilton-Temple Blackwood, first Marquis of (1826-1902), Brit. diplomatist, b. at Florence. In 1860 was appointed Brit. commissioner in Syria, where his ability and judgment were warmly recognised. From 1872-78 was governor-general of Canada, and during this period inspired the sev. provs. with the true spirit of confederation and with the idea of a great nation within the empire. In 1879 became Brit. ambassador at St. Petersburg, afterwards filling the same position at Constantinople, Rome, and Paris. From 1884-88 he was viceroy of India. In 1897 he was induced by Whitaker-Wright to accept the chairmanship of the London and Globe Finance Corporation, and on learning that it was in difficulties, courageously explained the position to a meeting of shareholders, his own honour being unimpaired. This disaster, together with the death of his eldest son, wounded in the S. African War embittered his last years. His book, *Letters from High Altitudes* was pub. in 1857 (ed. by R. W. Macan in *World's Classics*, 1910). See life by Sir A. Lyall, 1905.

Duffield, small tn. and par. in Derbyshire, England, situated on the R. Derwent. It is $4\frac{1}{2}$ m. N.W. of the tn. of Derby. Pop. 2200.

Dufftown, vil. in Banffshire, Scotland, founded by James Duff, earl of Fife, in 1817. It is a popular resort for invalids, and has whisky distilleries and limeworks. Pop. 1500.

Duffy, Sir Charles Gavan (1816-1903), at an early age drifted into journalism. Going to Dublin to study for the Bar, he founded in 1842 the *Nation*, which from the first became the organ of Young Ireland. In season and out D. therein demanded the cleavage of the union, and sought to band his countrymen together to re-establish, by force if necessary, the Irish Parliament. For preaching open rebellion D. was arrested in 1848, but the

juries disagreeing, he was discharged. He revived the newspaper after his release, but the cause of Irish unity at that time seeming hopeless, in 1855 he abandoned the struggle. He went to Australia, entered the Victorian parliament, and, after holding minor offices, in 1871 became Prime Minister for a short time, and later speaker of the House of Assembly. He wrote sev. books on Ireland, including *Ballad Poetry of Ireland* (1843), and issued a vol. of interesting *Conversations with Carlyle* (1892).

Dufour, Guillaume Henri (1787-1875), Swiss general and cartographer, b. at Konstanz, who after service in the Fr. army, reorganised the Swiss army which he commanded in the war which broke out in 1847 between the Protestants and Rom. Catholics on the question of the suppression of the Catholic Sonderbund. D. quickly brought hostilities to a close, thereby preventing the intervention of foreign powers; and his friendship and negotiations with Napoleon III. were later instrumental in dispelling a threatened war with Prussia. In 1864 he presided over the International Conference which framed the so-called Geneva Convention as to the treatment of the wounded in time of war, etc. But the most important work of his life was commenced in 1833, when the Diet commissioned him to supervise a trigonometrical survey of Switzerland, which he accomplished with complete success at intervals between 1842 and 1865.

Dufourspitze, highest peak of Monte Rosa in the central zone of the Middle Alps on the Swiss-It. S. border. It has an altitude of 15,215 ft., and was named after Gen. Dufour (q.v.).

Dufrénoy, Pierre Armand Petit (1792-1857), noted Fr. mineralogist and geologist, became prof. of Mineralogy and director of the Ecole des Mines, and prof. of Geology at the Ecole des Ponts et Chaussées. In conjunction with Élie de Beaumont, with whom he travelled through France, England, and Spain, D. pub., *Voyage métallurgique en Angleterre* (1827), *Mémoires pour servir à une description géologique de la France* (1841), and *Explication de la carte géologique de la France* (1873).

Dufresne, Charles, see DU CANGE.

Dugdale, Sir William (1605-85), Eng. garter king-of-arms, at an early age showed a love for antiquarian research. Through friendly influences he was in 1638 appointed a pursuivant-extraordinary, and in the following year rouge croix pursuivant with rooms in the Herald's College and a salary of £200 a year. During the Civil war he went from library to library quietly amassing material for the important works upon which he was engaged, viz. the *Monasticon Anglicanum*, the first vol. of which appeared in 1655, and the third and last eighteen years later; the *Antiquities of Warwickshire* (1656), and *The Baronage of England* (1675-76). D. is not always to be relied upon for accuracy, but beyond all question he rendered valuable service to

students of antiquarianism. His autobiography was first pub. in 1713, but the ed. to consult is that of 1827 (ed. by W. Hamper), to which is added his diary and correspondence.

Dugong, or **Halicore**, genus of the mammalian order Sirenia, or sea-cows. The few species are aquatic, usually marine, and in diet they are herbivorous; the existing forms are found in the Red Sea, Indian Ocean, and near Australia. They bear some resemblance to whales, e.g. in the notched tail, and reduced nasal bones, lack of posterior limbs, and in the short neck, but in most of their characteristics they are quite unlike these mammals. The *D.* attains a length of eight feet, and it is said to have originated the idea of the mermaid, for the female has two mammary, holds its young to its breast by means of one of its nailless flippers, and often raises its head out of the water. The teeth of this animal are five or six molars on each jaw, two inches on the upper and four on the lower jaw.

Duguay-Trouin, René (1673-1736), Fr. sea-captain, b. at St. Malo. Originally intended for the church, he abandoned the idea, and went to sea in 1689 on the outbreak of the war with England and Holland. He displayed great courage and made brilliant captures of Eng. and Dutch ships. In 1697 he entered the Fr. navy as commander, distinguishing himself in the War of the Sp. Succession, his most famous action being the capture of Rio de Janeiro in 1711. He subsequently served with the army, attaining the rank of lieutenant-general.

Du Guesclin, Bertrand du, see GUESCLIN.

Duhamel, Georges (b. 1884), Fr. writer, born in Paris. Began his literary career as poet, essayist and dramatist. He qualified as a doctor of medicine without intending to practice. Served in the First World War as a surgeon, and the extremes of physical and mental suffering he witnessed lent him added force as a writer of unguished war books passionately advocating the rights and majesty of the individual soul, his *Civilisation*, pub. in 1918, gaining for him the Prix Goncourt, contrasted with the wrongs and meanness of organised civilisation. But it is his later novels that have won most recognition. *Vie et aventures de Salavin* (5 vols., 1920-32; Eng. trans. of 1 vols. pub. under the title of *Salavin*, 1936), are profound studies of a man who is the idealist in every man, and who tries to live up to a worthy philosophy of life and fails. His ten vol. masterpiece, *Chronique des Pasquiers* (1933-43), presents human beings, not as they try and fail to be, but as they actually are, and his realism differs from that of, e.g., Zola, in that it does not lack sensibility or humour and sympathetic understanding. The 'Pasquier' *Chronicles* were trans. into Eng. by Béatrice de Holthoer. Member of the Fr. Academy (permanent secretary 1943-6) and of the Academy of Medicine and President of the Alliance Française. His works were banned by the Nazis. Other works include *Les Plaisirs et les*

Jeux (1922), a charming study of childhood, *Le Voyage de Moscou* (1927), *Scènes de la Vie Future* (1930), numerous essays and four vols. of autobiography. See D. Saurat, *Modern French Literature*, 1946.

Duikerbok, *Cephalophus grimmii*, genus of small African antelopes (q.v.) with crested heads, large muzzles, and short, conical horns in the males only.

Dullius, Gaius, Rom. general, who defeated the Carthaginians in a great sea fight (260 B.C.). By using grappling irons, he deprived the enemy of their advantage in naval tactics. This was the first naval victory the Romans had ever gained, and the memory of it was perpetuated by a platform, the *rostrum*, erected in the forum, and adorned with the beaks of the conquered ships.

Duino, see under TRIESTE.

Duirinish, parish in the N.W. of the is. of Skye, in Inverness-shire, Scotland, 18 m. long by 15 m. wide, area 80,067 ac., pop. 2600. Lady Grange, a Jacobite heroine, was buried near a pillar called the Trying Stone of Trumpan. Duvagan Castle is the seat of the Macleods of Macleod. This par. was celebrated for its pipers. The hulls called 'Macleod's Tables' rise from the peninsula of D.

Duisburg, on the r. b. of the Lower Rhine, Germany, combined in 1905 with Ruhrort and Meiderich to form one community in the vicinity of the Ruhr coal-field, which favoured the growth of iron and machine-building industries. The tn. is noted also for chemical, tobacco, and textile industries. The combined harbours form the largest riv. port in Europe, and exported coal and wrought iron. The tn. was occupied by Fr. troops from March 1921 till Aug. 1925. In the Second World War great destruction was wrought in D. by bombing attacks on industrial plant, while the damage sustained by the riv. docks and railway marshalling yards in what was the largest inland port in Europe affected rail and riv. communications for hundreds of miles. March troops reached the suburbs on March 30, 1945, and the tn. fell to them on April 13. Pop. 135,000.

Duke (Lat. *dux*, a leader, Fr. *duc*), first came into use as a formal title when Constantine called military governors of provs. either counts or Ds., to distinguish them from the administrators of justice and finance. Under the Franks the Ds., who often ruled sev. provs., became very powerful, whilst the counts, who had once been the most distinguished of the provincial commanders or Ds., now became their lieutenants. Thus the E. Frankish empire was split up into the dukedoms of Swabia, Saxony, Bavaria, Franconia, and Lorraine, and similarly the W. into the duchies of Aquitaine, Burgundy, Gascony, Normandy, and the Ile de France. Although with the strengthening of monarchies the substantial powers of the Ds. waned, the latter still rank next to princes of royal blood. The Black Prince was the first Eng. D., being granted by his father the duchy of Cornwall (1337), whilst the first Scottish king to confer the title was Robert

III., who made his two sons Ds. of Rothesay and Albany respectively (1398).

Duke of Albany's Regiment, see SEAFORTH HIGHLANDERS.

Duke of Cornwall's Light Infantry, formerly the 32nd and 46th Regiments, which were linked together in 1881 to form the D. C. L. I. The 32nd were formed in 1792 as Marines, and were present at the capture of Gibraltar in 1704. Served in Spain in 1705 under Lords Peterborough and Galway. Fought at Dettingen (1743) and Fontenoy (1745). Under Moore it fought at Corunna, and under Wellington during sev. battles of the Peninsular Campaign. For its distinguished conduct during the Indian Mutiny it was made into a Light Infantry regiment. The 46th were raised in 1741, and served for many years in America and W. Indies, India, and Crimea campaign, also Egyptian campaign of 1882, Nile 1881-5, and S. Africa 1899-1902. Raised fifteen battalions for First World War, which served in France, Flanders, Macedonia, Palestine and Aden. In the Second World War the D. C. L. I. took part in the B. of Normandy and other battles on the W. Front. Other units fought on the It. front. They were especially prominent in the dour fighting for Goch and c. the Roer riv. and other battles in the advance to the Rhine and beyond.

Duke of Edinburgh's Regiment, see WILTSHIRE REGIMENT.

Duke of Wellington's Regiment, see WEST RIDING REGIMENT.

Duke of York's Monument, erected by public subscription to the second son of George III., 1830-33. The monument keeps guard over the space of ground where George IV. built Carlton House in his recent days. It is at the end of Waterloo Place on the steps leading into St. James's Park. Made of Scottish granite, the column (designed by Wyatt) is 124 ft. high. It is surmounted by a bronze statue of the duke, 14 ft. high, executed by Westmacott. A staircase leads to the gallery, from which a fine view of the W. End of London and Surrey hills can be obtained, but in recent years it has not been used.

Duke of York's School, Chelsea, called also the Royal Military Asylum, was founded in 1801 by Frederick Duke of York (1763-1827) for soldiers' sons. In 1909 it was removed to Dover.

Duke of York's Theatre, in St. Martin's Lane, London, England. It was opened in 1892 as the 'Trafalgar,' but later received its present name. Among the more notable plays first staged here were Pinero's *Lilly*; Barrie's *Peter Pan* and *What Every Woman Knows*; Galsworthy's *Justice*; the farce *Brewster's Millions*; and the detective drama *Arsène Lupin*.

Duker, Carl Andreas (1670-1752), Ger. classical scholar, studied under Perizonius at Franeker and subsequently brought out the second ed. of Perizonius' *Origines Babylonica et Aegyptiaca* (1736). D.'s magnum opus was his edition of *Thucydides* (1731).

Dukeries, see WORKSHOP.

Dukes, Ashlev (b. 1885), Eng. dramatic critic, playwright and theatre manager. Director of the Mercury Theatre from 1933. Author of *Modern Dramatists* (1911), *The Youngest Drama* (1913), *Drama* (1926). Has written a number of plays, including *The Man with a Load of Mischief* (1924), *One More River* (1927), *Such Men are Dangerous* (1928), *Match-makers' Arms* (1930) *Mandragola* (from Machiavelli, 1930).

Dukes, Sir Paul (b. 1889), Brit. writer and musician; educated at Caterham and Petrograd Conservatoire. Assistant at Imperial Opera, Petrograd, 1914-15. Member of the Anglo-Russian Commission, 1915-1918. Director of Brit. Intelligence service in Russia, 1918-19. *Times* correspondent in E. Europe, 1920. Pubs.: *Red Dusk and the Morrow* (1922), *Adventures and Investigations in Soviet Russia* (1925), *The Story of 'ST25'* (1938), *The Black Horse* (with Ropshin-Savinkov, 1926), *Ballet Russe* (with Nicolas Legat, 1930), and *An Epic of the Gestapo* (1940).

Duke Town, see CALABAR.

Duke University, co-educational institution for higher education estab. in Durham, N. Carolina, U.S.A., in 1924, and named after James B. Duke, from whose endowment fund the cost of its estab. was defrayed. The premises expanded by the addition of a science building, a chapel, library, dormitories, etc. A feature of the univ. is its medical school.

Dukhobors, or **Doukhobors**, Christian community of nonconformist Russian peasants. Their name means 'spirit fighters,' and was applied to them by the Orthodox priests with the implication that they warred against the Spirit of God, but a review of their doctrine and practice shows that they make an earnest endeavour to realise something of the Gospel conception of love and universal brotherhood. Equality, peace, and loving-kindness are their ideals, and although they assemble for public worship, they counsel silent prayer and attach small weight to outward ceremony. Alexander I. banished them to Tauris, and Nicholas I. drove them from their new homes to Transcaucasia (1810-50). Their refusal to obey the law afforded a pretext for this persecution. In this barren region they nevertheless prospered, by dint of sober living and dogged perseverance. In 1895 they burnt their arms to show their disapproval of compulsory military service, and were subjected to the barbarous tyrannies of the Cossack soldiers. Eventually through the offices of Tolstol and the Society of Friends in England, some 8000 were despatched as emigrants to Canada (1898-99), where they were given ter in Saskatchewan.

Dukinfield, municipal bor. of Cheshire, England, 6 m. E. of Manchester. It is situated in the centre of a colliery and manuf. dist., with cotton and calico printing mills, iron foundries, and brick and tile works. Pop. 20,000.

Dulac, Edmund, Brit. illustrator; b. 1882, at Toulouse. As 'Edmond' D., educated at Toulouse Univ., and un-

willingly studied law for two years; for three years attended drawing and painting classes at Toulouse art school, and for three weeks at Julian's in Paris. Illustrated books since 1905. Exhibited portraits at Paris salon, 1904-5. In 1912 he became 'Edmund' D., a naturalised Brit. subject. Illustrations pub. include: *The Bronte Novels* (1905), *Arabian Nights* (1907), Shakespeare's *Tempest* (1908), *Rubdyád of Omar Khayyám* (1909), *The Sleeping Beauty and other Tales* (1910), Poe's *The Bells and other Poems* (1911), *Edmund Dulac's Fairy Book* (1916) Hawthorne's *Tanglewood Tales* (1918), weekly cartoons in *The Outlook* (1919), *The Kingdom of the Pearl* (1920), *Treasure Island* (1927), *The Fairy Garland* (1928), *Gods and Mortals in Lore* (1936); and postage stamps for the Fr. Provisional Gov. (1944).

Dulcigno, or **Ulcinj**, tn. and port of Montenegro, Yugoslavia, situated on the Adriatic Sea, 12 m. S.E. of Antivari. It is built on a rocky cape, and enclosed by forests and hills, which combine to give it a most picturesque appearance. D. was ceded to Montenegro by Turkey in 1880 in consequence of a naval demonstration under Admiral Seymour. In 1919, with Montenegro, it became Yugoslavian. The old quarter is walled and has a medieval castle. Pop. 5000.

Dulcimer, one of the oldest musical instruments, being found in Assyrian mural decorations. The different notes are obtained by striking wires, stretched with tuning pegs across a horizontal sound-chest, with two cork-headed hammers. It is the prototype of the modern piano.

Du Ligier de la Garde, Antoinette, see DESHOULIÈRES, MADAME.

Dülken, tn. of Rhineland, Germany. 11 m. S.W. of Crefeld, and 20 m. W. of Düsseldorf. Pop. 16,000.

Dulmen, tn. of Westphalia, Germany, 17 m. S.W. of Münster. There are iron mines and blast furnaces in the neighbourhood. Pop. 10,000.

Dulong, Pierre Louis (1785-1838). Fr. physicist and surgeon. Pupil of Berthollet and Thenard. Early distinguished for the discovery of chloride of nitrogen, in the preparation of which he lost an eye and two fingers. Collaborated with Berzelius in the analysis of water by the method of passing a current of dry hydrogen over red-hot copper oxide. But it is rather as a physicist that he acquired fame, particularly by his experiments in the theory of heat, to which he applied himself constantly from 1818. He also evolved the air manometer for measuring the density of gases and the cathetometer for measuring small differences of level of different liquids in tubes.

Dulse, popular name given to two species of edible seaweed, *Rhodymenia palmata* and *Ididrea edulis*.

Duluth, important lake port of Minnesota, U.S.A., situated on steep and picturesque slopes at the W. end of Lake Superior. It is second only to New York in commercial tonnage handled. It exports iron ore, wheat, butter and eggs, automobiles, and coal from the rich

agric. and iron-mining regions of the N.W. The Minnesota Steel Co. mills are here. Hydro-electric power contributes to the manuf. of steel and the milling of flour. The city, which is governed by commission, has 442 acs. of parks and 21 m. of scenic drives. Pop. 101,000.

Dulverton, par. and tn. of W. Somersetshire, Eng. 21 m. W. of Taunton. It is a fishing and hunting resort, and is the headquarters of the W. Somerset Yeomanry. Pop. 1500.

Dulwich, suburb of London, in the metropolitan bor. of Camberwell. The D. College, one of the important Eng. public schools, was founded by Edward Alleyn in 1606, and was formally opened in 1619 in the presence of the Lord Chancellor Bacon and numerous other eminent men. In documents signed by Edward Alleyn in 1626, immediately prior to his decease, it was intended that the school should educate eighty boys, twelve of whom were to be poor scholars. The remainder should be the children of D. residents, and 'towne or foreign scholars,' who would pay a fee appointed by the master and wardens. The college now comprises an Upper Dulwich College and a Lower Alleyn's School. There is a valuable collection of pictures which was bequeathed by Sir P. F. Bourgeois, R.A., in 1811. It contains sev. Murillos and valuable pictures from the Dutch school.

Duma, or **Gosudarstvennaya Duma**, the pre-revolution Russian national parliament. It formed the lower house, the upper being the Council of the Empire. It was created in 1905, when Czar Nicholas II. granted his celebrated constitution. The first D., in which a Radical party, known as Constitutional Democrats, preponderated, was opened in 1906, and dissolved in two months. Its members had no experience of parliamentary procedure, and expected at once to carry such drastic reforms as the expropriation of the landlords and universal suffrage. The second was convened on March 5, 1907, and only lived till June 16, 1907. The temper of the House was again highly progressive and socialistic. It clamoured for the abolition of the field courts-martial and refused to be put off with the leisurely reforms proposed by Stolypin, minister of the interior. An excuse for the dissolution was found in the implication of certain Socialist members in what was called a treasonable plot to suborn the army. The third D., which was convoked in Nov. 1907, sat till 1912. This was elected in accordance with an imperial ukase which, contrary to the famous Oct. manifesto of 1905, had tampered with the electoral law in such a way as to secure a majority for the moderate party, known as Octobrists, and the reactionary Right. In its early sessions, however, this parliament paved the way for a class of peasant proprietors by partially sweeping away the communal ownership of land, and also passed measures dictated by a spirit of religious toleration. The mode of election was extremely elaborate, having been carefully designed to give every advantage to the Russian as opposed to the foreign

and subject populations, and also to the wealthy, conservative and property-owning, as opposed to the peasant, democratic and labouring classes. Seven great cities, including St. Petersburg and Moscow, elected direct representatives, but elsewhere the more complex system of electing members, through electoral colleges, was in operation. The Russian revolution in 1917 and the estab. of the Soviet system of gov. under the practical dictatorship of Lenin and Trotsky, brought to a dramatic close the hist. of the Fourth Duma. See also RUSSIAN REVOLUTION.

Dumaguete, cap. tn. of the prov. of Negros Oriental, is. of Negros, Philippine Is., on the Tañon Strait. It lies in a fertile agric. dist., and is an important commercial centre and the seat of the Sillman Institute. Pop. 16,000.

Dumangas, city in the prov. of Iloilo, Panay, Philippine Is. In 1903 it was annexed to Barotac Nuevo. Pop. 12,000.

Dumanjug, tn. in the prov. of Cebu, is. of Cebu, Philippine Is., on the W. coast at the mouth of the D. riv. Pop. 25,000.

Dumas, Alexandre, père (1803-70), celebrated Fr. author, b. at Villers-Cotterets, son of Gen. Dumas, a Creole; lost his father when he was only four years of age and, for a time, led a chequered life, until,

ALEXANDRE DUMAS (PÈRE)

goaded by poverty, he went to Paris to seek his fortune. Later, while serving as a clerk to the Duc d'Orléans, devoted his leisure to play-writing. His success was immediate, for the vaudeville, *La Chasse et l'Amour*, which he wrote in collaboration with two friends, was produced at the Ambigu Comique in the autumn of 1825. Thus encouraged, he composed plays, writing comedy, drama, tragedy, in prose and in verse, with equal facility, until the production of *Madame de Chamblay* in 1868. Some of the plays were good; others were absurdly bombastic; some,

such as *Kean* (1838), frankly (and unconsciously) ridiculous; but whatever their merits or demerits, the author's knowledge of the stage was generally equal to making them successful for the moment. It is, however, unnecessary to devote any space to the consideration of these works, for it is not D. the playwright who is now remembered, but D. the novelist. In fiction his first effort was *Souvenirs d'Anthony* (1835), a collection of short stories, and this was followed by *Isabel de Bavière*, and *Acté* (1839). The most famous of all his books is the *Mousquetaires* series—*Les Trois Mousquetaires* (8 vols., 1841), *Vingt Ans après* (10 vols., 1845), and *Le Vicomte de Bragelonne* (26 vols., 1848-50). The two other prin. series are: (1) *Joseph Balsamo* (1846-48), *Le Collier de la Reine* (1850), *Ange Pitou*, (1853), and *La Comtesse de Charny* (1853-1855); (2) *La Reine Margot* (1845), *La Dame de Monsoreau* (1846), and *Les Quarante-Cinq* (1848). *Le Comte de Monte Cristo* appeared in twelve vols. in 1845. In the novels mentioned, D. is at his best. 'I seem to see myself set on a pedestal which trembles as if it were founded on the sands,' the great man said to his son one day towards the end of his life in a moment of despondency. He need have had no fear as to the foundations on which his reputation rests. 'These sands, your uncounted volumes, are all of gold, and make a foundation more solid than the rock,' wrote Andrew Lang. Thackeray again and again expressed his fervent admiration of his great contemporary. 'All the forenoon I read with intense delight a novel called *Le Vicomte de Bragelonne*,' he wrote to Mrs. Brookfield, 'a continuation of the famous *Mousquetaires*, and just as interesting, keeping one panting from volume to volume, longing for more.' 'D. is wonderful. He is better than Walter Scott,' he said on another occasion. *Les Trois Mousquetaires* is one of the world's masterpieces. Its faults are obvious, but are of little importance in face of the overpowering merits of the book. The weaknesses of exaggeration, bombast, historical blunders are outweighed by the wonderful high spirits, the miraculous adventures, hair-breadth escapes, splendid fights, indomitable courage, never-failing resource of the heroes of Dumas. D'Artagnan, Athos, Porthos, and Aramis, Milady, Chicot, and the rest, have taken their place in the world's literary portrait gallery. D. was epic in his writings. He conceived largely, and executed his conception on the grand scale, and limned his characters with a broad brush. For the rest he let them reveal themselves as the story proceeds, never halting to indulge in psychological studies. Yet these are living human beings, not only the outstanding figures on the vast canvases, but those who occupy minor positions. The inn-keeper is as clearly defined as the cardinal; the captain of the King's Guard no less alive than the executioner of Lille. His very dialogue caught the infection of his scenes, and is as tense and brilliant as the repartee is glittering. It is sometimes asserted

that much of the credit of those wonderful books is due to D.'s collaborators, but to take credit away from Dumas to give to Maquet and the rest is absurd. D. was unhappy in his marriage and wasted all his fortune in gross extravagance. He died at Puy, near Dieppe, broken in health and impaired in intellect, ministered to by his son and daughter. Dumas wrote his own *Mémoires* so far as 1832 (22 vols., (1852-54), but they cannot be regarded as a very trustworthy guide. His complete dramatic works were pub. in 5 vols. in 1874. See lives by B. de Bury, 1885; A. F. Davidson, 1902; J. Lucas-Dubreton, 1928; H. Gorman, *The Incredible Marquis*, 1929.

Dumas, Alexandre, fils. (1821-95), natural son of the novelist, and one of the most distinguished Fr. dramatists of his century, was born at Paris. His whole career presents a strange contrast to that of his father, and the same may be said of his literary productions. His father shows the riotous prodigality and lavish, brilliant fancy of the romanticists, while he himself is Parisian in his minuteness and delicacy of work. He shows, too, after the preliminary period in which he sowed his wild oats, a moral force and earnestness that make his plays almost social sermons. He was early legitimized, and after a course of training at the Institution Goubaux and the Collège Bourbon, he led a wild life for some years, accumulating a vast stock of debts. To pay these off, he seriously took up his father's profession, and his true literary experience begins with the pub. of *La Dame aux Camélias* in 1848. Not only does this novel treat the common romantic theme (as in Victor Hugo's *Marion Delorme*) of the courtesan brought back to virtue by honest love, it also furnishes some autobiographical notes. His succeeding novels, though all readable, are commonplace. The dramatizations of *La Dame aux Camélias* and *Duane de Lys*, played at last in 1852 and 1853 respectively, mark an epoch in his own career and in that of the Fr. stage. Henceforward, though he did not give up the novel, his best work was given to the drama, and his success was great. Almost all his seventeen plays are masterpieces of construction and style. Each of them on its appearance gave rise to lively discussion, which he treats in his celebrated prefaces. In the *Demi-Monde* (1855) he treats the social question arising from the existence in society of this class and he does so with realism and frankness, though his crusade had not much practical effect. He strikes the same note of warning to the youth of France in the plays *L'Ami des Femmes*, *La Princesse Georges*, *L'Étrangère* and other plays; and other reforms in the social or legal sphere are also advocated in *Le Fils Naturel* (1858), and *Un Père Prodigé* (1859). He soon became wealthy and honoured. In 1874 he was made a member of the Institute, and continued his work till his death at Marly-le-Roi, near Paris. He left unfinished *La Troubadour* and *La Route de Thèbes*. Other important plays of his are: *Le*

Demi-monde (1855), *La Question d'argent* (1857), *Les Idées de Madame Aubray* (1867), *Une Visite de noces* (1871), *Jenise* (1885). See life by J. Claretie, 1882.

Dumas, Jean Baptiste André (1800-84), Fr. chemist, b. at Alais, studied chemistry in Geneva, and was carrying on original research before he was twenty-one. In 1823 he migrated to Paris. In 1824 he founded the *Annales des Sciences Naturelles*. As a prof. of his science at the Sorbonne and elsewhere, he always succeeded in gathering round him an eager band of students. Under the Second Empire he served for a time as master of the mint (1868). His idea of substitution (metalepsis), which he supported by proving the similarity in properties between acetic acid and trichloroacetic acid (where chlorine has replaced the original hydrogen), assisted largely in the correction of the atomic theory, whilst he also discovered ingenious methods of ascertaining the amount of nitrogen in organic compounds, and of estimating the density of gases. His works include *Traité de chimie appliqué aux arts* (1828), *Leçons sur la philosophie chimique* (1883), and *Essai de statique chimique des êtres organisés* (1845).

Du Maurier, George Louis Palmella Busson (1834-96), Brit. artist and writer, b. at Paris, was the son of a Fr. *émigré* and an Eng. mother. In 1851 he was studying chemistry at Univ. College, London, and after living in Paris and Antwerp, where he lost the sight of one eye, he settled in London in 1860. His drawings appeared in *Once a Week* and *Cornhill Magazine*, but it is as a *Punch* artist that he lives. In its pages he drew pretty women, spruce nurse-maids, happy children, and proud fathers just as they ought to appear in 'good society.' It was his finished and graceful style which suggested to Mark Lemon the analogy between Du Maurier and the 'romantic tenor.' His novels, including *Trilby* (1894) and *The Martian* (1897) share the charm and wit of his illustration. See T. Armstrong, *Reminiscences of Du Maurier*, 1912; Daphne Du Maurier, *The Du Mauriers*, 1937.

Du Maurier, Sir Gerald (1873-1934), Eng. actor-manager, knighted in 1922, was the younger son of George du Maurier. He made his stage début at the Garrick Theatre, 1891, and was in Barrie's *The Admirable Crichton*, 1902. He was the original Capt. Hook in *Peter Pan*, 1901. Other successes were in *Raffles*, 1906; *Bulldog Drummond*, 1921; *Behold we Live*, 1932. Films: *Escape*, 1931; *I was a Spy*, 1933; *Catherine the Great*, 1934.

Dumbarton, co. tn. of Dumbartonshire, Scotland. It lies on the R. Leven, near its confluence with the Clyde, and is about 14½ m. N.W. of Glasgow. After Clydebank, it is by far the most important ship-building centre in the co., and, besides extensive engineering works, has brass and iron foundries and saw mills. The fortress and castle on the basaltic Rock of D. (240 ft.) is rich in historical interest. William Wallace was confined within its grim walls in 1305, and in 1571 it was cap-

tured, after a brilliant assault, by Crawford, who fought for King James. Formerly the capital of Strathclyde, it was named Dumbreath (fort of the Britons) by the Gaels. Pop. 22,000.

Dumbarton Oaks Conversations, conversations on world organisation between the United Kingdom, U.S.A., Russia and China, at Dumbarton Oaks near Washington, from Aug. 21, to Oct. 7, 1944. The outcome of these talks was agreement on tentative proposals for the estab. of a general international organisation, under the title of The United Nations, which should serve as a basis of discussion at a full United Nations conference. (This conference was held at San Francisco in 1945.) It was also agreed that the Charter of this organisation ('U.N.O.') should provide for the purposes, principles, membership and prin. organs of the organisation. These purposes were, primarily, to maintain international peace and security and to take effective measures for the prevention and removal of threats to the peace and the suppression of acts of aggression or other breaches of the peace, and to bring about by peaceful means settlement of international disputes which might lead to a breach of the peace. These purposes and the principles on which the organisation was to be based, are reproduced in the charter adopted at the San Francisco Conference. Further, it was also agreed at D. O. that the organisation should have a General Assembly, a Security Council, an International Court of Justice and a secretariat - in all of which it resembles the former League of Nations. The Security Council, which is the touchstone of the whole organisation, under the D. O. talks was to consist of one representative of each of eleven members of the organisation. Representatives of the U.S.A., the United Kingdom of Great Britain and N. Ireland, Russia, China and (later) France, were to have permanent seats; while the assembly were to elect six states to fill the non-permanent seats. The charter proposed by the D. O. talks confers on the Council primary responsibility for the maintenance of international peace and security and is to be so organised as to be able to function continuously. In all these particulars it naturally challenged comparison with the ill-fated council of the League of Nations which lacked an international police force to carry out its policies. To strengthen the Security Council in this regard the D. O. talks agreed that if the Council proposes in any given dispute to resort to force it may call on member states to make their contribution to the necessary forces and 'in order that all Members should contribute to the maintenance of peace, they should undertake to make available to the Council on its call and in accordance with special agreements concluded amongst themselves, the necessary armed forces, facilities and assistance.' In order to enable urgent military measures to be taken by the United Nations organisation it was agreed that there should be held immediately available by the Members, national

air force contingents for combined international enforcement action, the strength and degree of readiness of such contingents and plans for their combined action to be determined by the Council with the expert assistance of a Military Staff Committee. For the most part all these bases of agreement for the creation of a United Nations organisation were adopted at the San Francisco Conference (held in June, 1945). See under SAN FRANCISCO CONFERENCE; also UNITED NATIONS, CHARTER OF THE; COVENANT OF THE LEAGUE OF NATIONS. The Dumbarton Oaks talks were pub. as Cmd. 6560 (H.M.S.O.), 1944.

Dumbartonshire, see DUNBARTONSHIRE.

Dumb Cane, or *Dieffenbach Seguire*, species of *Dieffenbachia*. The plant occurs in tropical America, and has an acrid juice, which paralyses the power of speech in one who chews the stem. The natives made use of this in the torturing of slaves.

Dumbness. By the ancients, D. was thought to be, not the natural result of deafness, but the consequence of some brain trouble, or incapacity of the vocal organs, and by some was imagined to be possession by an evil spirit. Pedro Ponce de Leon (1520-84), a Spaniard, was the first instructor of the deaf and dumb, teaching many of them to speak, read, and write. There are three prin. methods in the instruction of the deaf and dumb: the oral, the sign and manual, and the combined method. The oral method instructs by and through speech; the pupils learn to pronounce the elemental sounds of the language, and to read from the lips. The second method is by a language of signs, and the third combines speech, lip-reading, writing, and signs. See also DEAF AND DUMB.

Dum-Dum, or **Dam-Dam**, tn. of India, in the presidency of Bengal, and the dist. of the Twenty-four Parganas, 6 m. from Fort William. For several years, until 1853, it was the headquarters of the Bengal artillery, and it was regarded as the 'Woolwich' of India. The soft-nosed expanding bullets known as Dum Dum were first manuf. here. The tn. is noted for the fact that the mutiny of 1857 originated here.

Dumfries, co tn. of Dumfries-shire, Scotland. It lies on the Nith, 8½ m. from its mouth in Solway Firth, and is connected by three bridges with Maxwelltown, its suburb, which, as it is situated on the r. b., belongs to Kirkcudbrightshire. The first bridge, now only a footbridge, over the Nith, opening a way to the W., was built in 1283. The tn. is engaged in the manuf. of tweeds and hosiery and has an important cattle mkt. Robert Burns, who lived here from 1791 till his death (1796), lies buried in St. Michael's Church (1746), and the site of the Franciscan monastery, where Robert Bruce slew the Red Comyn, is now partly covered by the Gothic Greyfriars Church (1867). At the County and Commercial hotel is a room in which Prince Charlie held a levée and which has remained almost unchanged since his day. The Mid-Steeple in High Street, once a

court-house, is the place at which Effie Deans was tried. There are memorials to Burns, Carlyle, and Sir Walter Scott at The Hole in the Wall. Nearby is a statue of Henry Duncan, the founder of savings banks; just beyond it lies the original garden of *Peter Pan*; J. M. Barrie was educated at the Academy here and took the garden as his model. Burns's house in Mill St., is now the property of the tn. council. At the Globe Inn, where he foregathered with his cronies, his chair and other belongings may still be seen. The old theatre of 1790, where Macready had his first success is now a cinema. The stately Caerlaverock Castle, to which Edward I. laid siege in 1300, is 8 m. from D. and is still in excellent preservation. Near D. is Sweetheart Abbey, whose last abbot, Gilbert Bruce, is believed to have been the original for Scott's *The Abbot*. The abbey was founded in 1273 by Devorguilla, wife of John de Baliol. It was here in 1300 that Edward I. received the Papal Bull that ordered him to cease the oppression of Scotland; he defied the Pope, thus beginning the breach that culminated under Henry VIII. Pop. 22,000.

Dumfriesshire, border co. of Scotland, bounded on the N. by the cos. of Lanark, Peebles, and Selkirk; on the E. by Roxburghshire; on the S. and S.E. by the Solway Firth and Cumberland; and on the W. by the cos. of Ayr and Kirkcudbright. The chief highlands, including White Coomb (2695 ft.) and the Lowther Hills (2377 ft.), lie N. The valleys of the three main rivs., the Nith, the Annan, and the Esk, all of which empty into the Solway, separate the N. of the shire from the S. Railways ascend Nithsdale, Annandale, and Eskdale, as far as Langholm. Loch Skene (1750 ft. above sea-level) in the N. gives rise to the beautiful waterfall called Grey Mare's Tail. The rural pop. is engaged in cattle and sheep rearing, and apart from Dumfries, Annan (pop. 6300), Langholm, and Lockerbie are the only tns. of importance. Area 1072 sq. m.; pop. 81,000.

Dümichen, Johannes (1833-94), Ger. Egyptologist. His series of learned works on Egypt, including *Geographische Inschriften altägyptischer Denkmäler* (1865-85), was the fruits of extensive travel and original research, especially into inscriptions.

Dumnonii, see DAMNONII.

Dumont, Alberto Santos, see SANTOS DUMONT.

Dumont, François (1688-1726), Fr. sculptor, b. in Paris and d. at Lille. He studied under his father, and first gained distinction with a figure of David, and of a Titan. Afterwards executed a number of monuments and works for churches. Died as the result of a fall while erecting the tomb of the duke of Melun. His son Edmé executed the well-known statue of Milton of Crotona testing his strength, which is in the Louvre.

Dumont, François (1751-1851), Fr. miniature-painter. Executed portraits of Louis XVI. and his queen, and Charles X. Many of his best works are in the Louvre.

Dumont, Pierre Etienne Louis (1759-1829), Fr. political writer. His *Souvenirs sur Mirabeau* (1832), are of peculiar interest, both because the author was a personal friend of the Fr. statesman—he is said to have composed some of Mirabeau's speeches—and because they give the impression which the Great Revolution made upon a discerning eye-witness. D. was instrumental in restoring freedom to his native city, Geneva, and has earned the gratitude of posterity for his able editorship of the *Traité de Legislation* and other works of Jeremy Bentham, the jurist. See J. Martin, *Etienne Dumont*, 1759-1829, 1912.

Dumont d'Urville, Jules Sebastian César (1790-1812), Fr. navigator, b. at Condé-sur-Noireau, was an accomplished linguist and student of entomology and botany. It was he who discovered and recognised the priceless Venus of Melos (Milo). The find occurred during a hydrographic survey of the Mediterranean in 1820. In 1830 he was in charge of the ship which took Charles X. to England. In 1838 he sailed for the Antarctic and discovered Joinville Island, Louis Philippe Land, and later (1810) Adélie Land. An is. off New Guinea, which he visited during his second voyage of circumnavigation (1826-29), bears his name, D'Urville.

Dumouriez, Charles François (1739-1823), celebrated Fr. general, was b. at Cambrai. In 1757 he entered the Fr.

GENERAL DUMOURIEZ

army and fought under his father, a commissary royal, during the Seven Years' War. He was afterwards sent as an envoy to Poland and Sweden, but while engaged in the latter country he fell into disgrace, and, being recalled, was imprisoned in the Bastille. On the succession of Louis XVI. he was released, and was soon made commandant of Cherbourg, where he did much to improve the naval administration. On the outbreak of the revolution, he took the popular side, ultimately becoming connected with the

Glondins, by whose influence he was made minister of foreign affairs. He resigned this post to receive command of the army in the N., and carried on a successful campaign against the duke of Brunswick. It was by his exertions that the latter was defeated at the battle of Valmy, and Franco was saved from the dangers of invasion. Later in the same year he pressed into the Austrian Netherlands and won the victory of Jemappes. In 1793 his career of conquest came to an end. He had attempted to make arrangements for the restoration of the monarchy, and he was charged with treason. Four commissioners were sent to arrest him, but he captured them and took refuge with the Austrians. He was not able to remain here long, and wandered throughout Europe with a price on his head, settling finally in England, where he died at Great Marlow. Of his numerous pubs, the most important is his *Mémoires* (1796).

Dumping. In its restricted business meaning *D.* refers to the method of disposing of superfluous stock at a low price in some place where its sale shall not affect the regular business. But in its wider economic meaning it denotes the export sale of a commodity at a price lower than that in the domestic market. A practice since the sixteenth century, it became prominent in the nineteenth. In the past forty years or more large cartels or trusts of sev. major manuf. countries pursued a policy of securing the export trade at dumping prices to kill competition. Among the most fruitful causes of discussion as to what constitutes *D.* between the two World Wars were: (1) The heavy selling of goods by Germany during her periods of inflation, which was a natural consequence of the rush of the Ger. people for more stable money than their own marks; (2) the return of Russia to international trading, with consequent heavy selling of oil and flour in Brit. home mktks.; (3) the more trivial but spectacular selling of Amer. superfluous magazines and pubs. in this country; (4) the selling of cheaply produced Jap. textiles and other goods in world markets, particularly from 1933. The introduction by the Brit. Gov. of a quota system for textile imports into the Brit. colonies offset this last phase of *D.* Laws imposing additional duties on dumped goods were passed in Canada (1900), in the Union of S. Africa (1911), and in 1921, in U.S.A., Great Britain, Australia and New Zealand. See J. Viner, *Dumping, A Problem in International Trade*, 1923.

Dumraon, tn., 6½ m. W. of Patna, dist. of Sháhábád, W. Bengal, India. Pop. 19,000.

Dun, Celtic and Teutonic root, meaning 'hill', and connected with the Anglo-Saxon *tun*, from which 'town' is derived. Cf. also Eng. 'dowus' and Fr. *dunes*. Various forms of it occur in place names like *Donegal*, *Dunedin*, and *Dumfries*. In early times the word was used in Ireland and Scotland of forts with ramparts. Such 'duns' are found at Duncricht and Tap o' Noth in Aberdeenshire, and in many Irish villages.

Duna, Hungarian name for the R. Danube.

Dünaburg, see DAUGAVPILS.

Duna-Földvár, tn., 33½ m. S.E. of Stuhlweissenburg, on the r. b. of the Danube, Hungary, with mills, tiles, pottery, hemp, and food industries. Pop. 12,000.

Dunajec-San, Battles of. The Rs. Dunajec and San both run N. from the Carpathians in Galicia. During the First World War their direction, and the fact that Tarnow is situated on the former and Przemyśl on the latter, brought them into prominence. In their advance the Russians swept over these areas in Sept. 1914, and reached Tarnow. The fact that the Russians had been reinforcing their Carpathian front at the expense of the Tarnow area decided the Central Powers to attempt a break-through at that place, which, had it succeeded, would have 'rolled up' the Russian forces on the Carpathians (q.v.). The Gers. withdrew a number of divs. from the W. front, and these, together with an Austro-Hungarian force, the whole under the command of Gen. von Mackensen, were concentrated in Galicia for the operation. The attack opened on May 2, 1915, and, owing to the intense preparatory bombardment, the Russians gave way almost everywhere, and the lower Dunajec was crossed during the same day. Great pressure was brought systematically against various parts of the sector, and although the Russians withstood it bravely, the tactical combinations of their opponents were too much for them. Tarnow, in fact, was not evacuated until May 5, and only after a desperate struggle. The Russians were attacked again on May 8, and by the night of May 12 the Central Powers were threatening their positions on the San, particularly Przemyśl. By May 21 the struggle for the fortress had begun, and although a powerful counter-attack was launched by the Russians, it failed, and by the first week of June they were forced back from the San.

Dunant, Jean Henri (1828-1910) Swiss philanthropist. See under RED CROSS.

Dunbar, fishing port of E. Lothian, Scotland. It is 29½ m. E.N.E. of Edinburgh by rail, and has two harbours, both fairly accessible, at the entrance of the nrth of Forth. The castle and Grey Friars monastery, which dates back to 1218, are both picturesque ruins. The former was captured by Edward I. (1296), and offered refuge to Edward II. after Bannockburn (1314), to the unfortunate duke of Albany (1479), and twice to Mary, Queen of Scots. The golf links and the slight rainfall attract many visitors in summer-time, and close by is the scene of the battle of Dunbar (1650). Pop. 4000.

Dunbar, Earls of: *Cospatrik* was created first earl of Dunbar by his kinsman, Malcolm III., and in 1072 received from him the grant of the tn. of Dunbar with the surrounding lands of Lothian.

Patrick (1284-1368), tenth earl, sheltered Edward II. in 1314 after the battle of Bannockburn at Dunbar Castle. He married 'Black Agnes' the sister of the

Randolph who led the centre of the Scottish forces at that battle. 'Black Agnes' herself is famous for her defence of Dunbar Castle against the Eng. under Salisbury in 1337, when she successfully held the castle for five months.

George, the eleventh earl, was deprived of his title and estates by James I. of Scotland in 1431. In 1605 the title was revived in favour of George, third son of Alexander Home of Manderston, who took a leading part in the re-estab. of episcopacy in Scotland.

Dunbar, William (c. 1460–c. 1520), greatest of the old Scottish poets, is generally supposed to have been born in E. Lothian and educated at St. Andrews. Practically nothing is known of his early life, and little of his later. He early entered the order of the Friars Minor (Franciscan), but gave this up in disgust. Thereafter he appears to have been employed by James IV. in some court and political business. His chief poems are *The Thrissil and the Rois* (The Thistle and the Rose), in which he celebrates James's marriage with Margaret Tudor (1503); *The Dance of the Seven Deadly Synnis*, an allegory (before 1508); *The Golden Targe* (1508), another allegory, and various lyrics, of which the most notable is (c. 1507) *The Lament for the Makaris* (poets of Scotland and England). In all these there is true poetry. In his allegorical poems, D. follows Chaucer in his setting, and is thus more or less imitative and conventional; in his satirical pieces and lyrics he takes a bolder flight and shows his native power. His comic poems are somewhat gross. The date and circumstances of his death are uncertain, some holding that he fell at Flodden, others that he was alive so late as 1530. Other works are *The Merle* and *The Nightingale*, and the *Fliiting* of D. and Kennedy. D. is described by Sir E. Gosse as 'the largest figure in Eng. literature between Chaucer and Spenser.' He has strength, swiftness, humour, and pathos, and his descriptive touch is vivid and full of colour. See J. Paterson, *Life and Poems of Dunbar*, 1880; J. Schipper, *William Dunbar. Sein Leben und Gedichte*, 1884; C. Steinberger, *Étude sur William Dunbar* 1908; R. A. Taylor, *Dunbar*, 1932.

Dunbartonshire, co. of Scotland, bounded on the N., E., and S.E. respectively by the shires of Perth, Stirling and Lanark, on the S. by the Clyde, and on the W. by Loch Long, a beautiful salt-water inlet, and Argyllshire; there is also an enclave of the co. to the E., bounded on the N. by Stirlingshire and on the S. by Lanarkshire. Ben Vorlich (3092 ft.) and Ben Vane (3004 ft.), and at least ten peaks over 2000 ft. high, crown the highlands in the W. and N.W., whilst in the S. rise the Kilpatrick Hills. The chief rvs. are the Clyde, with its affluent, the Leven, and the Kelvin; the prin. glens of the hilly regions, Glens Sloy, Douglas, Luss, and Fruin are named after the streams which water their beds. The splendid scenery of Loch Lomond attracts many visitors each year, and Garelochhead, at the N. end of the Gareloch, is also a favourite

tourist centre. The neighbourhood of so large a mkt. as Glasgow has led to the estab. of large dairy farms, and the successful adoption of highly intensive cultivation. Clydebank (14,100 inhabs.) and the co. tn. Dumbarton (22,500) are busily engaged in shipbuilding, and Alexandria (10,300), Renton, and Bonhill in bleaching, Turkey-red dyeing, and printing cottons and other fabrics. Coal is mined in Kirkintilloch (13,800). Pop. 156,100.

Dunblane, mkt. tn., on Allan Water 14 m. S.S.W. of Crieff, in W. Perthshire, Scotland. Woollen goods are manuf., but the chief interest of the tn. is historic. The cathedral, which was rebuilt in 1210 by Bishop Clemens, is in the Early Pointed style, with a fine W. window. An account of St. Blaen and of the early foundation of the Sec of D. may be found in the works of Dowden, and A. O. Anderson. D. was an important place in the Middle Ages, being not only the seat of an old diocese, but, lying near Stirling, where Eng. Kings often resided, it played no small part in our national hist. See A. B. Barty, *The History of Dunblane*, 1945.

Duncan I. (d. 1040), King of Scotland succeeded his grandfather (on his mother's side) Malcolm II. in 1031. He was regarded as an usurper by many of his subjects and his right to kingship contested, notably by Macbeth, who killed him in 1010.

Duncan II (d. 1094), King of Scotland, son of Malcolm Canmore, whom he succeeded in 1093, being supported in his claim to the throne by England against his rivals Edmund and Donald Bane. Killed in battle, 1094.

Duncan of Camperdown, Adam, first Viscount (1731–1804), Brit. admiral, b. at Lunzie in the co. of Angus, Scotland. He received his earliest education at Dundee, and in 1746 was placed under Capt. Haldane in the frigate *Shorcham*. Assisted in the attack on Gorra, a Fr. settlement in W. Africa. In 1795 he hoisted his flag as commander-in-chief of the North Sea, and began harassing the Dutch. On Oct. 11, 1797, he gained a decisive victory over the Dutch, and in recognition of his services he was created Viscount Duncan of Camperdown and Baron of Lunzie, and also was granted a pension of £3000 to himself and two next heirs to the title.

Duncan, Andrew, the Elder (1744–1828), Scottish physician, b. at Pinkerton, near St. Andrews. From 1774–76 he lectured on medicine at the univ. of Edinburgh. In 1790 he was appointed president of the Edinburgh College of Physicians and prof. of Physiology. In 1776 he founded a public dispensary, and in 1807 a lunatic asylum at Morningside, Edinburgh. His chief writings were *Medical and Philosophical Commentaries*, a quarterly jour. of medicine (1773–95), continued as *Annals of Medicine* until 1804, when his son took over the work of editor and issued the *Edinburgh Medical and Surgical Journal*. He also wrote sev. medical treatises. There is an autobiographical fragment in his *Miscellaneous Poems* by A. D. (1818).

Duncan, Andrew, the Younger (1773-1832), Scottish physician, son of the preceding, *b.* at Edinburgh. In 1807 he was appointed first prof. of medical jurisprudence in Edinburgh. From 1819-21 he was joint prof. of physiology with his father, and from 1821-32 he was prof. of *materia medica*. His chief literary work was for the *Edinburgh Medical and Surgical Journal* and an improved version of Lewis' *Edinburgh New Dispensary* (1803).

Duncan, Henry (1774-1846), founder of savings banks, *b.* at Lochrutton, Kircudbrightshire, Scotland. He was intended for a commercial life, but left it for the church, and in 1798 was ordained minister of Ruthwell in Dumfriesshire. He was remarkable for the breadth of his views and the diversity of his interests. He was captain of a company of volunteers, an ardent antiquarian and geologist, the pub. of a popular series of tracts entitled *The Cottage Fireside*, the editor of *The Dumfries and Galloway Courier*, and the author of *The Sacred Philosophy of the Seasons* (1836). His most important labours were connected with the estab. of savings banks, the first being instituted at Ruthwell in 1810, and later, through his efforts, all over the country. See life by his son, 1848.

Duncan, Isadora (1878-1927), Amer. dancer and pioneer in the revival of Gk. classical poses and barefoot dances with flowing draperies; *b.* in San Francisco, she had appeared on the New York stage before emigrating with her family to England. In 1901 she appeared in Paris, and at the Théâtre Sarah-Bernhardt in 1903. She won a reputation by her 'interpretations' of music by means of dancing. Her life was, however, marred by tragedy; in 1913 her two children, with their nurse, were drowned in the Seine at Neuilly as the result of a motor accident; in 1921 she married the young Russian poet Serge Yessenin, whom she divorced two years later; and in 1927 she herself was strangled by her own scarf while motoring. Her memoirs, *My Life*, were pub. in 1927. See P. Magriel (ed.) *Isadora Duncan*, 1948.

Duncan, Robert Kennedy (1868-1914), Amer. chemist; *b.* at Brantford, Ontario, Canada. Prof. of Chemistry at Washington and Jefferson College, 1901-6. From 1906 he was prof. of Industrial Chemistry at the Univ. of Kansas; and from 1910 director of industrial research - taking, at the same time, the same positions in Pittsburgh Univ. He discovered and patented a new process for manuf. phosphorus; a new low-melting glass; and processes for decorating glass. Initiated in 1907, at Univ. of Kansas, a scheme of industrial fellowships, which has since grown to remarkable proportions there and at Pittsburgh. Pub.: *The New Knowledge* (1905), *The Chemistry of Commerce* (1907), *Some Chemical Problems of To-Day* (1911).

Duncan, Thomas (1807-45), Scottish painter, *b.* at Kinclaven, Perthshire. He began to exhibit at the Scottish Academy in 1828, and won so great a reputation that in 1830 he was elected a member of

the Royal Scottish Academy and in 1843 an associate of the Royal Academy, London. His prin. pictures represent scenes from Scottish hist., and are remarkable alike for their skill in colouring and for the faithful portraiture of Scottish character. There are fine specimens of his work in the National Gallery of Scotland, including portraits of himself, Lady Stuart of Allanbank, and Lord Colonsay. His illustrations from literature include 'Jeanie Deans on her Journey to London' (1831) and 'The Woeful Heart' (1841), from *Auld Robin Gray*. His chief historical pictures are: 'Prince Charles Edward entering Edinburgh' (1840), 'Prince Charlie Asleep after Culloden' (1843), 'The Martyrdom of John Brown of Priesthill, 1685' (1844), now at Glasgow.

Duncan de Cérésantis, Mark (d. 1648), writer of Lat. verse. He entered the service of Sweden, and was Swedish ambas. to France in 1645, but renounced his position and his Protestantism and went to Rome. In 1647 he met the Duc de Guise, and accompanied him to Naples as secretary. He died of a wound received in an engagement with the Spaniards while aiding Guise in his attempt to take Sicily from Spain. His fame as a Lat. versifier was great; the most celebrated of his poems being the *Carmen Gratulatorium*, on the marriage of Charles I. of England and Henrietta Maria.

Duncansby Head, promontory (210 ft.) forming the N.E. extremity of Caithness, Scotland, 184 m. N. of Wick and 14 E. of John o' Groat's house.

Dunciad, The, celebrated satire pub. in 1728 in three books, to which a fourth was added in 1742, in which Alexander Pope takes revenge for the hostility of his critics by holding them up to ridicule as members of the court of Dullness.

Duncker, Maximilian Wolfgang (1811-1886), Ger. historian. In 1837 he accepted the post of prof. of hist. at Tübingen, but was recalled to Berlin in 1859, becoming counsellor to the crown prince in 1861, and director of the state archives from 1867 to 1874. His high place among Ger. historians exists chiefly on his *Geschichte des Alterthums*, 1852-57, Eng. trans. by E. Abbott, 1877-82. He also pub. *Origines Germanicæ* (1810), *Die Krisis der Reformation* (1845), *Zur Geschichte der Deutschen Reichsversammlung* (1849), and *Feudalismus und Aristokratie* (1858).

Dundalk (Gaelic, *Dun Dealgan*), cap. of co. Louth. It is situated on the R. Castletown, near its entrance into D. Bay, 12 m. S.W. of Newry. It is a railway centre for the Great N. railway, and there are important works belonging to the railway. There is also in normal times a daily service of steamers to Liverpool. A considerable trade in dairy and agric. produce and live stock is carried on; there are also mills for flax-spinning, breweries, and distilleries. The fisheries are important, especially the salmon-fishing industry. Pop. 14,700.

Dundas, In. of Wentworth co., Ontario, Canada, at the head of Burlington Bay, Lake Ontario. It has large mills worked

by water, and manufs. leather, paper, flour, machinery, and tools and textiles. Pop. 5000.

Dundas, group of about 500 coral is. (also called Juba Is.), off the E. coast of Africa, in lat. 1° S. They possess only one safe harbour.

Dundas, baronial castle, 1½ m. S.W. of Queensferry on the S. bank of the firth of Forth, Scotland. It dates from the eleventh century, and was the seat of the family of Dundas until 1875.

Dundas, Sir David (1735-1820), Brit. general and writer on tactics, b. in Edinburgh. He entered the army in 1752, and was aide-de-camp to Gen. Elliott in 1760-1, in the campaigns in Germany. Every year he was present at the manoeuvres of the Fr., Prussian, and Austrian armies, and in 1788 pub. the results of his observations of their tactics in *The Principles of Military Movements, chiefly applicable to Infantry*. His *Rules and Regulations for the Formation, Field Exercises, and Movements of his Majesty's Forces* (1792) were pub. as the official orders for the army, and were followed by *Rules and Regulations for the Cavalry* (1792). It was under these rules and regulations that the battles of Moore and Wellington were fought. He was made governor of Chelsea Hospital in 1804, and commander-in-chief of the army from 1809-11.

Dundas, Henry, first Viscount Melville (1712-1811), member of a distinguished legal family, was educated at Edinburgh Univ. At the age of twenty-four he was appointed solicitor-general for Scotland. In 1774 he became a member of parliament, and in the next year was made lord-advocate. He was a regular attendant at Westminster, where he vigorously opposed any concession being made to the Amer. colonies while they were in arms against the mother country, and in 1778 he supported a motion for the repeal of the Massachusetts charter. His advance was as rapid as it was steady. Later he was home secretary in Pitt's administration, and in 1794 secretary for war, with William Windham as secretary-at-war. He was in 1802 created Viscount Melville, and two years after returned to office with Pitt as first lord of the admiralty. Charged with malversation in 1806, he was impeached, but acquitted on all charges, and his name, which had been struck off the roll of privy councillors, was restored. He never again held office, and in 1809 declined the earldom that Percival offered him. An able man, and a ready speaker, he stands in the political hist. of his times as the intimate and trusted adviser of William Pitt.

Dundas, Sir Lawrence John Lumley, see ZETLAND, MARQUESS OF.

Dundee, city, a royal parl. and municipal burgh and seaport in the co. of Angus, Scotland, situated on the N. shore of the firth of Tay. The tn. which is Scotland's fourth largest city, stands on a gentle slope, rising from the water's edge to the hill known as the Law (571 ft.). The estuary opposite the tn. is nearly 2 m. wide, and its shipping is important

enough to make it the second port of Scotland. The tn. is well built, and underwent much improvement in the course of the last century. It possesses many fine buildings, among which are the City Square buildings, and the Albert Institute, which includes a free library, museum, etc. This institute, in fifteenth century Gothic, was designed by Sir Gilbert Scott. Other important edifices are the Royal Exchange, St. Paul's Church, Univ. College (St. Andrew's Univ.), Caird Hall, and the Technical Institute. There are sev. fine parks, chief of which are Camperdown Park of approximately 150 ac.; the Baxter Park; and Balcay Park on the hill of Balcay. The chief industry of Dundee consists in the manuf. of jute and heavy linen fabrics such as sailcloth. There are also manufs. of cordage, fine linen, confectionery, marmalade, cash registers and accounting machines, watches, plastics, etc. Some shipbuilding is carried on, and mill-wright work, and there are marine and other engine works wherein textile machinery, steam boilers and engines, etc. are manuf. There are also extensive sawmills. There are thirteen trade guilds, and about 100 spinning mills and factories. Dundee is the chief centre of the jute trade. It was once strongly fortified, and suffered greatly from war at various times. On account of the prominent part taken by its citizens in forwarding the work of the Reformation, it is often given the title of 'The Scottish Geneva.' On Dec. 28, 1879, part of the Tay Bridge (which connects D. with Fifeshire) and the train passing over it were blown into the river, with the loss of over seventy lives. The tn. of Broughty Ferry is included in the burgh of D. Pop. 175,500. See J. Thomson (continued by J. MacLaron), *The History of Dundee, 1874*. A. Maxwell, *Old Dundee: ecclesiastical, burghal and social, prior to the Reformation*, 1891; A. C. Lamb, *Dundee, its quaint and historic buildings*, 1895; Brit. Association, *A Scientific Survey of Dundee and District*, 1939.

Dundee, John Graham of Claverhouse, Viscount (c. 1649-89), Scottish soldier. He served as a volunteer in the Fr. army and in the Dutch army under the Prince of Orange, where he obtained a cornetcy in 1674 for saving the life of the prince at the battle of Seneffe. In 1677 he returned to England and obtained a captaincy in the regiment of the marquis of Montrose, charged with enforcing the penal laws against the Scottish Covenanters. Graham's attempt to disperse an armed force of Covenanters at Drumclog ended in his defeat, and was the signal for a serious and general rising. He was more successful at Bothwell Bridge (1679), and afterwards made a tour through the S.W. cos. in search of rebels, routing a company at Aird's Moss and killing the leader, Cameron. In 1682-84 he suppressed the Covenanters of Dundries, Annandale, Kirkeudbright, Ayr, and Lanark with the severity enjoined by the gov. killing, robbing, and starving them when they would not submit. In 1688 he was appointed second in command of the Scottish army,

and was ordered S. with his forces to protect the Stuart throne and oppose the landing of William of Orange. In the same year James II. created him Viscount Dundee. After James II.'s flight to France D. returned to Scotland and was indefatigable in supporting the Stuart cause. In July 1689 he organised a rising in the Highlands, and completely routed the forces of Mackay, but was killed in the moment of victory at Killiecrankie. See M. Napier, *Memorials and Letters of Graham of Claverhouse*, 1859-62; C. S. Terry, *John Graham of Claverhouse*, 1905; and I. MacLaren's *Graham of Claverhouse*, 1908; and Scott's *Old Mortality*, and *Redgauntlet*.

Dundonald, tn. In the par. of D., Ayrshire, Scotland. D. Castle, erected in the twelfth century, where Robert II., the first Stewart sovereign, died in 1390, and Old Auchans Castle, are ruins. Pop. 1600.

Dundonald, Earls of, see COCHRANE, DOUGLAS MACKINNON BAILLIE HAMILTON and THOMAS.

Dundrennan, vil. In the par. of Rerwick, co. of Kirkcubright, Scotland. 5 m. S.E. of Kirkcubright, with the ruins of an anct. Cistercian abbey (1142).

Dune, mound or ridge of loose sand heaped up by the wind on the seashore or occasionally on the shore of an inland lake and on the banks of a riv. The name is also used for the wide stretches of sand in an inland dist. of low rainfall. Among the minerals which occur among sand deposits, quartz is by far the most common and of the longest duration, as it is comparatively hard, has practically no cleavage, is insoluble in water, and does not readily decompose, while the other grains decompose comparatively rapidly. In general, the sand grains which form the Ds. are rounded, due to mutual attrition during transport; the greater the distance travelled the smoother and rounder the grains. The wind which heaps up the Ds. seldom carries even the smallest grains in suspension, but rolls them along the ground, sometimes with a movement as smooth as flowing liquid, and sometimes with a skipping motion.

A D. has a gentle windward slope and a steep leeward descent; the rolling grains being driven up a gentle incline and falling steeply into the hollow below. Moving sands are in many places altering the surface of the land; the continuous blowing of a steady wind in one direction frequently covering fertile tracts with this arid deposit, moving at the rate of from 60 to 70 ft. in one year. The average height of coastal sand Ds. is from 200 to 300 ft., but in the crescent-shaped sand Ds. of the Sahara they sometimes rise to a height of 600 ft. in a wide belt of sand called 'Iridi' or 'Gidi,' from the Berber word for Ds., and are separated by depressions, sometimes below sea-level, called 'Juf.' Little can be done to arrest the progress of moving sand Ds., but they can be fixed to a certain extent by planting *Carex arenaria*, and similar plants with long creeping roots. Particular attention is given to this form of

conservation in the Netherlands, because at some points on the Dutch coast the sand Ds. form the only protection for inland dists. against the sea, which is often at a higher level than the land. See H. Schirmer, *Le Sahara*, 1893; W. H. Wheeler, *The Sea Coast*, 1902; E. R. Matthews, *Coast Erosion and Protection*, 1934.

Dunedin, cap. of the dist. of Otago, is the fourth largest city in New Zealand, situated at the head of the Otago Harbour 15 m. from the sea. The harbour is accessible to vessels drawing 25 ft. right up to Dunedin, while Port Chalmers, 9 m. N.E. by rail, handles the shipping drawing over 25 ft. up to 30 ft. 6 in. Spread over seven hills, Dunedin has a beautiful setting, and has preserved much of the native forest in laying out the Town Belt and Public Gardens. Dunedin is often referred to as the 'Edinburgh of the South,' and is regarded as the most Scottish City outside Scotland. Scottish tradition is well preserved there. Dunedin is essentially an education centre, the Univ. of Otago catering for students of arts and science, medicine, law, dentistry, home science, physical education, commerce and mining. In addition there is a teachers' training college and many secondary schools and colleges (Public and Private). The city has a number of fine buildings, notably, the post office, tn. hall, First Church, Knox Church, Univ. of Otago, and the Otago Boys' High School. Local industry covers a wide field for in and around Dunedin are found woollen mills and clothing factories, engineering works, agric. implement makers, gas and electric range factories, soap works, lime and cement works, a rope and twine factory, printing works, iron foundries, paper mills, aerated water and cordials manufacturing plants, fertilisers and allied products manufacturers, boot and shoe works, the only iron rolling mills in the Dominion, the manuf. of wax matches, tanning and fellmongering, sawmilling, ink-making, production of hardware and woodware for building purposes, canning and preserving works, butter and cheese making, wax paper manuf., basket manufacturing, flour mills, and a linseed oil factory. Shipbuilding, one of the oldest industries, is now being revived, together with its associated trades, such as the overhauling and repairing of ships. 1948 marked Dunedin's centenary and many important events were held to celebrate the occasion. Pop. 88,800. (See illustration, p. 41.)

Dunedin and Stenton, Andrew Graham Murray, first Viscount and Baron (1849-1912), Scottish lawyer and statesman, b. at Edinburgh, Nov. 21. son of Thos. Graham Murray, of Stenton, Fordie, and Locholly, Perthshire, writer to the signet and sheriff of Aberdeen. Educated at Harrow and Trinity College, Cambridge. He was called to the Scottish Bar in 1874, sheriff of Perthshire, 1890-1; Solicitor-General for Scotland, 1891-2, 1895-6; Lord-Advocate of Scotland, 1896-1903; Secretary for Scotland, 1903-5; Lord Justice General and Lord President of the

Court of Session, Scotland, 1905-13. Since then lord of appeal in ordinary. Conservative M.P. for Ruteshire, 1891-1905; raised to the peerage in 1905; viscount, 1926. Appointed to War Compensation Royal Commission, Aug. 1915; Chairman, Royal Commission on Honours, Aug. 1922; Member of judicial committee of privy council on Irish boundary, July 1924. Resigned his office as a lord of appeal in 1932.

Dunfermline (Gaelic, the fort on the crooked linn), tn. 3 m. from firth of Forth

being called to the Scottish Bar in 1577. He became judge in 1593, Lord President of the Court of Session in 1598, Baron Fyvie in 1597, and chancellor in 1640-8. He was appointed guardian of Prince Charles, afterwards Charles I., and helped to arrange the union between England and Scotland. He was created earl of Dunfermline in 1606.

Dungannon, tn. of N. Ireland in the co. of Tyrone, 10 m. S.W. of Cookstown. It was the home of the O'Neills, kings of Ulster. There are manufs. of linen goods,

High Commissioner for New Zealand

DUNEDIN: THE OCTAGON, WITH ST. PAUL'S ANGLICAN CATHEDRAL AND THE TOWN HALL

and 16 m. N.W. of Edinburgh, in Fife-shire, Scotland. Since 1718 the tn. has been busily engaged in the linen industry, especially damasks, and it now has dye and bleach works, iron foundries and distilleries. The fine Norman nave, which is all that the Reformers spared in their assault on the abbey (1560), now forms the vestibule of the New Abbey Church. Malcolm Canmore and Margaret, who were married in D. (1079), were buried in the abbey, which for over two centuries afterwards was the recognised place of royal sepulture. St. Margaret, whose tomb may still be seen, Ralph Erskine, and Sir Noel Paton, are some of D.'s worthies, but of all her sons, her greatest benefactor was Andrew Carnegie, who presented the tn. with Pittencrieff Park and Glen, and a free library, besides an ann. income of £25,000. Pop. 40,000.

Dunfermline, Sir Alexander Seton, first Earl of (c. 1555-1622), Scottish statesman. He studied at the Jesuit College, Rome, but gave up this proposed admittance to the priesthood, and studied law in France,

earthenware firebricks, and tiles, also a trade in corn and flax. Pop. 4000.

Dungarpur, state of Rajputana, Central India, with a cap. of the same name. Area 1447 sq. m.; pop. 190,000. Cap. pop. 7500.

Dungarvan, urban dist. and seaport tn. of Eire, in co. Waterford. It is situated on the bay of D. There are fisheries and a trade in dairy and agric. produce. The legend runs that the tn. was spared by Cromwell because a woman drank his health at the gateway. Pop. 5200.

Dungeness: (1) Low headland on the S. coast of Kent, England, 10½ m. S.E. of Rye, with a lighthouse, coastguard station, and a small fort. Lloyd's signalling station is near. (2) Port at the entrance to the Hitchenbrook Channel, Cardwell co., Queensland, Australia, 60 m. N.W. of Townsville.

Dungeon, or Donjon (Lato Lat. *domnio*, from *dominus*, a lord), the prin. tower or the keep (*q.v.*) of a Norman castle. The modern use of the word 'dungeon' for a prison is derived from the position

of the Norman prison in the ground story of the 'donjon'.

Dungiven, mkt. tn. in the co. of Londonderry, N. Ireland. Near it are the remains of an Augustinian priory founded in 1100. The quartz crystals known as Dungiven diamonds are found near here. Pop. 700.

Dunglas, promontory on the R. Clyde, Scotland, 2½ m. E.S.E. of Dumbarton. It is a rocky headland, supposed to have been the site of a Rom. station, and the end of the wall of Antoninus. It has ruins of the castle of the Colquhouns of Iuss, and a monument to Henry Bell (1767-1830), the pioneer of steam navigation in Britain.

Dunholme, see under DUNHAM.

Dunkeld, tn. of Scotland, in the co. of Perthshire. It stands on the N. bank of the R. Tay, 15½ m. by rail from Perth. A bridge of seven arches (which was opened in 1808) here spans the riv. The tn. is said to have derived its name from a Culdee church, founded in 815 by Constantine, King of the Picts. Opposite D. is Little D., famed for its waterfalls. The cathedral, once the seat of the Scottish primates, contains a recumbent figure, in armour, of the Wolf of Badenoch. The most celebrated bishop was Gavin Douglas, translator of Virgil. The choir is still used as the par. church. Pop. 1000.

Dunkers, Dunkards, or Tunkers, also called 'Dippers,' and by themselves 'The Brethren,' a sect of Ger. Baptists founded in Germany in 1708 by Andrew Mack, of Swartzenau. Persecution began, and the Dunkers fled to Holland, and from thence between 1719 and 1729, emigrated to N. America, settling first in Pennsylvania round Philadelphia. They now number over 100,000, have many converts in Canada, and support missions in Europe, India, and Asia Minor. Their creed is strictly evangelical, and they enforce baptism by immersion, and only for adults. They resemble the Quakers in the plainness of their dress, in the avoidance of war and litigation, and in the refusal to take oaths. See also BROTHERS, CHURCH OF.

Dunkery Beacon, hill in Somersetshire, Eng., 1700 ft. high, the highest point on Exmoor. Owned by the National Trust.

Dunkirk (Fr. *Dunkerque*), fifth port of France, on the Straits of Dover, before the Second World War had communication with the whole world, but especially with Tilbury and Hull in England, Antwerp, Germany, the Atlantic and the Mediterranean, and by canals with the whole of E. France. It imported iron, wool, cotton, textiles, phosphates and nickel, and exported provisions and manuf. goods. It manufs. goods of hemp, jute, and iron, and refined petroleum. The pirates or privateers of Dunkirk preyed on Eng. commerce until in 1713 the treaty of Utrecht provided that the port should be filled up, and it remained so until 1783. It was in the possession of England from 1658 to 1662, when Charles II. sold it to Louis XIV. who fortified the harbour, making D. of great strategic importance. It was vainly besieged by the Eng. in 1793. Jean Bart was born here in 1651.

During the First World War, D. became a base for Brit. aircraft and seaplanes, mainly to deal with Ger. air raids over England. The base was estab. in 1914, and gradually expanded with the needs of the war. During the latter part of 1915 offensive raids against the Germans were made successfully by the D. station, the success of which led to its prompt development and expansion as a base. Working in close co-operation with the aircraft on the W. Front, it achieved notable successes, both in fighting and bombing. On May 23, 1917, a Ger. flying squadron raided S.E. England, and although the entire squadron escaped from England, one raider was brought down at sea by one of the D. station. Although it was one of their objectives, the Gers. never reached D., having been brought to a standstill at Nieuport, 20 m. to the E. The words 'ville héroïque sert d'exemple à toute la nation' were added to the arms of the tn. in 1917. The name of D. will go down in hist. for the successful evacuation in 1940 of the Brit. Army from its beaches. The Brit. forces, together with some allied contingents, began to withdraw to the Fr. coast on May 29. Some 220 or more Brit. naval vessels and more than 660 others, mostly small boats, took part in evacuating the troops. By June 3, the evacuation of over 337,000 Brit. and allied troops was completed for the loss of six destroyers and twenty-four minor war vessels, and about 1000 guns, together with all transport and vehicles. See under WESTERN FRONT IN SECOND WORLD WAR. D. was destroyed to the extent of ninety per cent. of its buildings, one of the sole remaining considerable buildings being the sub-prefecture where, on March 1, 1947, was signed by Mr. Ernest Bevin and M. Bidault, the Anglo-French Treaty of Alliance, to subsist for 50 years. Pop. (tn.), 10,500; (Arron.), 257,600. See under EUROPE.—*The Second World War* and *WESTERN FRONT IN SECOND WORLD WAR*. See E. K. Chatterton, *The Epic of Dunkirk*, 1940; J. Masefield, *The Nine Days Wonder*, 1941.

Dunkirk, city of Chautauque co., New York, U.S.A., on Lake Erie, and 48 m. S.W. of Buffalo by rail. It has a good harbour and lake traffic, and has railway repair works, and manufs. locomotives, motors, agric. implements and other iron goods. Pop. 17,700.

Dun Laoghaire, or Dunleary, see KINGS-TOWN.

Dunlin, Oxbird, or *Tringa Alpina*, species of Charadriidae which inhabits the N. parts of both the Old and the New World, and frequents flat coasts and tidal rivs. of Britain. The colours of this sandpiper are reddish black, white, and grey, and both bill and feet are black: in winter the plumage is grey and white. In habit it is gregarious.

Dunlop, par. of Ayrshire, Scotland, 8 m. N.N.W. of Kilmarnock, which gave its name to a popular cheese. Pop. 1490.

Dunlop, Frances Anne Wallace (1730-1815), friend and correspondent of Robert Burns, whose acquaintance she made as a result of her admiration for *The Cotter's*

Saturday Night, 1786. He wrote to her frequently, and was in the habit of enclosing poems in his letters, among those which he sent to her being *Auld Lang Syne*, and *Farewell, thou fair day*. He named his second son Francis Wallace after her. See W. Wallace (ed.) *Correspondence of Burns with Mrs. Dunlop*, 1898.

Dunlop, John Boyd (1840-1921), re-inventor of the pneumatic tyre, which was first patented by one Thompson in 1846. B. at Dregghorn, Ayrshire, Scotland. Went to Belfast 1867, and while working as a veterinary surgeon devised the Dunlop tyre, 1887. He sold out to Harvey du Cros in 1889, removed to Dublin in 1892 and kept a drapery estab. at Ball's Bridge, where he died.

Dunlop, John Colin (1785-1842), Scottish man of letters. He is noted for his *History of Fiction* (1814) which is still recognised as the best work on the subject. He also wrote *A History of Roman Literature* (1823-28) and *Memoirs of Spain during the Reigns of Philip IV. and Charles II.* (1834).

Dunlop Rubber Company. Received its present name in 1900, being previously registered in 1896 as Byrn Bros. India Rubber Co. Its authorised capital is £20,000,000. The company owns *inter alia* the cap. of 'Dunlop' manuf. companies in France, Japan and other countries, and of 'Dunlop' trading companies in most of the chief countries of the world. It also controls the Dunlop Tyre and Rubber Corporation, of New York, which was incorporated in 1919 as Dunlop (America) Ltd. This corporation has tyre manuf. plant in Buffalo and spinning mills in Utica, New York State. Sir Eric Geddes (1875-1937) was chairman until his death.

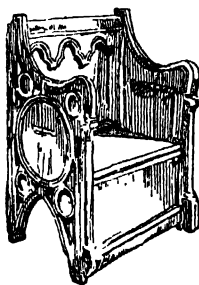

Dunluce, Earl of, see ANTRIM, MARQUESS OF.

Dunmanway, mkt. tn. of Eire, co. Cork, 30 m. W. thereof. It manufs. flannels, blankets, tweeds, and friezes, and has flax mills and tanneries. Pop. 1600.

Dunmore: (1) Vil. and watering place of Eire, on Waterford harbour, in co. Waterford, and 8½ m. S.E. of the city of that name. Pop. 500. (2) Small mkt. tn. in co. Galway, Eire, 7½ m. N.N.E. of Tuam. Pop. 600. (3) Banking post-bor. in Lackawanna co., Pennsylvania, U.S.A., on the Erie and Lackawanna railroads, adjoining Scranton. The tn. was incorporated in 1862. It is an important centre for anthracite coal, iron, and brick, and has flourishing silk industries. Pop. 23,000.

Dunmow: (1) *Great Dunmow*. Small mkt. tn. in Essex, Eng., on the R. Chelmer, 13 miles north of Chelmsford. It is thought to be the site of the Roman station of Caesarmagnus. The fine parish church, of thirteenth-fifteenth century dates, contains a curious gallery in the S. aisle. The tn. hall was built in 1578 and enlarged in 1855. There is a bacon factory. Pop. 2750. (2) *Little Dunmow*. 2 m. E. of Great Dunmow, owes its importance to a priory of Austin canons, founded 1106. The par. church

consists of the S. aisle of the chancel of the cruciform priory church, the foundations of which have been partially excavated. The Dunmow Flitch of Bacon was instituted in 1244 by Robert de Fitzwalter as a prize to any married couple who 'will go to the priory, and kneeling on two sharp pointed stones, will swear that they have not quarrelled nor repented of their marriage within a year and a day after its celebration.' The first recorded award was made in 1445, and successful claimants still continue to come forward, although the award was not made during

THE DUNMOW FLITCH CHAIR IN WHICH CLAIMANTS SAT

the Second World War. See W. Andrews, *History of the Dunmow Flitch*, 1877; J. W. Robertson-Scott, *The Strange Story of the Dunmow Flitch*, 1909. Pop. 320.

Dunmurry, vil., co. Antrim, N. Ireland, on the Glenwater, 1½ m. S. by W. of Belfast. It has linen manufs. Pop. 1500.

Dunn, James Nicol (1856-1919), Scottish journalist. Educated for the law, but gave up legal studies for journalism. Joined the staff of the *Dunder Advertiser* as a reporter, and later acted as special correspondent to the *Scotsman*. While with this paper he assisted in producing *Art and Literature and Pen and Pencil*. To him belongs the credit of bringing out such writers as George Stevens and W. E. Henley. In 1895 he was editor of *Black and White*, which periodical under his direction flourished considerably. His best days, however, were from 1897 to 1905, during which period he was editor of the *Morning Post*, in which capacity he enjoyed great popularity among the writers and artists of the London press.

Dunn, Samuel (d. 1794), Eng. mathematician. He wrote on astronomical subjects and is chiefly noted as the inventor of the 'universal planispheres or terrestrial and celestial globes in plano.' Author of *The New Atlas of the Mundane System* (1774) and *The Navigator's Guide to the Oriental or Indian Seas* (1775).

Dunnage, name given to the loose logs of wood that are placed between the cargo in the hold of a ship to keep it steady.

Dunne, Finley Peter (1867-1936), Amer. humorist, b. in Chicago. He became a newspaper reporter in 1885; city editor of the *Chicago Times*, 1891-2; joined the staff of the *Chicago Evening Post* and *Times Herald*, 1892-7; and was appointed editor of the *Chicago Journal*, 1897-1900. He is well known as the creator of 'Mr. Dooley,' the incomparable Irish-Amer. philosopher of Archey Road. The sayings of this character on social and political questions first appeared in the *Chicago Journal*, and were collected in 1898 under the title of *Mr. Dooley in Peace and in War*. This was followed by *Mr. Dooley in the Hearts of his Countrymen* (1898), *Mr. Dooley's Philosophy* (1900), *Mr. Dooley's Opinions* (1901), *Observations by Mr. Dooley* (1902), *Dissertations by Mr. Dooley* (1906), and *Mr. Dooley Says* (1910). See E. Ellis, *Mr. Dooley's America*, 1911.

Dunnet Head, most N. point on the mainland of Great Britain. It is a rocky peninsula in Caithness, Scotland, 346 ft. high, with a lighthouse on its summit, and the small fishing vil. of Dunnet on the S.W. of the bay.

Dunning, John, see ASHBURTON, BARON.

Dunnose, rocky headland on S.E. coast of the Isle of Wight, England.

Dunnville, farming vil. and port of entry in Haldimand co., Ontario, Canada; on the Grand R. and the Grand Trunk Railway, 40 m. S.S.E. of Hamilton. It is an important agric. dist. and the tn. has lumber interests. Pop. 3000.

Dunois, former ter. of France, in the prov. of Orléannais, comprising the present depts. of Eure-et-Loir, Loir-et-Cher, and Loiret.

Dunois, Jean, Comte de (c. 1403-68), Fr. soldier, commonly known as the 'Bastard of Orléans,' being the natural son of Louis, duke of Orléans (brother of Charles VI.) and Marie of Enghien. He fought at Beaugé (1421) and Verneuil (1424), and defeated the Eng. at Montargis (1427). He held Orléans till the arrival of Joan of Arc in 1428, and in the following year with her won the battle of Patay. He laid siege to Chartres and Lagny in 1432, and drove the Eng. from Paris in 1436, and from many cities in Guienne. He joined the league of revolted nobles in 1464, for which act Louis temporarily deprived him of his estates.

Dunolly, tn. of Gladstone co., Victoria, Australia, 30 m. W.N.W. of Castlemaine. Pop. 1000.

Dunoon, popular watering-place of Cowal, Argyllshire, Scotland, on the firth of Clyde, 7½ m. W. of Greenock. The ruins remain of a castle which was formerly the seat of the Stewarts. It was the site of hanging of thirty-six Lamonts by the Campbells in 1643. There is a monument to Robert Burns's Highland Mary, who was born in D. The tn. is pleasant and well built, with a steamboat pier and esplanade, and is the scene of the ann. Cowal highland games. Pop. 8700.

Dunraven and Mount Earl, Windham Thomas Wyndham-Quin, fourth Earl of (1841-1926), Eng. politician, b. at Adare

Abbey. In 1902 he was chairman of the Irish Land Conference, and became President of the Irish Reform Association. He strongly advocated the policy known as 'devolution,' which was denounced by the gov., with the result that the chief secretary of Ireland, Mr. Wyndham, resigned from office in 1905. Lord D. was a keen yachtsman, and twice tried, without success, for the America Cup, in 1893 and 1895. His pubs. include: *The Great Divide: Travels in the Upper Yellowstone in the Summer of 1874* (1876), *The Irish Question* (1880), *Self-Instruction in the Theory and Practice of Navigation* (1900), *The Legacy of Past Years* (1911), *The Crisis in Ireland: Federal Union through Devolution* (1920) and *Past Times and Pastimes* (1922).

Dunrossness, peninsula in the S. of Shetland mainland, Scotland, which terminates in Sumburgh Head. The par. includes part of Pomona and Fair Is. Picts Castle is a cylindrical structure or broch 153 ft. in circumference at the base and 40 ft. high. Pop. 3000.

Duns, or **Dunse**, police bor. of Berwickshire, Scotland, 30 m. W. of Berwick-on-Tweed. It has a corn exchange and a tn. hall. Duns Scotus and Thomas Boston were natives. In 1699 Gen. Leslie, with his army of Covenanters, encamped on Duns Law, a high mound rising some 700 ft. Pop. 1700.

Dunsany, Edward John Moreton Drax Plunkett, eighteenth Baron, Irish playwright; b. July 24, 1878; eldest son of seventeenth baron. Educated at Eton and Royal Military College, Sandhurst. Formerly Lieut., Coldstream Guards; Captain, Royal Inniskilling Fusiliers. Succeeded to barony, 1899. Fought in the S. African War 1899-1900, at Battles of Belmont, Graspan, Modder R., and Magersfontein; and in the 1914-18 War. Unsuccessfully contested W. Wilts. as a Conservative, Jan. 1906. In 1909 his first play, *The Glittering Gate*, was produced at the Abbey Theatre, Dublin. The play shows a dead burglar and a dead murderer, before the gate of heaven which they have to force open to gain admission to find nothing inside. In 1911 came *King Argimenes and the Unknown Warrior*; also—probably his best play—*The Gods of the Mountain*, in which a company of beggars, with an artful genius to lead them, impose themselves upon a city as gods—with the result they are punished by becoming real green-jade gods, pure and immovable. Other plays of his are: *The Golden Doom* (1912), *A Night at an Inn* (1916), *The Tents of the Arabs* (1920), *The Laughter of the Gods* (1919), *If* (1921), *Alexander*, and *Three Small Plays* (1925), *Mr. Faithful* (1927), *The Old Folk of the Centuries* (1930), *Lord Adrian* (1933), *Plays for Earth and Air* (1937). These plays are intellectual dreams. They deal in mythology; but it is a mythology of the author's own. He has also pub. some vols. of tales notably those of the adventures of 'Mr. Jorkens.' Also writes novels, one of his best being *The Wise Woman* (1933). See D.'s autobiography, *Patches of Sunlight* (1938).

Dunscore, vil. of Scotland, in co. Dumfries, 10 m. N.W. of the tn. of that name. It is chiefly noted for the fact that Burns once lived there. Pop. 1600.

Dunstman, one of the Sidlaw Hills in Perthshire, Scotland. It has an elevation of 1012 ft., and is situated 8½ m. N.E. of Perth. On its summit are the remains of 'Macbeth's Castle,' where Siward, Earl of Northumbria, is supposed to have defeated Macbeth in 1054. See Shakespeare's *Macbeth*, IV. i. 92.

Dunsink, hill 4 m. N.W. of Dublin, on which is the observatory of Trinity College.

Duns Scotus, Johannes (1265 or 1274-1308), medieval philosopher. His birth-place is uncertain, Duns in Berwickshire, Dunstan in Northumberland, and Dunum (Down) in N. Ireland, all claiming that honour. It is supposed that he became a Franciscan and studied and lectured (about 1301) at Oxford. In 1304 he moved to Paris, and three years later the doctor's degree was conferred upon him by the univ., and he was appointed regent of the theological school. In 1308 he was despatched to Cologne to found a univ. and d. there a few months after his arrival. D. S. acquired the title 'Doctor Subtilis' on account of his dialectical ingenuity and wit. In philosophy he revived nominalism in a mitigated form and denied the real distinction between essence and existence. In theology he strongly upheld the doctrine of the Immaculate Conception, which was opposed by the Dominicans, called Thomists, because they were followers of Thomas Aquinas. Scotus also preached that no one could attain to a pure knowledge of theology by reason alone, that revelation must give part of that knowledge. During the Revival of Learning, the Scotists, we are told, 'raged in every pulpit,' and thus 'Dunsinon' gave the word 'dunce,' meaning a dullard, or ignoramus. Scotus wrote commentaries on the Bible and on Aristotle, and the *Sentences* of Peter Lombard, called *Opus Oxoniense*, or *Inlincanum*. A complete ed. of his works was pub. in thirteen vols. by Luke Wadding in Lyons, 1639; reprinted (Paris), 1891-5. See W. J. Townsend, *The Great Schoolmen*, 1881; R. Seeberg, *Die Theologie des Duns Scotus*, 1900; E. Longpré, *La Philosophie du Duns Scotus*, 1921; C. R. S. Harris, *Duns Scotus* (with bibliography) 1927.

Dunstable, tn. 36½ m. N.W. of London, in the S. of Bedfordshire. It is connected by branches with two main railway lines. Since the eighteenth century it has been chiefly engaged in the manuf. of straw hats and now has also considerable printing works, and manufs. of sparking plugs. D. is linked with hist., because its Augustinian priory, founded by Henry I. in the early twelfth century, was the scene of the first miracle play performed in England; because Cranmer here annulled Catherine of Aragon's marriage (1533), and because until 1643 it possessed an Eleanor Cross. The church of St. Peter and St. Paul is a remnant of the old priory. On the nearby D. Downs is the London Zoological Society's Whipsnade zoo, and the head-

quarters of the London Gliding Club. Pop. 8900.

Dunstaffnage, ruined castle in Argyllshire, Scotland, on Loch Etive, 24 m. N.E. of Oban. According to tradition it was the royal seat of the Dalriadan kings. It was captured by Robert the Bruce in 1308, and became the stronghold of the Campbells and Macdonalds. It formed an Eng. military station during the risings of 1715 and 1745, and for a while the prison of Flora Macdonald in 1746. In 1910 the duke of Argyll disputed the ownership, but the case was decided in favour of A. J. Campbell, hereditary captain of D.

Dunstan, Saint (c. 925-988), Eng. archbishop and statesman, b. at or near Glastonbury, in Somersetshire of noble parents. After receiving a careful education, he was taken by his uncle, Aldhelm, to Athelstan's court. He did not remain here, however, but retired to a hermitage near Glastonbury, where he devoted himself to a life of prayer and austerity. In 940, on the accession of Edmund, D. was called from his retirement and made Abbot of Glastonbury, and he rebuilt and restored the abbey. The next king, Edred, gave D. almost unlimited power, and the prelate used this to introduce the Benedictine order into England and strictly enforce ecclesiastical discipline. For a time D. lost his influence, but it was soon regained, and in 959 he was made archbishop of Canterbury. He maintained almost absolute power during the reigns of Edgar and Edmund, but his credit and influence declined after the murder of the latter prince. He retired to Canterbury, where he died.

Dunstanburgh Castle is situated on the Northumbrian coast, England, 8 m. N.E. of Alnwick. The cliffs are basaltic in structure, and the quartz crystals found in the neighbourhood are called Dunstanburgh diamonds.

Dunster, picturesque mkt. tn. in Somersetshire, England, 23 m. N.W. of Taunton. Has an ancient castle and a quaint wooden yarn mkt. Pop. 850.

Dunsterville, Major-General L. C. (1865-1946), Brit. soldier, who entered the Royal Sussex Regiment in 1884, reaching rank of Major-Gen. in 1918. He transferred to the Indian Staff Corps in 1887, and held various important staff appointments. Served in the Waziristan 1894-1895, N.W. Frontier (India) 1897-8, China 1900, and Great War campaigns. Commanded Dunster Force, expedition to Baku, which was detached from Mesopotamian Expeditionary Force from Jan. to Sept. 1918. D. was Kipling's original of 'Stalky.' He wrote *Adventures of Dunster Force* (1920), *Stalky's Reminiscences* (1928), *More Farns* (1931), and *Stalky Settles Down* (1933).

Duntocher, tn., Scotland, co. Dunbarton, 8 m. N.W. of Glasgow. Manufs. farm tools. Pop. 3000.

Dunton, John (1650-1733), Eng. bookseller, b. at Graffham, W. Sussex, who had a business at the Sign of the Raven, near the Royal Exchange, London. He pub. a number of political pamphlets and satires

on the Whig side, and an interesting autobiography, *The Life and Errors of John Duntun* (1705), ed. with a memoir by J. Nichols (1818).

Dunwich, par. and vil. of England in E. Suffolk. It is situated on the coast $4\frac{1}{2}$ m. S.W. of Southwold. It is now merely a small watering-place, owing to the disastrous action of the sea, which has been undermining the tn. since the fourteenth century. It is, however, historically interesting. King Sigebert built there a palace for himself and a church for Bishop Felix. It was formerly the cap. of E. Anglia and from 673 to 870 the head of a bishop's see. In the reign of Edward III. the sea destroyed 100 houses. It sent two members to Parliament from 1296 to 1832. The corporation was not abolished until 1886, although the pop. was only 189 in 1920. There was a monastery at D. until the sea swallowed it up. Pop. 150.

Duodecimals, system of arithmetical notation where the local value of a digit increases by powers of 12 as it moves to the left, instead of by powers of 10 as in the ordinary or decimal notation. Two extra symbols are required, one to denote 10 and one to denote 11. The advantage of such a system, if universally adopted, arises from the fact that 12 splits up into the small factors 2, 2, 3. This method of notation was used by the Babylonians and other auct. peoples, and remains today in measures of quantity, i.e. dozen (12), gross (12 \times 12 = 144); in the divs. of the clock; Eng. currency (12d. = 1s.), etc. *D. arithmetic*, as practised by surveyors, is a system by which the calculation of square measure and cubic measure is reduced to operations in the powers of 12. The table for square measure is 12 sq. in. = 1 superficial prime; 12 superficial primes = 1 sq. ft. That for cubic measures is 12 cub. in. = 1 solid second; 12 solid seconds = 1 solid prime; 12 solid primes = 1 cub. ft.

Duodenal Ulcer, see under ULCER.

Duodenum, see under DIGESTION and INTESTINES.

Dupanloup, Félix Antoine Philibert (1802-78), Bishop of Orleans, born at St. Félix, near Chambéry in Savoy. Ordained a priest in 1825, he became a vicar of the Madeleine, Paris, and for a time tutor to the Orleans princes. Later he founded the famous academy at St. Hyacinthe. In 1819 he was appointed Bishop of Orleans. His educational doctrines had a far-reaching influence, and he wrote many books on the subject to propagate his theories. Among these are: *Méthode générale du catéchisme* (1811); *De l'Éducation* (1850); *De la Haute Éducation intellectuelle* (1855); and *L'Enfant* (1869). D. was a leader of the moderate Catholics, and his writings on eccles. and religious subjects include *La Souveraineté pontificale* (1860), *Le Mariage chrétien* (1869), and *Histoire de Notre Seigneur Jésus Christ* (1870). The *Journal intime de Mgr. Dupanloup* was ed. by Branchereau in 1902. See lives by F. Lagrange (Eng. trans. by Lady Herbert, 1885), E. Faguet, 1914. **Duparc (Marie Eugène), Henri (Fouques)** (1848-1933), Fr. composer, b. at Paris.

He was educated by the Jesuits at the Collège de Vaugirard, where he learned pianoforte from César Franck, and afterwards took private lessons in composition from the same master. His few works include a symphonic poem, *Lenore*, and a nocturne *Aux Étoiles*, but he is chiefly remembered for fifteen songs, among them 'Soupir' and 'Chanson Triste.' He was a fierce critic of his own work and destroyed sev. songs, and the music he wrote for Pushkin's *Rusalka*. He retired to Switzerland, suffering from neurasthenia, and died almost fifty years after his last pub. composition.

Duperrey, Louis Isidore (1786-1865), Fr. navigator, b. in Paris. He accompanied Freycinet on his voyage of exploration in the N. Pacific (1817-20), and on his return to France he was given the command of the *Cockle*. In 1822-25 he explored parts of Australia and New Guinea, and on his return pub. *Voyage autour du Monde* (1826-30).

Dupin, André Marie Jean Jacques (1783-1865), known as the Elder (in reference to his brother, Charles (1784-1873), engineer and economist), Fr. statesman and advocate born at Varzy in Nièvre. In 1811 appointed to serve on the commission charged with codification of the laws of the empire, and in 1815 he sat for a few months in the Chamber of Deputies on the side of the Liberal Opposition. He was president of the Chamber eight times between the years 1832 and 1848, resigning in 1848 on failing to secure the crown for the young count of Paris. The emperor restored him to his former office in 1857. D.'s writings are numerous and include: *Principia Juris Civitatis* (1806), *Mémoires et plaidoyers de 1860 au 1^{er} janvier* (1830), and *Mémoires ou souvenirs du Barreau* (1855-57). See J. Ortolan, *Notice sur Dupin*, 1840.

Duplex, Joseph François, Marquis de (1697-1763), governor-gen. of Fr. India, b. at Landrecies, Nord, France. In 1715 he went to India in the service of the Fr. E. India Company and in 1720 was elected a member of the council at Pondichéry. In 1742 he was appointed governor-gen. of Fr. India. When war broke out between France and England in 1744, D. strove to obtain the ascendancy of France in India by making overtures to the native princes. He laid siege to Fort St. David (1747), and spread his troops over the Carnatic. He attempted the subjugation of the S. of India, and at one time was proclaimed its viceroy by the natives. His plans were, however, defeated by Clive, until he was summarily recalled by the Fr. gov. in 1754, and was never rewarded for the undoubted services he rendered to his country. See Thibault Hamont, *Duplex, d'après sa correspondance inédite*, 1881; H. Castelnau, *Duplex, ses expéditions et ses projets*, 1888; G. B. Mallison, *Duplex (in the Rulers of India series)*, 1890; and the lives by E. Guérin, 1908, and J. Bid-dulph, 1911.

Duplex Querela (Lat., twofold complaint), process in eccles. causes, consisting of an appeal from an authority to one

above it, as from a bishop to an archbishop, and from an archbishop to the crown in council.

Duplicate Ratio, the proportion or ratio which the squares of any numbers bear in relation to that of the radical quantities. If any number of quantities be continued proportionals, the ratio of the first to the third will be a duplicate ratio of that of the first and second.

Dupniza, tn. of Bulgaria, 22 m. S. of Sofia. It grows tobacco and is noted for its springs. Pop. 15,000.

Dupont de Nemours, Pierre Samuel (1739-1817), Fr. economist and statesman, b. at Paris, negotiated with the Eng. commissioner the recognition of the independence of the U.S.A. Went to U.S.A. in 1799, where he was employed by Jefferson. His family settled in U.S.A., where they estab. themselves at Powder Mill in Delaware, in the production of gun-powder. The business grew, and by 1803 the descendants of D. de N. controlled 100 companies; in 1915 *E. I. Du Pont de Nemours & Co.* was founded in Delaware and became a leading Amer. chemical firm with many and varied interests, among them the production of nylon artificial silk.

Dupont, Pierre (1821-70), Fr. poet, b. at Lyons, son of a blacksmith, but being left an orphan at the age of five, he was brought up by a village priest. In 1839 he went to Paris, and three years later a song of his received a prize from the Academy. His best-known songs are: *La Chanson de blé*, *La Vache blanche* and *Le Braconnier*. They were collected under *Chants et chansons* (1852-54) and *Chants et poésies* (7th ed. 1862). See *Déchant, Biographie de Pierre Dupont*, 1871, and C. Lenient, *Poésie patriotique en France*, 1889.

Düppel, or **Dybol**, vil. of Sleswig, Denmark, on the peninsula of Sundewitt, 15 m. N.E. of Flensburg. It was the site of a struggle between the Danes and Gers. in 1848-49, and was bombarded by the Prussians in 1864.

Dupré, Giovanni (1817-1869), Tuscan sculptor, of humble Fr. origin, b. at Siena. As a boy he was put to hard manual toil, but was early fortunate in obtaining the help of the Rom. priesthood, who gave him the means of studying sculpture. Some busts of cardinals shown in Rome made a sensation. These were followed by the figures of 'Abel and Cain,' a work which was shown at the Paris Salon in 1855. Among his best works were the 'Triumph of the Cross'; a superb figure of 'Cain'; 'Pietà'; and the bust of Mme. Dora D'Istria. He died in poverty. See life by H. S. Fricze, 1888.

Dupré, Jules (1811-89), Fr. painter, b. at Nantes. He was the son of a porcelain manuf., and worked first in his father's, and later in his uncle's china factory. D. belonged to the romantic school of landscape painters, and painted nature best in her tempestuous moods. On his visit to England in 1831 he learnt much from Constable's pictures. D.'s best-known works are: 'The Forest of Fontainebleau,' 'Morning and Evening.'

His 'Crossing the Bridge' is in the Wallace Collection, London. See life by J. Claretie, 1879.

Dupré, Marcel (b. 1886), Fr. organ-virtuoso and composer, and one of the greatest improvisators. Organist at Notre-Dame, Paris.

Dupuy de Lôme, Stanislas Charles Henri Laurent (1816-85), Fr. naval architect, b. at Plœmeur, near L'Orient. He studied at the Ecole Polytechnique and in England. He designed the first Fr. war steamer, the *Napoléon* (1848-52), and invented methods of changing sailing men-of-war into steamers. During the siege of Paris he planned a steering balloon, but the siege was over before it was put to any use. He was appointed Inspecteur-Général du Matériel de la Marine in 1866, was elected a member of the Academy of Sciences in 1866, and a senator for life in 1877.

Dupuytren, Guillaume, Baron (1777-1835), Fr. surgeon, b. at Pierre-Builière, Haute Vienne, struggled with poverty until, in 1801, he received a coveted anatomical appointment in Paris. His connection with the Hôtel-Dieu dates from 1808, and in 1815 he became chief surgeon. He was an indefatigable student, especially of morbid anatomy, enjoyed a high reputation for the skill with which he performed a number of difficult operations, and throughout his life lectured to crowded halls of students. Among his best known works the *Traité sur l'Artificial Anus* (1828) is one of many.

Duquesne, banking post-bor. of Allegheny co., Pennsylvania, U.S.A., 10 m. S.E. of Pittsburgh, on the Monongahela R., and on the Pennsylvania Railroad. It has steel works and blast. furnaces. Pop. 20,600.

Duquesne, Abraham, Marquis (1610-1688), Fr. admiral, b. at Dieppe. He first joined the merchant service, and took part in the defeat of the Spaniards at the capture of the Lerins Is. (1637). He also fought at Guetaria (1638), Coruña (1639), Tarragona (1641), and Barcelona (1643). In 1676 he defeated the combined fleets of Spain and Holland off Stromboli, for which victory he was made a marquis by Louis XIV. He also bombarded Algiers (1682-83) and Genoa (1681), and did much service to his country by reorganising the Fr. fleet. See A. Jal, *Abraham Duquesne et la Marine de son Temps*, 1873.

Duquesne, Fort, Fr. fort and trading-post built in 1754 on the site where Pittsburgh now stands. The Brit. expedition against it under Braddock was repulsed in 1755, but in 1758 Gen. Forbes captured it from the Fr., and in the following year began the building of Pittsburgh and Fort Pitt, in honour of William Pitt, then Prime Minister of England.

Duquesnoy, François (1549-1646), a Flemish sculptor, commonly known as François Flaminio or (lt.), Il Flaminio. He chiefly excelled in modelling children. He executed groups of children for the high altar at St. Peter's, Rome; a 'Concert of Cherubim' in the church of the

Holy Apostles, Naples; 'St. Susanna,' in the Loretto church at Rome; and 'St. Andrew,' in the basilica of St. Peter's. D. died at Livorno and it was supposed that he had been poisoned by his brother.

Duralumin, alloy of aluminium (94 per cent), containing also copper, manganese, magnesium and silicon. It was invented in 1906 by Wilson, and for many years was the strongest of light aluminium alloys, having the then peculiar property of hardening spontaneously after a special heating process. But since then (c. 1925) various other alloys having similar properties have been developed. In its strongest state D. is as good as mild steel, but not so ductile and only one-third of its weight. Resists atmospheric corrosion but requires protection against sea water.

Duramen, in botany, is the heartwood, or older internal portion of the secondary wood, as distinguished from the outer sap-wood (*alburnum*).

Durance, riv. of France, which rises near Mont Genève. Its course is chiefly S.W. until it reaches Pertuis, when it turns N.W. It passes through Hautes-Alpes and Basses-Alpes. About 3 m. S.W. of Avignon it joins the Rhone. Its total length is 218 m., and the chief tributaries are the Buech and Verdon.

Durand, Charles Auguste Emile, see CAROLUS-DURAN.

Durango, (1) mountainous state of Mexico, 42,272 sq. m. in area, with a pop. of 483,800. The rugged peaks of the Sierra Madre cross the W. where grizzly bears, wolves, deer and wild turkeys are found. Cotton is indigenous; Columbus saw Indians clothed with it in 1502. The Toltecs believed that the god of the air had taught them its use, and it is still one of the great staples of D. Corn, tobacco, fruits, and sugar cane are also produced, and cattle-breeding is carried on. The iron mt. is almost the only one known, and is nearly 1 m. in length. There are also rich gold, silver and copper mines. (2) Cap. of the state 6207 ft. above sea-level, has an almost matchless climate, and the region round it is an open-air sanatorium. The cathedral is 250 ft. long by 153 ft. high. The cotton mills are important. Men and women promenade in the evening separately, going in opposite directions. There is a Bull Ring, as in other Mexican tns. Pop. 33,000. (3) Tn. in the Basque Provs., Spain. Pop. 3500.

Durānis, or **Durrānis**, the dominant race of Afghans, comprising the Zirk and the Panjpal. They inhabit the N. slopes of the Safed Koh.

Durant, banking post-tn. in Bryan co., Oklahoma, U.S.A., 19 m. N.E. of Denison. It is an agric. centre, and has cotton and cotton-seed oil industries. The tn. received a charter in 1904. Pop. 10,000.

Durante, Ser, poet of Tuscany who flourished in the early part of the thirteenth century and made an adaptation of the *Roman de la Rose*. See G. Massatinti, *Inventario dei MSS. Italiani delle Biblioteche di Francia* (vol. III.), 1888.

Durazno, name of a dept. and city of Uruguay, S. America. Vast numbers of sheep are pastured in the dist. The tn.

is on the main line from Montevideo to Rivera, and is situated on the Y1 R. Area of the dept. 5525 sq. m. Pop. 95,100; (tn.) 13,500.

Durazzo, or **Durrës** (anct. **Epidamnus** and **Dyrrachium**), port on the bay of Durazzo, some 49 m. S. of Scutari (Shkodër), in Albania. Epidamnus was founded in the seventh century by settlers from Corinth and Corevra. The Romans, who seized it early in the fourth century B.C., preferred to call the place Dyrrachium. It was a favourite harbour at which to embark Roman troops sailing eastward, and it was here that Pompey gained a short-lived triumph over Caesar, before his defeat at Philippi (48 B.C.). It was destroyed by an earthquake in 345 A.D., and was besieged and taken in 481, 1082 and 1185. Belonged to Venice from 1392-1501, and then to the Turks. It was the cap. of Albania during the 1914-18 War. A sand bar blocks the harbour, though olive oil and grain are still exported. From it the retreating Serbs were shipped to safety in 1915 by Fr. vessels. Pop. 9000.

Durban, port and largest city of the prov. of Natal, S. Africa. It lies on a landlocked tidal bay and a magnificent harbour, the only one of any importance between Delagoa Bay and E. London. The inner basin covers about 7 sq. m. with 3 m. of quays, and a flying boat station. It is the clearing-house for all the coast products, such as sugar, tea, coffee and fibre. It exports the coal of Natal, and has a whaling industry. D. has become a sea-side resort, and many thousand visitors live there during the winter, when the climate resembles that of the S. of France. The tn. and suburbs are very beautiful, especially that on the Berea, a range of hills with fine views, on which there are four public parks. Fruit is very plentiful, including the orange, mango, pineapple, guava, shaddock, etc. There are an art gallery, a museum, a handsome tn. hall, etc., erected at a cost of £352,000, new law courts, a Market House which cost £57,000, and botanic gardens. The Victoria Embankment along the Bay side has a memorial to Vasco da Gama, who is reputed to have passed what is now D. on Christmas Day, 1497, naming it Natal after the natal day of Christ; evidence, however, points to the fact that it was Pongoland which da Gama discovered. The city owes its foundation to Lieut. Francis Farewell who, impressed by the possibilities of the harbour, hoisted the Union Jack at Port Natal in 1824, obtaining a cession of land from King Chaka of the Zulus. The community was named D. in 1835, after Sir Benjamin D'Urban, then governor of the Cape. Salisbury Is., in Durban Bay, was converted into a naval base during the Second World War at a cost of some £2,000,000. The base grew out of a former mangrove swamp. A railway and road causeway linking the is. to the Bluff were also constructed. The base is commodious enough to take any type of ship in the Royal Navy. Pop. 338,800 of whom 117,200 are Europeans, and 221,600 are coloured.

See C. Russell, *Old Durban*, 1899; H. C. MacKerant, *Cradle Days in Natal*, 1930; A. F. Hattersley, *Portrait of a Colony*, 1940.

Durbar (from Persian *darbar*, meaning 'court' or 'audience'), the executive council of a native province of India and formerly used in this sense by Indian chieftains, who discussed state administration and other business in it. To-day the word is most commonly applied to such ceremonial gatherings or festivals as Lord Lytton held at Delhi in 1877, for the purpose of proclaiming Queen Victoria Empress of India. Delhi was the scene of similar state functions in 1903 and 1912, when Edward VII. and George V. were proclaimed emperor.

Düren, industrial tn. on the Roer, 18½ m. E. of Aachen, in Rhineland, Germany. It is a railway centre. Its Gothic church, the Annakirche, of the thirteenth to fourteenth century, the Gewandhaus of 1450, Kornhaus of 1588, and a museum suffered damage or destruction in bombing and the battles of 1945. It was noted for manufs. of metal goods, chemicals, glass and paper. In the early months of 1915 D. became the centre of most bitter fighting for the Roer riv. and suffered much destruction. The Amers. occupied half the tn. on Feb. 24, 1945, and the remainder a few days later. See WESTERN FRONT IN SECOND WORLD WAR. Pop. 40,000.

Dürer, Albrecht (Albert) (1471-1528), famous Ger. painter and engraver, son of a goldsmith. Founder of the Ger. school of painting, he was also considered the inventor of the art of etching and of printing woodcuts in two colours. His copper-plate engravings are especially famous, and he ranks higher as a designer of woodcuts than as a painter. In 1486 he became a pupil of the great painter Michael Wöhlgenuth. From 1490-94 he went on a tour probably through Ger., visiting Strasburg, Colmar, Basle, and Venice, where Mantegna's works impressed him greatly. On his return he married Agnes Frey, but their union is thought to have been an unhappy one. For a time he probably worked in Wöhlgenuth's studio, but by 1497 had one of his own. D. went to Venice, 1505-7, where he painted 'The Martyrdom of St. Bartholomew.' In 1512 he became court painter to Maximilian I., and painted for him 'The Virgin with many Angels.' He was deputy for Nuremberg at the Augsburg Diet, 1518, and painted Maximilian's portrait there. In 1521-2 D. and his wife visited the Netherlands and won the patronage of Charles V. He favoured the doctrines of the Reformation and was a disciple of Luther. The mural decorations of Nuremberg city hall—'The Calumny of Apelles' and 'The Triumph of Maximilian'—were designed by D. Among his most famous engravings are: 'Adam and Eve' (1504), 'The Nativity', 'The Great Horse' and 'The Little Horse' (1505), 'Melancholia' and 'St. Jerome in his Study' (1514), 'The Knight, Death, and the Devil' (1513), 'The Prodigal Son' (1503). Noted woodcuts are: 'The Apocalypse' (sixteen subjects, including

the Revelation of St. John, 1498), 'The Greater Passion' (twelve subjects), 'The Lesser Passion' (thirty-seven subjects). Among his best pictures are: 'The Feast of the Rosary' (1506, now in Strahow monastery, near Prague), 'Martyrdom of the 10,000 Christians' (1508, Vienna Gallery), 'Adoration of the Magi' (1504, Uffizi, Florence), 'Adam and Eve' (Florence), 'Adoration of the Trinity' (1511, Imperial Gallery, Vienna), 'The Four Apostles' (1526, Munich Gallery), 'Crucifixion' (1511). Among his portraits are those of Raphael, Melanchthon,

W. F. Mansel

ALBRECHT DÜRER

A self portrait at the age of 26

Erasmus, and himself. The series of engravings known as 'The Passion in Copper,' was done between 1508 and 1513. All D.'s work is marked by exuberant imagination, sublimity, and correctness of design, but some critics lament the lack of it, training. D. wrote on geometry and perspective, on mensuration (1525), on fortification (1527); *Vier Bücher über die Proportion* appearing in 1528. See Lady E. Eastlake, *Five Great Painters*, 1883; G. L. Schefer, *The Artist's Married Life*, 1818; D. Bueckhardt, *Dürers Aufenthalt in Basel*, 1892; M. Zucker, *Albrecht Dürer*, 1900.

Duress (from Lat. *duritia*, harshness), a legal term for 'constraint.' It is open to a defendant to advance a plea of D. if he has been driven by menace (*per minas*) of death or bodily harm to commit some act which would normally constitute a crime or misdemeanour. The constraint may also consist of imprisonment.

D'Urfev, Thomas (1653-1723), poet and dramatist, perhaps better known as 'Tom Durfev,' was a writer from childhood. At the age of twenty-three he witnessed the

production at the King's Theatre of his first play, *The Siege of Memphis* (1676), a tragedy that was not a success. He was happier in attracting favour with the many comedies that followed his first effort. He wrote a great number of popular songs. He also issued: *Tales Tragical and Comical* (1701), *Stories Moral and Comical* (1707), as well as other works. A noted wit, his presence was sought in society, and among his admirers was Charles II. See G. Daniel, *Love's Last Labour Not Lost*, 1863; S. Baring Gould, *Devonshire Characters and Strange Events*, 1908.

Durga, see Devi.

Durham, John George Lambton, Earl of (1792-1840), eldest son of W. H. Lambton of Lambton Castle, and M.P. for Durham, Eng. statesman, educated at Eton, and afterwards served in the 10th Hussars. At the early age of twenty, he married Miss Harriet Cholmondeley, by whom he had three daughters. After the death of his wife in 1815, he married in the following year Lady Louisa Elizabeth, a daughter of Earl Grey. In 1828 he was raised to the peerage, taking the title of Baron D. In 1830 he became a member of the cabinet as Lord Privy Seal. The liberality and ultimate success of the Reform Bill are said to be chiefly due to him. He went to Russia in 1835 as ambassador, and remained there two years, after which he was sent to Canada as Governor-General, 1838. His immediate task was to inquire into the causes of unrest in the provinces but though he successfully quelled all discontent, he remained in Canada only five months, resigning owing to criticism in England of his lenience towards the ringleaders of the rebellion in Lower Canada. But his famous Report issued in 1839, led to the Union of Upper and Lower Canada and the institution of a common Legislative Assembly responsible to the Executive Council. See DURHAM REPORT.

Durham, maritime co., with an area of 637,672 ac. in the N.E. of Eng., bounded on the N. by Northumberland, on the E. by the North Sea, on the S. by Yorkshire and westward by Westmorland and Cumberland. To the W. of a line drawn from Barnard Castle to Consett are highlands belonging to the Pennine Range, which rise to 2300 ft.; this dist. is mostly barren moorland. Loamy soil lies about the prin. rivs., the Tyne, Tees, and Wear. About a half of the co. is given over to pasturage, but oats and barley are grown. Sunderland (pop. 185,800) is the port for a valuable coalfield, and is the largest shipbuilding tn. in the Brit. Empire. There is also a large shipbuilding trade in Stockton-on-Tees (87,700) and West Hartlepool (68,100). The lead mines of Teesdale and the limestone quarries are a source of wealth. There are numerous iron foundries and glass, earthenware, and chemical works. Pop. 1,478,506.

Durham, co. tn. of Durham, England, lies 12 m. S. of Newcastle. Both the cathedral and the castle are magnificently situated on a tall rocky peninsula almost encircled by the R. Wear. In the year

995, Bishop Aldhun and his community of monks brought the incorrupt body of St. Cuthbert hither from Chester-le-Street, guided, so legend relates, by a girl looking for her lost dun cow. The site was then called Dunholme (Hill Island). Durham stood on the main line of Scottish invasions E. of the Pennines and so the community of St. Cuthbert was deliberately developed into a powerful buffer between Scots and Eng. The bishops became important secular rulers, holding sway over a 'county palatine' and having many royal privileges. They had their own

W. F. Mansell

THE NAVE OF DURHAM CATHEDRAL.

army which they often led in person. They also had their own courts, councils and judges of which traces remain in the Durham Court of Chancery and the Hall-mote Court. The bishop's palatinate powers were reduced progressively to the time of Wm. van Mildert (1826-36) who is reckoned the last of the 'prince bishops.' The cathedral as it now stands was begun in 1092 by Bishop Wm. of St. Calais. It is a stately pile with its massive Norman nave, its late Norman Giffard chapel, its Early Eng. Chapel of the Nine Altars and its Perpendicular tower. It housed a Benedictine monastery in its precincts until 1540. Of the monastic buildings remaining, the most interesting is the dormitory, one of the stateliest rooms in the country, built about 1400 and with the original oak roof still intact. This room is now used as a library and museum and contains various anct. MSS., the famous Conyers falchion, fragments of A.-S. crosses and other objects of interest. Leading from it is the 'loft', in which are kept the Cuthbert relics, fragments of the coffin made for the Saint in 698, his own portable altar and pectoral cross and the

oldest needlework in England, in the shape of the stole and manipie presented to St. Cuthbert's shrine by King Athelstan in 934. The cathedral occupies the S. side of Palace (or Place) Green. This green, like the Castle and most of the other buildings round it, now belongs to the univ. The building nearest the Castle gate, now part of the univ. library, was once the Exchequer built by Bishop Neville in 1450. Next door is the library built by Bishop Cosin in 1669 for the use of the diocesan clergy. On the opposite side are the seventeenth-century almshouses, now univ. lecture-rooms, also Cosin's work. The most remarkable features of the castle are the Norman chapel, dating back to 1072, the Norman gallery and doorway, the Great Hall dating back to 1072, the Norman gallery and doorway, the Great Hall dating from 1300, the kitchens built in 1499 and still used, and the Black Staircase built by Cosin in 1665. The tn. hall in the market place is modern (1851) and has some good modern stained glass. In the same building is the original guildhall where the city freemen held, and still hold, their meetings, for 8 of the 16 medieval freemen's guilds still survive. In the lobby are a portrait, a statue and some clothing of Joseph Boruwlaski, a Polish dwarf, 39 in. in height, who died in Durham in 1837, at the age of 98. The Mayor's chamber has eighteenth-century panelling and a fine Jacobean overmantel. Of the churches of Durham, the most remarkable are St. Oswald's built in the eleventh century, but badly restored; St. Margaret's, with considerable late Norman remains; St. Giles at the top of Gillesgate, built in 1112; and St. Mary-le-Bow with eighteenth-century screen and wainscotting. The two main bridges, Framwelgate and Elvet, both date from the twelfth century. The buildings at the S.E. end of the latter show traces of the chapel of St. Andrew which once stood there. Prohends Bridge was put up in 1771. From it the visitor has one of the best views of the picturesque banks which form a beautiful setting for the cathedral and the canons' houses. The view from South Street which stands on the opposite bank must be among the finest of its kind in Europe. Durham is rich in Georgian houses of which there are many in the N. and S. Baileys, in Old Elvet and in South Street. A number of them have fine staircases. Among the other interesting places is the café at No. 39 Silver Street, once the house of Sir John Duck, a seventeenth-century butcher's apprentice who made good; it has a particularly fine staircase. In the near neighbourhood are Kepier hospital, now a farm, founded in 1112 as a religious estab. and Sherburn hospital, a twelfth-century leper hospital; now, much altered, it is a combined hospital and almshouses. The site of the battle of Neville's Cross, where the Eng. defeated the Scots in 1346 is on the N. outskirts. The chief occupations are local gov., the distributive trades and coal-mining (though there are no pits in the immediate vicinity). The local

trades include a carpet factory, two organ factories and a sweet factory. Assizes and Quarter sessions are held here. The chief educational estab. include the univ. (*q.v.*), an old estab. public school for boys known as Durham School, a high school for girls, two grammar schools and various others. Pop. 16,200. See G. Home, *Durham Cathedral*, 1935; C. H. Cook, *Portrait of Durham Cathedral*, 1948.

Durham, c. seat of Durham co., N. Carolina, U.S.A., 25 m. N.W. of Raleigh, with a great trade in tobacco and manuf. of cigars and cigarettes, with one of the largest tobacco factories in the world. It has also large cotton and hosiery mills. It is the seat of Duke Univ., the North Carolina college for negroes and Lincoln hospital for negroes. Pop. 60,100.

Durham, or Shorthorn Breed, see under CATTLE.

Durham Light Infantry, formerly 68th and 106th regiments, linked in 1881 to form Durham Light Infantry. 68th formed in 1756 as 2nd Battalion, 23rd Regiment, but became 68th in 1758. Served mainly in France, West Indies and Gibraltar and joined Wellington's army in Peninsula in 1811. Later, served in N. America, Crimean War and Maori War in New Zealand (1864). The 106th Regiment was raised in India by the East India Co. in 1826 as 2nd Bombay European Regiment. Served in Scinde and Aden and in 1857 in Persian Expedition, and during the Indian Mutiny. After the mutiny it was transferred to the Brit. estab. as 106th Regiment and came to Eng. in 1871. Fought in Egyptian Campaign of 1884-5. The D. L. I. served in S. African Campaign of 1899-1902 and was in the Ladysmith relief column. During the 1914-18 War it raised some thirty-seven battalions which served in France, Flanders, Italy, Macedonia, Egypt, N.W. Frontier of India, and Archangel. The regiment also served in the Third Afghan War in 1919 against the ex-king Amanullah (*q.v.*). The D. L. I. fought on the W. Front and in Burma in the Second World War. The 10th and 11th Battalions were part of the 49th Territorial Div. and, together with the Tyneside Scottish and various Yorkshire units, they distinguished themselves in the battle of Normandy, in the capture of Rauray and Bayeux. One battalion was part of the garrison troops in the is. of Cos.

Durham Report, sequel to the rebellions in Canada of 1837-38. The rebellions failed because most Reformers, though bitterly opposed to 'Family Compact' rule (*i.e.* the rule of a small minority of wealthy and influential people) would not join an armed rising. But the Brit. Gov. nonetheless took prompt action by appointing the Earl of Durham (*q.v.*), one of England's foremost public figures to be governor-general of Canada with the mission of preparing recommendations for reforming the gov. of the Canadas so as to end the strife which for years had torn them into warring factions. Baffling problems awaited him: the assemblies of Upper and Lower Canada had

been suspended; numerous political prisoners filled the gaols; violence on the Amer. border threatened to flare up into actual warfare. Durham spent five months in Canada, mostly in Quebec, and through his staff, collected a great deal of information which he subsequently used in his R. On June 28 (1838) he freed all the political prisoners except a few, whom he banished to Bermuda; but in naming a particular place of exile he exceeded his powers and when the Brit. Gov. weakly disallowed his order, he resigned, to the great chagrin of the Canadian people with whom he was popular.

Gloom and disappointment would have marked the close of his mission had it not been for the R., on the preparation of which he expended intense energy. Two months after his return it was completed and laid before Parliament. It touched on all the provs., but paid most attention to conditions in the two Canadas. To end the crisis there, Durham put forward two prin. recommendations: the union of Upper and Lower Canada, and the introduction of Responsible Gov. He favoured union because the separation of the provs. since 1791 had caused many disputes and had made impossible, for example, the completion of the St. Lawrence Canals. Moreover he thought that conflict between Fr. and Eng. was the root of the trouble in Lower Canada and that union would resolve the difficulty by reducing the Fr. to a minority in the new gov. and assimilating them to the Eng. Canadians in language and laws. These views on the Fr.-Canadians are the least successful part of the D. R., though much of what Durham remarked here was well-founded, as for instance the Fr.-Canadian's lack of training in self-gov. But, as the future proved, the difficulties between the Fr. and Eng. Canadians could only be solved by developing co-operation and a sense of responsibility on both sides. The most important of the recommendations of the D. R. was Responsible Gov. on the model of the Brit. system of Cabinet Gov. adapted to colonial conditions. To avoid a clash between the Executive Council and the instructions sent to a governor, the R. proposed to limit the power of the colonial gov. to local affairs, in which the Brit. gov. had no desire to interfere. Four matters were to be kept under control of the imperial gov.: foreign affairs, the regulation of trade, land grants, and the form of gov. The distinction, however, of first advocating responsible gov. belongs to Robert Baldwin of Upper Canada, who had been urging it for some years. Baldwin wrote to Durham while he was in Canada and convinced the governor-general that responsible gov. would be effective. Durham's contribution, however, was equally essential; for by his R. he forced it on the attention of the Brit. gov. and people and thereby ensured that it would be given a trial. His other recommendations, if less important, were essential to his aims: to train people in democratic gov. he advocated the estab. of local and municipal govts. and elected councils. He also recommended the ex-

tension of education because 'general education was necessary to the estab. of a strong popular gov.' If the D. R. is not above criticism, its merits far outweigh its defects, and it is rightly regarded as one of the most important constitutional documents in the hist. of the Empire. For it upheld the ideal of colonial self-gov. as one to be cherished, not feared and suppressed. It pointed to the possibility of a strong Brit.-Amer. nation. To-day, for these reasons, the author of the R. is numbered among the founders of Canada. The Report was at once approved by the Home gov., but responsible gov. was not achieved immediately. The Family Compact groups were most hostile to it and many people on both sides of the Atlantic thought it was merely a step in the disintegration of the Empire. Almost ten years of political strife for Canadian Reformers passed before the nature of responsible Gov. was understood and the necessity for its full and free acceptance recognised. See G. W. Brown, *Building the Canadian Nation*, 1942; Sir R. Coupland, *The Durham Report*, 1945.

Durham University, opened in 1833. Archdeacon Thorp (d. 1862), who was largely responsible for the scheme for its erection drawn up by the chapter in 1831, was appointed the first warden. Univ. College and Bishop Hatfield's Hall, which was especially designed to give facilities for a univ. career to poorer students, are the chief residential estabs. Degrees are granted in music (since 1889) and hygiene, as well as in all the ordinary branches of learning. Women have been admitted as graduates since 1895. As early as 1300 there was a hall at Oxford reserved for Durham students.

Durian, genus of Bombacaceae, is indigenous to the Malay Archipelago. *D. zibethinus* is a large and lofty tree with smallish, alternate leaves, and yields the fruit known as durian. The durian is remarkable for the delicacy and richness of its flavour and the offensiveness of its odour, which has been compared with that of decaying onions.

Durlus, see **Douro**.

Dürkheim, grape-cure health resort with mineral springs, 6 m. S.W. of Mannheim, at the foot of the Hardt Mts., in the Rhineland-Palatinate, Germany. Pop., 9100.

Durlach, tn., Württemberg-Baden, 2½ m. from Karlsruhe to which it was joined in 1938. In 1565 a castle was built there, now used as a barracks. The manufs. are brushes, tobacco, beer, sewing-machines, bicycles, dental instruments, organ building. Pop. 18,700.

Durnstein, or **Durrenstein**, vil. beautifully situated on the l. b. of the Danube, 43 m. W.N.W. of Vienna, in Lower Austria. Close by are the ruins of the fortress in which Richard the Lion Heart was imprisoned (1192). Pop. 600.

Durostorum, see **SILISTRIA**.

Durra, or *Sorghum vulgare*, is a grass resembling Indian corn, much used for food in Africa, Asia, and India. The stem produces sugar, and the grain, fermented,

is made into alcoholic drinks. It is highly valued as a forage crop, as pasturage for sheep and all stock, and also as poultry food. When eaten green, sorghum has caused the death of animals, by reason of prussic acid found in the leaves. *Durrës*, see DURAZZO.

Durley, tn. of Gloucestershire, England, 5 m. S.W. of Gloucester. It was once famous for cloth manuf., but now its industry consists in manuf. of pins and agric. tools, incubators and cream-separators. The reformer Fox, bishop of Hereford, was born here in 1496. Pop. 3200.

Duruy, Jean Victor (1811-94), Fr. historian and statesman, sprang from the working-class. He passed with high distinction through the *École Normale Supérieure*, where he studied under Michelet, and having assisted the emperor, Napoleon III., in his *Vie de César*, was appointed, in 1863, minister of education. During his six years in office he modernised the curricula of lycées and colleges, instituted secondary education for girls, and founded the 'conferences publiques.' His *Histoire des Romains* (1879-85), is a splendid monument to his fame.

Duryea, anthracite mining bor. of Luzerne co., Pennsylvania, U.S.A. Pop. 8200.

Duse, Eleanora (1858-1924), It. actress, b. Oct. 3, at Vigevano; only child of Alessandro Vincenzo D., a Venetian actor (the son of the actor, Luigi D.). She was on the stage from childhood, and toured continually. During her first season of success at Naples, with *Les Fourchambault* by Augier, she was deserted by her lover, Martino Caffiero; and the boy to whom she gave birth at Turin lived for only a few days. In 1881, at Florence, she married Tebaldo Checchi, a fellow-actor. At the Carignano Theatre, Turin, she scored a success (immediately after a Bernhardt season) with *La Princesse de Bagdad* by Dumas fils. Later, she returned with her husband to Turin, where a daughter was born. The company visited S. America; and at Rio de Janeiro she separated from her husband on account of her passion for Flavio Ando, a young actor who had joined them. Checchi soon afterwards died in a consular post at Lisbon and left her a legacy. On return to Europe the company was disbanded; and she formed a new one, with Ando as its head. She began to tire of the old-fashioned Dumas plays, and came under the influence of Ibsen. She created the part of Santuzza in *Cavalleria Rusticana*. She rivalled Bernhardt in Paris in 1897. After her relations with Ando had cooled, she was associated for five years with D'Annunzio (q.v.) in an attempt to revive classicism in the It. theatre. Many of his plays were written for her. She played in such different rôles as Juliet, Francesca da Rimini, Marguerite, Camille, Fernando, Magda, Paula Tanqueray, and Ellida in Ibsen's *Lady from the Sea*. She would have nothing to do with make-up—relying on her natural liveliness of feature, voice, and gesture. She retired from the

stage in 1909. Owing to war losses, she returned to it in 1921, and repeated her triumphs in Italy, London, and America. She died of influenza at Pittsburgh, Pennsylvania. See E. A. Reinhardt, *Das Leben der Eleanora Duse*, 1930.

Dushambe, see STALINABAD.

Dussek, Jan Ladislav (1761-1812), Bohemian pianist and composer. He was an accomplished pianist at the age of 5 and an organist at 9. Was a choir boy at the convent of Jihlav, attended a Jesuit college and afterwards took his degree in philosophy at the univ. of Prague. For some time he supported himself as organist, and having made a name at Amsterdam as a pianist of remarkable virtuosity and delicacy of touch, he became prof. of music to the stadtholder at The Hague. Whether he played in Berlin, St. Petersburg, Milan, or London, he invariably attracted large audiences. His attempt to found a music-pub. business in London was a complete fiasco, and he was obliged to take refuge from his creditors in Hamburg. From 1809 till his death he directed the concerts of Prince Talleyrand in Paris. But he undermined his constitution by drinking heavily, in a vain effort to rouse himself from the excessive languor to which his obesity had reduced him. He wrote many pianoforte sonatas, trios, and quartets, etc., which have true melodic charm.

Düsseldorf, city on the r. b. of the Rhine in the Rhineland industrial dist. of Germany. Before the Second World War D. had 500,000 inhabs. and important iron and steel works. Between the two world wars it became the administrative cap. of the Ruhr and the leading commercial city of W. Germany. Nearly all the iron and steel heavy engineering and armaments plants of the Ruhr dist. had their head offices and administrative depts. there in an area which suffered severely in a single air raid by the R.A.F. on June 11, 1943. Its industries include cotton spinning and weaving, paper, silk, dyes, chemicals, and furniture, and the Rhine traffic in the harbour is considerable: the vol. of these industries has declined as a result of the war. The Academy of Art, founded here by the elector Charles Theodore in 1767, is an imposing Renaissance edifice of 1881, with a collection of Flemish and of 17th-century to eighteenth-century paintings and 11,000 drawings, the most important of which survived the bombardments of 1942-45. The municipal picture gallery of modern D. painters was in the Kunsthalle. There is also a museum of industrial art and a library of 100,000 vols. The other notable buildings include the Lambertuskirche, of the thirteenth century and the tn. hall of 1570-3. The poet Heine was born at 63 Bolkerstrasse, in 1797. Many of these features of the city have been damaged, although few are beyond repair. D. was occupied by the Fr. from March 1921 till Aug. 1925. The extensive Rhenish metal ware and machine factory, previously engaged in the production of heavy guns, changed over after 1921 to the making of locomotives and railway carriages. But

during the Nazi regime the prin. activity was the making of armaments, the largest war plant concern being the Rheinmetall-Borsig Factory, making guns, shells and other armaments; the Mannesmann-Rehren Werke, making iron and steel tubes, submarine mine cases and the like; and the J. G. Schwietzke Plant making torpedoes and torpedo tubes. It was therefore an important target for Brit. bombers. The first really severe raid was that of June 11, 1943, when a combined attack on D. and Münster was made by the R.A.F., some forty-three Brit. bombers being lost. In that raid extensive damage was caused and many factories which had been repaired after a much smaller raid in the summer of 1942 were again put out of action. All the main sheds in the Düsseldorf-Derendorf marshalling yard were burned out. On April 22, 1944, the R.A.F. delivered a heavy combined attack on D. and Brunswick, losing forty-two aircraft. On Nov. 1, 1944, the R.A.F. dropped over 4000 tons of bombs on D., losing twenty aircraft, but doing great damage. On April 3, 1945, the Gers. blew up the three bridges of D. to save the city from capture, but it fell to the Allies soon afterwards. *See further under RUHR, BATTLE OF THE; WESTERN FRONT IN SECOND WORLD WAR.*

Dust, small particles of earth, etc., which are moved by the slightest air-currents. Even in a room which has been kept spotlessly clean the existence of D. can be demonstrated when a strong beam of sunlight enters by a window. The D. of the atmosphere consists of tiny fragments of minerals, organic matter, carbon, and ash from burning substances, volcanic D., salt from sea-spray, and D. formed by the disintegration of meteors on their way through the atmosphere. D. was formerly considered a nuisance without any redeeming qualities, but J. Aitken, in 1880, demonstrated that it combined with its disadvantages sev. useful functions. When air containing water vapour is cooled to the point of saturation, the water vapour does not condense at once unless there is some solid substance for it to condense upon. Under suitable conditions of temperature the D. particles in the atmosphere become nuclei or centres for the condensation of water. These minute globules form clouds, mists, and fogs, and on coalescing form drops of rain. Aitken devised an instrument for counting the D. particles in a known volume of air. The results show that D. is more abundant than was suspected, the number of particles varying from 100 per c.c. in very clear air to about 100,000 per c.c. in the air of large cities. Many modifications of the sun's light are due to D. Without it we should have no twilight, no blue sky, no gorgeous sunsets, and none of the chiaroscuro effects which make scenery charming. On the other side of the account, D. presents to-day a most serious technical problem in many industries because of explosion risks and health hazards. In a certain mixture of air and suspended fine D., an explosion

of great violence may occur in the presence of a spark or flame, and preventive measures must be taken, e.g. in flour-mills, saw-mills and mines. More serious is the effect of D. on health: miners, particularly of anthracite, are susceptible to D. diseases but other industries are not without their dangers. It is the cause of various skin diseases, and of bronchial ailments in the cotton industry, with attendant risks of poisoning.

Dusuns, tribe of Brit. N. Borneo numbering 117,400 out of the total native pop. of 205,200 (1931).

Dutch Antilles, *see* WEST INDIES.

Dutch Art. The phrase here denotes the art of Holland produced from the end of the sixteenth century to about 1700. Much of the architecture and sculpture of the Low Countries was destroyed by protestant vandalism in the second half of the sixteenth century. At Amsterdam the Oude Kerk and the Nieuwe Kerk, and the church of St. Peter at Leyden all date from about 1300. The Groote Kerk at Rotterdam (1400); that of Haarlem (c. 1490); the Hague (1500); and St. Catherine's Cathedral at Utrecht (1524), are notable eccles. buildings. Civic architecture is represented by the great Stadhuis at Leyden (1580). It is interesting to recall that the domestic architecture of Holland was the basis of the charming style in which much of London was rebuilt after the fire of 1666. Examples of this influence may be seen in King's Bench Walk and New Square.

It is, however, the work of Dutch painters which must be considered among the glories of European civilisation; and throughout that work two themes predominate, Dutch home life and republican freedom. In the late sixteenth and early seventeenth centuries D. A. was influenced by It. renaissance and baroque art. Thus Cornelisz (1562-1638) tried to reproduce the style of Raphael, but without marked success. His 'Bacchus and Ceres' at Dresden, and 'Prodigal Son' at Budapest exemplify the motif of seduction in the guise of classical myth and moralistic art respectively. Abraham Bloemaert (c. 1565-1657) painted in the baroque style. He owed something to Titian as may be seen in his 'Shepherdess with Grapes' at Karlsruhe. His pupil Gerard van Honthorst (1590-1656) painted portraits of royal personages and other celebrated individuals. Those of Queen Elizabeth of Bohemia and George Villiers, first duke of Buckingham, are in the National Gallery, London. Jan van Goyen (1596-1656) was one of the founders of a school of painters specialising in picturesque naturalistic landscape. Among his most celebrated pupils was Nicholas Berchem (1624-83) whose 'Old Port of Genoa,' 'Jupiter with Nymphs on Ida,' and 'Musical Shepherdess' are in the Wallace Collection. Mention must be made of a distinct group of painters famous for their studies of lower and middle class life, emphasising particularly its gay and care-free aspect. The chief of these were Dirk Hals (c. 1589-1656) represented in the National Gallery, by his 'Prodigal

Son.' Adrian Brouwer (1608-40) whose tavern scenes are a reflection of his own somewhat dissolute life; Adrian van Ostade (1610-85) whose 'Alchemist' is in the National Gallery; and Jan Steen (1626-79), his pupil. Perhaps the most important of this school, however, was Jan Molenae (d. 1660), a pupil of Frans Hals. Besides tavern groups, he painted scenes from wealthy bourgeois life, and

'Young Woman in a Courtyard' and 'Peepshow Cabinet' (both in the National Gallery) by Samuel van Hoogstraten (1627-78). Pieter de Hooch (c. 1632-c. 1681) shows affinities with Vermeer. He chose mostly interiors illuminated by different lights, with the radiance of day pouring through open doors and windows. Three of his works are in the National Gallery.

W. F. Mansell

VERMEER'S 'LADY STANDING AT THE VIRGINALS'
National Gallery, London

his significance in the latter genre lies in the fact that such works as 'The Family Feast' at Amsterdam, and 'Musical Pastime' in the National Gallery were forerunners of the Dutch *tableaux de modes* which were later developed by Gabriel Metsu (1630-67) and Gerard Ter Borch (1617-81). The latter was a prolific artist who expended minute exactness upon details of dress and furniture. In portraiture he reveals the influence of Velasquez. The National Gallery possesses a splendid example of his work in 'The Peace of Munster' (see HOLLAND.—History). Yet another group of painters is remarkable for what has been called 'Architectural Art.' Handsome interiors are the features of such pictures as

Three names in D. A. tower above all others. Hals, Rembrandt, and Vermeer. Frans Hals (1580-1686) is one of the greatest portrait painters of all time, and as a colourist he had no superior in his age. He shows little trace of foreign influence and specialised in studies of laughing children and types of Haarlem low life. His most important works are the portrait groups of the Haarlem Civic Guards, and his 'Laughing Cavalier' in the Wallace Collection is justly one of the most celebrated pictures in the world.

Harmensz Rembrandt van Rijn or Ryn (1609-69) stands as one of the great geniuses of the race. From the first he was an ether of the highest skill and closely studied the it. masters in such

originals as he could buy. It has been said of his work that the form is never really the subject, but derives from the subject, and expresses his attitude of mind to that subject. Rembrandt has been called the artist of old age, and indeed his incomparable 'Head of an Old Woman' in the National Gallery is among the finest works in that collection. Also in the National Gallery are 'Christ before Pilate,' three self-portraits, 'Hendrickje Bathing,' and 'A Jewish Rabbi.'

Jan van der Meer, or Jan van Delft (1632-75), in his earlier period was influenced by the school of Rembrandt, but he later developed a less vigorous style, characterised by a delicate subtlety and harmony of treatment, and less bold colouring. To the first period belong 'Christ with Martha and Mary' (National Gallery of Scotland), and 'Woman and Soldier' (Dresden). Among later works are 'The Coquette' (Brunswick), 'Lady at a Casement' (New York), and 'Lady Standing at the Virginals' (National Gallery). His masterpiece is the 'View of Delft' (The Hague). Vermeer was almost forgotten for two centuries and many of his works were attributed to de Hooch and Ter Borch.

Magnificent examples of D. A. are to be found in all the prin. galleries of Europe and America, but the supreme collection is housed in the Rijksmuseum at Amsterdam. (See also under individual names.) See E. Fromentin, *Masters of Past Time* (trans.), 1912; H. B. Cotterill, *A History of Art, 1922-23*; R. H. Wilenski, *Introduction to Dutch Art, 1927*; E. A. J. Vermeulen, *Handboek tot de geschiedenis der Nederlandsche Bouwkunst, 1928-32*; S. Sitwell, *The Netherlands, 1918*.

Dutch Auction, an auction in which the article to be sold is first put up at the maximum price. If there is no offer, the price is then lowered by stages until a bid is made.

Dutch East India Company. This famous company was founded by Charter, dated March 20, 1602, by the union of a number of smaller trading companies and was given by the Dutch gov. the monopoly of the trade between the Strait of Magellan and the Cape of Good Hope, together with the right to enter into treaties and alliances in the name of the States-General and to set up factories. Like its Eng. counterpart, it was also empowered to build forts and to employ its own troops. In 1619 the company founded Batavia on the site of a native tu., and some three decades later was in possession of most of the chief commercial centres throughout the Indian Archipelago, such as Sumatra, Java, Ceylon, and Borneo, besides itself owning thriving colonies in S. Africa. It was not dissolved until 1798, when its possessions were assigned to the Dutch Gov. See F. Valentyn, *Beschryving van oost en nieuw Oost Indien* (Amsterdam), 1724.

Dutch East Indies, or Netherlands Indies, situated between 85° and 141° E. long. and 6° N. and 11° S. lat., form the Asiatic possessions of Holland, and, by the con-

stitution of 1922, are part of the Kingdom of the Netherlands. They include Java and Madura; the is. of Sumatra; the E. S., and W. of Borneo; Bali and Lombok; the Celebes; the Moluccas; Timor Archipelago; New Guinea to 141° E. long.; Bangka; Rian-Lingga Archipelago, and Billiton. These is. include thousands of small ones. They are controlled by a governor-general, who is assisted by a council of departmental heads. In 1918 a 'People's Council,' or Volksraad, was formed to act in an advisory capacity; of its members—European, native, and foreign Oriental—some were elected, some appointed by the gov. A further step towards self-gov. was made in 1927 when this Volksraad was made, in conjunction with the governor-general, the legislature for all matters of internal policy. The D. E. I. were invaded and controlled by the Jap. from 1941 to 1945; Netherlands authority was restored after their capitulation. But a revolutionary nationalist movement seized power from the Jap. on the is. of Java, Madura, and Sumatra, proclaiming an Indonesian Republic on Aug. 17, 1945, under the presidency of Dr. Soekarno. *De facto* recognition of the authority in these is. of the republic was given by the Netherlands States General on March 25, 1947. Madura was recognised as an autonomous state in Feb. 1948, and W. Java in March 1948 under the name of Negara Pascoendan. A provisional federal gov. for the whole Indonesian Union was set up also in March 1948. In this Union the Kingdom of the Netherlands and the former D. E. I. are equally sovereign partners. (See further under JAVA; INDONESIA.) The bulk of the native pop. is Mohammedan in religion, but the is. enjoy complete religious toleration. There are many public schools, both primary and secondary, also private schools and training schools, Dutch being the language of instruction. There are 4611 m. of railway, in Java and Sumatra. Jogjakarta, is the cap. of the Indonesian Republic. Rice, maize, cotton, sugar, coffee, cinchona, rubber, tea, potatoes, cassava, groundnuts, soya beans, and tobacco are cultivated, sugar, rubber, tea, tobacco and cinchona being the chief exports. Both tin and coal are mined, and increasing quantities of mineral oil are obtained annually. In 1910 the value of imports was £10,904,153 and exports £82,545,700. The total area is 735,263 sq. m., and the pop. approximately (1930) 60,727,000. Java is the most densely populated of the is., being in some dists. over-populated, and efforts have been made to persuade the Javanese to emigrate to S. Sumatra and other more sparsely peopled parts. The Dutch E. India Co., founded in 1602, ruled the is. from that date until 1798, when the company was dissolved. See G. T. Raynal, *Histoire philosophique et politique des établissements et du commerce, des européens dans les deux Indes, 1780*; D. J. H. Nysson, *The Races of Java, 1929*; E. S. de Klerck, *History of the Netherlands East Indies, 1938*; J. W. Nyssrom, *Surinam, 1942*; A. Hyma, *The Dutch in the Far*

East, 1942; H. J. van Mook, *The Netherlands East Indies and Japan, 1944*; J. S. Furnival, *Colonial Policy and Practice: a Comparative Study of Burma and Netherlands India, 1948*; D. Wehl, *The Birth of Indonesia, 1948*.

Dutch Guiana or Surinam, Dutch colonial dependency, on the N. coast of S. America between lat. 2° and 6° N. and long. 53° 50' and 58° 20' E., has an area of 55,143 sq. m. and a pop. of 203,500. It is bounded on

direction, because the ocean currents sweeping W. from the Amazon have deposited silt at their mouths and thereby considerably enlarged the original land area. A few m. from the coast there is a narrow zone of savannahs, and beyond, drained in part by the upper reaches of the Marowijne and the Nickeri, the unrelieved jungle stretching to the frontier of Brazil. Much of this jungle is uninhabited or only sparsely populated by

Royal Netherlands Embassy

DUTCH GUIANA: NATIVE TRANSPORT ON THE RIVER ABOVE MAMADAM

the E. by the R. Marowijne, which separates it from Fr. Guiana, on the W. by the Corentyne (or Corantijn), which divides it from Brit. Guiana, and on the S. by dense forests. The New R., which was at first assumed to be a trib., was subsequently proved to be larger than the upper Corentyne, and the ownership of the triangular area between the two rvs. has never been definitely determined; but the boundary is commonly taken to be the Upper Corentyne or Coeroeni R., and the Dutch may well lose the ter. by default, which would be no great loss unless what is at present thought to be only uninhabited and inaccessible jungle proves to have useful resources. The general direction of the rvs. in the interior is from S. to N., but near the coast most flow in a westerly

direction, because the ocean currents sweeping W. from the Amazon have deposited silt at their mouths and thereby considerably enlarged the original land area.

A few m. from the coast there is a narrow zone of savannahs, and beyond, drained in part by the upper reaches of the Marowijne and the Nickeri, the unrelieved jungle stretching to the frontier of Brazil. Much of this jungle is uninhabited or only sparsely populated by nomadic Indians—who hunt, fish, and grow manioc and cassava—or by Bush Negroes. Seven-eighths of the pop. of D. G. is in the narrow coastal belt into which all the agriculture and industry of the colony is concentrated: of these about one-third lives in the cap., Paramaribo. Most of the country is covered by dense jungle in which only the 'Amerindians' and Bush negroes, descendants of runaway slaves, live. The Amerindian pop. numbers only 2000 and each year diminishes, but the Bush negroes are increasing and now number nearly 20,000. The Saramaccaners form the largest tribe numbering twice as many as the others together. They live in the region between the Surinam R. at Kabel Station to its confluence with the Gran Rio and Pikien Rio.

The Aucaners of the upper Commewijne and Marowijne rivs. are the only other important tribe. The cultural influences of these tribes borrowing a common origin in Africa as well as during the days of slavery in the Caribbean, their language, religion, and art differ only slightly to-day, and indeed their present civilisation is said by anthropologists to be practically identical with that of Africa of the seventeenth century. Bush negro vills. have streets of hard packed earth, fringed by groups of palm-thatched huts with roofs sloping almost to the ground, the walls being of woven palm fronds. At the head of each tribe is a *granman* (great man) appointed by the governor of D. G. and under the *granman* are vil. *captains*, but the real power is in the hands of family groups. Clothing is simple—the men wear a *camissa* or a toga-like garment looking like a patch-work quilt, and the women a *pangl* or cloth round the torso. Cicatrization is a common form of decoration. Both the Saramaccaners and Aucaners let their hair grow long and braid it in fanciful designs. The Bush negroes live by hunting, fishing, and agric. and hunt with bows and arrows unless they can procure firearms. Their crops include yams, bitter cassava, peanuts, maize, dry rice, and a little sugar-cane. A serious crop pest is the umbrella or leaf-cutting ant which attacks newly-planted fields and old too if adjacent to the new. Among the Bush negroes there is still a belief in witchcraft and charms, but the more extreme manifestations of African superstition and orgies are absent. Surinam was the original home of the Arawaks, the most civilised of the Guiana Indians. They were peaceful agric. and proficient workers in stone. The Caribs, though originally living in the heart of the continent, at some early period migrated to Guiana and to the region lying around the lower Orinoco, and they became the traditional enemies of the Arawaks. The latter numbering about 1200 and the Caribs 1000 form four-fifths of the present Indian pop. of D. G. All the Guiana Indians live in much the same state as they did when the country was first explored. The women have been far less affected by civilisation than the men, which is natural because their work—agric., cooking, and childbearing—have not lessened in importance. The prin. agric. industries are sugar and rice. Liberian coffee and cacao are also cultivated. Gold is found in the interior and the forests yield balata among other products. Bauxite (1,020,000 metric tons in 1946) is also an important product. The plantations lie along the lower courses of the Surinam and Saramacca and also in the low-lying coastal regions, and the chief settlements are among these plantations. These settlements are inhabited by Javanese, Chinese, Coolies, Negroes and about 2000 whites. The total pop. according to religions is: Netherlands Reformed and Lutheran, 13,900; Moravian Brethren, 34,700; Rom. Catholic 34,500; Jews, 900 (all these totals include Europeans and Natives); Moslems

(Brit. Indians and Indoneses), 55,500; Hindus, 33,700; Confucianists, 1600; and others 2800. The average temp. from Dec. to March is 80° F. The nights are cool and health conditions are favourable.

The gov. of D. G. is administered by a governor and an advisory council all the members of which are nominated by the Queen of the Netherlands. The legislative body is called the Colonial States, whose members sit for six years. Paramaribo, the chief tn., is situated on a shell reef on the W. bank of the Surinam about 14 m. above its estuary. It is a sprawling tn. that is evidently Dutch in character, intersected by canals and with a diked countryside near at hand. Many of the tn.'s streets are lined with mahogany, flamboyant and tamarind trees and royal palms. The houses are mostly multi-storied buildings of wood with shutters against the heat. The hub of official life is the Gouvernementsplein. To the N.E. of this square is the governor's residence and to the N.W. a few lovely mellow brick buildings recalling the Dutch colonial architecture of New England. Beyond the Gouvernementsplein lies Fort Zeelandia, which formerly stood guard over the city. Of the smaller tns. Nieuw Amsterdam, close to the cap., is the administrative centre of the Commewijne dist., once important it is now deserted. Nieuw Nickerie, second tn. of D. G., is the centre of an important rice-growing dist. largely populated by Javanese and Brit. Indians (pop. 4000). Coronie is surrounded by great swamps but a new road to Paramaribo has lessened its isolation, which, however, accounted for much of its charm, for this tn. has a very old-world atmosphere with its single long avenue lined with coconut palms. Its many old graves testify to the fact that it was colonised by the Scots during the eighteenth century. Albani is a dreary little frontier tn. 18 m. above the mouth of the Marowijne R. The first attempt at the settlement of D. G. was made in 1630 by Capt. Marshall, an Englishman. In 1644 some Dutch and Portuguese Jews from Brazil introduced sugar cultivation, but it was not until 1650 that a permanent settlement was effected by the famous Francis, Lord Willoughby of Parham (see under BARBADOS). In 1666 the colony capitulated to the Dutch, and by the Peace of Breda in 1667 it was ceded to the Netherlands in exchange for New Amsterdam, now New York, which became a Brit. Possession. Thereafter Surinam was twice in the possession of England, from 1799 to 1802, and from 1804 to 1816, when it was finally handed back to the Dutch. See W. H. Brett, *The Indian tribes of Guiana: their condition and habits*, 1868; G. Palgrave, *Dutch Guiana*, 1876; W. E. Roth, *An inquiry into the animism and folk-lore of the Guiana Indians*; J. Rodway, *Guiana, British, Dutch, and French*, 1921; M. J. and F. S. Herskovits, *Rebel destiny. Among the Bush-Negroes of Dutch Guiana*, 1934; F. H. Dutens, Joseph Michel (1763-1818), Fr. engineer, was appointed chief engineer of the dept. of Lëman in 1803, and assisted in constructing the railway via the Simplon Pass. His *Mémoires sur les Travaux publics de l'Angleterre* (1819) was the fruits of his appointment to study the inland navigation of that country.

• **Du Toit's Pan**, see under DIAMOND.

Dutt, Romes Chandra (1848-1909), Indian writer and civil servant, was a native of Calcutta, and was educated at Presidency College before he came to England and studied at Univ. College, London. Having passed with the highest distinction into the Indian Civil Service (1871), he was appointed divisional commissioner in 1891 and 1895, being the first Indian to receive so high a post. In 1897 he retired from the service, and from 1904 to 1906 acted as revenue minister of the Baroda state. He wrote on the economic hist. of his country from 1757 until 1900, trans. Sanskrit writings into Eng. verse, including the *Mahabharata* (1898) and the *Ramayana* (1900), and pub. many novels in his native Bengali. See life by J. N. Gupta, 1911.

Dutt, Toru or Tarulata (1856-77), Hindu author, was a Christian girl of Calcutta, who, like Marie Bashkirtseff, developed in her girlhood a literary genius which showed small sign of immaturity. For over three years (1869-73) she was abroad in France and England. Her *A Sheaf Gleaned in French Fields* (1876) contains Eng. versions of Fr. poems, and she also trans. into Eng. passages from the Sanskrit *Vishnupurana*. Sir E. Gosse ed. her *Ancient Ballads and Legends of Hindustan* (1882).

Dutt, William Alfred (1870-1939), Eng. author and journalist, b. in Norfolk. He was educated at Bungay Grammar School. It was on the staff of the *Eastern Daily Press* that he received most of his journalistic training, and he was assistant editor of the literary department of the National Press Agency. He pub. *George Borrow in East Anglia* (1896), *Highways and Byways in East Anglia* (1901), *The Norfolk Broads* (1923), *The King's Homeland* (1904), *Wild Life in East Anglia* (1908), and *The Norfolk and Suffolk Coast* (1909).

Duty, see EXCISE and CUSTOMS DUTIES.

Duumviri, name applied in the republic of Rome to a magistracy of two: 1. *Duumviri Sacrorum* were the first two men to whom was entrusted the charge of the Sibylline books. 2. *Duumviri navales*, were specially elected for the purpose of equipping or recruiting the navy. 3. *Duumviri Jure Dicendo* were men with the highest judiciary powers in municipal tns. 4. *Duumviri Æde Dedicandæ* were elected for the purpose of dedicating a temple. 5. *Duumviri Perduellionis* tried those accused of treason. The office was created by Tullius Hostilius, but was afterwards abolished.

Duval, Claude (1643-70), highwayman, was a native of Normandy, and came over to England as servant to the duke of Richmond. Eventually he was hanged for his crimes, but his epitaph in Covent

Garden church, London, duly records his gallantries:

• Here lies Du Vall: Reader, if male thou art,

Look to thy purse: if female to thy heart.

Duveyrier, Henri (1840-92), Fr. traveller, b. at Paris, studied Arabic, and from 1857 to 1862 explored the Sahara, and lived for sev. months with the Tuareg, whose manners and speech he described in his *Exploration du Sahara: les Touareg du Nord* (1861). He also interested himself in the 'shats' of Algeria and Tunis. In 1881 he pub. *La Tunisie*.

Dux, or **Duěcov**, tn. at the S. base of the Erzebirgo, 4½ m. S.W. by W. of Teplice in Czechoslovakia with manufs. of glass, porcelain, and metal goods. There are lignite mines close by. Pop. 13,000.

Duxbury, city of Plymouth co., Massachusetts, U.S.A., on Duxbury Bay, 24 m. E.N.E. of Taunton. The cable line laid across the Atlantic in 1869 from Brest, France, terminates here. In 1872 an imposing monument was erected on Captain's Hill to Miles Standish, one of the first settlers in 1631. The house of his son Alex Standish, built in 1666, is still standing. Pop. 1700.

Duyt, see DOIT.

Duze, FRANCE, see DIEUZE.

Dvina, or **Dvina**: (1) The N., or Syevernaya D., a riv. of N. Russia. It waters the Regions of Vologda and Archangel, drains an area of 136,000 sq. m., is 760 m. long, including the Sukhona, and is free from ice for six months of the year. Its source is traced from the confluence of the Sukhona and Jug, and after traversing a broad flat country it enters the Gulf of Archangel in the White Sea by three mouths. The chief tribs. are the Vychegda (625 m. long) and the Pinega on the r. b., and the Vaga on the l. b. Considerable merchandise is shipped down this waterway. In 1919 it was the centre of operations by the forces of Gen. Ironside against the Bolsheviks, whose troops, together with those of Gen. Maynard at Murnansk, were evacuated in the spring of the same year by the N. Russian Relief Force under Gen. Rawlinson.

(2) The W. D. or Duna. It rises in the Kalinin Region U.S.S.R. on the Valdai Plateau, has a basin of 33,000 sq. m., is about 600 m. long, and is provided with excellent canal connections which augment its commercial importance. Vitebsk and Daugavpils (Dvinsk) and Riga in Latvia, are situated on its banks. After receiving many tribs., it empties itself into the Gulf of Riga. During the First World War, the D. It. was an effective barrier against Ger. offensives intended to envelop the Russian right flank. The Gers. did not make any very serious attempt to break through at this point until the summer of 1915. They were supported by their fleet, which, however, was defeated by the Russian fleet, supported by Brit. submarines. Gen. von Below, who was in supreme command of the Ger. forces in this region, endeavoured to offset the naval defeat with a victory on land, and to this end he

organised offensives against Lennvaden and Friedrichstadt (Jaun Jelgava), from which the Russians withdrew after having destroyed the bridges. Another offensive was directed against Jakobstadt (Jakabpils), where the railway crosses the D. But here the Russians fought stubbornly and brought the offensive to a standstill by the end of the first week in Sept. Beyond a small Russian offensive in Feb. 1916, which had for its object the prevention of Ger. troops being sent further S., the region was quiet until the following June, when a Ger. offensive failed. In July 1916 a Russian counter-offensive overwhelmed the Gers. to a depth of 10 m. In the Second World War, a Ger. force crossed the D. in July 1941 at Jakabpils, took Ostrov and reached the main Russian defences on the way to Leningrad. There was again fighting. The position of Smolensk, pivot of the whole Ger. position in this region in 1943 covering the gap between the D., and the Dnieper, involved further battles in the region during the Russian counter-offensives of 1943.

Dvinsk, see DAUGAVPILS.

Dvořák, Antonín (1841-1904), a Bohemian musical composer, b. of humble parents at Nelahozeves (Mühlhausen). Destined at first to be a butcher, but his remarkable talent for music so attracted the attention of his first teacher that he was sent to the organ school of the Gesellschaft der Kirchenmusik in 1857. Joined the orchestral band of the Bohemian Interimstheater at Prague in 1862, and eleven years later became organist of the church of St. Adalbert in that town. During this time he wrote many songs, overtures and symphonies, and in 1874 produced his opera, *König und Köhler*, which was not a success; and composed diligently in this period when he was, for a time, under the strong influence of Wagner. His first success came in 1873, his *Hymnus* with text by Halek being well received by the Bohemian public. Then, through the influence of Brahms, Vienna became interested in his work, and after the pub., in Vienna, of his *Moravian Dances* and particularly his *Slav Dances* (1878), his fame spread into most countries. He was appointed director of the National Conservatory of Music in New York (1892-95), and in 1901 director of the Prague Conservatory. The most successful of his choral works produced in England was *Stabat Mater* (1883). Visited England sev. times up to 1887, conducting *The Spectre's Bride*, the *Requiem* and *St. Ludmila*. After his appointment in New York, the melody and rhythmic structure of his work show the influence of negro folk-music. In his later years he somewhat eschewed symphony and chamber music for opera and symphonic poems. D. had great creative power; 'intellectual control' is subordinated to elemental expression. At times a certain melancholy and religious fervour characterise his work, which shows a very wide range. He is often compared with Smetana, for both represent in modern Czech music the typically

national-classical generation. Other well-known works of his are the cantata, *The Spectre's Bride* (1885); the oratorio, *St. Ludmila*; *Slavische Tänze*, a composition for two pianos; and the symphonies in D minor, E minor (The New World Symphony), F, and G. See W. H. Hadow, *Studies in Modern Music*, 1908;

Dvur Kralove (Ger. *Königinhof*), town of Czechoslovakia, on the l. b. of the Elbe, 70 m. N.E. of Prague. It has cotton and linen manufs. Here, in 1817, were discovered the famous Knighthof MSS., and in 1866 the Prussians defeated the Austrians here. Pop. 13,000.

Dwale, see BELLADONNA.

Dwarf (from A.-S. *deorg*), an individual considerably below normal size. The causes of dwarfism are somewhat obscure; in most cases heredity plays an important part and the general diminutiveness of all the structures is not readily explainable by any known defect in the nutritional conditions of the embryo. A distinction should be drawn between pygmies, where small stature is normal to the race, and individuals who fall considerably short of the size of their parents. True Ds. should further be distinguished from rickety Ds., where the deficiency is not general, but can be attributed to a more or less local condition. Such cases usually exhibit a bent spine and misshapen lower limbs, while the head and other structures may be of normal size, the

effect of the whole being as a result grotesque. Even the true Ds. are found to possess heads and chests large in proportion, though many famous Ds. are said to have presented in miniature the proportions of a well-built normal man. While giants are often constitutionally feeble, the dwarf condition is not usually accompanied by other physical and mental defects, except that very diminutive individuals are not uncommonly sterile, even when mated with individuals of similar proportions. Ds. are usually robust, free from disease, long-lived, and of ordinary or even superior mental endowment.

Famous dwarfs.—Owing to their dainty appearance and lively intelligence, Ds. have often been the favourite attendants of persons of high position, and hist. records many instances of the high value set upon diminutive persons by wealthy European and Oriental monarchs. The

E. N. A.

THE WEDDING GROUP: GENERAL TOM THUMB AND LAVINIA WARREN

Egyptian Pharaohs undoubtedly used members of the dwarf tribes of equatorial Africa as court attendants. It is also recorded that Ptolemy Philadelphus had as tutor the poet Philetas of Cos, who was said to be so small that he had to wear leaden weights to avoid being blown away. Julia, niece of Augustus, had two Ds., Coropas and Andromeda, each of whom was 2 ft. 4 in. in height. Mary I. of England had a page named John Jarvis who was 2 ft. high. A fair amount of information is obtainable concerning the life of Jeffery Hudson, who was born of normal parents in 1619 at Oakham in Rutlandshire. At nine years of age he was 18 in. high and well proportioned in every way. He was introduced to Charles I. and his queen in a pie which was brought to the dinner table, and was adopted into the service of the royal family. He became a soldier in the Royalist cause, and is said to have fought two duels, one with a turkey-cock and one with a full-sized antagonist, whom he shot dead. At thirty years of age he was 3 ft. 9 in. high,

having grown, so he announced, during his imprisonment by Turkish pirates, who ill-treated him. He died in 1682 at the age of sixty-three. Queen Henrietta Maria also had two Ds., Richard and Anne Gibson, who were married at the instance of the queen and had children of normal size. Of continental Ds., the chief are Béhé, the favourite of Stanislas, King of Poland, who was 2 ft. 9 in. high, and Richebourg, who was only 1 ft. 11 in. high; he died in 1858 at the age of ninety. In the nineteenth century many Ds. were publicly exhibited in England. The Pole, Borulwaski, was 3 ft. 3 in. high when full grown; he died in 1837 at the age of ninety-eight. Charles Stratton, popularly known as General Tom Thumb, was exhibited in London in 1844 and 1857. He was 2 ft. 7 in. high, and married another D., Lavinia Warren, in 1863; he died in 1883. Other exhibited Ds. were: Don Francisco Hidalgo, 2 ft. 5 in.; Jan Han-nema, 2 ft. 4 in., the so-called Aztecs, who appeared in 1853; and the Chinese D., Che-mah, who measured 2 ft. 1 in.

The Dwarf in Mythology.—The folk tales of most countries include accounts of diminutive people, usually with superhuman attributes. It has been suggested that such accounts have their origin in the existence of pygmy races in Europe in the Neolithic period, but the widespread nature of the fairy legend hardly needs such explanation. The fairy is by no means always pictured as of diminutive size. The true fairy, or invisible spirit, is probably a little person simply in order to explain the difficulty of seeing him. It is otherwise, however, with the D. of Teutonic legend. These are people of grotesque appearance, often malicious and of marvellous cunning in the working of metals. They possess in an exaggerated form the characteristics of many individuals of stunted growth; a disinclination for human society, great strength of arm and hand, shrewdness above the ordinary, a tendency to revenge for fancied slights, but a capacity for great devotion where their affections are engaged. Ds. amongst the ignorant and superstitious have been credited with supernatural powers, especially those individuals who are deformed. For dwarf races, see PYGMIES. See W. Bodin and B. Hershey, *World of Midgats*, 1935.

Dwarfing Trees, art introduced some centuries ago by the Japs. The tiny trees have all the appearance and characteristics in miniature of the same species growing freely in the open; they sometimes live as long as 250 years. They are best grown from seed, and the treatment consists of frequent pruning of shoot and root, twisting and bending of the branches, insufficient nourishment, the use of small pots so as to confine the roots and anything which can paralyse vitality without actually killing the plant.

Dwarka, maritime tn., Gujarat, India, in the W. of the Kathiawar Peninsula, Bombay. By the seashore stands the great temple of Krishna, with a pyramid 140 ft. in height, which is annually visited by 10,000 pilgrims. Pop. about 5000.

Dwight, Timothy William (1752-1817), Amer. author and divine, graduated at Yale College, 1769. During the War of Independence he served as an army chaplain, and wrote *Columbia*, a fine battle song. His books show a great diversity of interest. Southey believed that posterity would best esteem his *Travels in New England and New York* (1821-22) because of the light they throw on contemporary social and economic conditions; his sermons, entitled *Theology Explained and Defended* (1819), enjoyed for many years a conspicuous popularity.

Dwina, see DVINA.

Dwygtylchi, par. of N. Wales, in Carnarvonshire, 3 m. from Conway. Pop. 4500.

Dyaks, or Dayaks, certain tribes inhabiting Borneo. They may belong to the same race as the Malays. Sea Ds. or Ibans are the most numerous of the races of Sarawak. In 1940 the census showed 52,759 men, 57,101 women and 57,712

DYAK WARRIOR

E.N.A.

children, a total of 167,572. There is much conjecture as to the origin of these people, but it is certain that they are not indigenous to the country. They are most numerous in Sarawak and Labuan and from there have spread to Brunei and to North Borneo, in recent years. The Ibans are a vigorous healthy race who dwell in long houses containing as many as 40 families. They have little native culture but are quick to learn, and have borrowed customs and ideas freely from many races, including Europeans, with whom they have come in contact. Normally they plant hill padi, felling large areas of jungle for the purpose, but in recent years they have adopted irrigation and, especially, in the Kanowit Dist., have

been very successful. They own large areas of rubber and being of a thrifty nature, some of them are men of considerable wealth. Land Ds. in 1940 numbered about 37,000, and are only found in Sarawak. Their origin is obscure, but it is of interest to note that relics of Hindu culture have been found in the Samarahan and that some Land D. tribes, alone of the inhab. of Borneo, burn their dead. They are a peaceful people and for many years were oppressed by the Brunei nobles and raided by the Sea Ds., and it was their pitiful state that first roused the sympathies of Sir James Brooke. The Ds. are slightly built, and in colour lighter than a typical Malay. They are very strenuous and persistent workers and have a cheerful disposition. Their chief industries are weaving and spinning, dyeing, manuf. iron and steel implements. Their former practice of head-hunting is now unknown. In warfare their chief weapons were the blowpipe and a long spear or a curved sword. See C. Bode, *Head-hunters of Borneo*, 1882; H. L. Roth, *The Natives of Sarawak and British North Borneo*, 1896; W. O. Krohn, *In Borneo Jungles*, 1927; T. Harrison (ed.), *Borneo Jungle; An Account of the Oxford Expedition to Sarawak*, 1938; Agnes Keith, *Land Below the Wind*, 1939.

Dyas, see PERMAN.

Dyblö, see DÜPPEL.

Dyce, Alexander (1798-1869), eminent Eng. critic and scholar, b. at Edinburgh, educated at Edinburgh High School, and graduated at Exeter College, Oxford. He entered holy orders, but in 1825 settled in London and devoted his time to literature. His first pub. was *Select Translations from Quintus Smyrnaeus* (1821). He is famous for his annotated eds. of the early dramatists and poets, which include Peele (1823-39), Webster (1830), Greene (1831), Middleton (1840), Beaumont and Fletcher (1843-46), and Marlowe (1850). His scholarly ed. of Shakespeare, pub. in 9 vols. (1857), has not been surpassed. D. also edited the poems of Shakespeare, Pope, Akenside, and Beattie, and the critical and theological works of Richard Bentley. With Collier, Halliwell, and Wright, he founded the Percy Society, and for the Shakespeare Society pub. two early plays which he had discovered, namely, *Timon* and *Sir Thomas More*. His *Recollections of the Table Talk of Samuel Rogers* (1856) must also be mentioned. He attacked Payne Collier's ed. of Shakespeare in *Remarks on Mr. J. P. Collier's and Mr. Charles Knight's Editions of Shakespeare* (1844), and *Strictures on Mr. Collier's New Edition of Shakespeare* (1859), which cost him his friendship with his fellow writer. D. left his valuable library, which contained many rare books, to the S. Kensington Museum, London. In the *Catalogue*, pub. in 1875, is a 'Biographical Sketch', by John Forster.

Dyce, William (1806-64), Brit. artist, b. at Aberdeen. His most famous scriptural paintings were a 'Madonna and Child,' and 'Joshua shooting the Arrow of Deliverance'; some of his classical pic-

tures also are of great merit, but his finest and best-known works are the Arthurian frescoes in the robing-room of the House of Lords.

Dyck, Sir Anthonis (Antony) Van see VAN DYCK.

Dyer, Sir Edward (d. 1607). Eng. poet and courtier, b. at Sharpsham Park, Dorset. After studying at Oxford he travelled awhile, and then entered the court of Elizabeth, who employed him on sev. embassies. He, Sir Philip Sidney, and Fulke Greville were intimate friends from boyhood, Sidney himself writing of their having 'one mind in bodies three.' D. and Greville were chief pall-bearers at Sir Philip's funeral. Spenser speaks highly of D. as a poet, but only one of his songs is now generally remembered, *My Mind to me a Kingdom is*. His verse and prose writings were collected by A. B. Grosart (1872). See R. M. Sargent, *At the Court of Queen Elizabeth: the Life and Lyrics of Sir Edward Dyer*, 1935.

Dyer, George (1735-1841). Eng. author, b. in London, educated at Christ's Hospital and Cambridge. Besides writing a *History of Cambridge University* and other vols., he assisted in the preparation of Valpy's ed. of the classics (141 vols.), ruining his eyesight in the work. His friend Charles Lamb speaks of him very tenderly in his essays, *Orford in the Vacation*, and *Amicus Redivivus*.

Dyer, John (c. 1700-58). Brit. poet, spent some months sketching and painting in S. Wales. *Grongar Hill* (1726), which describes his native scenery of Towry, secured instant renown. The impressions of his tour in Italy are expressed in his *Ruins of Rome* (1740), which is more readable to-day than his didactic epic on sheep and wool, entitled *The Fleece* (1757).

Dyer, Reginald Edward Harry (1864-1927). Brit. soldier, b. Oct. 9, at Simla, India; son of Edward Dyer, a brewer. Educated at Middleton College, co. Cork. Commissioned in W. Surrey Regt., 1885 and transferred later to the 25th Panjabis of Indian army. He served in the Burma campaign of 1886-87, and the Zakka Khel expedition of 1908. In the First World War he commanded 45th infantry brigade on the E. Persia border. Brigade-Commander at Jalandhar, 1919, he was sent by the viceroy in April of that year to Amritsar, where rebellion was strongest. Here he pursued a policy of terrorism (see AMRITSAR) of which particulars became known only gradually; D. was appointed in May to command on frontier. An inquiry at Lahore, Nov. 1919, at which D. gave evidence, resulted in his being directed to resign. He afterwards dabbled in science, and was inventor of a range-finder. Wrote *The Raiders of the Sarhad* (1921).

Dyer, Thomas Henry (1804-88). Eng. historian and antiquarian, b. in London. His chief historical works are, *Life of Calvin* (1850), *History of Modern Europe* (1861-4), and sev. vols. on Rom. hist., which have been severely handled by critics. His antiquarian books on Pompeii and Athens have met with greater approval.

Dyer Sir William Turner Thiselton- (1843-1928). Eng. botanist, b. at Westminster. Prof. of natural hist. at R.A.C., Cirencester, 1868; prof. of botany, Royal College of Science, Ireland, 1870; assistant director at Kew Gardens, 1875; and director, 1885-1905. He also acted as Brit. Commissioner at sev. great exhibitions—Melbourne, Paris, and St. Louis. He ed. the Eng. ed. of Sachs's *Text-book of Botany* (1875) also *Flora Capensis*, and *Flora of South Africa*. He was vice-president of the Royal Society from 1896 to 1897, and was made K.C.M.G. in 1899.

Dyersburg, city of N.W. Tennessee, co. seat Dyer co., with flour and saw mills, cotton gins and textile mills, etc. Pop. 10,000.

Dyer's Rocket, see WELD.

Dyes and Dyeing, art of colouring fabrics, textile or otherwise, in such a way that the colour is evenly distributed and is difficult to remove. D. is in common use with wool, silk and leather, which are animal in origin, and with cotton, jute, linen, etc., which come from the vegetable world. It is an old art practised by E. peoples from time immemorial. Thus there is mention in the Book of Exodus of 'blue and purple and scarlet,' and it is believed that the Tyrian dyes were discovered by the Phœnicians as far back as 1000 B.C. It is this purple, which was manu. at Tyre, Tarsus, and Alexandria, that is constantly referred to, not only in the O.T., when the prophets speak of the purple-dyed vestments of the priests, but in the works of Homer, Strabo, and Herodotus, and indeed the one D. process described at any length by the natural historian, Pliny, is that of obtaining the same Tyrian dyes. Thus from the account of Pliny certain shell fish have been made by moderns to yield the royal colour over again. Other evidence that D. was one of the primitive arts is offered by blue and fawn, and reddish pieces of mummy cloth discovered by Egyptologists, whilst coloured church vestments that are still preserved clearly show that D. was practised with considerable success in the twelfth and thirteenth centuries.

Cotton and Linen are composed of fibres essentially of cellulose, which are susceptible to strong acids and alkalis, but dilute alkalis and weak acid solutions have little effect.

Wool contains sulphur and has basic properties. Alkalis and strong acids tend to destroy it.

Silk resembles wool in some ways, but is more resistant to acids and alkalis.

Jute contains cellulose and a tannin combined.

Artificial silk is of various kinds, such as rayon (including viscose, decomposed nitrocellulose and cuprammonium types), which is essentially cellulose, a cellulose acetate type, which is no longer composed of cellulose, but of the compound cellulose acetate; and nylon. Each type presents its own problems to the dyer, and much research was, for example, necessary before dyes suitable for nylon were

elaborated. The same is true of the new plastic fibre terylon.

Unions, e.g. fabrics made of more than one of the above.

The prime necessities of a good dye are, of course, that it is both permanent and even—two qualities which it is by no means easy to obtain. Thus, the simplest process affords hardly any safe dyes. This method may be briefly described as submersion of the fabric to be dyed in a bath of the colouring matter. Hardly any natural dyes are effective when so used, but good results are obtained by bringing certain artificial dyes, such as sulphindigotic acid and picric acid, which were once popular, or modern aniline dyes, into contact with wool and silk. The pigments are in some way absorbed by the fibre, and the solution is robbed of its colour. It has been found by experience that temp. has a great deal to do with the goodness of the dye. The next process is similar to the first, except that the reduction of an insoluble colouring matter to a soluble state is an indispensable prelude. Thus, arnatto and indigo are applicable in this way if, that is, they have first been acted upon by solvents, whilst the pink pigment of safflower is set free by the action of "alkali."

Cotton possesses no affinity for native colouring matters. It is therefore necessary to introduce what are known as 'mordants' to prepare the material for the reception of the dye. An example will best illustrate the function of a mordant. It is required, let us say, to obtain black calico with the aid of the natural dye, logwood. First of all the calico is steeped in a hot aqueous solution of sulphate of iron. As the acid of this salt is not volatile, the cloth is passed through lime water, the effect of which is to precipitate the mordant, in this case, hydroxide of iron, which enters into some kind of intimate combination with the calico. If the calico is now put into a hot logwood decoction, it will, within half an hour or so, assume a dense black colour. (A great many substances are now employed as mordants, the chief of which are the salts of tin, iron, aluminium, copper, and chromium. Stannous chloride, or muriate of tin, is one of the most popular.) What has really happened is that the colouring principle (logwood) has lost its solubility and entered into combination with the iron hydroxide, the resulting compound being precipitated and in some manner infused into the fibre. The precipitate so formed is technically called a lake of the logwood, or the iron hydroxide. If the 'lake' were first made and then the calico put into a bath of it, there would be no D. at all, as the precipitate would simply rest on the surface of the fibre and would enter into no sort of intimate union at all.

There are two classes of mordants, the acid and the basic. *Acid mordants* include bodies such as tannin and oil mordants, e.g. that made by the action of strong sulphuric acid on olive oil. They are used largely for the fixation of basic dyes on cotton, the process being carried out either in a moderately cold solution

or up to about 70° C. A feebly acid substance is usually added to slow down the dyeing process and obtain even shades.

Basic mordants include the hydroxides of metals such as iron, chromium, tin, and aluminium, all of which are insoluble in water. They are used in conjunction with acid dyes. Wool is capable of splitting up some salts of these metals and precipitating the corresponding hydroxides. Cotton, however, is unable to do this, and therefore a salt of the required metal with a very weak acid such as acetic acid is decomposed by the action of water (hydrolysis) to give the metal hydroxide. Or sometimes a fixing agent is used to perform the precipitation of a basic substance.

Before proceeding to a classification of dyestuffs, there are a few other points to which it is necessary to draw attention. 'Adjective' dyes are those where a mordant is used, whilst the other and more direct dyes are often spoken of as 'substantive.' Mordants may be introduced in three ways: (1) By the 'mordanting and D.' method, the material is first mordanted and the D. is a separate and subsequent operation; (2) the material may first be dyed and afterwards mordanted, the two operations being performed in a reverse order. This is called the 'D. and saddening' method, and is largely employed with acid mordant dyes. As the colour is clearly fixed in the first bath and only developed in the second, this process does not commend itself for the matching of patterns; and (3) the two operations of D. and mordanting may be performed together by which it is called the 'single bath' method.

Classification of dyestuffs.—For convenience of discussion and clearness of arrangement, it is usual to divide dyestuffs into three broad groups: (a) Organic natural dyestuffs; (b) mineral dyestuffs; and (c) organic synthetic dyestuffs, which include nitro-, azo-, and azino-compounds; sulphurised dyestuffs, and quinone and triphenylmethane derivatives; the phthalocyanines (e.g. Monastral Blue); and such recent developments as Alcan Blue.

(a) *Organic natural dyestuffs.*—One of the oldest of these is indigo. This is obtained from the *Indigo tinctoria*, a plant much cultivated in India. For twelve hours the leaves are steeped in a water vat, and are then transferred to a second vat and agitated. The result of this is that the soluble indigo-white, formed in the first vat, is oxidised by means of the oxygen in the air to indigo, which falls down as a blue sediment. The contents of the vat are then boiled and repeatedly strained, after which the indigo is compressed into slabs, from which are obtained the well-known cubes of commerce. Natural indigo, like so many other native dyes, is now being rejected for an equally effective synthetic preparation. Yarn and piece goods especially are dyed with indigo. Textile fibres readily absorb the soluble indigo-white referred to above, which is obtained from the commercial product by the action of a reducing agent. Exposure to air re-oxidises the dye so

that the cotton or other stuff is dyed to the requisite blue. Indigo is freely used in combination to produce other shades. Logwood is derived from a tree indigenous to Central America, the scientific name for which is *Hæmatoxylon campechianum*. It is invaluable in the production of black or blackish wool and cotton, the shade depending on the particular mordant. Thus, with salts of iron it produces dark greys and black; with dichromates, various blues and black; with aluminium salts, purple; and with different copper salts, dull blends of green and blue. If a very fast black is wanted for cotton, it is usual to employ iron-tannate as the mordant. This is fixed on to the fibre by first working the cotton in a decoction of sumac or some other tannin compound and then dipping it into a bath of the soluble iron salt. The cloth is now ready for immersion in logwood, provided, that is, it has been first thoroughly well washed. Cochineal, which is obtained from a small insect, the *Coccus cacti*, is especially suitable for animal fibres, and can be made to impart some fine scarlets and crimsons to woollen fabrics. Various reds and reddish-browns are still produced in wool-D. from sanderswood, barwood, and camwood, which are procured from W. African species of *Baphia* and *Pterocarpus*. Different shades of yellow are procurable from fustic, which comes from the *Morus tinctoria*, a species of mulberry tree, and also from weld, which comes from a wild mignonette (*Reseda luteola*); Persian berries, derived from the Rhamni of the Levant, and from the Quercitron bark, which is the inner bark of a N. American oak (*Quercus tinctoria*).

(b) *Mineral dyestuffs*.—These have been largely replaced by coal-tar dyestuffs. The colours obtainable are Prussian blue, manganese brown, chrome yellow, and iron buff. The first is procured on cotton by treating it first with prussiate of potash and then with salts of iron, whilst on wool the prussiates must be decomposed with mineral acids. The brown is produced from potassium permanganate. Animal fibres boiled in a solution of this salt become impregnated with it, and the permanganate thus absorbed is easily reduced to the insoluble manganic hydroxide, which is also brown. If cotton is to be dyed brown, it must be mordanted with manganous chloride. After the D. operation, it must be passed through a hot solution of sodium hydrate so as to get a precipitation of manganous hydroxide. This salt is readily oxidised to the brown manganic hydroxide, the common practice being to pass the cotton into a cold and dilute solution of bleaching powder. Ferric hydroxide gives iron buff, and yellow and orange may be obtained in cotton D. by fixing lead sulphate or lead oxide on to the fibre, and then submitting the fibre to a solution of bichromate of potash.

(c) *Organic synthetic dyestuffs*.—A remarkably wide range of colours is producible from such dyestuffs, and as they are easy to manipulate and effect often a cheaper and faster dye than the natural

dyestuffs, they are popular with manufs. and are rapidly superseding the former class altogether. Generally speaking, the colour depends on the chemical group to which the dye belongs. It will be convenient to classify these colouring matters:

(1) *Nitro-dyestuffs*.—These are applicable to animal fibres, which are dyed in a bath slightly acidified with sulphuric acid. The chief members of this section are aurentia, picric acid, Victoria-palantine and naphthaline-orange, and naphthol, yellow.

(2) *The di- and tri-phenylmethane group*.—Methyl violet, magenta, malachite green, and auramine, and indeed most of the basic dyes, belong to this class. If sulphonated, these bodies become acid dyes and give such colours as acid violet, acid magenta, guinea-green, etc. Wool is dyed most of these colours in a neutral bath. The dye-bath is at first cold, but the temp. is gradually raised to boiling point so that practically the whole of the bath is exhausted. Cotton fabrics should first be mordanted with tannic acid and fixed in tartar emetic. The chief objection to this class is that they are fugitive to light.

(3) *The azo-group*.—Members of this class may be sub-divided into monazo-disazo-, trisazo-, etc., dyes according to the number of their azo-groups, and they may be still further split up into oxyazo-(OH), and amino-azo-(NH₂) dyes. In this group are counted nearly all the direct dyes, and their application is quite straightforward. Acid or neutral bathis may be used. One means of overcoming the tendency of these colours to fade on exposure to light is to treat the fabric after D. with a hot solution of chromium fluoride, or copper sulphate. Under this heading fall the benzidine colours. Azo dyes form about half the total number of dyes in general use.

(4) *Anthracene-derived dyes*.—Alizarin (synthesised in 1868 by Graebe and Liebermann) is the oldest of these. Others are, anthrapurpurin, flavopurpurin, anthracene blue, alizarin brown, alizarin green, alizarin indigo blue, alizarin black. In recent times sev. vat dyes have been made. These vat dyes, like indigo, are insoluble in water, but can be obtained as the leuco-compounds when reduced. These are soluble in alkalis, and if the fabric to be dyed is steeped in an alkaline solution of the leuco-compound, the latter is taken up. Subsequent oxidation brings out the coloured material required.

Indanthrene (in various shades of green, yellow, etc.), the Alcol colours, (yellow, red, etc.) and anthraflavone are examples. The trade name for the common method of obtaining some alizarin colours is the sulphated oil process. The stuff to be dyed is impregnated with alizarin oil, and then dried. After being mordanted with aluminium acetate, it is dyed, steamed and finished. Alizarin gives splendid Turkey-reds on cotton. These dyestuffs give stable colours.

(5) *Aniline black*.—The composition of this colour is still a vexed question. It is

produced by the oxidation of aniline. There are, broadly speaking, three stages in the oxidation. Emeraldine is produced if the oxidation is limited; nigraniline is the second product and gives a violet-black; the third and final product is ungreenable black, which is remarkably stable.

(6) *The phthalein group of colouring matters.*—This includes gallein, erythrosin, and the eosins. The dyes produced are wonderfully bright but fugitive to light.

(7) *The synthetic indigo group.*—The synthetic production of indigo on a manuf. scale was made possible by the researches of Baeyer (1880) and Heumann (1890). Indigo itself is a vat dye. Other dyes are the alibia colours (containing bromine) thioindigo colours (containing sulphur), etc.

(8) *The sulphide dyes.*—These have been largely developed of late years. They are insoluble in water, but are soluble in sodium sulphide. Frequently the dye is reduced to a leuco-compound, which is then taken up by the fabric, when subsequent oxidation brings out the colour. They are largely used for D. artificial silk, but are not so good for wool. They give excellent fast colours. Vidal black is a typical example.

(9) *The phthalocyanines.*—The first phthalocyanine dye was discovered by chance in 1928, during the routine manuf. of phthalimide at Grangemouth. It and other members of its class may be regarded as being built up of four molecules of phthalonitrile and a nucleus consisting of either two atoms of hydrogen or an atom of almost any metal, e.g. copper. Phthalocyanines were first marketed in 1935.

(10) Other classes of dyes are azine, oxazine, thiazine, thiazole, acridine, nitro, quinoline.

Theory of Dyeing.—It is probable that the process, as applied to wool and silk, results in chemical action, but it is idle to make even this tentative assertion in the case of cotton and other vegetable stuffs. Writers on the subject uphold either the mechanical or chemical hypothesis. According to the first the colouring matter is absorbed into the fibres of the material; variation in size of dye molecules and in the pores of different fibres accounts for the fact that the same dye will not colour all fabrics equally well; furthermore, heat and the action of certain chemicals are held to expand the pores. The following facts support the chemical combination theory: not only colouring matters, but also textile fibres are all either acid, or acid and basic in character, and the fibres can absorb and retain acids, alkalies and certain salts. See A. Flindley, *Treasures of Coal Tar*, 1917; A. R. Ramsey and H. C. Weston, *Artificial Dyestuffs*, 1917; A. G. Green, *The Analysis of Dyestuffs*, 1920; K. Saunders, *The Aromatic Diazo-Compounds*, 1937; C. Whitaker and C. Wilcock, *Dyeing with Coal Tar Dyestuffs*, 1939.

Dye Trade. The hist. of the trade in dyestuffs goes back to the middle of last century, when Sir W. H. Perkin (then a

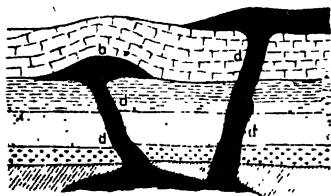

lad of 18), discovered the aniline dye, 'mauve' or 'mauveine.' Eng. people were slow to see the importance of the discovery, and as a result of farsighted action on the part of the Gers. there was developed in Germany an immense dye-making industry, enabling the Ger. firms to obtain practically a monopoly of the dye trade of the world. When the First World War broke out the Gers. had ready to hand factories fully equipped for the production of high explosives of all kinds in great quantities. On the other hand Great Britain and her allies were put in a position of the gravest possible embarrassment and danger owing to the absence of such factories. After the armistice of 1918 the Brit. Gov., as the result of a series of resolutions passed by the Allies in Paris, took steps to prohibit the import of dyestuffs under the Customs Act, 1876. It was decided in the Courts that the prohibition was illegal, and accordingly the Import Regulation Act of 1920 was passed, setting up a Committee for the issue of licences for the importation of dyestuffs. Unfortunately there was an interval of nearly a year between the decision of the Courts and the operation of the Act, and the Gers. availed themselves of that opportunity to pour into Great Britain enormous quantities of dyes of all kinds. The result was that for over two years after the Act became effective the dye-makers of this country were struggling against an overwhelming burden of foreign competition. Since then, however, they have made very remarkable strides indeed—so remarkable that an unsuccessful effort was made by the Labour Gov. in 1930 to put an end to the Act of 1920 (generally known as the Dyestuffs Act), the assumption being that the Brit. dye-makers had done so extraordinarily well that they were in no further need of protection. To-day, of the dyestuffs used in Great Britain 93 per cent are produced in the country and all the intermediates are home-made. All that is left to the foreign producer is 7 per cent, consisting very largely of comparatively small quantities of dyes of a novel or particularly complex type, because Brit. dye-makers have wisely concentrated on the production of dyes for which there is the greatest demand. Before the First World War the production of dyes in Great Britain was about 9,000,000 lb. avoidupois; by 1931 it had become 55,000,000 lb., and exports, which were 4,000,000 lb. before the First World War, were 15,000,000 lb. When the Act came into operation at the end of 1920 the price of dyestuffs was 4s. 4d. per lb.; the pre-war price was 1s. per lb. To-day the average price of Brit. dyes is 1s. 5d. per lb. The Brit. dye-makers claimed that this Act must be continued for a time unless the country is prepared to run the risk of seeing a great deal of the work which had been done thrown away and the development of the industry suddenly arrested, and this view prevailed in the House of Lords where the gov. was defeated. Both in Germany and the U.S.A. the substantial dye-making industries have been sheltered by high

protective tariffs, securing for the dye-makers a monopoly of their own market. This has been very effective in the U.S.A. where the tariff Act of 1930 levies a duty of 7 cents per pound plus 10 per cent *ad valorem* on Amer. selling price of similar competitive articles. The result is that in the last year reported the U.S.A. produced 111,121,505 lb. of dyes, 13,244,676 lb. of colour lakes, 5,000,000 lb. of coal tar medical products, 1,599,430 lb. of coal tar perfumes and 2,292,450 lb. of perfumes. Before the First World War, the production of dyes in Great Britain was about 9,000,000 lbs.; by 1935 it was well over 50,000,000 lbs.; while exports had risen from 4,000,000 lbs. to 16,000,000 lbs. See H. Levinstein, *The British Dyestuff Industry*, 1919.

Dyk, Victor (1877-1931), one of the leading men of letters and dramatist, as well as politician, of Czechoslovakia, *b.* at Psovek, Bohemia. As a lyrical poet, he found his themes in exhortation to his nation and political satire. His dramas were noted for an epigrammatic style, but as a novelist he was less successful. When Czechoslovakia became a free nation, he was a member of the Legislative Assembly, then of the House of Representatives and, finally, of the Senate. Among his vols. of verse are *Force of Life* (1898), *Fanities* (1900), *Satires and Sarcasms* (1905), *The Window* (1921), and *The Ninth Wave* (1930). See lives by H. Jelínek, 1932, and A. Novák, 1936.

Dyke Acland, Sir Henry Wentworth, see ACLAND.

Dykes are wall-like masses of igneous rock which fill up more or less vertical fissures in the earth's crust, and are so called from the Scottish word for wall.

DYKE

- d. Igneous rock forcing its way in overlying stratified rocks. When this solidifies, in the cracks igneous dykes are formed.
- b. A dome of lava solidified before coming to surface—a laccolith.

The two main characteristics of D. are: (1) They are bounded by more or less parallel surfaces and are of nearly constant width; (2) they are generally vertical at the time of intrusion. They commonly occur on the sites of old volcanoes, and the manner of their formation can be observed in the active volcanoes such as Vesuvius and Etna. Volcanic cones are fissured either by the hydrostatic pressure of the column of lava in the pipe, or by

explosions due to the pressure of dissolved vapours and gases acting on the walls and roof of the funnel. Into the rents and fissures so formed the lava rises, forming D., veins, and horizontal sheets or sills. If the lava is extremely fluid, it ascends rapidly in the cracks and fissures and, cooling quickly on the outside but more slowly in the centre, forms D. with a vitreous edge and a crystalline interior. When, however, the lava is most viscous, it may solidify before reaching the top of the fissure, leaving a cavity which in time becomes filled with fragmental material by the crumbling of the walls, thus giving rise to 'Agglomerate D.' Since D. are of deep-seated origin, they are only exposed to observation as the result of erosion. If the sedimentary strata, into which they have been injected, are more easily weathered than the igneous material of the D., the latter stand up as vast walls, while where the igneous rock is more easily denuded the course of the D. is represented by a trench. As a general rule, D. run in straight lines, but may occasionally be zigzag. They vary in thickness from a few inches to 20 or 30 yds., and may be any length from a few feet up to 100 m. The Cleveland D. of the N. of England is 60 m. in length, and some of the Scottish D. are even longer. As well as forming a network in fissure eruption regions, as in Scotland, Iceland, and the Faroe Is., D. occur in the neighbourhood of large plutonic intrusions, such as granite bosses. These D. are finer grained than the granite from which they come, and may merge into mica porphyries, granophyres, and quartz-felsites. Where D. are intruded in the sedimentary strata, whether through fissures or along joint planes, the adjacent rocks are to some extent affected by the extremely high temp. of the igneous material. The rocks may occasionally be recrystallised, sandstones being altered to semi-crystalline quartzites, and limestones converted into crystalline marbles; more often, however, they are only baked or indurated, as when soft clays are metamorphosed to flinty shales, Lydian-stone, or porcellanite (see METAMORPHISM). Regarded petrographically, D. belong to the phase 'Minor Intrusions' (sometimes called the dyke-phase), the third phase in the regular cycle of igneous activity, and according to their distribution and arrangement may be referred to two types: (1) D. in plateau regions; (2) D. in mt. dists. The former are characterised by a regional parallelism, whilst the latter are more often grouped about certain centres and tend to a radiate arrangement. See IGNEOUS ROCKS, VOLCANOES, etc.

Dykes, John Bacchus (1823-76), Eng. church composer; graduated at Cambridge, and became junior canon and precentor of Durham in 1849. Doctor of Music in 1861, and vicar of St. Oswalds, Durham, 1862. As joint-editor of *Hymns Ancient and Modern*, he wrote for that compilation some of its best-known tunes, e.g. 'Jesus, lover of my soul'; sev. of his anthems and services also have attained great popularity.

Dykh-Tau, third highest mt. in the Caucasus, 17,190 ft.; it belongs to the Elburz group.

Dymoke, Eng. family holding the right of hereditary championship to the crown. Their representative formerly had to appear at the coronation banquet and challenge all comers to dispute the king's title. This office is held by tenure of 'grand serjeanty' in connection with the manor of Scrivelsby, Lincolnshire, which passed to Sir John D. (fourteenth century) by his marriage with the heiress of the Marmions.

Dynamical Units, see UNITS.

Dynamic Isomerism, see TAUTOMERISM.

Dynamics (Gk. *dynamis*, strength, force), the science of motion, a branch of mechanics devoted to all problems of motion, as opposed to *Statics* that deals with problems of bodies in equilibrium or at rest. D. depends on three laws, called Newton's laws of motion. These state (1) Every body continues in a state of rest, or of uniform motion in a straight line, except in so far as it may be compelled by impressed force to change that state; (2) change of motion (momentum) is directly proportional to the impressed force, and takes place in the direction in which force acts; (3) to every action there is always an equal and opposite reaction, viz. if a body A exerts a force on a body B, then simultaneously the body B exerts an equal and opposite force on the body A. On these three laws depend all our knowledge of motion of terrestrial and heavenly bodies. Einstein's theory of relativity has shown that in certain very special problems the system of mechanics based on Newton's laws fails to account for the quantitative results obtained. The science of D. was begun by Galileo at the end of the sixteenth century, when he studied the motion of falling bodies and disproved the Aristotelian idea that the speed of a falling body depended on its weight. Galileo, Huyghens, and especially Newton, laid the foundations of the subject, which was further developed by continental mathematicians in the eighteenth century, and subsequently by numerous other mathematicians and scientists. See S. Loney, *Treatise on Elementary Dynamics*, 1889-92; H. Lamb, *Dynamics*, 1923; E. T. Whittaker, *A Treatise on the Analytical Dynamics of Particles and Rigid Bodies*, 1927; S. Goldstein (ed.), *Modern Developments in Fluid Dynamics*, 1938; M. Davidson, *Introduction to Dynamics*, 1918.

Dynamite, explosive consisting of some absorbent material impregnated with nitro-glycerin. Nitro-glycerin, which was discovered by Sobrero in 1846, is produced by dropping glycerin into a mixture of strong nitric acid and strong sulphuric acid, and is itself a powerful though dangerous and unreliable explosive. In 1863 Alfred Nobel commenced experiments with absorbent substances with a view to arriving at a solid or plastic explosive with nitro-glycerin as its active constituent. He was only moderately successful until he applied the method of causing explosion by detonation with

mercury fulminate. He finally fixed on a siliceous earth known as kieselguhr as the absorbent best suited for the purpose. Kieselguhr or guhr is composed of the fossilised remains of diatoms, and consists of silica to the extent of about 95 per cent. It is found in Austria, Germany, Norway, Scotland and Australia. It has the advantages of being itself inert and non-combustible, and of being capable of absorbing three times its weight of nitro-glycerin. In actual manuf. the nitro-glycerin is produced by mixing three parts of nitric acid of sp. gr. 1.5 with five parts of sulphuric acid of sp. gr. 1.84; the mixture is cooled and the nitro-glycerin is introduced in a thin stream by means of compressed air. The kieselguhr is prepared by calcination at low red heat in which moisture and organic substances are removed. The guhr is usually pink at this stage, owing to the presence of iron. (If not, red ochre is added.) Magnesium carbonate or calcium carbonate up to 2 per cent is then ground in. (These carbonates serve to neutralise any acid subsequently formed if the nitro-glycerin decomposes during the lapse of time before the dynamite is used.) The well-ground mixture is then sifted through a 30-mesh sieve. The guhr is weighed out into lined rubber bags, and three parts of nitro-glycerin are added for every part of guhr, and the mixture is thoroughly completed by hand, after which the product is compressed into cartridge form by means of a special D. pump in which all precautions are taken to avoid friction. The D. is then wrapped in waterproof paper. D. is a greasy plastic solid of sp. gr. 1.55 to 1.65. It burns quietly when ignited, but may be exploded by a fairly vigorous percussion. It explodes with great rapidity, requires very little tamping, and has great shattering power if simply laid upon the ground. This has given rise to the saying that 'dynamite explodes downwards', as a hole is torn in the ground even when it is unconfined in other directions. It loses only one-sixth of its power under water, so is well adapted for subaqueous operations. It freezes at 40° F., and when frozen is difficult to explode. The operation of thawing D. is attended with some danger, and should only be performed when the rise of temperature can be carefully regulated. D. is used chiefly for blasting. Its shattering power is too great for quarry work generally, but for breaking up huge boulders and roots of trees, and for destroying obstacles to navigation under water, its efficacy is unrivalled. The rapidity of explosion renders its use as a propellant in guns impossible, though used as a shell explosive in the pneumatic guns of the U.S.A. military and naval services. There are many modifications of the D. made with kieselguhr. One of these is blasting gelatine, where the nitro-glycerin is incorporated with collodion cotton, forming a gelatinous plastic material which is quite unaffected by damp. In order to prevent D. from freezing, the addition of such compounds as monochlorodinitro-glycerin or glycerin

dinitrate has been suggested. See A. Marshall, *Explosives*. 1917-32; J. Reilly, *Explosives. Matches and Fireworks*, 1938.

Dynamo, see ELECTRIC GENERATOR.

Dynamometer, any instrument used for the measurement of force or power developed in machinery. It is often termed a brake or absorption D., so called because it absorbs energy from the machine due to a frictional resistance. The instrument measures this absorption, and so affords a method of obtaining the rate at which the machine is doing work on the brake. As a transmission D., it transmits the power measured without any absorption of energy other than that due to the friction of the machine, and which by construction can be reduced to a minimum.

Dyne, dynamical absolute unit of force in the centimetre-gramme-second (C.G.S.) system. It is defined as the force which, applied to a mass of one gramme, will produce in it an acceleration of one centimetre per sec. The practical unit of force is the megadyne, i.e. 1,000,000 dynes.

Dyrrhachium, see DURAZZO.

Dysart, royal burgh and seaport, near Kirkcaldy, Fifeshire, Scotland; the earldom of D. dates from 1643. There are coal mines near and the tn. weaves textiles and exports coal. Pop. 4500.

Dysentery (Gk. *δυσ*, difficult; *έντερον*, intestine), an infectious inflammatory disease of the large intestine, characterised by the formation of ulcers and the consequent evacuation of blood and shreds of tissue. The disease was at one time common in temperate climates, but is now practically restricted to the tropics, particularly where sanitary arrangements are imperfect. It was a serious disease in the First and Second World Wars. There are two main types: *amoebic D.*, caused by the presence of a protozoan, *Amoeba dysenteriae*, and *bacillary D.* Two distinct bacilli have been identified as associated with dysenteric symptoms; that discovered by Shiga in Japan and that discovered by Flexner in the Philippine Is.

Symptoms.—The onset of the disease is accompanied by general illness and diarrhoea. The desire to evacuate is particularly distressing and the discharge is often scanty in amount. The evacuations are at first slimy, then blood-streaked, and if the disease is not checked, ultimately consists almost wholly of blood and shreds from the lining of the large intestine. The ulceration commences about the solitary glands of the colon (large intestine), and gradually spreads until the greater part of the organ is affected. Occasionally the ulcers perforate the intestine, and death is likely to result from hæmorrhage or peritonitis. Febrile symptoms become intensified, it is difficult to satisfy thirst, and the patient becomes greatly exhausted. Gangrenous matter may appear in the evacuation. If recovery takes place, convalescence is protracted, and the disease may persist in a chronic form for years, as the injury to

the tissues of the colon is usually extensive. A troublesome complication of amoebic D. is the formation of abscesses in the liver, often some time after the initial attack.

Treatment.—Owing to the great mortality produced by the disease when epidemic or endemic, preventive measures are of great importance. The stools of infected and convalescent persons should be disinfected and not allowed to contaminate drinking water; precautions against house flies are also necessary, since they frequently spread the disease. The diet should be carefully regulated, no intemperance either in eating or drinking should be permitted, and unripe fruit should be avoided. The most efficacious remedy at the onset of the disease is a good dose of castor oil accompanied by laudanum. Afterwards, ipecacuanha or large doses of salines should be administered. The pain may be alleviated by opium administered every two or three hrs. Opium in warm water and antiseptic solutions may be injected into the bowel, but frequently the passage is so inflamed and irritated that such treatment becomes impossible. Enomata of quinine have been found particularly efficacious in amoebic D. The variety caused by the bacillus of Shiga is best combated by the specific anti-toxin. In some cases of D. recourse is had to appendicostomy, when the appendix is brought to the surface and used as an entrance for irrigating fluids. The active principle of ipecacuanha, emetine, has now been extracted and can be injected or given through the mouth in cases of amoebic D.

Dysmenorrhœa, see under MENSTRUATION.

Dysodil, yellow, greyish, or greenish mineral substance found in Sicily. It is bituminous, and burns vividly, with a disagreeable smell. It is laminated in structure, and often contains fossil fishes and plants.

Dyson, Sir Frank Watson (1868-1939), astronomer royal, Greenwich Observatory from 1910 to 1933; b. at Ashby-de-la-Zouch; son of Rev. Watson D., Baptist minister. He was educated at Bradford Grammar School; and at Trinity College, Cambridge—where he had a distinguished career, being Second Wrangler and Smith's prizeman, also winning the Isaac Newton studentship. He was chief assistant at the Royal Observatory, Greenwich, 1894-1905, and secretary to the Royal Astronomical Society, 1899-1905; in the latter year he was appointed Astronomer Royal for Scotland. He became F.R.S. in 1901, and contributed many mathematical and astronomical papers to the society's *Transactions*, and other scientific journals, and besides official publs. wrote *Astronomy: a Handy Manual* (1910) and (with R. Woolley), *Eclipses of the Sun and Moon* (1937). Knighted 1915.

Dyspepsia (Gk. *δυσ*, badly; *πέψιν*, to digest), functional derangement of the digestive processes. It is simply another name for indigestion, which may be due to general weakness in the organism owing

to other disease, or may be caused by the imperfect carrying out of digestion owing to unsuitable habits of life. By far the commonest cause of D. is improper feeding, either as regards quantity and quality, or as to the manner in which the food is assimilated. The general tendency is to eat too much and too hurriedly. In the first case the stomach and intestines are overworked, and in the second they are given unsuitable material to work upon owing to insufficient mastication. Other causes are the taking of large quantities of liquid during meals, thus diluting the secretions of the digestive tract, and the excessive use of stimulants, including alcohol, tea, coffee, aromatic substances, and smoking. D. may be traced to causes not directly connected with food. Diseases of the teeth, liver, and pancreas, catarrh of the stomach, poverty of the secretions owing to deficient blood supply are all possible precursors of difficult digestion. One of the characteristic symptoms of incipient consumption is a particularly intractable indigestion. Any derangement of the nervous system, such as is caused by worry, mental anxiety, or excitement, is liable to interfere with proper digestion.

The *symptoms* of D. include flatulence, eructations, heartburn, and the characteristic furred, pallid, or pimple tongue. Discomfort is felt in some part of the digestive tract; diarrhoea is likely if the condition be temporary, whilst constipation is characteristic of a more chronic form of D. Other organs suffer impairment of function; vision becomes cloudy or weak, the muscles lose their power to some extent, and there is a general feeling of unfitness for effort. Perhaps the greatest suffering is due to mental symptoms; the dyspeptic finds it difficult to take an optimistic view of things, and is a prey to irritable impulses and gloomy foreboding.

Treatment.—In the first place, D. may be avoided by giving some attention to diet. Faulty teeth should be repaired or replaced, a habit of thorough mastication must be formed, food must be taken regularly and in reasonable quantity, and fluid should be taken separately from the more solid constituents of food, and should preferably be plain water. There are many systems of diet advocated as preventive of D. Probably all of them prove beneficial in some cases or other, but the individual can generally hit upon a system which suits his own peculiar tastes and habits of life. The great secret is temperance. An estab. dyspeptic need not necessarily have recourse to drugs. He should take regular exercise, devote plenty of time to meals, avoid all food which his experience shows him to be unsuitable, and fight against a habit of constipation. When drugs are recommended, the particular circumstances must be borne in mind. A transitory attack may be met with a purgative. If stimulants are required, whisky, quassia, and gentian tonics are usually recommended. Bismuth carbonate has a soothing effect on the nerves of the gastric region. If acid

is deficient in the gastric juice, dilute hydrochloric acid may be taken, and other constituents of the secretions replenished with pepsin or rennet. Where the presence of gaseous products causes discomfort, charcoal in the form of biscuits has an easing effect.

Dysprosium, metal belonging to the 'rare earth' family. It was discovered in 1886 by Lecoq de Boisbaudran. Its symbol is Dy, its atomic number 66, and its atomic weight 161.2 (H = 1) or 162.5 (O = 16). D. oxide is a white solid. D. occurs naturally in the minerals euxenite, fergusonite, xenotime, polycrase and gadolinite, etc. Chemically it is related to erbium, holmium and thulium.

Dytiscidae, or true water-beetles, are coleopterous insects with bare eleven-segmented antennae, and hind legs capable of swimming only. The perfect insect is purely aquatic, though it can fly from one pond to another, the larva is also aquatic, but before changing into a pupa it comes to earth and buries itself, and the pupa is wholly terrestrial. The beetle can live for sev. mins. in a submerged state, but it is obliged to come to the surface for air: this it stores up in air-tubes under its elytra, or wingcases, which fit tightly to its body. It is an active creature, carnivorous of habit: it grasps the prey with its legs and then feeds by its toothed jaws, or mandibles. The larva has hollow, curved mandibles which are used for piercing the prey and sucking the juices from it swiftly and fiercely. The males are frequently found in the mating position attached to the females by suckers on their fore-feet. There are nearly 2000 species of this family already known inhabiting water of cooler parts of the world, and among the chief genera are *Dytiscus*, *Cybister*, *Acilius*, and *Hydroporus*. Related families are the *Gyrinidae* (whirligig beetles) and the *Hydrophilidae*.

Dzaisang, see ZALIAN.

Dzaojikao (formerly Vladikavkaz), cap. of the North-Ossetian Autonomous Republic of the R.S.F.S.R. It is a large tn. with wide acacia-lined avenues, and tram-cars, a huge mkt., and a magnificent view of the Caucasus range, dominated by the rugged peak of Mt. Kazbek some 30 m. to the S. Through the tn. flows the swift Terek riv. A degree of oriental colour and even squalor is provided by the existence of many 'dukhangs'—underground eating and drinking places, and though these nominally belong to the tn. council's organization of catering establs., they are not run on ideal lines. Pop. 80,000.

Dzhalal-Abad, Region of the Kirghiz S.S.R., Soviet Central Asia, in the Tien-Shan mts.

Dzherzhinsky, Felix Edmondovich (1877-1926), Russian revolutionary of Polish birth: b. at Vilna. He joined Social Democratic Party in 1895. Between 1897 and 1902 he was sent to Siberia three times, and three times escaped. Took part in revolution of 1905, and was banished: returning to Warsaw in 1912, was imprisoned until released by the revolution of March 1917. He organ-

ised the secret police or Cheka—later known as the OGPU. In 1921 he became commissar of transport. In 1924 he was head of the supreme Economic Council.

Dzhugashvili, Josif Vissarionovich, see STALIN.

Dzungaria or Zungaria, mountainous region of Sinkiang, China, bordering on Russian Turkestan, and lying between the Tien-Shan on the S., the Greater Altai on the N., and the Mongolian Gobi on the E. The surface is mainly a desert and slightly

hollowed plateau, but there are large tracts of forest, and the plains and valleys afford good pasturage, while cereals are grown in parts. There are numerous int. streams, but the only important rivs. are the Black Irtysh and the Ili. The minerals include gold, copper, iron, and salt. The country was conquered by the Chinese emperor in the eighteenth century. The inhabs. include the Kalmuck Dzungars and Turgots, and also Khalkas and Dungsans, Chinese and Kirghiz.

E

E, fifth letter of the Eng. alphabet, was originally (i.e. in the Semitic alphabet) a consonant, having the phonetic value of *h*, and was called *he*. When the Gks. took over the Semitic alphabet, *he* became *epsilon*; in some varieties of the Gk. alphabet it was adopted to represent the short *e*, while the Semitic *heh* was adopted to denote the long *e* or *ē*. (In other Gk. alphabets, *epsilon* was adopted both for the long and the short *e*.) The Etruscan and the Lat. alphabets used the letter **E** for the sound *e* as in 'men' or 'prey' and made no distinction between long and short vowel.

E is the most frequently used of all the Eng. letters. Its phonetic value, however, varies: the long *e* (as in 'me') agrees with the continental *i*; the short *e* (as in 'men') and the open and long *e* (as in 'prey') agree with the continental *e*; whereas as a final letter it is usually silent (as in 'table').

As a numeral, **E** stands for 250, and in the calendar it is the fifth of the dominical letters.

E, in music, is the third note in the natural scale of C. Its major key has four sharps.

Ea, one of the twelve great gods of the Assyro-Babylonians, god of the ocean and subterranean springs, called Oannes by Berossus (third century B.C.). **E** was father of Merodach. Eridu (modern Abu Sharhrein) was especially sacred to him, as also the Euphrates.

Eadie, John (1810-76), Scottish theologian. From 1843 to the end of his life he was prof. and lecturer of biblical literature in the United Secession Divinity Hall. He possessed wide learning and much power of exposition. His chief works are: *Biblical Cyclopædia* (1819), *Ecclesiastical Encyclopædia* (1861), ed. of Cruden's *Concordance* (1839) and the *Family Bible* (1851).

Eadmer (or **Edmer**) of Canterbury (c. 1064-1124), Eng. historian and monk, intimate friend and chaplain of Anselm. He was nominated bishop of St. Andrews in 1120, but as there was controversy between Canterbury and York for jurisdiction over the see, while the Scottish king maintained his independence of either, **E** returned and resigned the position. His chief works: *Historia Novorum*, 1060-1122 (first printed 1623), and *Vita Anselmi* (publ. 1551) are both in the Benedictine ed. of Anselm's *Works*, 1721. **M. Rule's** ed. in the Rolls series appeared in 1884. **E's** lives of Dunstan, Bregwin, and Oswald are in H. Wharton's *Anglia Sacra*, II. (1691). See G. Grub, *Ecclesiastical History of Scotland*, 1861; Père Raguey, *Eadmer*, 1892.

Edgar the Peaceable, see **EDGAR**.

Eads, James Buchanan (1820-87), Amer. engineer and inventor, granted a

gov. contract (1861) for constructing a fleet of ironclads for use on the Mississippi. With these, the capture of Fort Henry was effected during the Civil War. **E** constructed the steel arch bridge at St. Louis (1867-71), and undertook to deepen the Mississippi's channel by means of jetties. He also planned a ship-railway across Tehuantepec isthmus, but his project was not carried out. See How, *J. B. Eads*, 1900.

Eagle: (1) A gold coin of U.S.A., worth 10 dollars or over £2 10s. The double **E** is a gold \$20 piece, and there are half and quarter **E's**. The bird represented is the *Haliaeetus leucocephalus* (bald or white-headed **E**). (2) The military standard of the Romans, and earlier nations. The Persians, in the time of Cyrus the Younger (fourth century B.C.), carried an **E** on a spear as their standard. The Rom. **E** was of silver, bronze, or gold, with wings extended. It was carried on the top of a spear, with a cross-bar supporting it. Some held thunderbolts in their talons. Napoleon's armies had a similar standard (1804). As an armorial bearing the Imperial **E** was adopted by the Holy Rom. empire, and later by Austria, France, Germany, Russia, U.S.A., and Poland.

Eagle, term employed in speaking of many species of Falconidae in the subfamily Aquilinae. They occur in all parts of the world, usually building eyries in forests or on mountains, and all are fierce and powerful birds of prey. The species described in mythology and art belonged to the genus *Aquila*, but it is not known from actual specimens. *A. chrysaetos*, the golden **E**, is a large and fiercely predaceous bird rarely found in Britain though it has been known to breed in remote parts of Scotland. Its nest or eyrie is usually built on cliffs or mts. *A. nevadensis*, the spotted or screaming **E**, occurs in N. Europe. The sea-**E's** are represented by the genera *Haliaeetus* and *Thalassaeetus*; the hawk-**E's** by *Spizaeetus* and *Limnæus*; the fishing **E's** by *Pandion*; the harrier-**E's** by *Circus*. The Erue or White-tailed sea-**E**, *Haliaeetus albicilla* ceased to breed in Britain only in comparatively recent years. The **E** has been adopted by various nations as a symbol of power, particularly by Germany or, again, as exemplified in the Bible (Ek. xvii.) or as an emblem of nobility and generosity; while, in Christian art, it typifies meditation, and is the symbol of St. John the evangelist. In the Bible, the Hebrew term (*neshet*) equivalent to Gk. (*æeros*), like the Arabic *nisr*, denotes sev. birds of prey. Probably the griffin culture is most often intended. It has no true feathers on head and neck, hence the phrase 'enlarge thy baldness as the **E**' (Mic. i, 16) This bird abounds in Palestine, making its nests in the high

cliffs overlooking the valleys (Jer. xlix., 16). The E. is noted for the telescopic range of its vision, and spies its prey from immense distances, while its flight seems to be watched by many other birds that follow to feast upon the carrion (Matt. xxiv., 28). There is an allusion in Ps. ciii. to the anct. belief that the E. was able to renew its youth. In the Middle Ages it was believed that every ten years the E. beat its way upward high into the sun, whence, plunging

GOLDEN EAGLE

into the sea, its old plumage was shed for new, and its youth was restored. See under separate headings for descriptions of species.

Eaglehawk, municipal bor. of Bendigo co., Victoria, Australia, 4 m. from Bendigo, and 105 m. from Melbourne; noted for fine gold mines. Pop. 5000.

Eagle-hawk, see HAWK-EAGLE.

Eagle Island, Ireland, see ACHILL.

Eagle-owl, or *Bubo*, genus of the family Strigidae, which is represented in all parts of the world but Australia.

Eagle Pass, tn. of S.W. Texas, U.S.A., on the Rio Grande, in an agric. and coal-producing dist. Pop. 6400.

Eagle-wood, see ALOES-WOOD.

Eagre, see BORE.

Eakins, Thomas (1844-1916), Amer. painter; b. at Philadelphia, Pennsylvania; studied art in Paris under J. L. Gérôme at the Ecole des Beaux Arts, also under Léon Bonnat. Also worked in the studio of Dumont, the sculptor. In America, he was prof. and lecturer on anatomy and painting in various schools of art. Assisted his pupil, Samuel Murray, to model the colossal figures of the Prophets on the Witherspoon Building at Philadelphia; modelled two reliefs on the Trenton battle monument, also the horses ridden by Grant and Lincoln on the Soldiers' and Sailors' Monument at Brooklyn. Painted the Crucifixion in Overbrook Seminary; portrait of Cardinal Martinelli; and many other portraits—being best known as a portrait painter.

Ealdhelm, or **Aldhelm** (c. 640-700), Saxon ecclesiastic and scholar, educated

at Canterbury. He became abbot of Malmesbury (676), and bishop of Sherborne (705). The Church of St. Lawrence at Bradford, Wiltshire, alone remains of his buildings. He wrote treatises and verse in Lat. and Eng., some of which survive. The best known are: *De laude virginitalis* (prose) and *De laude virginum* (poetry). See J. A. Giles (ed.) *Opera*, 1844; G. F. Browne, *Aldhelm*, 1903; J. H. Pitman, *The Riddles of Aldhelm*, 1925.

Ealing, pari. bor. and suburb of London, England, 9 m. W. of St. Paul's Cathedral. The anct. vil. now the centre of the tn., lies S. of the high road to Uxbridge. Pop. 120,000.

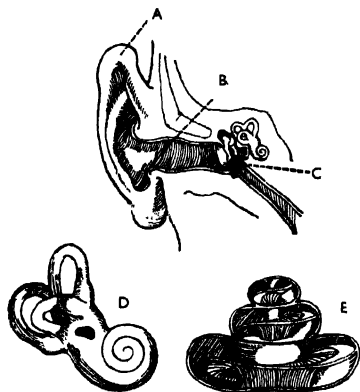

E. A. M. (Ellinikon Apelevtherotikon Metopon), Gk. resistance movement or 'National Liberation Front' in Second World War. See under GREECE.

Eames, Emma (b. 1867), Amer. prima donna, b. at Shanghai, China; studied at Boston, Massachusetts, and Paris. Made her début at Covent Garden in 1891.

Ear. The E., the organ of hearing, is divisible into three parts: (a) the external; (b) the middle; (c) the internal. The most important portion is the internal E. or *labyrinth*, the other two can be considered merely as accessories to this, their function being the collection and transmission of the sound waves so that the sentient portion of the organ may be affected. The parts will be described from the exterior inwards. The external E. consists of two parts, the *pinna* and the *meatus*. The former is a broad, peculiarly shaped, and for the most part, cartilaginous plate, concave on the whole, but thrown into various elevations and hollows to which distinct names have been given, the largest and deepest hollow being the *concha*, which surrounds the entrance to the meatus. The variety of contour is to ensure that the sound waves collected within the rim of the pinna are reflected into the external auditory canal, somewhat similar to the action of the Whispering Gallery of St. Paul's. The pinna is also used to ascertain the direction from which the sound is coming. The meatus, about 1½ in. in length, has an outer cartilaginous portion with many fine hairs and a large number of sebaceous glands which secrete *cerumen* or E. wax. The innermost half of the tube enters the temporal bone which encloses the middle and internal E. The meatus is first directed upwards and then, narrowing in diameter, surmounts a convexity in the floor of the osseous part to dip downwards and widen again to its termination at the obliquely placed *membrana tympani* or *drum*.

The middle E., or *tympanum*, is a narrow, irregular cavity varying in width from ½ in. to ¾ in. between the tympanic membrane and the outer bony wall of the labyrinth. Its enclosed air is in direct communication with the pharynx (throat) by means of the Eustachian tube. This arrangement ensures that the cavity is kept supplied with renewed air at the same pressure as that of the external E. so that the drum is able to vibrate freely.

It contains a chain of small bones which convey the vibrations across the cavity to the middle E. The *membrana tympani* is an ellipsoidal disc about 0.37 in. by 0.33 in., and about $\frac{1}{16}$ in. thick. To its inner surface is attached the handle of the first bone (the *malleus*, or hammer), the rounded head of which fits into a corresponding hollow in the second bone (*incus*, or anvil), and this in its turn articulates with the *stapes*, or stirrup, which fits into the *fenestra ovalis* of the internal E. The *fenestra rotunda* separates the *scala tympani* from the middle E. The complicated ligament and muscle attachments of the chain of bones ensure an exact reproduction at the *fenestra ovalis* of the highly complex movement of the tympanic membrane.

PARTS OF THE EAR

A, pinna; B, meatus; C, eustachian tube; D, cochlea and semi-circular canals; E, section of cochlea.

The internal E. is contained in the petrous portion of the temporal bone and consists of a complex cavity, the osseous labyrinth (auditory capsule), hollowed out of the bone and containing the *membranous labyrinth*. The former is incompletely divided into three parts, viz. the *vestibule*, the *semicircular canals*, and the *cochlea*; the membranous labyrinth is smaller, and the space between the two is occupied by *perilymph*, while *endolymph* is contained in the inner labyrinth. The vestibule forms the central chamber of the labyrinth and communicates in front, by means of a large opening, with the cochlea, and behind, by means of five smaller openings, with the semicircular canals; its outer wall is penetrated by the *fenestra ovalis* mentioned above. The semicircular canals are three tubes differing from one another in direction, length, and position with regard to the vestibule; they are arranged in three planes mutually at right angles, and whatever may be their function in hearing they are certainly of

the greatest importance in the guidance of co-ordinated movement so that bodily equilibrium may be maintained. Each canal is about $\frac{1}{8}$ in. wide, but each is dilated at one end forming an *ampulla* about $\frac{1}{4}$ in. in diameter, and on each ampulla is a crest or ridge (*crista acustica*) projecting into the cavity of the canal and consisting of *auditory epithelium*, which contains distributed filaments of the auditory nerve. The *cochlea* (Lat. a snail shell, from its spiral shape) appears in the form of a blunt cone about $\frac{1}{2}$ in. in height and the same in breadth at the base. It consists of a gradually tapering spiral tube of $2\frac{1}{2}$ turns and some $1\frac{1}{2}$ in. in length, the inner wall of which is formed by a central column, or *modiolus*, from which projects a spiral lamina along the whole extent of the cochlea. The membranous labyrinth consists of structures lined throughout by epithelium, and at certain parts receives branches of the auditory nerve. In the vestibule and canals the structures have a general resemblance in form to the complicated cavity in which they are contained. They do not, however, lie loose within the osseous labyrinth, but along the convex border of the canals, and at the places of entrance of the nerves into the vestibule and ampullae they are fixed to its walls. In the cochlea the membranous structures complete the septum and enclose an intermediate cavity. In the osseous vestibule there are two membranous sacs: (a) the *utricle* (Lat. *utriculus*, a small bladder), connected with the canals, and (b) the *saccul*, connected with the cochlea; these sacs are only in indirect communication with one another. Both contain small masses of calcareous particles (*otoliths*) which are set in movement by vibrations, and they also contain patches of auditory epithelium with nerve filaments. The cavity of the osseous cochlea is divided into three distinct parts: *scala vestibuli*, *scala tympani*, and *canalis cochleae*, by means of two membranes: (a) the *basilar*, and (b) the more delicate *membrane of Reissner*, the oblique direction of which latter causes the smallest portion, the cochlear canal, to have a triangular section; this is in communication with the saccul and contains endolymph, whereas the other two *scala* contain perilymph. The cochlear canal is highly complicated, and only a brief description is possible here. The most important structure of the floor of the cochlear canal, that is, on the basilar membrane, is the so-called organ of Corti, which consists of rods of Corti. There is an inner row and an outer row all along the spiral, each row containing sev. thousand rods, flanking the rods are rows of cells (sev. thousands in each row), each cell bearing short hairs on its free surface, and the auditory nerves passing through the lamina spiralis reach the cochlear tube along the whole length of the spiral and end in filaments which are lost in the organ of Corti, but are probably connected with the hair cells. It is thought that the cochlea distinguishes pitch and timbre in notes. What takes place in hearing may be summarised thus:

The vibrations set up by a sounding body are conducted by the accessory apparatus to the perilymph through the membranous sac, thence to the endolymph. The vibrations in time reach those particular places containing auditory epithelium, and set the auditory hairs or the otoliths in movement, and so excite the delicate filaments below, which causes impulses to pass along the auditory nerve to the brain.

Deafness and diseases of the ear.—The most common affection of the E. is deafness, which is of various types. An impacted plug of wax will cause it, and should be removed by syringing, which however must be carried out with care. It is best to drop a few drops of hydrogen peroxide or liquid paraffin into the E. for two or three nights before syringing, in order to soften the wax. A *furuncle* or boil may also cause deafness, but the diagnosis must be made by a doctor, as it may be confused with other more serious conditions, such as mastoid inflammation. By far the greater number of cases of deafness, however, are caused by affections such as catarrh of the middle ear or Eustachian tube, which, if not properly treated at an early stage may proceed to chronic catarrh. *Adenoids* are a common cause of deafness among children. *Otosclerosis* also brings middle-ear deafness, and is due to obscure changes in the bony labyrinth, but unhappily neither its cause or cure is known. Other diseases include *Otitis Media*, or inflammation of the middle ear; ear-ache, caused by inflammation of the middle ear, or the presence of a foreign body; *Otorrhea*, chronic suppuration of the middle ear; and *nerve-deafness*, due to an affection of the cochlea or the acoustic nerve.

Earheart, Amelia (Mrs. G. Palmer Putnam) (1898–1937), Amer. social services worker and air-woman, b. in Atchison, Kansas. Was the first woman to fly the N. Atlantic, flying as a passenger from Newfoundland to Burry Port, Wales, in 1928. She served with the Red Cross during the First World War and subsequently directed a social service centre in Boston. Flew from Newfoundland to Ireland in 13½ hrs., 1932; and made the first solo flight from Honolulu to Oakland, California, doing the journey in 18½ hrs., in 1935. In July, 1937, when attempting a flight round the world, she was lost at sea with her navigator, Capt. Noonan, near Howland Is.

Earl, title of Brit. nobility, between a marquis and a viscount. It was during the Norman period that this title first became hereditary, and for some time they were called counts, and their wives in the present day are called countesses. The title of E. was the highest hereditary dignity until the reign of Edward III., who created his eldest son 'Duke' of Cornwall, 1337. The eldest son of an E. bears the title of 'viscount,' while the younger sons are styled 'honourable.'

Earle, John (1824–1903), Eng. philologist and clergyman, professor of A.-S. at Oxford, 1849–54; re-elected, 1876. He became rector of Swanswick in 1857,

prebendary of Wells (1871), and rural dean of Bath (1873–77). His works include: *Two of the Saxon Chronicles Parallel* (1865), *A Book for the Beginner in Anglo-Saxon and The Philology of the English Tongue* (1866), *Anglo-Saxon Literature* (1884), *English Prose, its Elements, History, and Usage* (1890), *The Psalter of 1539* (1894), *A Simple Grammar of English now in Use* (1898), *The Alfred Jewel* (1901).

Earle, William (1833–85), Eng. soldier, served in the Crimea. He became military secretary to Lord Northbrook, viceroy of India (1872–76), commander of the garrison of Alexandria during Wolseley's campaign (1882–84), and led a column of the Gordon rescue expedition (1881). While leading his detachment against the Arabs at Kirbekan, he was killed. A memorial statue was erected in Liverpool. See Sir H. Brackenbury, *The River Column*, 1885.

Earlestown, eccles. par. of S. Lancashire, England, 5 m. from Warrington, with railway wagon works, and a sugar refinery. Pop. 11,000.

Earl Marshal of England. The king's marshal (A.-S. *nearh* and *seate*, groom) became early one of the chief officers of state, and, under the Norman and Plantagenet kings, judge in the Courts of Chivalry. Since 1672 the office has been hereditary in the family of Howard (dukes of Norfolk). The earl marshal is now head of the Herald's College in England, regulates all matters connected with armorial bearings, standards, etc., and controls the arrangements for state functions, such as royal processions, drawing-rooms, balls. In Scotland a similar dignity was hereditary in the family of Keith from the fourteenth century till 1716.

Earlom, Richard (1743–1822), Eng. mezzotint engraver, a pupil of Cipriani. He was the first artist to make use of the point in mezzotint work. He engraved plates after Rembrandt, Vandyck, Correggio, and others; the six after Hogarth's 'Marriage à la Mode' are well known. 'Fruit and Flowers,' after J. van Huysum, made his reputation, and 'Bathsheba leading Abishag to David' won much praise. His patron, Boydell, pub. the 'Liber Veritatis,' 1777, with a series of prints from the originals of Claude Lorrain.

Earl's Court, part of the metropolitan bor. of Kensington, London, England, on the District Railway and Piccadilly Tube, with a large hall used for exhibitions and entertainments.

Earlston, Errolsdoun, or Errolsdoun, par. and mkt. tn. of Berwickshire, Scotland, on Leuder Water, 4 m. from Melrose. Tweeds, ginghams and other textiles are manu., and there are dye-works. Ruins of an auct. tower remain, the traditional abode of Thomas the Rhymer (thirteenth century). Pop. 2000.

Early Closing. The movement for reducing the working hours of shop assistants was inaugurated in 1842, since which year the compulsory weekly half-holiday, the introduction of 'summer time,' and other reforms have appreciably improved their conditions. The provisions of the

Shops (Early Closing) Act, 1920-21, were permanently adopted in 1928. The Act states that for only one day weekly may a shop remain open until nine o'clock, and on the remaining evenings it must close no later than eight, although customers inside the doors before closing time or anyone requiring some article urgently in case of illness may be served. Exemptions are given in respect of exhibitions, seasons such as Christmas, while special provisions are made for holiday resorts and sea-fishing centres. The occupier of a shop breaking the law is liable to a maximum fine of £5 for a first offence, and £20 for any subsequent offence. The President of the Early Closing Association is Mr. Winston Churchill, and its Secretary, Albert Larking, C.B.E.; the head offices are 1-3 St. Paul's Churchyard, London. See SHOP ACTS.

Early, Jubal Anderson (1816-94), Amer. Confederate general, practised law from 1838-61. He served in the Florida War (1837-38), and in Mexico (1847-48). In the Civil War he commanded a brigade at Bull Run (1862), and distinguished himself at Williamsburg, Antietam, Fredericksburg, Chancellorsville, and Gettysburg, commanding part of Lee's army. After some successes in the Shenandoah Valley, he was defeated by Sheridan (1864), and by Foster at Waynesborough (1865). He wrote *A Memoir of the Last Year of the War for Independence in the Confederate States* (1867). See G. Pond, *The Shenandoah Valley in 1864*, 188.3.

Early English Text Society, founded in England by Frederick James Furnivall, 1864, in connection with the Philological Society, as were also the Chaucer and Ballad Societies of 1868, and the Wyclif Society of 1882. For these societies Furnivall ed. many works, such as *Saint Graal* (Eng. verse by Lancelot, 1440 (1861-63); Walter Map's *Quest del Saint Graal* (1864), and *The English Conquest of Ireland, 1165-85*, from Giraldus Cambrensis (1896). The aim is to increase knowledge of O. E. writers.

Early Old English, see under ENGLISH LANGUAGE.

Earn, loch of Perthshire, Scotland, about 6½ m. long by 1 m. broad, and about 300 ft. deep. On the S. is Ben Vorlich, a mt. of 3224 ft. and Ardvorlich House is the 'Darnlinvarach' of Scott's *Legend of Montrose*. The riv. issues from the loch, flows E. through the well-wooded valley of Strathearn, past Comrie, Crieff, and Bridge of E., a watering-place near the saline springs of Pitcaithly. The E. finally joins the Tay near Abernethy, about 6 m. from Perth.

Earnest (Scottish, *arles*), trifling sum of money or token given to 'bind the bargain' of a sale or agreement, marking the assent of both parties to a contract. A practice of great antiquity, it is still sometimes observed in England and Scotland. It is not quite the same as part payment, for in the case of E. proper, or 'dead E.', no allowance is made later for the value of the token given beforehand by the purchaser.

Ear-ring, strictly a ring worn as an ornament suspended from the lobe of the ear, which is pierced for the purpose. The custom of wearing Es. has existed among the Orientals from the earliest times. It was common to both sexes among the Asiatic races (Persians, Babylonians and Carthaginians), but reserved for women only among the Gks. and Roms. In Elizabethan times in England, Es. were still worn by men, and sailors sometimes continue the custom. This form of jewellery is not now so universal in Europe as formerly. The two chief kinds are a jewelled stud fitting closely to the lobe, or a drop or pendant hanging from a gold loop.

Ear-shell, see HALIOTIS.

Ear Stones, see OTOLITHS.

Earth (A.-S. *eorthe*), the planet on which we live. The term is also used to denote the solid portion of the globe, in particular the uppermost layer, consisting of disintegrated rock and organic particles loosely bound together, otherwise known as soil. The early chemists recognised four elements: fire, air, water, and E., of which all other substances were thought to be mixtures or modifications. In modern chemistry the term persists as applied to certain metallic oxides. The older chemists gave the name E. to non-metallic substances which were insoluble in water and were not affected by high temps. As many of them had an alkaline reaction they were known as alkaline Es., but subsequent investigations have shown that each such E. is a compound of a metal and oxygen. The term alkaline E. is now restricted to lime, strontia, and baryta, these being oxides of calcium, strontium, and barium. There is another extensive group of oxides known as the rare Es. They occur in sev. rare minerals found in Scandinavia, Siberia, Greenland, and N. America, and are employed in the manuf. of mantles for incandescent gas lamps. The chief metals of the rare Es. are scandium, yttrium, lanthanum, didymium, terbium, and erbium.

The Earth as planet.—The E. is a member of a group of bodies distinguished from other bodies in the universe by their motion around one member of the group, the sun. The central body, or sun, is the only member of the group, as far as we know, which shines by its own light. The other bodies consist of planets which move in elliptical orbits about the sun, and satellites which revolve around certain of the planets. The planets, in order of nearness to the sun, are Mercury, Venus, the Earth with its satellite the moon, Mars, with two satellites; then come a vast number of minor planets or asteroids, and outside of these the larger planets, Jupiter, Saturn, Uranus, and Neptune, with seven, ten, four, and one satellite respectively. The path of the E.'s motion round the sun, that is of its *revolution*, is an ellipse of which the sun forms one focus. The mean distance of the E. from the sun is about 93,000,000 m., and the eccentricity of the orbit is about 3,250,000 m. The plane of the orbit is called the ecliptic, and it is inclined to the E.'s

equatorial plane at an angle of $23\frac{1}{2}^\circ$. The time which the E. takes to make a complete circuit is known as the solar year, and measures 365 days 5 hrs. 48 min. 46 sec. The E. has another movement, rotating about its own axis, thus causing points on the E.'s surface to have periods of sunlight alternating with the periods of darkness. Owing to the inclination of the E.'s axis to the plane of the ecliptic, some places are presented to the rays of the sun more directly than others; this causes the phenomena of the seasons. Also places in high latitudes are presented for longer periods to the sun's rays according to the position of the E. in its orbit; this accounts for the variations in the lengths of day and night in those latitudes. The E. is nearly spherical in shape. The ancients believed it to be a flat disk, and the belief persisted in the popular mind for many centuries. Pythagoras, however, asserted that the E. was spherical and his view was strongly supported by Aristotle, who employed many of the arguments current to-day. The horizon becomes wider as the position of a spectator becomes more elevated, the E. always throws a circular shadow on the moon when it is in eclipse, and the lower part of a receding object is the first to disappear. The E. is, however, not a perfect sphere. In the seventeenth century Jean Richer observed that a clock which kept perfect time in Paris lost about $2\frac{1}{2}$ min. a day at Cayenne, and the pendulum had to be shortened in order to correct the error. Newton explained the occurrence by showing that the attraction due to gravity was less at the equator than in more northerly latitudes owing to an increased distance from the E.'s centre of gravity. This conclusion received confirmation by experiments with delicate spring balances, which registered less weight for a given mass in equatorial than in regions of higher latitudes. It was also observed that the length of a degree of latitude is greater towards the poles than near the equator. The degree is readily indicated with great accuracy by astronomical methods, and its length being determined by careful E. measurement showed beyond doubt that the E. is flattened at the poles. The amount of the flattening is not great, the extent by which the polar diameter is less than the mean equatorial diameter being about one two hundred and ninety-eighth part of its length. The equatorial section of the E. is also slightly elliptical. The approximate length of the polar diameter is 7899 m. and the mean length of the equatorial diameter is about 7926 m., giving a difference of 27 m. approximately. The mass of the E. is given by the most recent researches as 6,000,000,000,000,000,000 tons. The mean density of the earth is computed as about 5.5, the density of pure water at 4° C. being taken as unit. The planet E. is a great magnet. If a magnetic needle is placed upon a pivot so as to oscillate freely it takes up a position which is approximately N. and S. The N. and S. poles of the E. considered as a magnet are some distance from the poles of the

rotatory axis and are liable to secular variation of position.

Origin and history of the Earth.—No theory of the origin of the E. has been generally satisfactory. The nebular hypothesis, which appears to be most in favour, states that the solar system was at one time a great mass of vapour, in which a central nucleus was gradually formed. This nucleus, which is represented by our sun, cast off the less central portions of the mass, which cooled down to form the present planets. The satellites were thrown off from the planets in the same way as the planets separated from the parent sun. There is certainly abundant evidence that the E. was at one time at a much higher temp. than to-day. The gradual rise of temp. on descending towards the E.'s interior suggests that the innermost regions are still at an enormously high temp. The existence of volcanoes which pour out molten rock and hot gases is taken by some as sufficient evidence that the interior is still in a fluid condition, and that the crust is a solidified envelope of comparatively little depth. Physical facts are, however, rather against the likelihood of a permanent gaseous or molten interior, and some scientists have gone as far as to say that the amount of radium in the E. indicated by the discoveries fairly near the surface is sufficient to account for almost any degree of temp. Attempts have been made to compute from geological, physical and other data the length of the period during which the E. has been in a solid state. Lord Kelvin based his hypotheses on arguments derived from consideration of three kinds of data. By judging the rate of the loss of heat from this planet, he placed the limits of not less than 20,000,000 years and not more than 400,000,000 years, as the length of time from the first superficial solidification of the E. to its present condition. From estimating the amount of retardation of the E.'s rotation due to tidal friction he judged that the E. became consolidated not much more than 100,000,000 years ago. Thirdly, by calculating the probable age of the sun's heat, he brought down his estimate of the age of the E. to about 20,000,000 years. Geologists, however, are disinclined to accept any period less than 100,000,000 years as sufficient for the elaboration of the present structure of the E. It is indisputable that many millions of years, probably thirty or forty, must have elapsed while the great sedimentary rocks were being deposited. With respect to the larger features of the E.'s surface, it is likely that two different kinds of movement are responsible. Where the contraction of the E. has caused a lessening of the support below the surface, there has been a subsidence of great areas. In the second place, where the rigid crust has been able to contract into a smaller space, great ridges and folds have been formed, showing marked continuity and parallelism. The subsidences which caused the ocean appear to have taken place at different ages. The Atlantic Ocean probably dates from

middle Cainozoic times; the Indian Ocean may be older, and the Pacific, whether a subsidence of great antiquity or not, has certainly suffered great modifications in comparatively recent times. Akin to the general discussion of the age of the E. is speculation concerning its future. The gradual loss of energy which has diminished the speed of rotation of the E. and caused its cooling and condensation is still going on. The constant operation of tidal friction will cause it to rotate more and more slowly, and the gradual cooling of the sun itself, if not fed by meteors from outer space, will inevitably diminish the amount of energy in the system. A time will come, many millions of years distant, when the members of the solar system will return to their anct. nucleus, and by the force of their impact will establish a nebula of sufficient energy to proceed upon another cycle of planet formation.

Structure of the Earth.—The E. consists of an outer gaseous envelope, the *atmosphere*; a middle layer of water, the *hydrosphere*, occupying the hollows in the surface of the globe; and a central core of solid material, the *lithosphere*. In the course of its solidification, the lithosphere developed ridges, which are represented by the great mt. ranges, and subsidences, which are represented by the great oceans. The progressive cooling had its consequence in stresses in various parts of the surface of the lithosphere which took effect in various movements, sudden occasionally, but long sustained for the most part, and so the general shape of the E. was and is constantly changing; in places the land is gradually lifted above the sea, while other lands are gradually submerged, only to reappear in a later age. There are other agencies at work tending to change the form of the E. The disintegrating forces of frost and water action gradually wear down the older rocks, while the deposition of the débris, mixed with relics of organised life, builds up layers of sedimentary rock. The oldest sedimentary rocks, known as Archaean, contain no traces of life. The sedimentary rocks containing fossils are divided into four main groups: the *Paleozoic*, containing such formations as the Cambrian, the Old Red Sandstone and the Coal Measures; the *Mesozoic*, containing the great chalk layers; *Tertiary*, containing friable rocks rich in fossils; and the *Quaternary*, consisting of sands, gravels, and clays of recent formation. The study of the crust of the E. is the aim of the science of *geology*. In *geography*, the surface of the E. is considered; its div. into continent and ocean, the features of the land masses, mountains, rivs., plateaux, plains, etc., the distribution of life on the globe, the manner in which the various sections of the human race have grouped themselves, the nature of their govts., their industries, their cities and tns., roads of communication, commerce and mrkts. *Astronomy* deals with the E. as a planet, its movements, and the methods of accurately measuring them. The measuring of the surface of the E. is the concern of *Geodesy*. The constitution of the various

rocks is dealt with in *Mineralogy* and *Chemistry*. The constitution and phenomena of the atmosphere are the business of *Meteorology*. The hydrosphere is studied under the name of *Oceanography*. See also OCEAN AND OCEANOGRAPHY.

Earth-closet, see under SEWAGE.

Earth Currents. The discovery of E. C. was made after the introduction of telegraphy. They arise from a variety of causes, viz. (i.) electro-chemical action in mineral deposits, (ii.) electric waves such as wireless waves, (iii.) electric railways, etc., and (iv.) telegraph lines are traversed by E. C., and were discovered by C. V. Walker and W. H. Barlow in England, and the latter E. C. are the most noteworthy. If two metal plates are sunk in the earth at some distance from each other, and then connected by a wire, E. C. flow from one plate to the other, and may be detected by a delicate galvanometer placed in the circuit. The potential difference between the plates may be as much as 20 millivolts per kilometre distance between them. This P.D. varies daily, and indeed may cause serious interference with the transmission of messages. The lines running from N.E. to S.W. in England are the principal sufferers from E. Cs. Within recent years prospectors for mineral deposits have made use of E. Cs. set up in a wire joining two plates embedded in the earth. The presence of such mineral deposits decreases the electrical resistance of the return earth circuit and by shifting the plates it is possible to locate the deposits by the large increase in the E. Cs. traversing the circuit.

Earthenware, see POTTERY.

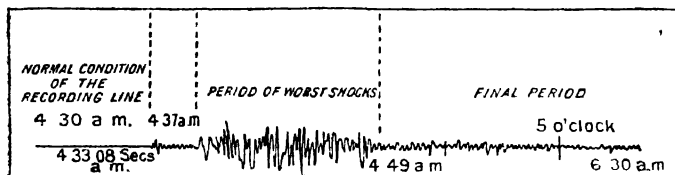

Earth-house, or Yird-house, the usual name throughout Scotland for archaic underground buildings, also known as 'Picts' dwellings,' 'weems,' 'coves' or 'caves.' Examples remain in the Brit. Isles (especially in N.E. Scotland), in Nebraska, Kansas, and the W. states of N. America, where they are called 'dug-outs'; in Austria, Germany, and other parts of Europe, and in Armenia and Egypt. Aristotle, Xenophon, and Strabo gave descriptions of structures of the kind, which are evidently of very anct. origin, though it cannot be definitely settled by whom they were first built. They are perhaps of Celtic origin in the Brit. Isles. Very similar are the adobe dwellings in California and the dome-shaped snow-huts of the Eskimos. Es. existed also in Asia and in Japan, especially in Korea and the N. An E. usually consists of a single irregular chamber of unewn stones, the sidewalls gradually converging towards the top till only a space of from 4 to 5 ft. remains to be spanned by rough flag-stones. A passage or gallery (8-10 ft deep) leads to the room, getting wider and higher as it proceeds from the entrance. The roof was often only 1 ft below the surface, and the whole was covered in by

earth, sometimes raised very slightly in a mound above the level of the surrounding district. In later times there were often two or three rooms connected with each other. A few such houses were dug out of hard soil or chalk, and had no stonework. Various implements of flint, bone, or metal are the chief remains found in them. Clovanor near Alford, Aberdeenshire, and Crichton, Midlothian, possess specimens belonging to post-Roman times. See M. Martin, *Description of the Western Islands*, 1703; J. Anderson, *Scotland in Pagan Times: the Iron Age*, 1883; Kärner, *Künstliche Höhlen aus alter Zeit*, 1903.

Earth-nut, see GROUND-NUT.

Earth-pillar, pillar of earth or soft rock capped by a large boulder or some harder material, such as sandstone or limestone. These columns are formed by the action of rain on a mass of soft, stony clay, and the washing away of softer substances beneath cracks formed in the cap of rock. They occur in the moraines of glaciers,

The nature of E. movements has been studied by the aid of self-recording instruments called *seismometers* (q.v.). The movements consist of series of waves, which appear to be of two distinct types. The first type consists of waves of elastic compression proceeding from a centre of disturbance in much the same way as waves of sound are propagated in air by a vibrating body. The centre of disturbance is some point, or rather assemblage of points, at some distance below the surface of the earth's crust, and from this the waves proceed in all directions, thus giving the form of a series of spherical or spheroidal shells with a common centre or focus. The amplitude of the wave is the distance which each particle moves from its mean position; the period is the time required to complete each oscillation. The greater the amplitude and the less the period, the more violent are the effects at the surface of the earth. Other waves exist which move in a direction transverse to the direction of propagation of the

SEISMOMETER RECORD OF THE MESSINA EARTHQUAKE (1908)

boulder-clay, and similar formations, and are from 30-100 ft. high. Examples are found in the 'bad lands' of W. N. America, in the 'Garden of the Gods,' in Colorado, and at Bolzano (Tyrol). There are also specimens at Fochabers in Scotland and elsewhere.

Earthquake, trembling or shaking of the earth. The intensity of the phenomena associated with seismic disturbances may vary from a slight tremor only perceptible with the aid of delicate instruments to a great convulsion accompanied by considerable changes in the surface structure of the earth, with consequent destruction of much life and property. Great E. may or may not be heralded by preliminary tremors. These are followed by a shock or a series of great shocks extending over a few minutes, during which buildings are cracked and huge fissures appear in the earth. This is the period of greatest destruction, unless the advent of a huge sea-wave carrying with it large masses from the shore makes the havoc more complete. After the main shocks comes a series of minor disturbances, which may extend for many weeks or even years, gradually diminishing in intensity and frequency. In many cases observers have testified to the existence of sound-rumblings unconnected with any visible displacement of E., gradually increasing to a maximum and then decreasing to silence.

waves of elastic compression. These are due to a change of shape in the medium in which the waves are propagated. The point of the surface immediately above the focus is called the epifocus, and it is here that the effects of the wave are most immediately felt, a vertical shock being sustained. Further away from the epifocus the shocks are more oblique in their direction. Much valuable work in the determination of the seat of disturbance in E. was done by Robert Mallet (1810-1881), who derived his conclusions from the direction of cracks in damaged buildings. Proceeding from the assumption that the direction of the fracture was in general at right angles to the direction of the wave, he obtained a series of directions, the intersection of which would give the position of the centre of disturbance. Other methods of determining the depth of the focus have since been elaborated, notably that employed by Maj. Dutton in connection with the Charleston E. of 1886. This depends upon the determination of an 'index-circle.' Over a great area surrounding the scene of the E. isoblastic lines were drawn connecting those points where the vibration felt was observed to be equal in intensity. The 'index-circle' was defined as the curve joining the points where the intensity suddenly diminished. Theoretical considerations showed that

the focal depth was obtained by multiplying the radius of the index-circle by the square root of three. Such determinations are made with difficulty, because although the waves are theoretically propagated in spherical or ellipsoidal form from the focus, the heterogeneous nature of the structure of the earth's crust causes many disturbances of direction, the waves being refracted and reflected by masses of varying density and elasticity in the medium.

The cause of Es. may be broadly explained by reference to the contraction of the outer crust of the earth due to the cooling of the planet. The crust itself possesses a certain amount of rigidity, but the contraction of the interior occasions differences in the amount and distribution of the support afforded to the crust by the underlying structures. Hence there occur subsidences accompanied by the fracture of strata, or folding movements generally bearing some relation to the direction of folds on the earth's surface. Thus the greater proportion of observed Es. appear to take place in regions where there is a sudden slope towards a great depression, as on the Pacific coast. Generally speaking, the more violent manifestation of E. action may be located on two great circles, the one encircling the Pacific Ocean, and the other following the great depression of which the Mediterranean forms a part.

The effects of Es. are immediate and permanent. The immediate effects include the widespread destruction of life and property, often exceeding in extent the effects of the most disastrous wars. The more permanent effects are due to changes effected or induced in the surface of the earth's crust. Thus the elevation or depression of an area by only a few feet may lead to great changes in the drainage system of the country, with consequent far-reaching effects on its economic condition. Though occasionally a displacement may lay bare some hitherto hidden source of mineral wealth, the general consequences to a country of its position in an E. belt are fraught with danger to its economic prospects and the moral condition of its inhabitants. It is perhaps for this reason that Japan has been for many years the foremost of all countries in the world in its encouraging attitude towards seismological research. But some Es. are harmless, e.g. in Johannesburg, where they are of common occurrence, and do no more than rattle teacups. They appear to be due to the removal of ore in the gold mines to the S. of the city, causing the fall of rock formerly supported.

Notable earthquakes.—Among Es. of particularly disastrous effects are the following: Lisbon (1755), when from 30,000 to 40,000 lives were lost; the greater part of the city was wrecked, fire broke out, and a tidal wave swept over the quays and destroyed the shipping; property was destroyed to the value of £20,000,000; Calabria (1783), when 60,000 lives were lost; Aleppo (1822), 20,000 lives lost; Naples (1857), 12,000

lives lost; Peru (1868), 25,000 lives lost; Krakatoa, where the E. was accompanied by a volcanic disturbance by which the is. was completely destroyed; Charleston (1886), where almost every building was damaged; India (1896), when Assam was devastated; Mont Pelée (1902), 20,000 lives lost; India (1905), where a disturbance spread from Kangra over an area of 1,500,000 sq. m., causing the loss of 20,000 lives; California (1906), when a large portion of San Francisco was destroyed; Valparaiso (1906), 2500 lives lost; Messina (1908), when Messina, Reggio, and many vills. were totally destroyed, with a loss of life estimated at 77,283. Japan suffered its worst disaster on Sept. 1, 1923, when an E. followed by a tidal wave and fire destroyed the cap. city, Tokyo, one of the world's largest cities, and Yokohama, the chief port. Casualties were 246,540, of whom 103,733 were injured, 99,331 killed, and 13,176 missing and probably all killed; 447,128 houses were destroyed by fire, and 128,266 by collapse. On July 23, 1930, the region near Naples had one of its worst Es.: 2142 persons were killed and 1551 were injured. In March 1931 Nicaragua had an E. which destroyed the cap. city of Managua, hundred of persons being killed and injured. In 1935 Quetta, in Brit. Baluchistan, was destroyed by an E. and the work of restoration of the military cantonments took a number of years. Montserrat in the W. Indies had a series of small Es. in 1936. Turkey suffered a series of Es. in Anatolia in Jan.-Feb. 1940, involving the death of over 30,000 persons, Erzingan being almost wholly demolished.

See J. Milne, *Seismology*, 1898, and *Earthquake*, 1898; C. E. Dutton, *Earthquakes in the Light of the New Seismology*, 1904; C. Davidson (a great authority on the subject), *A Study of Recent Earthquakes*, 1905; *A Manual of Seismology*, 1905; *The Origin of Earthquakes*, 1912; *A Manual of Seismology*, 1921; *A History of British Earthquakes*, 1925 (the best book of its kind, citing 1191 earthquakes ranging over nearly 1000 years); and many other works including H. Jeffreys, *Earthquakes and Mountains*, 1935; *The Japanese Earthquake of 1923 and Studies of the Periodicity of Earthquakes*, 1936; *Great Earthquakes*, 1936.

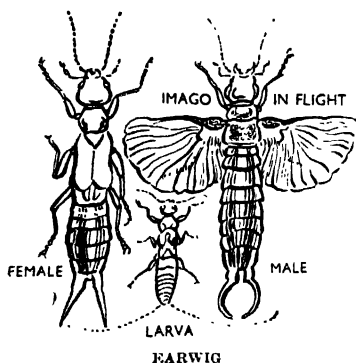

Earth-shine, light reflected from the earth's sunlit surface to the moon, causing the dark parts of her surface to become slightly luminous (with a reddish tinge) for a few days before and after new moon. The appearance popularly described as 'the old moon in the new moon's arms' (the whole surface being visible in ashy-coloured light) is a result of the E.

Earthworks, mounds or walls of earth, or earth and stones, for purposes of defence, the marking of boundaries of political or agric. units of land, and for surrounding a burial ground or settlement. See BARROW; CAIRN; CASTLE; FORTIFICATION; HILL-FORTS; OFFA'S DYKE; ROMAN REMAINS IN BRITAIN.

Earthworms belong to a div. of Annelids called Oligochaeta. They are found in all parts of the world, though naturally

they do not thrive in arid tracts; and their effect upon the fertility and drainage of the soil can hardly be calculated. Burrowing into the ground, they cast up the earth they have swallowed, and so pursue a constant and thorough system of ploughing. Though eyeless, they evade the light and only come out of their burrows at dusk, often remaining, even then, with their tails in the holes and their bodies working round and round. The Brit. E. are confined to the Lumbricidae, and are usually about 6 in. long, with a pointed head, rounded body and slightly flattened tail. The *Allotobophora*, which are largely distributed over England and Ireland, are also found in the Arctic regions, and are the only E. capable of burrowing through snow and ice; *Lumbricus terrestris*, the common E., and *L. feticidus*, the dunghill worm, represent another genus; and *Allurus*, the remaining genus, are equally at home on earth or in water. Some tropical species of E. reach a gigantic size, those found in Central Africa, Australia, and Ceylon growing to a length of 3 to 6 ft.

Earwig, name given to certain species of Forficulidae. *Forficula auricularia*, the common E. is found all over Europe, and is regarded by horticulturists as a great pest, as it feeds on young shoots, the petals of flowers, and the flesh of soft, ripe fruit.

the name arises from a popular but erroneous idea that this insect will crawl into the ear and remain. The E. is gregarious and nocturnal, and makes its home under stones, beneath the bark of trees, or in almost any dark hole or crevice. The larvæ, when hatched, cluster round their mother, whom they closely resemble, except for the lack of wings.

Easdale, small is. on the W. coast of Argyllshire, Scotland, in the firth of Lorne. It is 1½ sq. m. in area, and is noted for its primary slate quarries, belonging to the Earl of Breadalbane.

Easements form one of the class of rights called incorporeal hereditaments (*q.v.*) (and see also **GRANT**). E. consist of those rights in the nature of privileges or

conveniences without profit which one or more persons have in, or over, the land (*q.v.*) of another, as *e.g.* a right of way or a watercourse (see **LAND LAWS**). E. are usually annexed or appurtenant to the ownership of a particular piece of land (the dominant tenement), and are said to be *affirmative* if the owner of the *servient* tenement must *allow* the owner of the *dominant* tenement to do something, as *e.g.* to use a right of way across his land; *negative* if he must *refrain from doing* something, as blocking up the 'ancient lights' of the other. E. consist chiefly of rights of way, watercourse, and light (see **LAND LAWS**), but any right over the land of another which is not 'capricious,' *e.g.* a right to increased lateral support for land weighted with buildings, and a right to access of air for one's chimney or window is an E. A right to light may be defeated by blocking access to light, unless the right arose by express grant or by prescriptive title or user of twenty years. E. arise either by (1) custom, *e.g.* where villagers have been accustomed for a number of years to use a pathway over a piece of land; (2) grant; (3) prescription, either at common law, *i.e.* where the right has been enjoyed from the time of legal memory (accession of Richard I.); or under the Prescription Act, 1832, which makes an uninterrupted user for twenty to forty years respectively, *prima facie* evidence (*q.v.*) of the right to a way or watercourse, and twenty years as uninterrupted user conclusive of a right to light; (4) necessity, *i.e.* where absolutely necessary to the reasonable enjoyment of a tenement, *e.g.* if A sells B a piece of land entirely surrounded by other land of A's, a right of way in B is necessarily implied over the surrounding land. E. are lost by non-user for twenty years, by express release, or, of course, by reason of the dominant and servient tenements falling into the possession of the same person.

East, quarter of the horizon where the sun rises, when in the equinoctial. From very early times the E. has been clothed in a certain sacred mystery, and it was the custom of many of the pagans, as it is generally among christians, to build their altars in the E. part of the temples, so that they could offer their sacrifices towards the rising sun. Hence arose the custom of turning towards the E. for prayer, also the practice of laying the dead with their feet toward the E.

East, Sir Alfred (1849-1913), Eng. painter and etcher, b. at Kettering, studied art in the Glasgow School of Art, and later at the Ecole des Beaux-Arts in Paris, where he received lessons from Bouguereau. A.R.A., 1899. In 1906, the year when he pub. his *Landscape Painting in Oil Colour*, he was chosen president of the Royal Society of Brit. Artists. His pictures are widely distributed, and may be seen in the galleries of Birmingham, Chicago, Budapest, and Venice. As a painter of landscape, he evinced a rare gift for arranging his lines and masses as to produce, almost invariably, a charming and well-balanced composition. 'The White Carnival'

(Brussels), 'Autumn' (Manchester), and 'Passing Storm' (the Luxembourg), display this and other merits. He was knighted in 1910, and elected R.A. in 1913.

Eastbourne, municipal and co. bor. and favourite seaside resort, 64 m. S.S.E. of London, Sussex, England. Formerly the site of the present tn. was occupied by the three hamlets of East-borne, South-borne, and Sea-Houses, the antiquity of which is attested by the mention of Borne in the Domesday Book. The interesting par. church of East-borne belongs to the transitional Norman period, and dates back to the twelfth century. The modern tn. with its miles of terraced promenades, its spacious tree-lined streets, pavilioned pier, theatres, Winter Garden, golf links, and handsome public structures, owes much to the seventh Duke of Devonshire whose family seat is at Compton Place, Eastbourne, and whose name is commemorated in Devonshire Park, a fine public pleasure-ground. The boundaries of the bor. were extended in 1911, 1927, and 1938, and in 1929 the Eastbourne Council completed the purchase of some 4,000 acres of Downland, extending from Beachy head to Folkington. The summit of Beachy Head is 575 ft. above sea-level and during the Second World War was the site of a radio location station. Civilian casualties through enemy air raids were: killed, 174; injured 932. 475 houses were destroyed and no fewer than 11,000 were damaged. This damage was caused by 747 high explosive bombs, 4000 incendiary and oil bombs, and 15 flying bombs. Pop. (estimated, 1940) 56,770.

East Cape (Asia), see DEZHNEV, CAPE.

East Chicago, city of Lake co., Indiana, U.S.A., on Lake Michigan, with a port importing coal, iron ore, and limestone, and exporting gasoline and steel products. There are important steel works, oil refineries, etc. Pop. 54,600.

East Cleveland, city of Cuyahoga co., Ohio, U.S.A., a suburb of Cleveland. Pop. 39,400.

East Conemaugh, bor. of Cambria co., Pennsylvania, U.S.A., 3 m. N.E. of Johnstown. Pop. 7000.

Easter, religious festival of great antiquity observed among Christians, in commemoration of the resurrection of Christ, occurring about the time of the vernal equinox. The Eng. name E. and the Ger. Ostern are said to be derived from the name of the feast of the Teutonic goddess Ostera, celebrated by the anct. Saxons early in the spring. When Christianity was introduced some definite way of fixing a date for E., upon which

many other festivals of the church depended, became necessary. There was much difference of opinion, and the E. churches commemorated our Lord's death on the fourteenth day of the moon after the spring equinox, and kept E. two days later; while the W. churches kept E. on the Sunday following the fourteenth day of the moon. The sect known as Quartodecimans commemorated only the death of Christ, on the same day as that of the Jewish Passover. The E. Church adhered to this, but the Church of Rome soon rejected it, saying that Christ's resurrection took place on the first day of the week after the Passover, and ought in that case to be kept on a certain Sunday. In A.D. 325 the Council of Nicea was held, and there it was settled that E. should be held on the first Sunday after the fourteenth day of the moon that occurred next after the vernal equinox, and that should the fourteenth day of the moon fall on the day of the equinox, the following Sunday was to be E. Sunday. Also it was decided that, in finding E., the vernal equinox should be considered to fall every year on March 21. It was later directed that this calculation should be made according to the tables of Victorius of Aquitaine, which he introduced in A.D. 457. As Britain was now no longer a part of the Rom. empire, this sixth-century order regulating E. had no effect at first on the Brit. church, which continued its calculation on the method originally approved of. But after more than a century of controversy the matter was ultimately settled at the synod which was held at Whitby, Yorkshire, in 664; and after this date the Brit. clergy conformed to the general practice of the W. church.

As at present ordained, E. falls on one of 35 days (March 22-April 25). On June 15, 1928, the House of Commons agreed to a motion for third reading of a Bill that Easter Day shall in the calendar year next but one after the commencement of the Act and in all subsequent years be the first Sunday after the second Saturday in April. E. would thus fall between April 9 and 15, both inclusive—i.e. on the second or third Sunday in April. A clause in the Bill provides that before it shall come into operation regard shall be had to any opinion expressed officially by the various Christian Churches. In consequence of lack of support, there is no present prospect of the adoption of a fixed E. Sir J. G. Frazer observed that 'at Rome the sacred fire in the temple of Vesta was kindled anew every year on the 1st of March, which used to be the beginning of the Roman year,' and from this old custom bonfires are still lit by the priest on E. Eve in many parts of Europe, especially Germany. The E. fire of Germany corresponds to the Beltane fire of Celtic Europe, which has the same ceremonies and beliefs, namely, that wherever the light of the fire reached, the fields would be fruitful and the inhabitants safe from sickness and danger. Games were also in use to celebrate E., such as dramatic performances, dances, songs, etc., and special cakes were made, of

which custom the present-day 'hot-cross buns' (bearing a representation of the cross), and 'simmel cakes' are relics. The custom of the giving of E. eggs, as symbols of resurrection, life, and fruitfulness, is an anct. custom and widespread, especially in Europe. See J. Tyrer, *Historical Survey of Holy Week*, 1932; Sir H. Grierson (ed.), *And the Third Day: a Record of Hope and Fulfilment*, 1918.

Easter Island, Rapanui, or (Sp.) Isla de Pasqua, lonely is., with an area of 46 sq. m., in the Pacific, situated in 27° 8' S. lat., and 109° 26' W. long. Since 1888 it has belonged to the Chileans, who use it as a convict station. It was so called because Admiral Roggeveen discovered it on Easter Day in 1722. In shape the island is triangular, and the three corners are each marked by volcanic heights. So far the Polynesian natives only take advantage of the fertile soil to grow potatoes, sugarcane, and bananas, but a Fr. house of Tahiti has introduced cattle-grazing. The spacious stone dwellings, the huge carved images of grey trachytic lava, and the broad platforms of massive, uncemented masonry, which are found on the is., are an enigma to archaeologists, who are at a loss to account for their presence on shores so remote from the known centres of early civilisation. Since the Peruvians deported the natives to work guano (1863), the number of these latter has dwindled to a hundred.

Eastern Front or Russo-German Campaign in the Second World War. (For Far Eastern Front, see **PACIFIC CAMPAIGNS**.) The Ger. invasion of Russia began on June 22, 1941. The goals in the main Ger. lines of advance were Leningrad, Moscow, and Kiev, after pressing the Russian armies back against the Berezina and the Pripet Marshes. This was Napoleon's plan, the main strategical possibilities of a campaign against Russia, owing to conditions of terrain, topography, and transport not being changed essentially even to-day. As in Napoleon's day, the strongest thrust was in the centre in the direction Vilna-Smolensk-Moscow. The invasion was made by three main armies, the N., and weakest, under von Leeb, the Central, and strongest, under Gen. von Bock, and the S. under von Rundstedt. Gen. von Leeb's primary task was to clear the Baltic states of Russian forces and bottle up the remaining Russian forces in the N. of Leningrad; and then, having taken Leningrad, he was to converge, with the Central Army, towards Moscow. These two armies were to move rapidly in the wake of the spear-head thrusts of the armoured panzer divs. under Guderian, Germany's leading tank general. But the S. army's position was very different. There Lwów (formerly Leinberg) and the very strong natural line of defence along the Grodek chain of lakes left only one chance of a frontal break-through, in the direction Vladimir-Volynski-Lutsk-Novogorod Volhynsk. The 'Stalin Line,'

with Kiev as a strong base behind it, stretched along the Dniester and through very easily defensible country in the direction of Zhitomir and Korosten; and to make a flank movement across the Pruth and then over the Dniester against the Stalin Line was impracticable owing to the weakness of the Ger. and Rumanian forces available for such a frontal attack, and even the minor Hungarian and Rumanian flanking attack through the Carpathian passes from the S. against Lwów was not at first successful owing to premature snowstorms (end of June). Everywhere, too, von Rundstedt's army was met by the élite of Russian troops. Swampy defiles along the S. edge of the Pripet Marshes involved complicated tactical manoeuvres by shifting tank forces behind von Rundstedt's lines. The main lines here of the Russian defences had been long previously laid down by Tukhachevsky but, as has been well said, his ghost and those of the hundreds of able Russian general staff officers who had been shot in the purge four years previously were now fighting on the side of the Gers. Rundstedt was compelled, after many difficult salhes, to wheel round to the S.E. right under the guns of Kiev and of the Stalin Line at Korosten, and to effect a daring operation in order to annihilate a large part of Budyonny's army W. of the Dnieper—operations for which there is no precedent. But in the tenth week of the campaign, von Rundstedt dominated the Dnieper and could co-operate strategically and tactically with von Bock's army.

The Central and N. armies followed much the lines of Napoleon's advance and that of the Gers. in the First World War—the first objective being the gap between the upper Dvina and upper Dnieper. This gave opportunities for breaks through parallel to the N. edge of the Pripet Marshes, from Grodno towards Baranovitch and Minsk, and from Vilna towards Minsk and Polotsk, this last being supported by von Leeb's right wing. In the First World War, however, the Gers., having inadequate forces, wasted their strength against the line of the Narva instead of attacking from Vilna. But in the Second war conditions favoured the invaders, whose new frontiers in Poland enabled them to attack from Vilna at once, while the fact that bridges over the Bug remained intact allowed Guderian to rush his panzer forces in a little over a fortnight through the Pripet Marshes and the Stalin Line towards Vyanza, 120 m. W. of Moscow, destroying or capturing a number of Russian armies on the way—one of the greatest battles in the hist. of warfare. The experience of the last war proved that the best line of Russian defence would have been along the lower Dvina towards Dvinsk, and thence due S. along the lakes and swamps around Lake Narocz through Minsk towards Hoberusk, or along the Stalin Line; for these lines could easily have been reinforced from the reserves assembled near Moscow just before the invasion was launched. It seems, however, that these reserves were thrown into the battle around Smolensk

after the encirclement of two large army groups east of Bialystok and near Minsk by Bock's panzer divs. and shared the fate of these two groups. Here there was a real chance in the first days of the campaign that breaks-through followed by encircling movements might involve the destruction of large Russian armies, but in the S. such chance would have existed only if von Rundstedt had had much stronger forces for a flanking movement across the Pruth and Dniester; while in the N. von Leeb had no such chance except, possibly, between Daugavpils (Dvinsk) and Lake Peipus after the Stalin Line had been pierced. Von Leeb, however, carried out a daring advance, capturing Kaunas and Daugavpils, breaking through the Stalin Line, repelling counter-attacks from Volki Luki, the Valdai Hills and Novgorod, and hemming in the remains of the Russian armies on the coast of Estonia and in Leningrad. The advance was fraught with risks, but von Leeb had the advantage, which the other Ger. armies lacked—the railways as far as the Dvina were of standard gauge so that supplies could be run to Riga and Dvinsk in the wake of the panzer advance thrusts. These tactical and strategical successes of the N. and Central armies were mainly due to the fact that the Russians elected to make their stand in the tatters recently acquired by the 1939 treaty with Hitler. Events showed that they ought to have adopted 'scorched earth' tactics from the beginning and destroyed all communications W. of the line Dvina-Lake Narocz-Minsk-Pripet, and then brought all their reserves into the Stalin Line, which they might have held indefinitely.

The Gers., pursuing their familiar blitz tactics, had hoped for much speedier triumphs in the opening two or three weeks' fighting. They had hoped that the impetus of the first drive would have given them Kiev and also carried them half way to Moscow from Minsk. But they made impressive advances, reaching the so-called 'Stalin Line,' which ran from the Gulf of Finland through Lake Peipus, along the frontiers of Latvia, Poland and Rumania to the Black Sea, with a depth at Minsk and other vital places of between 50 and 100 miles. But nowhere was this 'line' less than 20 miles deep, and the delaying tactics pursued by the Russians enabled them continually to strengthen their defences. By July 2, the Gers. had captured Riga, the Latvian cap., 300 miles from Leningrad, the port falling in a pincer movement from Jakobpils (Jakobstadt) on the Dvina, 70 m. to the S.E. and from Libau, 120 m. to the S.W. The Finnish threat to Murmansk and Karolia, which had early developed, was now becoming serious and strong reinforcements of the Soviet army and air force were rushed up from Leningrad to the N. front; while the threat to Leningrad through the Baltic States was checked by massing troops on the fortified lines running along the old Russian border W. and S.W. of the city against a threatened attack from Tallinn.

The Russian military leaders early reached the conclusion that it was impossible to hold up, indefinitely, massed forces of tanks with fortified lines, and they therefore began to work out the plans for an 'elastic defence,' the basic principle of this new strategy consisting of the separation of the Ger. panzer arm from its supporting infantry, coupled with harassing guerilla tactics. The defences of the road to Kiev had been planned personally years previously by Marshal Timoshenko, the Soviet commander-in-chief. But here, as in the threat to Leningrad, the position was critical after only ten days' fighting. All was dependent on the magnitude and quality of the Russian equipment. Technically the Russian war-machine of 1941 was very different from that of 1941. The modern Russian soldier and Army technician were almost entirely the product of the 'New Civilisation.' Yet Soviet industrialism, which secured imposing results in mechanisation and motorisation, did not wholly eliminate the human heritage of former days. Quality was always a weak link in the Soviet economy; but, since 1936, real progress was achieved through the energy of Ordzhonikidze, commissar for heavy industries; though the wastage of raw materials and the proportion of spoiled goods remained inordinate. Much remained to be done in general economic organisation. Under centralisation of economic direction excessive bureaucracy and inadequate planning were defects which left a deep imprint on Russia's economic life. In organisation and liaison Germany had the upper hand. Yet, the very precision of the Ger. war-machine hinged on its ability to keep to its time schedule. If this could be upset by the Russians the contending forces would, so far as technical performance was concerned, be more evenly matched. In the first days of July the Russians opposed a particularly stout resistance on the Berezina River (q.v.) to the N.E. of Minsk, repeatedly preventing the Gers. from crossing and, at the same time, taking a heavy toll of tanks. Fierce fighting developed towards Daugavpils, Borisov, Bobruisk and Tarnopol and the Russians were forced to withdraw in the Dvinsk area. Fantastic figures of Russian casualties were announced by the Ger. gov. to palliate their own losses. The Gers. claimed to have killed 500,000 Russians in the Bialystok area alone and that the total casualties were over one million; but the political necessity of producing apparently dramatic results for the rash offensive discounted these totals. The Russians, for their part, put the Ger. losses at 750,000 killed, wounded and captured. That the losses on both sides were very great is to be inferred from the fact that some 9,000,000 men were engaged on the vast battle-fields from the Arctic Ocean to the Black Sea; and that, at this rate of loss, both would soon have to call upon their reserves of man-power; but in this respect the advantage lay with Russia whose mobilisation was as yet far

from completed. Hence delaying actions were fought all along the front to give as much time as possible for mobilisation and the despatch of reinforcements.

The Germans approach the Stalin Line.—By this time the opposed 'line' ran through Riga—Daugavpils—Borisov—Volynsk—Tarnopol—Cernauti—Bielst. But along most of the front the position was very confused. For there was no 'line' in the orthodox sense as in 1914, but rather a defence of more or less unrestricted depth. The Russians were still fighting for the most part on soil annexed by them within the previous two years and the next stage of their resistance was based on the original defences begun on a large scale ten years previously along the former frontiers from Latvia to the Black Sea, and in July this 'line' had been pierced at only one point—from Minsk towards Smolensk. The determination of the Russians to resist the invader by all and any means was illustrated by the promptitude with which they carried out Stalin's 'scorched earth' order—the order to destroy everything in the wake of their retreat. The number of Ger. graves in Przemysl showed that the campaign, even at that early stage, was incomparably the bloodiest in the war. For battles over a front of such extent, involving such great numbers of men and elaborate equipment, there were no parallels. Ordinary standards of warfare were inapplicable, where the fighting assumed such novel patterns. The series of great counter-attacks by the Russians over the thousands of miles of front S. of Leningrad were evidence of this unorthodoxy. Gigantic battles were fought over vast stretches of country, and what convention might call the 'battle-front' was merely the main watershed of the resistance. Far behind, to the W., there were taking place other battles, sometimes by smaller bodies of men, living as they might and fighting with the fury of fanatics. Such deep battles involved problems for both sides. Soldiers might be starved, but tanks had to be fuelled or they became mere practice targets for any kind of artillery; for the supply cisterns, which some tanks carried, might extend the range but could not wholly meet the need, and the systematic destruction of all local supplies tended to immobilise them. By the end of the first sixteen days of the invasion, the Gers. had reached a depth of no less than 300 miles, giving an average of about 20 miles a day over the whole period—slightly faster than their advance on the W. Front to Sedan. Both sides were now preparing for a tremendous Ger. offensive against the Stalin Line, or chain of strong positions within the U.S.S.R. proper. So far the Gers. had captured practically the whole of the fringe of ter. annexed by the Soviet Union since 1939, except Estonia. Though progress had been made in the Baltic States, the vital sector in the campaign was in the neighbourhood of Minsk, where the Gers. were now making two distinct thrusts on either side of the railway, the N. through Lepel and the S. through

Bobruisk. Repeated Ger. attempts to cross the Dnieper were repelled and powerful counter-attacks were launched here and elsewhere by the Russians. W. of Kiev, in the Novgorod-Volynsk sector, the Gers. attacked with large tank forces. In the ensuing days, a savage battle raged round Ostrov, near the junction of the Latvian, Estonian and Soviet frontiers on the main Berlin-Warsaw-Leningrad railway. Hitherto the Ger. advance in the Baltic states had been comparatively leisurely, the roads being mainly intact and railways having the Ger. gauge as far as the Dvina, and the inhabitants welcoming and assisting the Gers. and so frustrating Russian ambush and guerrilla tactics. But over the border bridges were destroyed and the closer the threat to Leningrad, the stiffer became the defence. In White Russia the Russians destroyed a whole Ger. panzer div. between Polotsk and Borisov. In Bessarabia, heavy rain was bogging Ger. vehicles and the Russians had forced part of the invading forces back to the Pruth.

The end of the third week of what may be called compendiously the 'Battle of Russia' found the Gers. halted on a line running, roughly, from the Gulf of Riga across Latvia and White Russia to the River Berezina and then down, through the border regions of the Russian Ukraine, to the Upper Dniester, the Pruth and the Black Sea. There was now a pause in the struggle due to Ger. difficulties of supply and the exhaustion of the Ger. tank crews. At this time after three weeks' furious fighting the Gers. were still 140 m. from Leningrad, 400 m. from Moscow, 150 m. from Kiev and 130 m. from Odessa and at only two points were they in Russia proper—between the Ostrov and Minsk sectors and near Novograd-Volynsk, in the Ukraine. Against this, the Gers. had sustained great losses in men, tanks and planes, and, moreover, the Ger. High Command found itself unable to concentrate the entire strength of the Luftwaffe on the Russian front on account of the growing Brit. air raids in the W. of Europe, five of the best fighter squadrons being transferred to the W. in an attempt to check the R.A.F. When the Ger. attacks in force were resumed Pskov became the centre of the most desperate fighting, the Gers. making strenuous efforts to enhance their threat to Leningrad. In White Russia the Soviet forces retook Rogachev and Zhlobin, two important tns. The fighting spirit of the Russians remained unbroken. Everywhere the great mass of the people seemed to be fighting the 'national war for the Fatherland.' In Moscow a kind of Home Guard—the People's Guard—was raised, formed of civilians of both sexes, who had been taught sharpshooting and air defence in previous years. In all the tns. far to the W. of Moscow the able-bodied stayed on and barred their factories for resistance. Large groups of other civilians were evacuated to the Volga and the Urals. At the opening of the campaign errors were made which led to large bodies of men being cut through and en-

circled; but soon afterwards in defence and counter-attack the Russians showed not only coolness and great courage but marked ingenuity. Much had been learned from the mistakes of the Finnish War, particularly in the organisation of small units within the infantry to be trained for independent action, and in mobility generally. The continued guerrilla fighting in the border provs. of Russia showed that these steps had been put to effective use.

The second German drive.—In this drive in the titanic battles which began approximately on July 15, the Russians hurled some of their newest 150-ton tanks into the conflict which raged around Kiev's suburbs. Anti-tank and machine gun fire met the advancing Gers. from every alley and window. In the N. the Ger. thrust at Leningrad made some progress in Estonia, and Tallinn, the cap., by Stalin's order, was transformed into an inferno of fire and destruction so as to deprive the enemy of every kind of property, food and machinery. On July 16 the Russian Baltic fleet, headed by the *Kiroff* and the battleship *October Revolution*, with destroyers, bombarded Riga. Russian bombers also raided the port and barracks now occupied by Ger. troops. In White Russia, though Smolensk still held out, the fighting by July 18 had moved further E. as the result of the Ger. thrust between the Dvina and the Dnieper. The ensuing days saw more hard fighting to the N.W. of Smolensk, round Pskov, Porkhov, Polotsk and Nevel. 300 Russian tanks being engaged in the Bobruisk sector. Both sides again suffered heavy losses. But now (July 20) so menacing was the Ger. drive that a supreme effort in counter-attack was demanded, and Stalin, by assuming the post of Commissar of Defence, had put himself at the head of the people's armies. By a variety of tactics the Russians bewildered, delayed and wore down the Ger. columns. Ger. panzer units were allowed to pass as if they had carried all before them. Russian armoured units would then suddenly emerge from concealment and make an unexpected onslaught on the slower Ger. infantry, which was thus exposed to the full blast of the Soviet tanks. Often at dusk, Russian motorised units joined in behind a Ger. column, following it up until there was a suitable moment when the Gers. were advancing into an ambush and these tactics were especially successful after the capture of Novograd-Volynsk by the Gers. The Gers. now found that they were unable to convince the world that they were on the point of capturing Leningrad, Moscow and Kiev, particularly as the Russians showed a faculty for adapting themselves to any change of tactics which the Gers. attempted. In consequence, the Ger. High Command now declared that the only real military advantage they could achieve consisted of encircling and destroying the Russian forces and that further territorial gains were of dubious worth because of their cost.

The next centres of severe fighting were

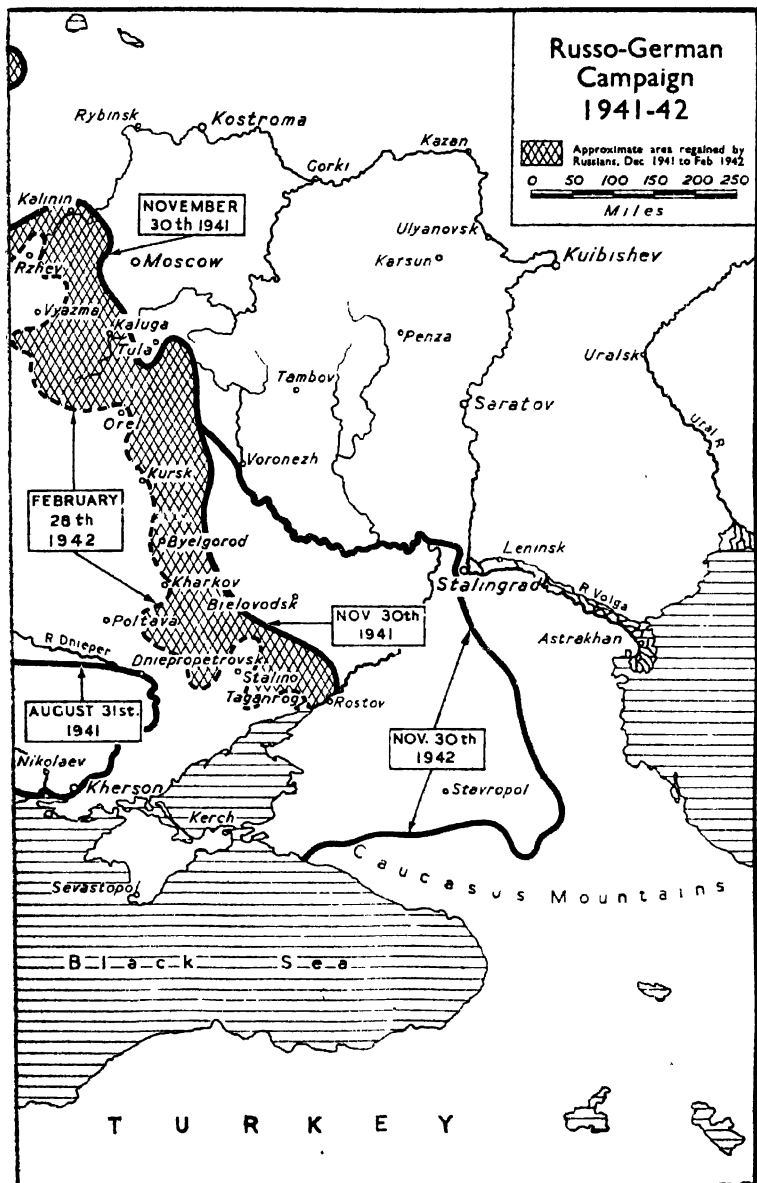

E.E. 5

in the sectors of Petrozavodsk, on the Murmansk railway, N.E. of Lake Ladoga, and of Zhitomir, in the Ukraine, E. of Novograd-Volynsk, on the road to Kiev. There was also a renewal of the intensive Ger. drive towards Leningrad, in which the Russians continued to offer a stubborn resistance at Porkhov, and in the drive towards Moscow, where the Russians still held out stoutly in the Smolensk sector. On July 21 Moscow had its first of a series of Ger. air-raids, but very few Ger. bombers were able to penetrate the city's defences. The Gers. lost 22 out of over 200 planes and it was evident that the Russians had benefited from Britain's experience of raids, the interchange of information leading to the timely adoption of fire-watching and A.R.P. organisation. The Ger. intention was much simpler than its result. It was to strike in two thrusts towards Moscow, one N. of the Smolensk-Moscow road through the gap between the Dvina and Dnieper rivs. and S. of the road eastwards from Bobruisk. When they had got so far the two columns would meet, compressing and annihilating the Russian forces between them. The Gers. knew that in the critical battle for Smolensk everything depended on whether reinforcements would arrive in time. It was the part of the Russian defenders, boldly staying in their positions after they had been penetrated by the tanks, to see that reinforcements did not arrive. Again at the N. end of the front the invaders were making but little headway, and the main defending forces near Murmansk had not yet been engaged; while the heavy fighting N. of Lake Ladoga was chiefly responsible for the great numbers of wounded then spreading over Finland in the last two weeks of June and intensifying the gloom in that unhappy country, where the atmosphere was strikingly different from that of the last war. The destruction, too, of war material on both sides was immense, and the losses were cancelling each other out. Thus the great battle or series of battles on the Russo-Ger. front bade fair to produce a degree of exhaustion and wastage comparable to that on the W. Front in 1918. The Gers. sought strenuously to convince the world that they had torn a gap in the Russian line as wide as that at Sedan, but the conditions on the Russian front, as shown above, were quite dissimilar. There was, moreover, no trace of that political disaffection upon which the Gers. had counted, nor any sign of disintegration in the Red Army. Furthermore, as has been seen, the Russians were only now completing their mobilisation and could always bring up new units to meet Germany's battered hordes. Yet the problem for Russia seemed to be whether the political and industrial risk involved in an ordered retreat towards the Urals would counterbalance the risk of losing the Red Army in the pitched battle which the Gers. were now seeking to force on it.

A War of attrition.—Apart from the growing threat to Odessa, the fighting began now, as in the previous World War,

D

to take on every day more of the character of a war of attrition. Since the advances beyond Minsk and Bialystok, the large scale Ger. encircling movements had not yet resulted in a single decisive thrust. Every indication now seemed to point to the launching of their third offensive, which promised to exceed in ferocity its predecessors, inasmuch as failure to break through anywhere might bring the whole campaign to the verge of desperation. There was now (Aug.) a comparative lull in operations against Leningrad like that on the more S. front, the pause being due to the Gers. concentrating on the improvement of their communications. Towards the end of the first week of Aug. the fighting was mainly around Lake Ladoga near Kexholm, and in the Ukraine where Marshal Budyonny still held the invaders. The check at Smolensk, however, required explaining away, and to restore confidence in Germany, the Ger. High Command actually claimed that, since the opening of the Ger. invasion in June, the Russians had lost 895,000 prisoners, over 13,000 tanks and 9,000 aircraft. The Russian Command, while not disclosing their own losses, estimated the Ger. casualties during the six weeks of fighting at 1,500,000 and attributed the exaggerated Ger. claims to the necessity of bolstering up the moral of the Ger. people and lowered fighting spirit of the Ger. troops. A serious threat to the Soviet defences was now, however, developing in the S. Ukraine in the vicinity of Uman, Byelaya Tserkov, and Korosten. In this region the forces of Gen. von Rundstedt were making strenuous efforts to destroy those of Marshal Budyonny, who was stubbornly contesting the thrust against Odessa and, meanwhile giving the Ukrainians time to gather the harvest. He skillfully extricated his forces from Rundstedt's trap and re-consolidated his front along the E. bank of the R. Bug. Fighting was still severe in Estonia, Finland, and around Smolensk, but the Ger. main effort was concentrated in the Ukraine, because success there might well give them the industrial area of the Donetz basin and, ultimately, the Caucasus. On Aug. 13, the Russians evacuated Smolensk. But this did not mean the end of the great battle of Smolensk and very desperate fighting continued round the city, the encircled Russians W. of Smolensk, far from being put out of action, constituting a serious encumbrance to the Ger. advance and harassing and hindering the supply of munitions and food to the enemy. With Aug. half gone, the Ger. armies still had no spectacular prize for the Ger. people. Leningrad, Moscow, Kiev, and Odessa still remained in Russian hands. The position in the centre, where the armies of von Bock faced those of Marshal Timoshenko, was static and the Russian commander was steadily foiling all attempts by von Bock's troops to break through on Budyonny's right flank. But in the S. the position of the Russians was critical and Marshal Budyonny's retreat involved a drastic change in tactics.

Yielding to ever-increasing pressure from the forces of Gen. von Rundstedt, Budyonny had given up the valuable Krivoe Klog industrial area, and was exerting all his efforts to withdraw his armies to the E. bank of the Dnieper so as to protect Odessa and as much of the E. Ukraine as might be practicable.

Novgorod evacuated—Battle for Leningrad—After stubborn resistance the Soviet forces evacuated Kingisepp (formerly Zhamburg) the first station inside Russia on the main Tallinn-Leningrad railway and 90 m. by road S.W. of Leningrad yielding in face of a Ger. attack N. of Lake Pelpus and from the direction of Narva. In the centre the immediate Ger. objective was Gomel, an important railway junction halfway between Smolensk and Kiev, which was deemed almost impregnable and which the Gers. had seemed on the point of taking a month previously. And always, while the W. nations hoped that their Russian allies might be able to produce a position of stalemate, as often were they disillusioned by the blazing up of attacks along the whole front from the White Sea to the Black Sea. Stubbornly as the Soviet troops fought for their land, the Ger. advance continued, slowly but remorselessly, involving ever more sacrifices by the Russians in conformity with the 'scorched earth' policy of Stalin. But the nearer the Gers. approached the great city the more obvious it became that the inhabs. intended to defend it to the death, and that over a million inhabs. proposed to carry weapons and to use them, while the outer defences of the city were formidable to a degree. By Aug. 21 the Russians had to evacuate Gomel and had lost a large number of prisoners and guns in its defence. There was something in the nature of a pitched battle for this, and the Gers. paid a high price for it. The tremendous pressure of the Ger. thrust on Leningrad met strong resistance from Marshal Voroshilov's army. The month of Aug. was ending and the 50-mile deep defences of the city showed no sign of collapse or of weakening. The Russo-German campaign was now over two months old and in that period the Gers. lost between 1,500,000 and 2,000,000 in killed and wounded, more than 8,000 tanks, 10,000 guns and some 7,200 aeroplanes. The total Russian losses were also very high but were probably much less in men and rather less in material.

The fact that, at this date, President Roosevelt and Mr. Churchill had chosen Moscow as the place where proposals for aid to Russia would be discussed was not without significance at this crucial juncture of the life-and-death struggle between Russia and Germany, since their decision implied that two of the best-informed statesmen in the world were confident that Moscow could withstand all dangers for a long time. Nevertheless, the Gers. continued to advance regardless of losses. Novgorod, S. of Leningrad, was evacuated by the Russians on Aug. 25 after tenacious fighting. In the S., Marshal Budyonny's forces were retiring towards

the crossings of the Dnieper and the important town of Dniepropetrovsk (formerly Ekaterinoslav) famous for its colossal dam, a peak of Soviet achievement, was now threatened. The following day Luga, 90 m. S. of Leningrad, fell to the Gers. and the outskirts of Dniepropetrovsk were also abandoned by the Russians. The citizens of both sexes of Leningrad were now flocking in their thousands to join the Home Guard. Day by day fierce fighting continued along the entire front, but with especial severity towards Leningrad, Gomel, and Odessa. The Russians, however, destroyed the dam over the Dnieper and so had paralysed the vast industrial undertakings of the E. Ukraine—a salutary warning to the Gers. of the determined Russian temper. Dniepropetrovsk itself was now abandoned. The destruction of the dam at Dniepropetrovsk was turning a substantial section of the Dnieper back to its original rapids and swamps. As Budyonny had withdrawn most of his troops across the Dnieper the riv. was likely to prove a serious barrier to the invader. A brilliant counter-attack by Gen. Konev in the Gomel region just E. of the Pripiet marshes certainly saved Budyonny's forces from being outflanked by Gers. crossing the Dnieper.

The battle for Leningrad was now reaching an acute stage, the fighting being particularly fierce round the vital railway junction of Veliki Luki, 120 m. N. of Smolensk, which now fell into Ger. hands. Ger. 'Stuka' dive bombers were launching numerous attacks on Leningrad's outer defences and had been doing so for many days, yet without dominating the air, and the casualties inflicted by the Russian anti-aircraft guns and fighter-planes ran into hundreds of bombers and fighters (Aug. 20–Sept. 3), being heavier than the Russian air losses. The operations against Leningrad both in scale and intensity overshadowed those elsewhere on the front (Sept. 1–4), for the Gers., true to their estab. tactics, were concentrating all their available forces to achieve the object which at this moment was most important to them. But Marshal Voroshilov, now personally in command and assisted by a war council of six, not only continued to hold the Gers. at bay but threw back his enemy sev. miles in the centre of his advance.

Russian victory at Yelnya.—In the Smolensk area, Timoshenko's counter-attacks made the Gers. reconstitute the central sector, in which their advance from Gomel to the rear of Kiev was retarded. On Sept. 4 the Ger. forces halted 50 m. from Leningrad and bitter fighting raged along a line which had now become more or less stabilised. Marshal Voroshilov held an advantage in the possession of supply bases close to the rear, as Leningrad's military industry was extensive and highly developed, whereas the Gers. were able to obtain scarcely any supplies locally and only at all from far-distant Germany. The Russian defensive forces on the outer periphery of the Leningrad sector were making full use of the marshy

terrain and mining all roads wherever they had to withdraw. Casualties on both sides continued to mount up. The fighting in the centre of the front showed no sign of abating (Sept. 7). In the S., Budyonny's guerillas, especially the Cossack groups, were very active and were creating great difficulties behind the lines of von Runstedt's army and thereby delaying that general's assault on Odessa and the Crimea. After some 26 days of fighting the Russians succeeded in re-taking the tn. of Yelnya, 45 m. E.S.E. of Smolensk, eight Ger. divs. being routed, their remnants retreating westwards (Sept. 8). But the battle for Leningrad continued with unabated fury and the Gers. captured the important tn. of Slisselburg, E. of the city near Lake Ladoga. Timoshenko's army, continuing to counter-attack in the Yelnya sector, had now driven back the Gers. 15 m. beyond that tn. and was still advancing. This victory at Yelnya was the first major success against the Gers. that the Russians were able to claim. It was the more momentous in view of the approach of winter and seemed in the eyes of Russia's allies almost to justify the hope of an eleventh-hour turning of the tide of war on the E. front. At least, however, it virtually assured the safety of Moscow for the rest of the year while a successful Ger. drive across the Dnieper was rendered improbable. The urgency, in view of the impaired Ger. morale at home, of the Nazi need to capture Leningrad was revealed by an order of the day issued by Marshal von Leeb, declaring that the city must be taken within the next few days regardless of cost. This order (Sept. 10) was a direct consequence of the serious threat to both Ger. flanks which had developed owing to the successful convergent threats of Marshals Timoshenko and Budyonny towards Gomel. These compelled the Gers. to make a supreme effort at both ends of the front, at Leningrad and Odessa, with the aim of reaching these objectives without further loss of time. It was, further, essential that troops and equipment should be set free in order that the entire strength of the Ger. military machine might be hurled into the central sector, towards Moscow: this was necessary, not only because the colder weather heralded winter's approach, but also because, if Timoshenko and Budyonny were able to concentrate enough men and equipment, they would stand a good chance of inflicting such a serious major defeat that the Gers. could not recover from it, at least during 1941; while the effect on the spirit of the Ger. home front might well be disastrous. This explained why the Ger. air raids on Leningrad were the fiercest of the whole war and why, regardless of the sacrifice of life, Ger. ground troops were driven relentlessly into the deadly fire of the Russian fortresses, although Marshal Voroshilov's barrage still prevented the invader from making any substantial advance.

Russians evacuate Kiev.—Kiev was now in danger from a double thrust—to the N. across the riv. and a drive by von Bock

S.E. from Gemel. An obvious purpose of this thrust was to occupy the Donetz basin, one of the main industrial systems of Russia, and the Crimea, against which an amphibious attack was being developed. Soon the Ger. drive through Kherson bade fair to cut off the Crimea from the mainland. By Sept. 20 the situation of Kiev had become hopeless, but the battle for the city, which had now lasted 45 days, cost the Gers. 70,000 men. On Sept. 21 the Russians evacuated Kiev, but a fierce and confused battle continued to the E. of the city, both sides suffering great losses. When the enemy entered Kiev they found the city devastated, all the most valuable industrial equipment having been taken away. At the southernmost extremity of the front von Runstedt's drive to the Sea of Azov had completely isolated the Crimea by land, but behind the very powerful fortifications of the peninsula the Russians still offered a very stubborn resistance.

Meanwhile the battle for Leningrad continued with undiminished ferocity on land, on sea and in the air; but so tenacious was the defence of the army of Marshal Voroshilov that, even by the end of the month, no substantial change had occurred in the situation. Again and again the Gers. resumed the assault on the outer defences with waves of dive bombers and with infantry armed with flame-throwers; and so incensed were they at being repulsed that they warned the defenders that if they did not surrender the city it would be burnt to ashes. The battle had drawn somewhat nearer the city by Sept. 26, but not actually in the suburbs, the defence being of considerable strength and depth. R.A.F. fighters had now reached the city and were providing escorts for Russian bombers.

Germans drive on Moscow—*Soviet Government moved to Kuibishev*.—The ensuing month saw most bitter fighting along the whole front. This fighting soon became concentrated in tremendous drives towards and around Moscow and against the Crimea—Leningrad being, for the most part, left free from major thrusts because the Gers. hoped that they might, by cutting the rail communications, starve out that city. The drive on Moscow took the familiar form of two converging thrusts—one from the S.W. and the other from the N.W. Simultaneously the Gers. launched a powerful drive in the Ukraine towards Kharkov and attacked the Crimean roads and railways from the air. These great attacks were prepared and launched before Hitler, in order to revive the waning enthusiasm of the Ger. people, had announced on Oct. 3 in Berlin that the Ger. armies were on the point of delivering new offensives. The Russian people, however, were not long to be left in doubt that they were shortly to experience heavy trials; but their spirit of resistance showed no sign of weakening in spite of the early successes of the Ger. onslaughts. These were especially furious in the region of Briansk and Vyasma, S.W., and around Orel due S., of Moscow. Orel was evacuated on

Oct. 8, Briansk four days later, and Vyasma on the 13th. The Ger. pincers were remorselessly closing in a ring round Moscow. It was evident that the Ger. High Command was prepared to throw in fresh forces as often as the situation demanded it. By mid-Oct. the Russians, strengthened by reserves from Siberia, had checked the enemy in the S. and central areas of the Moscow sector; but a formidable threat was developing in the vicinity of Kalinin, N.W. of the cap. and, as ever more masses of Gers. were flung into the attack, the peril to Moscow and also to the Crimea deepened. The Soviet gov. now moved from Moscow to Kuibishev, though Stalin himself remained in the cap. This move, however, was precautionary and did not indicate that the Russians believed the fall of Moscow to be imminent. The danger, indeed, in the Crimea was the greater; for Odessa was evacuated by Oct. 16 after furious street fighting between the Gers. and rear-guard defending Russian forces covering the garrison while it was being evacuated by sea to other sectors. It now seemed clear that the Gers. could not take Moscow by their present surge forwards, which by mid-Oct. had not yet brought even their armoured shock units within 50 m. of the Kremlin at any point. By Oct. 18 their efforts to encircle the city had brought their forces in a ring marked by Kalinin, Rzhev, Mozhaisk, Kaluga and Tula. By the thrust through Kaluga they hoped to take the important industrial tns. of Serpukhov and Kolomna, the capture of which would not only deprive the Russians of valuable munitions, but would also cut the two main railways radiating S. and S.E. from Moscow, and practically encircle the city. But the pace of the Ger. advance towards their goal had now become slower and the Russians were making strong counter-attacks, notably at Kalinin, which often changed hands, Mozhaisk, Maloyaroslavets and near Orel. On Oct. 19 Stalin signed an Order of the Day, as chairman of the defence committee, that 'Moscow would be defended to the last,' while a state of siege was declared in the capital.

After a lull of some days, the Gers. resumed the offensive in the S., mixed Axis forces of Rumanians, Its., Hungarians and other mercenaries advancing towards Taganrog and the industrial centres of the Donetz basin. The main advance was chiefly along the coast towards Rostov and the Don. Heavy attacks had been delivered for weeks on the Perekop Isthmus, but the Russians held this gate to the Crimea with amazing tenacity. At about this time the Russian armies were re-grouped into a N. group under Marshal Zhukov, former chief of the general staff, who included Moscow in his command, and a S. group under Timoshenko.

Over 100 Ger. divs. were now operating between the Orel and Kalinin regions and half of these, including 4,000 tanks, were in the central sector trying to smash a path to Moscow through Mozhaisk and Maloyaroslavets. Their losses in the first fortnight of Oct. in this one sector

were about 200,000 killed and a similar number seriously wounded or missing. Towards the end of Oct. the Russians were compelled to evacuate Stalino, an important armament centre in the Donetz basin, but only after a battle in which the Gers. lost 50,000 men in killed and wounded. Other important tns. lost were Kharkov and the railway junction of Belgorod. When the Russians had failed to hold the line of the lower Dnieper, the Donetz industrial regions appeared to be doomed as soon as the Gers., with their mercenaries, should be in a position to undertake a determined drive: for Marshal Budyonny had no really favourable natural line of defence before the Don. The Russian difficulty in the S. was that Marshal Timoshenko only assumed command of this front when it was wavering under a succession of heavy blows, and his first task was to re-form, reorganise, and regroup his armies and to do so under the pressure of the enemy.

The loss at this date of some of the industrial centres of the Donetz Basin, such as Stalino, was serious and, of necessity, demanded a correspondingly greater effort by Britain and America to make good Russia's supply of war material; and even if Germany could not easily secure the Russian material of which she stood in sore need, she might be able to cut the link connecting Russia to her overseas supply bases.

The position in early Nov., following the setting in of snowy conditions alternating with heavy rain, so that tanks and motorised columns were bogged, was that the Russians had been compelled to make a considerable withdrawal in the Crimea, while holding the attackers on the Moscow front. But at least they denied the Gers. much advantage from their conquests. The advancing enemy hordes, instead of finding cities of plenty, with warm accommodation for their troops during the winter campaign, came always upon a scene of utter desolation. Everywhere in the wake of the Russian retreat was evidence of the efficiency with which the workers and plant had been evacuated and destruction wrought on what was left of industrial buildings and equipment. Russian resistance, strengthened by reinforcements, was now so successful that in the centre and N.W. the Gers. were fought to a standstill and, in places, even compelled to fall back. On Nov. 3, however, the Gers. began their fifth attack on Moscow, using strong tank forces and large numbers of dive-bombers. But they were soon forced to abandon their characteristic tactics of going all out for a breach with a large armoured forces backed by motorised infantry and to launch attacks in the old manner, with a small tank detachment followed closely by infantry advancing on foot. The inference was that they did not hope to break through and that their armoured divs. were below strength. Their main blows were at Kalinin and Tula; but they made no headway and attributed their failure to weather conditions. In the S. von Runstedt captured Feodosia, a Black

Sea port near Kerch Strait, and broke through the ill-fortified Perekop Isthmus by throwing in overwhelming forces, regardless of casualties. On Nov. 6, Stalin, on the occasion of the twenty-fourth anniversary of the October Revolution, declared to the Soviet that Ger. plans for overrunning Russia had miscarried and that the strength of their enemy was beginning to fail, while the power of the Soviet Union was still growing. He stated that Russian losses since the opening of the invasion were 350,000 killed, 378,000 wounded and 1,020,000 missing; during the same period the Gers. had lost in killed, wounded, and prisoners over 4,500,000 men.

For a brief space winter brought to a standstill all major operations except those in the Crimea, where, in the course of Nov. the Gers. overran most of the peninsula, taking the cap., Simferopol, and the naval base of Kerch, and threatening Sevastopol. The lack of adequate winter quarters, which the hoped-for capture of Leningrad, Moscow and Rostov was intended to provide, was leading to discontent and resentment among the Ger. troops and necessitated profound military redispersions. But, although the weather and the lengthening Ger. supply lines reduced mobility, heavy fighting broke out on various parts of the front and the Gers. gained one important success in the capture of the junction of Tikhvin, S. of Lake Ladoga and due E. of Leningrad. But the Russian position with regard to reserves was improving as the result of the organisation by Marshals Budyonny and Voroshilov of new armies composed of partly-trained men. In Rostov there was bitter street fighting, while, in the Donetz basin, the Russians recaptured some heights and even advanced some 30 m. or more. It might well seem remarkable that the Ger. armies could continue for months to sustain an offensive on so vast a scale with lines of supply extending for hundreds of miles in a hostile land where, as the year wore on, weather conditions grew ever worse. Often in these later months Ger. tanks and lorries were halted axle-deep in mud and snow. Yet always their armies advanced undeterred by the task of disposing not only of their own great numbers of wounded and dead but of the not less numerous Russian prisoners.

Russian counter-offensive.—The Ger. plan, in their second general offensive against Moscow, which had begun in mid-Nov., was to break through the Russian lines and encircle the city with a wide out-flanking movement by almost all their armoured and mobile strength, combined with pressure on the front or centre, this latter attack being mainly carried out by infantry formations of the normal type. In order to achieve this, the Gers. must capture Tula, and other places to the S., and Klin, Rogachev and other places to the N. and, finally, strike at Moscow from three directions and occupy the city. Up to Dec. 6, the Russian forces waged fierce defensive battles against very large Ger.

tank groups and divs. of motorised infantry (11 panzer divs., 4 motorised divs., and 4 infantry divs.), holding back the offensive of the shock flank groupings of the Gers. and repelling their auxiliary thrusts in the centre (12 infantry and 2 panzer divs.) especially in the direction of Narafominsk, Zvenigorod, and Istra. The desperate Ger. onslaught had, by Nov. 26-27, made some progress W. and N.W. of the city, while also maintaining formidable pressure against Gen. Belov in the Tula area. But these relatively small gains had been won only at the price of very heavy losses, the Ger. dead (from Nov. 16 to Dec. 6) numbering 55,000. On Dec. 6 Gen. Zhukov launched a counter-offensive against the Ger. forces on both flanks. Both Ger. formations were routed in five days' fighting and re-treated rapidly, losing an additional 30,000 dead. In these three weeks the Russians captured and destroyed (without taking into consideration Air Force operations) 1434 tanks, 3416 lorries, 675 guns, and hundreds of machine guns and other material. Equally dramatic was the change on the S. front where, early on Nov. 29, the Soviet Fifty-seventh Army of Gen. Remizov attacked across the Don S.W. of Rostov and launched an assault which crumpled the Ger. defences and carried the Russians back into the city itself. The following night the Soviet Ninth Army under Gen. Kharitonov, crossing the Don near Novochoerkassk, broke through the Ger. lines and entered Rostov from the N.W. thereby almost encircling the Gers. After savage street fighting for two days, in which the Gers. lost over 5,000 dead and great quantities of guns and munitions, the remnants of their forces under Gen. von Kleist re-treated in disorder towards Taganrog pursued by the Russians and harried by guerillas. Two Ger. tank divs., one motorised div. and the S.S. Viking div. had ceased to exist; while another, the S.S. Adolf Hitler (tank) div., and three other infantry divs., and suffered crushing losses. This was Germany's first serious defeat on the E. front, and was a remarkable vindication of Stalin's judgment in placing Marshal Timoshenko in direct command on the S. front. The Ger. explanation of their 'evacuation' of the city was at once a signal proof of their defeat and a commentary on their military mentality. For the Ger. High Command made the astonishing statement that their armies fell back in order to carry out 'ruthless reprisals' against the civilian population in their rear.

This major Russian victory helped the army of Gen. Belov in co-operation with the forces of Gen. Konev, to make further progress in the all-important Tula section at a moment (Dec. 2-3) when Ger. tank thrusts round Mozhaisk were forcing the Russians to retire to new positions. But some few days later the Ger. armies, beaten to a standstill on the whole E. Front by intense cold and deep snow and, above all, by the almost miraculous tenacity and courage of the Russian soldiers, halted their Russian campaign for the

winter. Brit. and Amer. aid in tanks, guns, planes, and other equipment contributed to this result; as also indeed did the constant bombing of objectives in Germany and the occupied countries of W. Europe by Brit. airmen, and Gen. Auchinleck's offensive in Libya; for these assaults involved the transfer to W. Europe and N. Africa of increasing numbers of Ger. fighter planes and pilots from the E. Front. The Ger. official announcement of their intention to abstain from any major strategic moves during the winter was a momentous one, for their abstention was forced upon them by the miserable condition of the majority of the Ger. soldiers, who were quailing before the first Russian frosts. The effect of the Ger. admission coupled with the supersession of Marshal von Bock on the Russian armies was electrical, and it became evident that, in spite of the rigours of winter, they would certainly not allow the Gers. leisure to dig in anywhere near the front as it now stood. The recapture of the important tn. of Tikhvin by Gen. Meretzkov, formerly commander of the Leningrad military dist., and of Elets, E. of the Orel-Kursk line, were symptomatic of the general tendency exemplified in Gen. Konev's relief of Tula. From this time the Russian generals took the initiative and throughout the bitterly cold winter months steadily pressed the invaders back. The Ger. front as at Dec. 6, the farthest point of their advance, ran approximately through Shlisselburg-Novgorod - Kallnin - Rogachev - Moskva - Narafominsk - Serpukhov - Tula - Stalinogorsk - Elets - Byelgorod - Kupiansk - Rostov-Kerch. By the end of Feb. much ter. had been recovered, the Ger. line being forced back to Kholm, Veliki Luki, Rzhev, Yelnya, Orel, Kursk, Kharkov, Lozovoe and to within a few miles of Mariupol, hundreds of tns. and vils. being liberated in the advance. Kallnin, an important tn. on the Moscow-Leningrad railway about 100 m. N.W. of the cap., fell on Dec. 15. This success, coupled with the Ger. defeat at Tula, compelled the Ger. forces, which had attacked the approaches of Moscow frontally, to make a hurried withdrawal, leaving in Russian hands great quantities of material and many prisoners. Moreover, the Gers. now began to find difficulty in transferring troops to hard-pressed points without the risk of dangerously weakening other points, since the Russians were attacking all along the front and there was always a danger of Ger. reinforcements being stranded and frozen on the journey. On Dec. 29-30 Russian troops under Gen. Kozlov on the Caucasian front, in collaboration with naval forces, made a landing in the Crimea and occupied the tn. and fortress of Kerch and Feodosia. Russian cavalry were now in action in the Ukraine against Ger. infantry, not only by day but also during moonlit nights. So ill-clad were many Ger. troops for the winter campaign, that the Ger. gov. organised a house-to-house collection throughout Germany and occupied countries of warm clothing of all kinds, in-

cluding also privately-owned skis. This collection operated especially harshly on the luckless inhabs. of Czechoslovakia and Poland, who had already endured untold hardships. However, few of the comforts reached the Ger. troops in time.

The New Year opened well for Russian ascendancy, the tn. of Kaluga, 110 m. S.W. of Moscow, being recaptured, while no fewer than 16 Ger. divs. under the Ger. panzer leader, Gen. Guderian, were routed. A Black Guard Brigade, which was flown from Poland in troop-carrying planes, failed to stem the retreat. As a fact Kaluga had changed hands many times in furious fighting. Its final capture by the Russians marked the definitive liberation of the tns. of Naravominsk, Lugorski, Zavod, Alexin, Tarusa, Odoyev, Likhvin, Kozelsk and hundreds of vils. and settlements. The Russians were now pursuing the Gers. from Kerch, where again large quantities of equipment were abandoned. On the central Moscow front their advance was threatening Rzhnev, Vyazma and Yukhnov, the Gers. extricating thither what they could of their forces around Maloyaroslavets—one of the celebrated battlefields of Napoleon's campaign—and from the important position of Mozhaisk, which latter position still remained in the tenacious Ger. grip. Maloyaroslavets, 80 m. S.W. of Moscow, fell on Jan. 9 a. r. l., three days later, the Russians retook Borovsk and were closing in on Mozhaisk. This latter tn. fell on Jan. 19, three Ger. divs. holding on till the end, the whole scene of battle being weirdly illuminated at night by two blazing vils. in the near vicinity. Every house in Mozhaisk had been turned into a fortress. There were huge stocks of ammunition in the tn. which the Gers. were unable to move. Strictly, the fighting in this region was a large-scale rear-guard action, most of the Ger. troops originally garrisoned there having been withdrawn to avoid encirclement. In the Crimea the Gers. retook Feodosia, though Russian pressure was maintained E. and W. of Taganrog. In the centre, following a break through in the Valdai Hills between Smolensk and Lake Ilmen, more places were recaptured, including Kholm and Andreapol, the advance bringing the Russians to within 100 m. of the Latvian border and threatening Veliki Luki, the railway junction and base for von Leeb's forces investing Leningrad. Considerable progress was also made in the Ukraine by the armies of Timoshenko, who had begun a new general offensive on Jan. 18, much booty being taken after the capture of the hotly-contested position of Lozovoe (Jan. 29). A few days later the famous Russian marshal was striking towards Dnepropetrovsk, Myelgorod and Kharkov. At the same time especially fierce Russian assaults were being delivered on the Leningrad front towards the vital position of Shlisselburg (15–20 m. E. of Leningrad), where Gen. Morozkov's forces were attacking across the ice and along the shores of Lake Ladoga in an attempt to trap von Leeb's positions in this area which the Gers. had heavily

defended with fortified lines and deep mine-fields. But the deliverance of Leningrad was not yet at hand, for other positions lay athwart the Russian path, notably in the Staraya Russa area, S. of Lake Ilmen, where the next great battle was begun at the end of Feb. Surprise moves by the Russians, involving the cutting of two roads through deep snow-fields and a night march of 27 miles by troops specially protected against the intense cold, outwitted the Gers., who had made the tn. of Staraya Russa a munitions base and starting-point for their Moscow offensive, and effectually destroyed every hope of relief from outside the huge encircling ring of the Red Army.

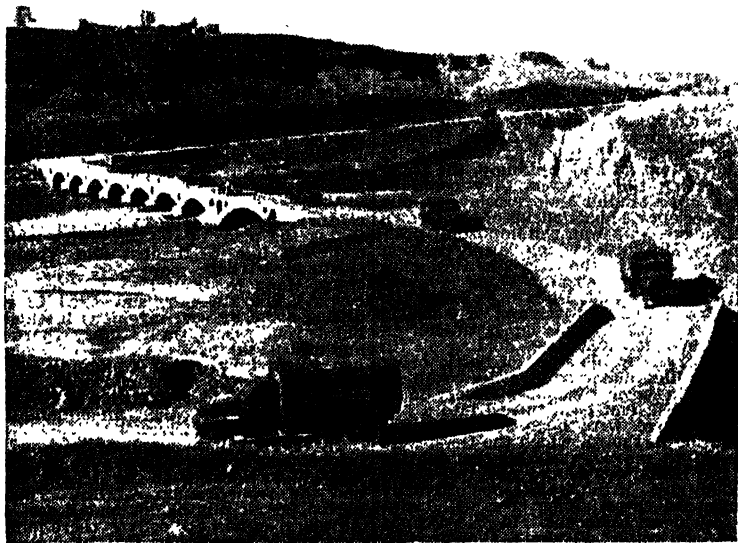

Spring was now at hand and the fate of continents hung upon the titanic struggle. The Gers. were striving to maintain a series of large-scale centres of resistance or buttresses, behind which they might keep communications open and, for a time, provision by air-borne supplies. The Russians for their part, were penetrating between these strong places, which, in fact, represented a modern or informal version of the ring-defences of the last century, heavily-fortified vils. or small tns. taking the place of the forts with which engineers like Brialmont and Vauban surrounded their main fortresses. To storm these by frontal assault was too costly. The Russians succeeded in reducing some by sev. ingenious methods, but as yet Vyazma, Orel, Kursk, Kharkov and others still blocked the way, preventing them from using communications essential to the continuance of their offensive and leaving in Ger. hands springboards for the much-heralded Spring counter-offensive.

By 1942 allied war supplies were pouring into Russia in ever-increasing quantities via Bandar Shahpur on the Persian Gulf and the Trans-Iranian railway. Transported across salt marsh and desert to Ahwaz, road and rail convoy there joined the flow of supplies carried by riv., all thence continuing N. to the U.S.S.R. Brit. and Amer. war equipment was also reaching Russia's arctic ports in convoys after hazardous passages around the North Cape. These supplies were soon to change the Russian army from an almost immobile force to one capable of manoeuvre.

The Battle of Kharkov—Fall of Sevastopol—German Offensive in the Don Region.—The Russians anticipated the German spring offensive by launching (May 13) an offensive, on a 50 mile front, in the Kharkov region. This offensive by Marshal Timoshenko was a counter-move to the formidable Ger. drive in the Kerch peninsula, where the Russians were driven back by combined Ger. and Rumanian forces to the coast of the Sea of Azov. At one time the Russians were actually fighting near the outskirts of Kharkov, but, though many Ger. prisoners and much material were captured, Timoshenko did not succeed in taking the city itself. His attack, however, which, by May 17, extended along a 100-mile front between Myelgorod and Smiyev (40 m.

N.E. and 20 m. S.E. of Kharkov), aimed at enveloping Kharkov from the N. and S. and engaging the main Ger. forces under Marshal von Bock rather than attacking the city itself. In the first five days of the battles for Kharkov 12,000 Ger. soldiers were killed, with the loss of 400 tanks and 150 aircraft; but the Russian losses were not much less, for wherever the Russians advanced the Gers. threw in reinforcements of men and material, particularly tanks. On May 19 von Bock delivered a heavy counter-attack in the

crossings and threatened to cut off large Russian forces in the Izyum-Barvenkovo area, but these forces were relieved by a force of tanks and infantry even larger than those of the enemy. The strategic purpose of Timoshenko's attack in the Kharkov battles was to counteract the Ger. plans for a great offensive against Rostov in preparation for a drive on the Caucasus—for which plans the Gers. had massed 500,000 men, comprising 30 infantry divs. and 6 tank divs. By the end of May the losses on both sides were

A CONVOY OF SUPPLIES ON THE PERSIAN ROUTE TO MOSCOW

Donetz region around Izyum, 70 m. S.E. of Kharkov and at Barvenkovo 20 m. S. of Izyum. Meanwhile bitter fighting was still raging in Kerch, where Gen. Kozlov's rearguards inflicted heavy casualties, but the Russians lost a great many prisoners. There were numerous spectacular air fights, the Russian Stormovik dive-bombers proving effective against tanks, while Brit. Hurricanes, and Amer. Tomahawks and Alcobras were also used. The Gers. now hurled masses of tanks into the Izyum-Barvenkovo region in an ambitious attempt to break through S. of Kharkov and envelop Timoshenko's forces; but massed Russian artillery and anti-tank guns successfully held these formidable thrusts. Both sides brought up great reinforcements of tanks and planes and the toll of casualties continued to rise in what was proving one of the bloodiest of all battles. The Gers. made great efforts to force the Donetz

enormous—the Gers. lost 90,000 killed and captured, the Russians 75,000. The next great battle was for Sevastopol, which began early in June with air raids on the beleaguered city and the mass concentration of great quantities of siege guns and other artillery. The Ger. attacks were, as usual, carried out without regard for losses—thus 6,000 Gers. were killed by the Russian garrison in one day alone. On June 10 the Russians repulsed seven Ger. attacks and in one period of three days' fighting the Gers. lost nearly 15,000 killed. Gen. Mannstein, commanding the attack, had some 10 divs., numbering between 130,000 and 150,000 men and, like von Kleist at Kharkov, was always ready to throw in fresh reinforcements of all kinds in seemingly unlimited numbers. Meanwhile, on the Kharkov front, where after three weeks the fighting had slowed down, the Ger. infantry and tanks now tried to recapture strong points in their second

line of defence which had been taken by the Russians. In his counter-offensive on this front von Bock was using strong tank formations, with massed artillery. His tactics represented, in effect, a modification or extension of the original spring plan which Timoshenko's Kharkov battle rendered expedient. He was, in fact, compelled for the time being, to join battle further N. than he had intended. His original plan had been to strike at Rostov through the Donetsk basin and, simultaneously, to cross the mainland from the Crimea. That he would pursue this plan as soon as he had sufficiently restored his positions in the Kharkov region was as certain as that the main battle for the Caucasian approaches was now joined. Now, at last, with the imminent fall of Rostov, and the loss of numerous tns. in the Donetsk basin had come the great struggle, with the Russians always stubbornly retreating before far superior numbers and equipment but yet always keeping their armies intact—a consideration of far greater importance than the retention of tns. and ter. Mid-June saw the resumption of most savage fighting both on the Kharkov front and before Sevastopol. Furlous hand-to-hand fighting raged outside the famous city of the Crimea in which thousands of Ger. and Rumanian soldiers fell. Heavy toll was taken of Ger. lives also by the guns of the Black Sea fleet but, notwithstanding the resolution of the garrison and of the crews of the ships, the Ger. hordes steadily penetrated the Soviet defensive positions. The Russians tried to make landings from the sea at Eupatoria, Yalta, Kerch, and Mariupol, but without decisive results. On June 20 eight Ger. attacks were beaten off, the garrison in historic Balaklava resisting the most intense gunfire, while Russian marines, landed from a cruiser, struck heroically at the enemy N. and S. of the city and at the cost of still more heavy casualties, the Ger., after ceaseless air bombing and artillery fire, at length succeeded in driving a wedge in the Soviet positions in the Balaklava sector (June 21). Fort Maxim Gorki had already fallen. Fresh units were flung into the battle at Sevastopol on June 23 where the Gers. were now delivering attack after attack over heaps of their own dead. The tn. had ceased to be practicable as a naval base, but supplies and reinforcements were brought in by sea, while children and old people were evacuated. By the last days of June the city area of Sevastopol had been practically destroyed by bombing and shell fire, though the garrison, with forlorn courage, continued to repel waves of enemy infantry and tanks. Elsewhere the position, from the Russian standpoint, was no better, for on the Kharkov front von Bock's offensive was still heavier than in the Izyum-Barvenkovo battle, and the Russians were forced to evacuate Kupiansk, an important rail junction, some 60 m. S.E. of Kharkov; but at least Marshal Timoshenko's armies still remained intact.

Sevastopol fell early in July, but the

news of the fall affected the Soviet people less than the tales of its heroic defence, which moved them more than any other event of the war, adding, as they did, yet another epic to Russia's splendid past. A few days later the Gers. delivered an attack of great violence from the Kursk-Byelgorod area, due N. of Kharkov—their immediate objectives being the important railway junction from Voronezh to Moscow in the N. and to Rostov in the S. and the Don riv. In the Kursk region the Gers. attacked with more than 1000 tanks and soon made a deep penetration of the Russian front—their customary tactics in the first stage in armoured warfare. The tremendous weight of the Ger. attack was unparalleled even in this war, and it overrode Soviet resistance in some sectors where, however, the Russians fought effective delaying actions in a most stubborn defence, which restricted the tempo of the Ger. advance. But the Gers. made rapid progress all along the Don from Voronezh to Svoboda, Boguchar and Millerovo, and by mid-July the main battle extended from the junction of the R. Boguchar with the Don to the Sea of Azov, including the Donetsk basin, the Russians retreating to their main prepared line, 200 m. long, along the lower Don—the strongest natural defence line for approaches to the Caucasus since the Dnieper was abandoned in 1941. Apart from severe fighting round Rzhev and near Orel, the fiercest struggles in the next ensuing weeks were the battles for Rostov and Voronezh. The capture of Millerovo, where the railway from Voroshilovgrad meets the Moscow-Rostov railway, placed those parts of the E. Don basin still held by the Russians in a precarious position. The German advance was most methodically planned and powerfully supported, and the Ger. commander no longer repeated the error of sending tank columns far afield without heavy infantry and artillery support. The outstanding feature of the Don battle up to mid-July was Marshal Timoshenko's skilful conduct of the very difficult operation of retreating under pressure methodically and without disorder, which suggests that a withdrawal was foreseen as probably necessary. The hope of Russia's allies was that, if his armies could reach the lower Don essentially unbroken, the Gers., after their expenditure of men and materials, would be no nearer his defeat than before and must fight the battle all over again with Timoshenko holding more favourable positions than before. If, however, the Gers. succeeded in effecting a permanent landing behind the Don, or forced the riv. near its mouth, the position would be changed radically to Russia's disadvantage. In the tremendous battles fought between May 15-July 15 the Ger. losses in killed, wounded and prisoners, were 900,000 officers and men. Of these no fewer than 350,000 were killed. In addition the Gers. lost 2000 guns of all calibres, 2900 tanks and at least 3000 aircraft. The Russians lost during the same period 399,000 officers and men in killed, wounded and missing, 1905 guns, 940

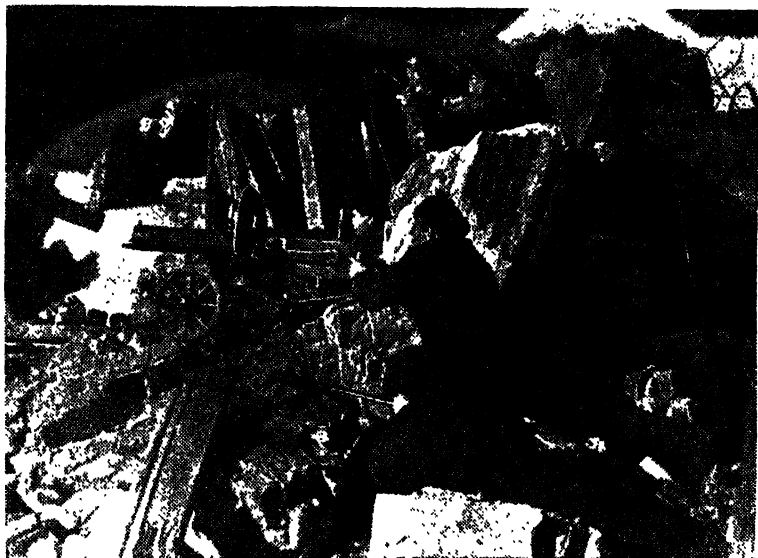

tanks and 1354 aircraft. The disparity in losses affords some indication of the improved organisation and power of resistance of the Red Army which forced the Gers. from the first to throw into action their main forces and reserves, to advance far more slowly than before and, in the course of the fighting, to suffer enormous and irreplaceable losses in men and material. However, notwithstanding losses, the Ger. armies continued to advance and the Russians to fall back. By the early days of Aug. two great battles were being fought in the S.—the battles for the Volga and for the Caucasus. The threat to the whole position of the Soviet became obvious, for the relentless advance seemed not unlikely to mean the isolation of the Caucasus and the forcing of a salient between Gen. Lvov's army there and Timoshenko's forces defending the Volga. Stalingrad, the great riv. port manuf. and business centre, was now von Bock's immediate objective: but Timoshenko offered a stubborn defence, particularly at Kletskaya, in the hope of diverting the enemy's main blow southward against Kotelnikovo, which lies 100 m. S.S.W. of Stalingrad. In the N. Caucasus the Ger. forces under von Kleist were threatening the oilfields of Maikop and the city of Krasnodar, having added thousands of sq. m. of Russian ter. to the 30,000 sq. m. they had already seized N. of the Don since the spring advance. The Kuban Cossacks fought with characteristic bravery, but the rich Kuban steppe, with its comfortable vills. and settlements, was being turned into an inferno of conflagrations. Ger. parachutists sought to sow panic in the ranks of the Russian rearguards by setting fire to homes and fields behind the battle line. But grave and far-reaching as were the Ger. successes in N. Caucasia for the cause of the United Nations, it was realised that the battle for Stalingrad was far more momentous. Wisely Timoshenko had elected to direct all his limited resources towards the defence of Stalingrad and the Lower Volga. Meanwhile, von Bock was anxiously launching unsuccessful counter-attacks in the Voronezh region. Heavy reinforcements, however, continued to reach his powerful army in the Don bend (round Stalingrad), but attacks delivered five or even ten times a day on a broad front failed to break the Soviet defence. About Aug. 13, Marshal Timoshenko's forces, counter-attacking in the battle for Stalingrad, routed powerful forces of Ger. tanks and improved their positions near Kotelnikovo, while, at the same time, the Russian attacks on the Voronezh front grew in intensity.

The battle for Stalingrad and the invasion of the Caucasus.—In the autumn the chief objectives of the Ger. invaders were Stalingrad—a narrow city on high ground stretching for 20 m. along the W. bank of the Volga—the Grozny oilfields, and the Black Sea port, Novorossiisk. The Gers. were not able to attack all along the E. front, as they had done in 1941; instead, they adopted the plan of concentrating their maximum strength in the S. on very narrow fronts and else-

where acting on the defensive, notably at Voronezh and at Rzhev. The main object of the Ger. offensive of 1942 was, however, not the occupation of the oilfields, but to outflank Moscow from the E., to cut off Moscow from the Urals, and then to strike at the city itself. The Ger. advance southwards towards the oil regions aimed not so much at occupying those regions, which were an auxiliary objective, as to the diversion and encirclement of the main Russian forces to the S. in order to bare the Moscow front. In connection with the thwarting of this plan the importance of the Russian attack at Voronezh cannot be overrated. In the vicinity of Rzhev Gen. Zhukov delivered an effective counter-offensive in the triangle formed by Gzhatsk and Vyazma with Rzhev. Further N. there was occasional activity in the region of Lake Ilmen. But it was the battle for Stalingrad which dominated everything, and gradually, as the months wore on, the name of the city assumed almost a symbolic significance. Therefore, the Ger. forces had pushed on inexorably and the fate of Russia might well seem to have hung in the balance on the day of Aug. 22, when Marshal von Bock ordered a general assault and, with 1000 aeroplanes, set a large part of Stalingrad on fire. But now at length the Russians stiffened their defence, rising superbly from the ruins of the stricken city and thenceforth contesting every yard of advance. In the first phase of the battle, round Kotelnikovo, the Ger. forces suffered a sharp defeat, the scene presenting a desolation of charred wheat, a sordid litter of smashed tanks, scorched and splintered undergrowth and numerous corpses blackening in the burning sun. A new Ger. offensive, however, began from the S.W. of the city on Aug. 31 after a brief lull following the almost complete destruction of Kleist's 14th Panzer Div. For hrs. the defence stood firm and the Ger. attacks broke against the Russian heavy guns and mortars. N.W. of the city von Bock delivered an equally determined attack, but met with still stiffer resistance. In the general result, however, this double threat to Stalingrad had become gravely accentuated by Sept. 3. The next day the Gers. attacked again with very powerful air forces and a constant stream of ground reinforcements. Von Bock had received orders from Berlin to take the city at all costs and destroy the Russian forces there and in the whole of the Caucasus. Satellite troops, composed of Rumanians, Its., and Hungarians, were sacrificed remorselessly. The battle for Stalingrad had become one without precedent in the three years of war—the very touchstone of the fortunes of the United Nations. Lodged deeply within the city's defences Ger. mechanised vanguards wormed their way through to the approaches of Stalingrad and, turning E. and W., sought to tear open the Russian lines and force a path for the large infantry forces lying in front of Kotelnikovo and along the railway to Stalingrad. By the end of the fourth week of this titanic struggle more than 20 Ger.

divs. were opposed by a rather smaller force of Russians. Day after day Bock used shock tactics in the hope of taking the city after only a short struggle; but he was gradually forced to begin siege warfare, for the Russians had learned that the offensive spirit of the Ger. infantryman was low unless he was well backed up with machines. Moreover, the Russians were now not only accustomed to tank attacks, but were also resisting the dive bombers with greater resolution. Bock constantly brought up fresh troops under cover of

reaches of the riv. Meanwhile, in the Caucasus, the sustained and vigorous defence of the Grozny oilfields and mt. passes threatened the Ger. time-table, and elsewhere, at Rzhnev and at Voronezh the Russians still held the initiative. Yet despite the heaviest losses the Gers. continued to pour in fresh troops to the attack on Stalingrad. Through clouds of dust and rubble of shattered houses Ger. infantrymen, encouraged by specious promises of extra pay and furlough, crept forward with tommy-guns through the

Soviet Weekly

RED ARMY MEN ATTACKING IN A RUINED FACTORY IN STALINGRAD

darkness, but the Russians were still securing a huge flow of reserves and supplies by the circular railway which entered the city in the N.W. and S.W. There was still no sign that either of the foes was reaching the end of his resources or of his fighting spirit. The closer the Gers. approached the city itself the more obvious was it that the Russians would defend it street by street and block by block. Bitter street fighting followed a Ger. break-through into the N.W. (Sept. 17). But the Russians were determined to resist a *outrance* and the road of retreat was barred to the defenders by the will of the whole Russian people. There was no thought but to wear the enemy down by the vigour of the defence and the power of counter-attack. Nor did the Soviet Gov. conceal their acute anxiety about the fate of Stalingrad or the importance which they placed on the control of the lower

Soviet lines. Every pile of rubble, every crater in the broad streets, every window in the battered houses, however, was a Russian point of resistance. Furious air fights between Amer. built Alcobras and Russian Yaks, on the one side, and Ger. Messerschmitts and Junkers on the other, went on all day. Houses were rent asunder, streets collapsed, and the fronts of factories fell as if undermined by an earthquake. The city, which was the especial pride of the Russians, had now become a smoking cauldron in which two armies were locked in a frenzied struggle for the mastery. And now at this climax Stalin called on the troops of the city to attack and to recapture every lost position while, at the same time (Sept. 19) the Soviet Army launched a new offensive in the Voronezh region from four or more directions with a view to relieving the position at Stalingrad. Meanwhile the

city was rapidly being converted into a honeycomb of defences in preparation for battles for every house and every storey. Relentless fighting was proceeding on the featureless steppe away from the city itself, where troops could move only with the greatest risk. Here around windmills and piles of shattered guns, among the bodies of the unburied dead, the Russians were now attacking with the utmost ferocity. The noise of the battle was probably quite unprecedented in warfare: an appalling roar compounded of the harsh din of the heavy tanks, the incessant stutter of machine-guns and the whining zoom of hundred of aeroplanes fighting large air battles in formation. Only in the rare lulls did the screams of the dying and the moans of the battle-crazed reach the ears of the combatants. The area of this remarkable battle now extended along a 40-mile belt of country along the bend of the Volga, comprising Stalingrad itself and clusters of satellite vil. settlements. At right angles to the riv. ran numerous deep ravines. For weeks the whole of this region had been mercilessly bombed by the Gers. and by now (Sept. 24) the terraced houses, quays, embankments, and factories of Stalingrad were shattered beyond recognition. The whole region of Stalingrad had become a battlefield. It had no inhab., only defenders. The position inside Stalingrad was at its most critical point on Sept. 26, when, in spite of a Ger. reverse in the 24th, the garrison found itself being overwhelmed by the tremendous onslaught. But at this juncture the 13th Div. of the Guards, under Gen. Rodimtsev, reached the E. bank of the Volga opposite the city after a series of forced marches and were rushed up from the rear in lorries and every vehicle imaginable in a manner almost reminiscent of Gen. Gallieni's Paris troops in the first battle of the Marne in 1914. Some regiments were landed in the N. and some in the S., as the Gers. had broken through to the riv. and controlled part of the bank in the centre. This was the period during which the Gers. plausibly claimed to have cut the city in two. Both halves of the Guards Div. then attacked and cleared the enemy from the Volga bank, joining up to form the first Soviet line inside the city. Fighting with their backs to the riv., they gradually drove further W. until they had secured more room for tactical movement. Their great feat was the seizure of 'Iron Hill,' which dominates the city and long stretches of the riv. Their spirit infused the whole of the defending force and from the moment of their dramatic intervention the Russian resistance in Stalingrad stiffened.

A lull in this frenzied and protracted struggle only came on the fifty-first day of the battle. Repeatedly, during these seven weeks the Gers. strove to pierce the thin Russian front and reach the coveted Volga. They showered countless leaflets on the city, calling on the Russians to surrender. The pamphlets lay shrivelled in the hot breath of the blazing ruins, unheeded, and the city still stood. Hist.

may well ask how Stalingrad withstood protracted attack by such a preponderance of tanks and infantry, supported always by a greatly superior air force. Guns were the real mainstay of the Russian defence. Their mobility and the open nature of the country allowed them to concentrate in masses on narrow sectors. Thence their fire, often from three or four regiments at once, converged on the great German tank columns as they streamed across the steppe. And now, as winter approached the Gers.' chances of taking the city dwindled. Every yard of advance was contested, every factory wall defended to the last; especially fierce was the struggle for the 'Red October Factory.' But Nov. came with Hitler's boast at the end of Sept. that Stalingrad at least would fall still unfulfilled. Meanwhile Marshal Timoshenko's relief force was slowly advancing from the N.W.

In Aug. Gens. Zhukov and Konev had succeeded in cutting the single line between the Itzhev region and the main Ger. armies there and to the S.W. Here too there was desperate street fighting the city being of the highest strategical importance and containing an enormous supply of stocks accumulated in the previous autumn when it served as the base for von Bock's and List's expeditionary forces against Moscow. But while Zhukov was making headway here in the centre of the E. front, Marshal Timoshenko's forces in the S. were forced to withdraw to new positions covering Stalingrad. Meanwhile heavy fighting was also in progress still further south, where the Gers. were advancing on Novorossisk and Tuapse, port for the Maikop oilfield on the Black Sea and on Mozdok near the Grozny oilfields. But here again, at Mozdok, the Russians stood firm as at Stalingrad and for weeks the attacking Ger. forces made no appreciable advance, until late in Nov., when they took Nalchik and advanced to Ordzhonikidze and the all-important Georgian military road, which leads directly to Tiflis. But here they were pulled up by a brilliant counter-offensive at Ordzhonikidze and routed in such decisive manner as to end the danger to the Grozny oilfields, at least for the winter. In their retreat the Gers. abandoned nearly 150 tanks owing to lack of oil fuel. But a still more dramatic change came over the S. Russian front from Nov. 19 when the Russian troops at the approaches of Stalingrad passed over to the offensive both from the N.W. and from the S. of the beleaguered city. In a few days they had broken the Ger. line in the N.W. on a 20-mile front and on a 15-mile stretch in the S., advancing from 40 to 50 m. They occupied the tn. of Kalach on the Don and the tn. of Abganerovo, thus cutting both railway lines supplying the Axis forces on the E. bank of that riv. On the fifth day of the offensive, Stalingrad's battle-worn defenders were at last relieved, when a Russian army broke through to link up with them from the N. and they themselves then joined in Marshal Timoshenko's great offensive. The result was that the Axis

forces were now facing an increasingly precarious position with Russian armies closing in behind them across the Don to the W. At the end of a week some 51,000 Axis prisoners were taken and 46,000 men killed, besides 80,000 wounded. The booty included nearly 400 tanks, 1300 guns and over 5600 motor vehicles. Near Kletskaya on the Don bend N.W. of Stalingrad three entire Ger. divs., together with their generals, surrendered on Nov. 24. This change in the fortunes of the Russians was an indication of effective unified strategy on the part of the United Nations, for it followed immediately on the Brit. defeat of Rommel in the battle of Egypt and the successful landing of large U.S.-Brit. expeditionary forces in Morocco and Algeria.

Russian Counter-offensive.—Destruction of Ger. VIII Army.—Fall of Rostov.

Following orthodox strategy the Gers., in the early summer of 1942, had concentrated their strength for the blow at their main target, Stalingrad, on a 200-mile front from Izyum to Kursk. They drove E. and S.E., following the two main railways to Voronezh and Rostov respectively, their right flanking out, as it passed the industrial trns. of the Donetz, in order to try to encircle the Russians retiring on Rostov. But the Gers. were held at Voronezh by Gen. Golikov, and, as there was no other W. to E. railway in Ger. control for the next 200 m. southwards, the Ger. main concentration was switched southward to follow the railways to Stalingrad. Thus Rostov was taken and the Gers. rushed forward up the Salsk-Stalingrad railway, and it was then that the Ger. High Command boldly broadened their whole plan, abandoning orthodoxy and over-reaching themselves. For they now aimed, not only at taking Stalingrad, but at cutting off Russia from her oil and from her Brit. and Amer. supplies, separating the Central European part of the Soviet Union from the Volga and the Ural area and surrounding and taking Moscow, and so putting the Russian armies out of the war. But the Russian High Command had observed that the Ger. troops were really insufficient for the 900-mile front N. of Kursk and, behind these lines, the Russians were left in comparative peace to withdraw, train and move reserves as they chose. In sharp contrast to the Ger. was the Russian strategy, which aimed at surrounding and routing the Ger. forces on the approaches to Stalingrad. This plan was effected in Nov.-Dec. 1942 in three stages. The first was the Russian offensive N.W. and S.W. of the city, which has been described. The task of routing the Ger. flank groups on the approaches to Stalingrad and surrounding the principal concentrations on those approaches was successfully executed by the troops operating in the N.W. of the city. The second stage was the Russian offensive in the area of the middle Don (Dec. 16-30). The Russian troops here were assigned the task of penetrating to the rear of the Ger. troops in the Don bend and preventing those Ger. troops which were surrounded

on the approaches to Stalingrad from escaping or being relieved. The third

Soviet Weekly

TROOPS OF THE RODIMTSEV
DIV. ON RECONNAISSANCE IN
STALINGRAD, WINTER 1942

stage was the Russian offensive S. of Stalingrad. The Ger. command, having led their troops (the Sixth Army) at

Stalingrad into a cul-de-sac and having brought them to the brink of a catastrophe now made a desperate attempt to relieve them. With that object in view, they concentrated a considerable force N. of Kotelnikovo, and on Dec. 12 launched an offensive. The Soviet troops, however, routed this new concentration, rolled the Gers. S. and so deprived them of the last chance of breaking through to the encircled Sixth Army. In all, during these three stages of their offensive to the end of 1942 the Red Army routed 36 enemy divs., including 6 tank divs., besides inflicting heavy losses on 7 others. During the same period the Ger. and satellite troops lost a total of 175,000 officers and men in killed and 137,700 prisoners; while the Russian booty included 542 aircraft, 2064 tanks, 4451 guns, 138,000 rifles, 5,000,000 shells, 2000 railway trucks and much other material besides the destruction of 1249 aircraft, 1187 tanks, and 1459 guns. The general direction of these successful operations was in the hands of Gen. Zhukov, the celebrated defender of Moscow. Towards the end of Jan. 1943 the Russians had, in the main, completed the destruction of the Ger. Sixth Army, which was commanded by Gen. Paulus. 600 Ger. transport planes, sent to relieve the trapped army, had been destroyed. Famine, disease, and Russian bombs and gun-fire had, by mid-January, reduced an army of over 300,000 to between 70,000 and 80,000 men. Those that remained rejected a Russian ultimatum to surrender and the Russians then launched a new and final attack of annihilation. At this date numerous Ger. officers were escaping by air or surrendering. The fire of the few remaining forces was now obviously weakening, and, on Jan. 31, the Russians captured Field-Marshal Paulus (he had been given that rank by Hitler a few days previously), 15 generals and the remnant of the Sixth Army. In the course of the general offensive against this army, the Russians had captured 46,000 prisoners in all; the inference, therefore, is that most of the rest were killed. Catastrophic losses in equipment and prestige, apart from the loss of men, were incurred by the utter collapse of the Ger. Stalingrad expedition. On this same day the Ger. position in the Caucasus was rendered still more precarious by the loss of the junction of Tikhoretsk and the clearing of the Maikop oilfields. The blow which stunned the Ger. will at Stalingrad seemed, indeed, to have affected the command of the whole S. front, including the Caucasus. A confident army, flushed with victory, experienced a transition from a wholly offensive to a wholly defensive force. Certainly winter conditions were partly responsible for the change in mind, but the chief factor was just as certainly the Russian method of offensive warfare, which Gers. had not previously experienced. That the powerful, experienced Sixth Army, copiously equipped, as few field armies have ever been equipped before, with guns, armour and munitions for the reduction of Stalingrad (confi-

dently promised by Hitler) could allow itself to be so effectively enveloped and then completely destroyed would have been pronounced no less fantastically ridiculous by any Ger. soldier or civilian than the idea of its total eclipse would be extolled—as it was—in Berlin as 'a proud epic of Ger. military hardihood.' But the fact is that the Gers. did not believe that the Russians could have any really formidable reserve armies and so had not made any adequate emergency dispositions beyond extending the scope of an elastic 'hedgehog' system, which had proved effective in the winter of 1941-42.

Before Marshal Voronov and Col.-Gen. Rokossovsky had reached the point at Stalingrad that they must pause to bring up materials and regroup for their next offensive, Gens. Vatutin and Golikov were attacking westward and driving the Ger. forces out of the Don bend; while, soon afterwards, Gen. Eroshenko (commander of the S.W. front in the Stalingrad battle) and other generals attacked again from the Kotelnikovo region towards Salsk and Rostov and before even this attack had reached its height, another army on the Voronezh sector forced the Gers. and Hungarians to retreat rapidly and yield essential railways. And at the same time the Russians were prosecuting operations on the middle front so that the Gers. were unable even temporarily to weaken that front by sending reinforcements S. In one of these central front attacks the Russians captured Veliki Luki, a most important stronghold, and in another they reduced Schlisselburg, the fortress tn. eastward of Leningrad and so reopened a land-corridor to the long besieged garrison and inhabitants of that great city (*see further under LENINGRAD*). Altogether less dependent on railways than the Gers, the Russians, accustomed to large-scale operations across their native winter countryside, were now demonstrating that their soldiers were not only better officered for such warfare but were more than a match for Ger. soldiers on the open steppes. The next places to fall were Izyum in the Kupiansk region (Feb. 9), Stary Oskol, 50 m. W. of Voronezh, the port of Azov, 10 m. S.W. of Rostov, and, in the first fortnight of Feb., the important tns. of Kursk and Byelgorod, the capture of the last-mentioned place increasing the threat to Kharkov from the N., Kupiansk, Lozovaya (increasing the threat to Kharkov from the S.), Bataisk and Novochoerkassk, which brought the Russians to the gates of Rostov, and Krasnodar, a large tn. which gave them control over the Kuban riv. country. Thus, by this time the Russians were threatening the entire Donetz basin and the whole of the W. Caucasus, having recaptured in three months of winter all the ter. that the Gers. had taken in five months in 1942. The Russian victory at Krasnodar was the crowning achievement of the Caucasian armies' three month offensive—one of the most remarkable campaigns in modern military hist. It was characterised by deep raids, decisive pioneer tactics and great endurance on the part

of the men in overcoming great natural obstacles. The new tactics of the Russians overcame many obstacles which had long blocked their path. Thus, the fall of Kursk and Kramatorskaya removed two vital pins on the extreme end of a 220-mile front and, as a result, the Russians now enjoyed a wider freedom of manoeuvre. Flying columns of tanks, motorised infantry and ski troops all played their part in the complicated moves by which forces, simultaneously attacking from various directions, first encircled and then captured these strongholds. On Feb. 14 Rostov was taken by the forces under Col.-Gen. Malinowsky and on the same day the fall of Voroshilovgrad, 70 m. N.W. of Rostov, gave the Russians a key point on the railway to Kharkov. The recapture of Rostov was a heavy blow to the Gers. and set the seal on the remarkable recuperative power of the Russian people, the stoicism of their forces and the strategical skill of their generals. The most violent battles for the city occurred on the I. b. of the Don particularly in the Bataisk region. A powerful Ger. force massed N.E. of the city threatened the Russian right flank, but Malinowsky forestalled this move by cutting the Rostov-Novocherkassk railway, while another force led by Cossacks, crossed the ice on the Don delta near Azov and took a key position S.W. of the city. Then Malinowsky made a frontal attack on the centre, the Don was crossed and the S. part of Rostov captured including the railway station, while the rail connection with Taganrog was cut and Novocherkassk taken in a night attack. The rest of the city soon fell and the Gers. retreated in disorder. With its fall and that of Voroshilovgrad and Voroshilovsk the entire Ger. position in the Donetz basin was threatened and Russian forces were closing in rapidly on Kharkov, their successes placing them in an unbroken arc round the city. This great city, the third in importance in Russia, fell to the Russians on Feb. 16 after a determined attack which led to fierce street fighting. The operation which liberated Kharkov, though only for a month, and the routing of the Ger. forces in the area was the achievement of troops commanded by Col.-Gen. Golikov. Snowstorms raged during the later stages of the battle, but they did not impair Russian mobility. Golikov drew the main Ger. forces to the E. and S.E. of Kharkov and then struck decisively from the N. The city itself was protected by three defence zones, and before these were reached, the strongholds of Byelgorod, Volchansk and Chuguyev had to be taken; but always the strongest Russian blow was being prepared in the N. and N.E. Ger. aircraft played an active part in the defence of Kharkov as the Russian concentric attacks closed in on the city, and every man available for the front was mobilised even to the members of the gestapo. But Russian aircraft maintained their supremacy and heavy Russian tanks and self-propelled artillery swept into the city unexpectedly from the

S.W., while the main forces were fighting their way down from the N. Street fighting lasted for a day and a half, at the end of which the city was in Russian hands. As they fled the Gers. fired and mined all the finest buildings. The central part of Kharkov was now but a shell and all the railway lines had been removed to Germany.

While the Russians were pursuing the garrison of Kharkov westward, a new offensive was in preparation further N. under Marshal Timoshenko. This offensive was launched late in Feb. between Leningrad and Moscow, the Gers. being driven out of an area of 900 sq. miles in a few days. The following day Timoshenko captured the stronghold of Rzhev, 2000 of the garrison being killed; and the next day, continuing their advance W. of Rzhev, the Russians cleared the whole length of the railway between Moscow and Velki Luki. The position of the Gers. defending Orel had now become perilous. The mild winter and thaw, however, stopped further advance by the Russians in the Ukraine and their lengthening communications constituted a danger irrespective of the weather. Early in March they were faced with a concentration of 25 Ger. divs.—many brought up from the W. of Europe—on a narrow sector in the Donetz Basin and were forced to retreat towards the N. bank of the Donetz, evacuating Krasnodar, Lozovaya, Pavlograd, Kramatorskaya, Barvenkovo, and other towns W. of Moscow, however, they made further advances, particularly towards Vyasma, which they entered on March 12. Ger. resistance around Orel, however, was now stiffening. S. and W. of Kharkov the Russians were being very hard pressed. Notwithstanding the heroism of the Russian gunners and 'tank-busters,' the Gers., by sheer weight of armour and control of good roads, pressed relentlessly on Kharkov, neither side counting the cost in a great battle which increasingly assumed the character of tanks versus guns. The Gers. had an unprecedented number of machines concentrated on a very narrow front, with strong infantry and aircraft support. The Russians massed guns at vital points and inflicted heavy losses, but the Gers., undeterred by mounting casualties, resumed their attacks again and again and by March 15 had recaptured most of the city. The powerful Ger. recoil of Feb.—March eliminated the threat of envelopment to their armies between the Donetz and the sea and cut off, with considerable loss, some of the advanced Russian columns. Above all, it inflicted on the Russians a bitter disappointment in the subjugation of Kharkov again so soon after its dramatic liberation. But although the Gers. had, by the end of March, re-established their position along the line of the Donetz to N. of Taganrog, they were not appreciably better off in the matter than when they set out for the Volga and the Caucasus the previous year and, in their existing situation, this was equivalent to a heavy strategic defeat on the result of the whole period. It is generally surmised that Russia's

total casualties at this point were about 6,000,000. The Ger. losses were not much lower, but their man-power problems were much more intractable than those of the Soviet.

The Kursk-Orel battles.—The capture of Kharkov was the high-water mark of the Russian offensive in the Donetz region. At one time, for a fortnight, they held the entire course of the Donetz riv. The dense railway network of the Donetz industrial basin was in process of envelopment by two strong arms—under Gen. Malinowsky and Gen. Vatutin respectively operating towards Taganrog and Sineelnikovo—within which the Ger. armies were being destroyed. Other Russian forces, 20 m. N. of Taganrog, had crossed the Mius riv. Gen. Popov took Krasnoarmeisk and Vatutin occupied Pavlograd just N. of Sineelnikovo and Krasnograd, while Gen. Golikov advanced on Poltava. Already the Russians held Zenkov, Akhtyrka, Lobedin and Sumy to the N.W. of Karkov. The entire Ger. forces E. of the Dnieper bend were on the verge of a disaster exceeding that of the Sixth Army at Stalingrad. But at this point fortune deserted the Russian arms. The unusually early end of a remarkably mild Russian winter left the Russians at a great disadvantage, and their mobility was abruptly checked by ground softened by melting snow. As the already overworked Russian armies now unexpectedly and perforce came to a halt the Gers. gained time to regroup and reinforce. They quickly launched a counter-stroke from within and outside the Donetz basin and the Russians, realising the impossibility of their situation began a withdrawal. Krasnoarmeisk, Pavlograd, Krasnograd and Lozovaya were abandoned. Manstein, instead of commanding a defensive retrace, now drove offensively towards the Donetz and Kharkov, with a strong force brought by rail from the Dnieper bend with ample armour and air support. The Gers. indeed had long prepared this counterstroke, and it is not a little surprising that it was delayed as long as it was. Kharkov and Bielgorod soon fell to Manstein. Kramatorskaya and Slavyansk were abandoned. The first week of April found the Russians, however, still holding bridgeheads on the r. b. of the disputed Donetz area, chiefly in the Izium and Chuguyev sectors, and the Gers. launching repeated attacks towards Izium. The Russian positions on the lower Donetz and down the Mius to the Azov Sea remained firm and Voroshilovgrad was still in Russian hands. Between that time and early July there was a lull on the whole front. The only marked activity was in the Kuban region. Here the forces of Gen. Maslennikov were pounding Novorossisk, while the Gers. and their satellites launched frequent and furious counter attacks. It may be noted here that at this date (June 22, 1943) the Ger. losses during the two years of war in Russia in killed and prisoners were 6,400,000 against the Russian loss of 4,200,000 killed and missing. The Gers.

lost during the same period 56,400 guns, 42,400 tanks and 43,000 aircraft. Russian losses in war material were 36,000 guns, 30,000 tanks and 23,000 aircraft. Then came the spectacular Ger. Kursk-Orel offensive, which began on July 4—a delay explicable only on the assumption that their plans were affected by the early Axis collapse in Tunisia and probably by the withdrawal of many satellite troops from the E. front. If Germany hoped to force an issue on the E. front it could only be on the great Russian salient 130 m. across the chord stretching from N. of Kharkov to S. of Orel.

The ideal aim of this long-prepared offensive, like its predecessors, the offensives of 1941 and 1942, was to smash the Russian armies rather than merely to eliminate the Kursk salient, and to do so before the Allies might launch their 'second front' offensive in Europe—an offensive which, indeed, was already imminent in the expedition to Sicily. Judging by the troops and planes engaged and by the armour thrown in, this was the biggest battle of the war up to that time and the daily casualties indicated that the fighting was of twice the intensity of the Stalingrad battle. Again, from the number of air engagements and aeroplanes brought down, the Ger. air sorties were much in excess of the 2000 daily sorties during the biggest Stalingrad onslaughts and the number of tanks engaged was far greater than anything that was possible in the relatively cramped space of the street fighting of Stalingrad. A considerable proportion of the tanks used, particularly in the first wave of every attack, were 'Tiger' tanks—tanks with a firing power double or treble that of the ordinary or medium tanks used by the Gers. in 1942. One peculiarity of this terrific battle was that the Gers. attacked the very two sectors of the front where the Russians had been expecting them for sev. months and where the Russians had been organising defence in depth with exceptional thoroughness. A certain number of the 1800 Ger. tanks which were crippled or wrecked in the first four days fighting came to grief through blundering on the Russian minefields. Every type of weapon was used in this great battle on both sides—tanks, artillery, planes, mortars, machine guns—but the progress of the battle was essentially determined by the contest between the Ger. tanks and the Russian artillery and other anti-tank weapons. If the Ger. Tiger tanks were formidable, they certainly did not come up to Ger. expectations as a new weapon which should prove decisive in swinging the war in Germany's favour. Moreover, there was now much better co-ordination between the ground forces and the Russian Air Force, and that Force played an enormous part in reducing the effectiveness of the help given by the Ger. bombers to their advancing troops. Air losses were heavy on both sides. But the outstanding feature of the Bielgorod-Orel battle was the tremendous Ger. losses in tanks and the insignificant operational gains. This Ger. offensive differed from those of

1941 and 1942 in that almost from its beginning the Russians, after giving some ground, notably in the Byelgorod region, were soon counter-attacking with such vigour that the Ger. gov. was compelled to try and induce the world to believe that they had had no intention of opening an immediate large-scale offensive until the Russians launched a mighty assault on their positions. On July 9 both sides threw in more armour, while the Gers. were now using some of their operational reserves. Violent fighting broke out in new sectors between Orel and Byelgorod, particularly near Sevsk. During July 11 the Russians continued to repulse great attacks in the Orel-Kursk offensive delivered by tanks and motorised infantry. The Gers. sent into action simultaneously 400 tanks, together with large forces of infantry. Some 182 Ger. tanks were destroyed on that day and over 2000 officers and men were lost. The first week of this great Orel-Byelgorod battle ended without any climax being reached, though the Ger. right arm made some progress between Byelgorod and Kursk. It was, however, significant that already the Gers. were forced to resort to artillery bombardment after their costly armoured thrusts, and that they were even now regrouping their mauled forces. On July 13 the Gers. attempted no major operations in the Orel-Kursk direction, but in the Byelgorod sector they lost 96 tanks in hard fighting. During July 12-14 Russian pilots shot down 156 Ger. planes. The Gers. themselves now began to excuse their failure by reference to the terrible weight of Russian artillery fire in the 'unparalleled duel raging around Orel.' Decisively beaten N. of the Kursk salient, the Ger. general, von Kluge, now tried to widen the Ger. wedge driven towards Kursk from the direction of Byelgorod; Russian counter-attacks here were intensified with the arrival of fresh Russian tank troops. Then the Russians, far from being exhausted by their dour defence, suddenly took the offensive, in two directions from the N. and E. of Orel. In three days (July 14-16) they routed 5 Axis divs., killing 12,000 and taking 2000 prisoners. The tables were now turned on the Gers. with a vengeance, for their very reinforcements were tired and the men's senses had become blunted and benumbed by long periods without sleep in the battle zone. By July 18 the Russians had made such good progress that they were threatening the vital Orel-Briansk railway. Day by day further advances towards Orel were made and scores of inhabited places liberated. Equally important progress was made further S. in the Byelgorod area. With the capture of Bolkhov the chief Ger. resistance N. of Orel was at an end. In ten days' fighting in this great Orel offensive the Russians killed 50,000 Gers. and took 6000 prisoners, together with 372 tanks and 720 guns. The Russians had now recovered all the ground gained by the Gers. on the N. side of the Kursk salient and nearly all their gains in the Byelgorod region. On Aug. 4 the Russians stormed

and captured Orel, which restored to them a valuable railway junction and promised the restoration of through rail traffic on the main line from Moscow to Kursk.

On the same day Byelgorod was also successfully stormed by the Russians. Byelgorod was actually the base of the main thrust of the Ger. Kursk offensive, and it was there that the Gers. had gained a substantial though short-lived success. The immediate result of this second triumph was a big Russian advance towards Kharkov. Simultaneously, the Russians also mastered the concurrent local Ger. offensive in the Donetz basin and on the Mius riv.—the sole Ger. effort to counteract the general Russian surge forward—and, continuing their offensives in the Kharkov and Briansk areas, they liberated daily scores of vils., while inflicting ever mounting losses on the Gers. They then opened a new offensive at Spasdeinsk, 70 m. S.E. of Smolensk—a move rendered possible by the Orel victory—captured the tns. of Akhtyrka and Krasnokutsk and cut the railway from Kharkov to Poltava. The Gers. brought up reinforcements in the Kharkov area in the hope of stemming the Russian drive on Poltava and Dnepropetrovsk and keeping open the last corridor of escape and supply. But savage counter-attacks did nothing to loosen the Russian grip. In six weeks from July 1 to about Aug. 12 the Gers., according to Russian official figures, lost 1,000,000 men. Of these 300,000 were killed, 25,600 captured and the rest put out of action by being seriously wounded. In that period 4600 Ger. planes, 6400 tanks, 3800 guns and 20,000 lorries were destroyed. Vast booty was captured, including 837 tanks and over 1000 guns. Russian losses are unknown.

The fall of Orel and Byelgorod soon had its effect on the co-ordinated Russian operations further S. in the Kharkov region. The value of Kharkov itself lay in the fact that it was the most important centre of communications in S. Russia. It lies in the midst of a vast plain, undefended by any natural obstacles such as steep river banks, woodlands or marshes, which partly explains why it changed hands four times between 1941-13. From the beginning of Aug. (1943) the Russians were pressing hard on three sides of the city, steadily closing in from N. and S. upon its westward or rearward communications, and thereby threatening the garrison with isolation as at Stalin-grad. The Gers. fought for Kharkov with great tenacity, recognising it as the hub of their entire position on the E. front and, about Aug. 10, they began a series of heavy counter-attacks which gained appreciable ground against the Russians enveloping Kharkov from the N. But the Russians soon fought the whole of the counter-attacking armies to a standstill and as their corridor of retreat was now narrowed to only 20 m. the Gers. evacuated Kharkov, the operations in the immediate vicinity of the city lasting only a few hours. An Order of the Day was issued by Stalin announcing that the city had been taken by storm and naming

among the victorious commanders Konev, Vatutin, and Malinowsky. If the city had been gravely damaged by the retreating Gers. one of the outstanding advantages gained by its recovery, apart from the psychological factor, was the command of a first-class strategic railway which this victory, following on those of Orel and Byelgorod, now restored to the Russian armies, and so enhanced the prospects of liberating the Ukraine. Meanwhile in the Donetz Basin, S. of Izyum and S.W. of Voroshilovgrad and in the N. near Briansk, the Russians continued to develop their offensives.

The Donetz Basin overrun.—Late in Aug. 1943 Taganrog was in danger, the Gers. having been deprived of all rail communications with the port. What had seemed to them to be merely subsidiary operations were now developing into major attacks near the centres of the Donetz Basin, or 'Donbas.' The Gers. evacuated Taganrog on Aug. 30. Its occupation by the victorious Russians meant the liberation of all the Rostov region, and, soon after, the Mius defence line, which the Gers. had so stubbornly defended in the final stage of the Russian winter offensive, was now at length broken. The Ger. withdrawal was a preliminary to their gradual evacuation of the entire Donbas; for Taganrog was one of the corner-stones of their defences in that area and its abandonment made a withdrawal also from the Kuban and the Crimea a matter for urgent consideration. Four Ger. divs. were surrounded and routed at Taganrog, 35,000 Gers. being killed. The Russians made their next big advance in the Seversk area, taking the important positions of Klysk and Glnkov and penetrating into the N. Ukraine. They also took Yelnya, a most important fortress in the Smolensk area. This double offensive on the central front was the most extensive the Russians had undertaken since Stalingrad and their largest-scale enterprise in any summer season. With the capture of Sumy—duly celebrated like the fall of Taganrog by salvos of guns at Moscow—the whole of the Kursk region was freed. In the Donbas the Russians next took Lisichansk, Voroshilovgrad and other places and, in an advance along the shores of the Sea of Azov, they took Budennovka (2-3 Sept.). One large city only, Stalino, now remained to the Gers. in the Donbas, their reserves being no longer sufficient to enable them to mount such a counter-attack as that which had retaken Kharkov earlier in the year. Most of their available reserves were now concentrated for the defence of their positions in the region of Poltava and Krasnograd—vitally important to stem a possible Russian attempt to break through to the Dnieper. Stalino was however taken on Sept. 8 after a 12-mile advance in which over 150 inhabited places were liberated. Thus were the Gers. now thrown out of the whole of the Donetz Basin and another salvo of guns was fired at Moscow. The capture of Konotop and Bakhmach N.W. of Kharkov involved a breakthrough

which cut the Gers.' main lateral railway and took the Russians appreciably nearer Kiev.

The opening of the summer campaign, as shown above, was made on Ger. initiative—an initiative strangely delayed. When it came, on July 5, it was evident that the Gers., compelled to look southward by the Brit.-Amer. threat from N. Africa, were mainly concerned to economise troops by shortening their E. line. They had tried first to do so by a forward movement, an offensive delivered with great force against the principal Russian salient, in front of Kursk. But the Russians soon fought this offensive to a standstill and then at once began their own massive counter-offensives. These were all in progress as the Brit. and Amer. forces overran Sicily, and the manifest embarrassment of the Ger. armies in Russia had its effect on the train of events that overthrew Mussolini on July 25. When Kharkov fell on Aug. 23, the Russian line was already in motion towards the vitally important stronghold of Briansk in the centre of the line. From that moment the Gers. began to fall back all along the line, except in the far N., harried at every point by the victorious Russians. Late in Sept. the Russians had taken Briansk and were advancing on Smolensk the gates to which had been burst open by the capture of the outer bastions at Yartovo and Dukhovschina. The capture of Chernigov by Gen. Rokossovsky gave the Russians complete control of the Desna riv. throughout its length, and when, soon afterwards, Poltava fell, the Russians were well advanced towards the Dnieper bend. Smolensk, so long Hitler's headquarters on the E. front, was taken by storm by Gen. Sokolovsky on Sept. 25, a triumph which had a profound psychological effect on the Russian people. Following the fierce three-day battle which resulted in the capture of Poltava, the Russian forces took Kremenchug, the important rail junction on the E. bank of the Dnieper (Sept. 30) and thus now stood on the E. bank of that great natural defensive barrier, facing Zaporozhje and Kiev. Still further S. they captured Novorossisk, the Black Sea port, after a five-day battle in which 4 Ger. divs. were routed, and so increased the threat to the Gers. in the Crimea.

There followed a lull of some ten days—a delusive lull for the Gers., during which the Russians were bringing up great reinforcements. The Ger. armies had, during their long withdrawal, suffered severe losses in rearguard or delaying actions, but they were not routed. Though much weakened, they had avoided disintegration, but they had failed to disengage from their Russian pursuers. Moreover, the plan adopted for withdrawal had the flaw that sound military strategy was subordinated to political and economic necessity; for while they had intended to narrow the front and thereby save man-power by falling back to the line of the upper Dnieper, N. of Kiev, they were nonetheless compelled to hold the 600-mile front of the Dnieper bend or salient between Kiev and

Kherson, the ruling considerations being the grain and manganese ore of the Ukraine and the unstable political situation in Rumania and the Balkans, regions which had to be kept remote from involvement in the war at all costs. This decision, which meant that the Gers. must hold a front at least as long as that which they had held in July, enabled the Russians to maintain, in Sept., a position of great strategic advantage and it was this advantageous position which Stalin suddenly at the end of the brief lull proceeded to exploit along the whole front from Novol to the Black Sea.

Dnieper 'Bend' battles.—Early in Oct. the Russians broke through the Ger. defences W. of Veliki Luki and took Novol, an important rail junction 30 m. S.W. of that place. But their main effort was much further S., where their reinforcements were now streaming across the Dnieper and enlarging a number of bridgeheads N. of Kiev. Their tanks went into action on the W. bank of the river, their guerillas rendering effective assistance. The breaking of the Dnieper Line was the result of a lightning operation that took the Gers. completely off their guard. Fighting through a 30-mile zone of devastation on the l.b., Russian vanguards swarmed across the riv., and the powerful Ger. forces who had planned to take up positions on the high right bank often found themselves cut off and met their fate in the swamps at the hands of merciless guerillas. Despite the deployment of yet more powerful Ger. forces against the Russian bridgeheads, the Russians gradually gained ground and, S. of Pereyaslavl, the riv. crossings were now out of range of the Ger. guns. Meanwhile the Gers. were driven from their last foothold on the Caucasian mainland. Land and sea operations, together with a terrible pounding from 'Stormovik' planes, finally cleared the Taman peninsula, 20,000 Gers. being killed and 3000 taken prisoner. Meanwhile there was fighting of bitter intensity for Kiev, with tremendous air battles over the city; but the main battles of the whole front were those which were developing at ever greater pressure in the Dnieper Bend between Kremenchug and Melitopol. Zaporozhe, the important junction of railways and waterways on the lower reaches of the riv., was captured on Oct. 14 and the railway linking Melitopol with the Crimea was cut at two places, an augury of still greater victories to come. The final storming, on Oct. 23, of Melitopol, the gateway to the Crimea, after eleven days of the bitterest street fighting that even Russia had seen, opened the way across the Nogaisk steppes and threatened 1,000,000 Gers. still fighting in the Dnieper Bend to the N. and in the Crimea further W. The street battles which preceded the capture of Melitopol were probably as desperate as those of Stalingrad. The Gers. had to be cleared from every house and building, and even from the cathedral. The Russian wedge across the Dnieper had now broadened and deepened into a huge triangle 60 m. wide at its base and nearly as deep,

covering hundreds of sq. m. of the W. Ukraine. From its left flank the drive on Dniepropetrovsk had now been launched with strong artillery and tank support along the narrow triangle between the Dnieper and the railway to Krivoi Rog. By Oct. 25 the great industrial centres of Dniepropetrovsk and Dniprodzerzhinsk on the riv. had been taken and a compact wall of Russian armour was pressing forward from Kremenchug, Zaporozhe and Melitopol. The capture of the two industrial tns. was the outcome of careful preparation under Gen. Konev, in which the assault on Zaporozhe and the big Russian drive from Kremenchug played a part in overwhelming Ger. resistance, so that the two cities fell without any violent street battles. The Gers., however, were steadily reinforcing Krivoi Rog, which they evidently meant to hold at all costs. Rightly indeed they recognised that this sector was the most vital of the whole battle area. But they were in full retreat in the area S.E. of the lower Dnieper, while the Red Army under the victorious Russian generals Malinovsky and Tolbukhin, was sweeping on rapidly across the Nogaisk steppe. On Oct. 31–Nov. 1 the Russian troops cut the land retreat for Ger. forces in the Crimea by delivering a swift blow on the Perekop isthmus, which carried them through the Ger. defences to Armiansk.

Fall of Kiev.—Though the Gers. might hope, by heavy counter-attacks, to stave off collapse at such vital points as Krivoi Rog and Gomel, the Russians held the initiative all along the line, for their blows fell now at one point and now at another, while the Gers., denied the use of strategic railways which were cut at vital centres, were unable to rush reserves to threatened places. It was in these circumstances that Kiev fell in the early days of Nov., and Jitomir (10 m. W. of Kiev) a week later, thereby cutting N. and S. rail communications and carrying the victorious armies of Gen. Vatutin within 60 m. of the pre-war Polish frontier; while at the same time heavy Russian blows were being struck at Krivoi Rog in the S. and in the Nevel region farther N. Kiev, the Ukrainian cap., was found to have suffered gravely, though the Russian advance had been planned to save as much of the city as possible from the Ger. demolition squads. When the Russians reached the high ground overlooking the one-time Russian cap., leaving behind them hundreds of wrecked Ger. guns and scores of tanks they saw the city a sea of flames. For one whole day a huge pall of smoke hung over the ruins, reflecting the glow. Russian guardsmen cut right across the city from the N., while Russian tanks set out at dawn, but only to plunge into smoky darkness when they reached the outskirts. One by one they found Kiev's proud monuments, churches, monasteries and modern buildings shattered. Nonetheless the liberation by Gen. Vatutin's troops of Kiev on Nov. 6 was the occasion for the greatest popular demonstration which Moscow had seen since its inhab. rose to meet the foe in the dread winter

of 1941. In the final two-day battle for Kiev the Gers. lost in killed 15,000 men and 6200 prisoners, together with 244 tanks, 174 field guns and 126 aircraft. It may be mentioned that Ger. losses in the four months since July 5 were 2,700,000 men killed, wounded, or captured. Of this number 900,000 were killed and nearly 100,000 taken prisoners. More than half the prisoners were wounded. In material they lost 9900 aircraft, 15,400 tanks destroyed or disabled and 2300 tanks captured, 19,800 guns, 75,000 machine guns and 19,000 trench mortars. But the Russian losses were also heavy, and moreover they were accentuated by the wrecked industries, especially in the Donetz Basin. Before retreating the Gers. had destroyed all furnaces, rolling mills and coke ovens. Winding machinery and cranes at the mines had been cut so thoroughly with oxy-acetylene lamps that repair was practically impossible.

General Vatutin's advance to Poland—Relief of Leningrad—German Eighth Army destroyed—Fall of Nikolai and Krivoi Rog.—The Russians were now on two fronts—Kiev and the Dnieper Bend; secondary fronts were Gomel and Vitebsk further N. Their method was to ring the changes upon these sectors, switching fresh power to one as the strength of the defence increased at another. Thus the Kiev offensive was begun after Ger. reserves had been concentrated at Krivoi Rog; while the Gomel offensive was intensified when the Gers. struck at Jitomir (Nov. 18) and at the same time the offensive was renewed in the Dnieper Bend. In their violent counter-attacks against the S. flank of the Russians' Kiev salient the Gers. were using their Fourth Panzer Army, the most powerful armoured force at their disposal in Russia and the force which under von Hoth had intervened in the battle of Stalingrad with such dire results for itself, since when it had been reinforced and assigned the task of extricating the Gers. from one difficult position after another. The Russians had just taken Korosten, the rail junction N. of Jitomir, and Rezhitsa, a centre of communications 20 m. W. of Gomel, when the Gers.' great counter-thrust to drive the Russians off the Kiev-Jitomir road was launched. The Russians fell back stubbornly, but, as indicated above, other Russian forces were soon creating a diversion, and, having reached the Beresina, were threatening Gomel (Nov. 23). Two Russian Ukrainian armies were also active in the 'Bend' in especially fierce fighting S. of Kremenchug. The industrial centre and rail junction of Gomel seized by Gen. Rokossovsky's armies (Nov. 26-27) in a bold by-passing manoeuvre. The initial attack to recapture the centre was deliberately begun in a region S. of Mogilev on account of its poor roads, which however had been remade under cover of rain and fog. This reconstruction enabled the Russians to develop a surprise attack on the Sorh R. and the result was the speedy collapse of the whole elaborate field system which had for over two years constituted Gomel one of the

most important Ger. bases on the central front. The next appreciable Russian success was the capture of Znamenka in the 'Bend' by Gen. Konev; while in the direction of Kirovograd, a most important position on the lower Dnieper about 20 m. W. of Znamenka, the Russians were exerting heavy pressure (Dec. 10-11). This fighting in the Bend was well timed, for in the Kiev salient the battles had reached a pitch of violence unsurpassed through the whole war and not unnaturally, in view of the German objective, which was to regain Kiev and restore their fortunes in S. Russia. But the Russian defences were deep enough to absorb the Ger. drive and, by the end of some three weeks, Gen. Vatutin, commander of the First Ukrainian armies, had now massed a great array of guns and anti-tank weapons for his counter-offensive. On two days alone (Dec. 10-11) his forces, in meeting the last furious Ger. assaults destroyed 200 Ger. tanks. The tide here began to turn in favour of the Russians about Dec. 18, when Vatutin was preparing to begin his massive counterblow against a foe whose tremendous losses in the past six weeks were beginning to tell; but the Russian general was careful to bide his time until the Ger. strength should be still further exhausted, especially as he would have to launch his offensive through lines in which the Russians were still fighting mainly on the defensive, and against a drive the power of which was still considerable. Meanwhile the Russians had begun a new offensive near Nevel in the N. and in a few days had broken through the Ger. fortified line on a front 50 m. long and penetrated to a depth of 20 m. Some 20,000 Gers. were killed here and 2000 taken prisoner, hundreds of places being freed in the region overrun (Dec. 15-20). The Ger. offensive in the Kiev salient collapsed towards the end of Dec. and now at length Vatutin struck back, advancing (Dec. 27) on a 50-mile wide front. After two months of anxious and prolonged battle a very powerful group of Ger. forces had gradually been brought to its knees—4 tank divs. were routed and 15,000 Gers. killed in two days—and Vatutin's recoil now bade fair to take his forces even beyond his farthest point westward the previous Oct. While these momentous events were happening in the Ukraine, the White Russian city of Vitebsk was being subjected to pressure from many points and S.W. of Zlobin in the Beresina basin the Gers. were being made to pay a high price for their efforts to recover the initiative in that region. Korosten was recaptured on Dec. 29 by Gen. Vatutin in his spectacular westward sweep, thereby giving him a junction of five railways. At the same time the battle for Vitebsk was nearing its climax, the fighting being especially dour, for here the Gers. were exceptionally strong in artillery and mortars. The following day Vatutin had retaken Korostyshev and his tanks were driving across open country towards the rail junction of Berdichev. Other Russian forces were pressing on from two directions on Jitomir and during

the fighting of Dec. 24-29 eight Ger. tank divs., including the S.S. Adolf Hitler and Reich Divs., and 14 infantry divs. were routed. Vatutin's counter-offensive had in less than a week recovered every important point won in seven weeks' bitter fighting by von Manstein's counter-attacks, with one exception, Jitomir, and that place fell on Dec. 31. By Jan. 2 Gen. Bagramian's troops were at the walls of Vitebsk, the number of Ger. dead found on the approaches being very great,

of Russia. Berdichev was taken on Jan. 5, 1945.

But the Ger. resistance in the 'Bend' remained as tenacious as ever despite Vatutin's success further N. It was evident that the Gers. realised the necessity of keeping the Russians from the Balkans at all costs; and the fact that Vatutin was nearing the Polish border was less alarming to the German Command than the Dnieper Bend battles owing to the large reserves they had in Poland, and

British-Soviet Society

the ravines that wrinkled the battlefield being piled with dead. With gathering impetus Vatutin's offensive was now sweeping forward on almost all sectors, von Manstein being out-manceuvred and suffering, not so much from lack of men, as from lack of mobility through the loss of strategic railways. Practically all the Ger. successes in Russia from the beginning of the war were achieved by seizing and exploiting the better lines of communication. Of that advantage it was the prin. object of Russian strategy in 1943 to deprive them; and by the end of the year the object was largely accomplished, the Gers. being left with very few of the excellent lateral railways by which they were previously so often enabled to switch reserves between the points at which major action developed. The important junction of Byelaya Tserkov, 40 m. S.W. of Kiev, was taken on Jan. 4 after four days of severe battle. In this battle troops of the First Czechoslovak Brigade took a successful part as allies

the difficult relations between Russia and Poland over the age-old question of their common frontier, a matter on which the Russians brooked no interference even by their W. allies. Meanwhile by a brilliant attack in the 'Bend' Gen. Ivan Konev seized Kirovograd. Not even the bridges had been destroyed, and the inhabs., whom the Gers. had begun to evacuate, were saved by Konev's troops. Big-scale tank and air fights marked the battle for this great stronghold—an eighteenth-century garrison tn. built originally to defend the Dnieper from attacks by Crimean Tartars and Poles. The Gers. counter-attacked frequently and with violence, but the Ger. commander of the garrison eventually seemed to lose control, and, by the final storming on a frosty moonlit night, when the Russians broke in from sev. sides at once, the Gers., realising the hopelessness of their position, had evacuated the tn., but only after leaving 15,000 of their dead in the area of the battle. Further N. Vatutin's First

Ukrainian Army had pushed on into Poland and was advancing on Rovno (Jan. 12). Southward of this front, the Russians were driving on Vinnitsa and the junction of Zhmerinka, on the main railway from Odessa to Warsaw. A well-planned outflanking move gave the Russian troops of Gen. Rokossovsky possession of Mozyr and Kalinkovichi the twin Ger. bases in the Pripet basin in White Russia (Jan. 13). These constituted the main enemy base on this front after the fall of Gomel and Rezhitsa, and the battle for their elimination revealed in the Russians a mastery of tactics and a skill in the co-ordination of all arms which they rarely themselves surpassed even in this war. Prodigious feats were accomplished by throwing light bridges over the marshes and laying timber 'corduroy' roads over the mud, with the result that their troops could take 76-mm. guns with them in a cross-country advance.

But great as were these victories in White Russia, the Russian High Command had been preparing a powerful blow much farther N., around Leningrad. Here they were aiming at the railway between the great city and Moscow, and now advanced to wipe out the salient which for so long had outflanked Leningrad and to a large extent nullified the advantage derived from the relief a year ago on the E. side following the reduction of Shlisselburg. The new offensive, under Gens. Govorov and Meretskov, was begun in the area of Oranienbaum and in the Volkhov region N. of Novgorod. This famous and, anct. tn. was taken by storm on Jan. 20, together with the fortresses of Krasnoye Selo, and Peterhof. Novgorod was regarded by some Gers. as being the key position of the whole of the E. front. One result of the Russian advance of the opening days through the most powerful defences was the capture of sev. great Ger. siege guns which, from a distance of 20 m. from Leningrad, had fired shells into the city over a very long period. A few days later Pushkin (formerly known as Tsarkoe Selo, later as Detskoe Selo or Children's Palace) and another historical tn., Pavlovsk, also fell to the troops of Govorov; while S.W. of Leningrad, the Russian advance overwhelmed the Ger. beachhead along the S. shore of the gulf of Finland—a stretch of 50 m. enabling ships of the Baltic fleet to sail once more and land supplies.

In the whole course of the Ger. withdrawal since the opening of the summer campaign of 1943 no large body of Ger. troops had ever been cut off, and it seemed well within the capacity of the Ger. generals, skilled in defence, to continue the movement without disaster until they could take up their positions on the 'Ost-wall' or fortified zone behind the Bug, which they regarded as impregnable. But the renewal of the Russian offensive S. of the Kiev salient and towards Kirovograd in Jan. increased the threat to some 10 Ger. divs. constituting the Eighth Army, based on Kanyev, S. of Kiev, the last Ger. foothold on the middle Dnieper. When the Gers. were thrust back on either side

of Kanyev, these 10 divs. were left in a 'pocket,' the 50 m. mouth of which was gradually sealed by convergent Russian movements from E. and W. Orthodox strategy should have made it obvious to Gen. Manstein that no practical purpose could be served by leaving these divs. at Kanyev, and it is probable that, but for Hitler's intervention, he would have sent relief forces much earlier to co-operate with the commander of the Eighth Army in a withdrawal. Thus the dangerous salient at Kanyev gradually became a fatal trap owing to Hitler's orders to hold out even at the price of annihilation. A five-day battle closed the gap. Gen. Vatutin, pressing from the Kiev salient and Gen. Konev advancing from Kirovograd, joined hands near Shpola, while the actual closing of the gap was effected by Gen. Rotmistrov, the tank leader of Stalingrad fame.

Meanwhile in the N., on Jan. 26, Gen. Govorod captured Krasnogvardeisk the railway junction S. of Leningrad, together with a long stretch of the Tosno-Narva railway and vast quantities of arms and ammunition. By the taking of Lyuban and other stations, the whole trunk line between Moscow and Leningrad was cleared of the enemy, except at Chudovo, where, however, the Ger. garrison was surrounded (Jan. 28). Chudovo soon fell to the Russians who were now advancing irresistibly on the great Ger. base of Luga, some 50 m. W. of Novgorod. On Feb. 1 the Russians took Kingisepp, 75 m. S.W. of Leningrad and within 10 m. of the Estonian frontier, the important junction on the line to Narva. Two Russian forces, 50 miles apart, were closing in on Luga, and the Gers., realising the danger of envelopment, threw in reserves into strong counter-attacks. They employed evasive tactics for some days and thereby escaped the threatened trap, but the withdrawal, besides costing them Luga (Feb. 13) was accomplished only at a great price in casualties and booty. Moreover they still had far to go before turning the corner of relative safety S. of Lake Peipus, where Pskov stood as a focal point of strongly fortified roads and railways. On Feb. 5 the Russians reached the mouth of the Narva riv. and the shores of Lake Peipus.

By Feb. 5 the remnants of the Ger. Eighth Army—which comprised as well as the 10 infantry divs., the S.S. Viking Panzer Div. recruited from 'quislings' in the 'Nordic' countries—had been driven into a still narrower area and lost control of all communications and all the tns. But the Gers. were still resisting on the banks of the Dnieper and Tysamin. It was evident that their position was hopeless ever since Gen. Konev, having taken Novocheerkassk, overcame the formidable natural defences of Smysla, due S. of that place, and since Col. Gen. Rotmistrov's tanks, veterans of the great battle with Manstein S. of Stalingrad, had fought their way to Shpola. A shattering blow at the remaining Ger. positions in the Dnieper Bend was struck when the Third Ukrainian army broke through the fortified defence lines N.E. of Krivoli Rog and N.E.

of Nikopol, routing 4 Ger. infantry divs. and 3 tank divs., besides capturing the rail junction Apostolovo, W. of Nikopol, and Marganets station, E. of that city. Through this victory the way of retreat to the W. was cut off for some five Ger. divs. in the Nikopol area. Meanwhile S. of Nikopol, Russian troops under Gen. Tolbukhin defeated seven Ger. divs. and broke through to the left bank of the Dniester throughout the whole length of the Ger. bridgehead on that riv. In the same series of battles in the Dnieper Bend the Third Ukrainian Army, co-operating with Tolbukhin's Fourth Ukrainian Army, routed the Ger. group in Nikopol and on Feb. 8 carried the town, with its celebrated manganese mines, by assault. On the field of battle in the Nikopol area the Gers. left 15,000 dead. The position of the Ger. Eighth Army had changed sharply for the worse by February 8, for all the good airfields were now in Russian hands, and air-borne supplies to the trapped divs. had become meagre, owing to the large number of Junkers transport planes shot down by the Russians. Seven Soviet spearheads of attack were now thrusting at the doomed army which was now compressed within an area of less than 250 sq. m. and with 90 m. of front to defend. Manstein's powerful efforts to bring relief had cost him 20,000 dead by Feb. 10, and the distance on that date between his forces and the Eighth Army had now increased to 21 m. The Ger. units at Kanyev were nearly all veterans of the Russian front, including the Viking Panzer Div., which latter had been badly mauled when Gen. Kleist had been hurled out of Rostov in 1941. The end came a week later after the fall of Korsun. An ultimatum was sent by Gen. Konev calling on the Gers. to surrender but, acting on Hitler's order to stand and die, they rejected the ultimatum. Gen. Konev therefore completed their annihilation. Some 52,000 Gers. were killed in the Kanyev trap or pocket and 11,000 were taken prisoner. The sequel to this victory was the capture on Feb. 22 of Krivoi Rog and the area of its iron mines, after heavy house-to-house fighting. Gen. Rotmistrov, the tank leader, was promoted Marshal of the Soviet Tank Forces by decree of the Presidium of the Supreme Soviet, in recognition of his part in trapping the Eighth Army. Russian official figures state that in six weeks' fighting on the whole front the Gers. lost at least 250,000 men killed and captured, besides 6000 guns, 1000 tanks and 600 aircraft. These figures included the four weeks' fighting on the Leningrad-Volkhov fronts, the Kanyev 'pocket' and capture of Nikopol and the break-through E. of that city; but were exclusive of the battles around Vitebsk, Staraya Russa (which highly important place had been evacuated by the Gers. about this time), Novo-Sokolniki, the Beresina and Pripiet rivs. and in Poland, all of which, on a conservative estimate, would double the foregoing figures of casualties.

The destruction of the Dnieper bend 'pocket' at Korsun removed a handicap

on the development of the Russian plans, which were necessarily directed to cutting the Odessa-Lviv railway, and released a large force for an advance towards the Bug. It was at this time that the victorious Gen. Vatutin fell ill (he died in April after an operation) and the fact that his place was taken by Marshal Zhukov, the defender of Moscow, emphasised the importance of this part of the front. Zhukov's dramatic intervention soon brought material results in a great breakthrough between Shepetovka and Tarnopol on a 100-m. front. This was a battle of heavy armour, in which between March 4-5 were defeated 4 Ger. tank divs. and 8 divs. of infantry under Manstein. It might seem that the Gers. were taken by surprise, but, although the front W. of Luck had been quiescent for the past month, it could always be assumed that the Russians would neglect no reasonable opportunity of striking a heavy blow in a region in which the enemy line ran parallel to the most important strategic railway in S. Russia—the railway between Odessa and Lwow. For the railway was the mainstay of communications between the Ger. armies on the whole of the S. front and their bases and, on its retention, depended their ultimate chance, in case of a general retreat, of keeping in touch with the armies in the N. Manstein, compelled to fight on a line parallel to his communications, had long occupied one of the classic positions of strategic disaster. Before the Ger. invasion of 1941 the railway was a double line of 500 m. and the Gers. had since converted the gauge and doubled the track, so as to carry not only supplies to their armies of the Don and Dnieper, but the mineral traffic back to Germany from Nikopol and Krivoi Rog. Manstein had now lost control of it, for the line was cut by the loss of Volochisk and he had become dependent on single-line tracks across the Dniester towards Rumania and far removed from the Ger. armies of the central group. Zhukov's offensive, which cost the Gers. some 15,000 killed and 3000 prisoners between March 4-6, threatened to force Manstein back against the Carpathians and the Rumanian frontier—a threat implicit in all the Russian advances made in the winter along the middle Dnieper. This new blow brought the threat much nearer realisation. Yet the Gers. appeared to face the prospect of isolation with equanimity, for their forces in the Dnieper bend had continued their retreat without undue haste and indeed showed no sign of pulling out altogether from S. Russia. Meanwhile farther N. the Russians captured Staraya Russa, S. of Lake Ilmen (Feb. 18) and, with the seizure of Rogachev, Dno and Vitebsk on the route to Pskov a week later, were threatening the Ger. lines of retreat in White Russia. The Russians broke into Tarnopol on March 9 but the Ger. resistance there, at Proskurov and at Vinnitsa had greatly strengthened.

The Gers. were, however, allowed no respite, for the armies under Marshal Konev (Second Ukrainian Front) in their turn

resumed the offensive further S. and also broke through on a 100-mile front, crossing the Bug and taking Uman and Kristinivka, and heavily defeating 14 Ger. divs. (March 5-10). Marshal Rotmistrov's armoured forces were first to cross the Bug, and in the battle more than 2000 tanks were engaged—a big tank battle even for this war. Then, soon afterwards, forces of the Third Ukrainian army under Gen. Malinovsky, having forced the Dnieper, stormed the tn. of Kherson (March 13), which then constituted a powerful base of resistance at the mouth of the riv. The garrison of Kherson were completely outmanoeuvred and once again the unorthodox Russian strategy had dislocated Ger. fixed plans and proved that the Russian soldiers could rise superior to any conditions of weather and terrain baffling to most other troops. Marshal Konev, having broken through on the Bug front, was now pressing without pause towards the Dniester valley and Bessarabia. By March 20 his troops were across the Dniester, having forced the riv. on a stretch of 30 m. and captured the Moldavian tn. of Soroka. The rapidity of his advance is shown by the fact that, on reaching Ryshkanovka (Rascani) he had advanced 200 miles from the positions on the Dnieper where only seven weeks previously his guns were firing on the Ger. positions at Kan-yev. He was, moreover, in Moldavian ter., ter. which had been in Rumanian possession only in the uneasy period between the wars, a fact which ensured the sympathy of the people for the advancing Russians. In the course of this great advance, there was evidence of Germany's dwindling strength in equipment. From motor-vehicles the Gers. had been reduced to peasant carts, and it was a common sight in the wake of their retreat to see abandoned wagons containing wounded men and men dead from neglect; while bridges were either intact or were being rapidly repaired by the inhabs. for the Red Army. Women offered to tend the Russian wounded, and feasts of local dishes and sharp-flavoured Moldavian wine were offered to the soldiers. The fall of Zhmerinka and the isolation of the great hedgehog stronghold of Vinnitsa removed the danger of a Ger. counter-thrust against Russian units advancing on Mogilev-Podolski. Both the latter and Vinnitsa fell to the Russians soon afterwards.

Meanwhile for the past fortnight Manstein had been making strenuous counter-attacks in the Tarnopol-Proskurov region, hoping at least to retain the railway between the two tns. These attacks were well supported with fresh divs. drawn from the reserve, but, though the numbers of these divs. were far short of those employed months ago against the Kiev salient, the battles took a similar course, with Russian anti-tank and field artillery densely massed and infantry entrenched on the line of the Ger. counter-advance. Gradually, however, but more quickly than hitherto, the Gers. were bled white, and then suddenly Zhukov struck again

on a wide front on sev. sectors at once, broke through the Ger. defences in the Tarnopol-Proskurov region and swept forward from 40 to 60 m., forcing the R. Pruth and closing in on Kamenets-Podolsk and Proskurov. In these battles the Gers. left up to 20,000 men killed and more than 3500 prisoners, besides 300 tanks and much other war material.

It might be said that all roads in S. Russia led to Plocsti. That was the prize for which the Russians were driving across the rivs. of the Ukraine and Bessarabia. It seems incredible that Manstein planned to abandon not only the Bug but also the Dniester riv. barriers without a struggle and in circumstances that opened the way for a vast turning movement at the expense of his forces still fighting on the lower Bug. But so it seemed. The line of the middle Dniester caved in suddenly, but that of the lower Bug, far to the S.E., held firm. Yet if the Dniester positions were not restored, those on the Bug could not be maintained and Odessa would fall to the Russians and the road into Rumania would be opened by way of the coastal plain.

This, in fact, is precisely what happened. Before the end of March Konev's troops, having crossed the Dniester on a front of 110 m. reached the Pruth for 50 m. of its course. Other forces occupied Proskurov and surrounded the Ger. garrisons of Tarnopol and Kamenets-Podolsk, both extremely powerfully fortified. Kamenets-Podolsk, centre of Ger. resistance N. of the Dniester, was stormed by Zhukov's tanks and infantry, thus cutting the only railway left for the retreat of the Gers. in the Proskurov area. At the same time Malinovsky's forces captured Nikolaiev, the Black Sea port on the mouth of the lower Bug—the last tn. held by the Gers. on the l. b. of the riv. This rapid success was due partly to the catastrophe suffered by the Gers. between the Ingulets and Ingul, in which the Gers. lost the major proportion of the forces intended for the defence of the Black Sea coast, though they still retained considerable strength in artillery and tanks for the Nikolaiev garrison. The Russians soon forced the Pruth, and by the last day of March Zhukov took Kolomea, 45 m. N.W. of Cernauti. Cernauti fell the next day. Zhukov's and Konev's forces had now joined hands, and all three Ukrainian armies, were moving simultaneously. Ochakov fell in a sea and land attack to Malinovsky on March 31. Announcing on April 2 that Russian troops had entered Rumanian ter. (as distinct from Bessarabia or ter. claimed to be really Russian) Molotov, foreign commissar, stated that Russia had no wish to acquire new ter. and that the Red Army's object was to pursue the Ger. and satellite armies until their final rout and capitulation. Rapid progress was now being made towards the capture of Odessa and, meanwhile, some 15 Ger. divs. in the Skala region, S.E. of Tarnopol, were surrounded and gradually wiped out. The Russians claimed that between March 4-31 the Ger. losses on the First Ukrainian front (Zhukov) included

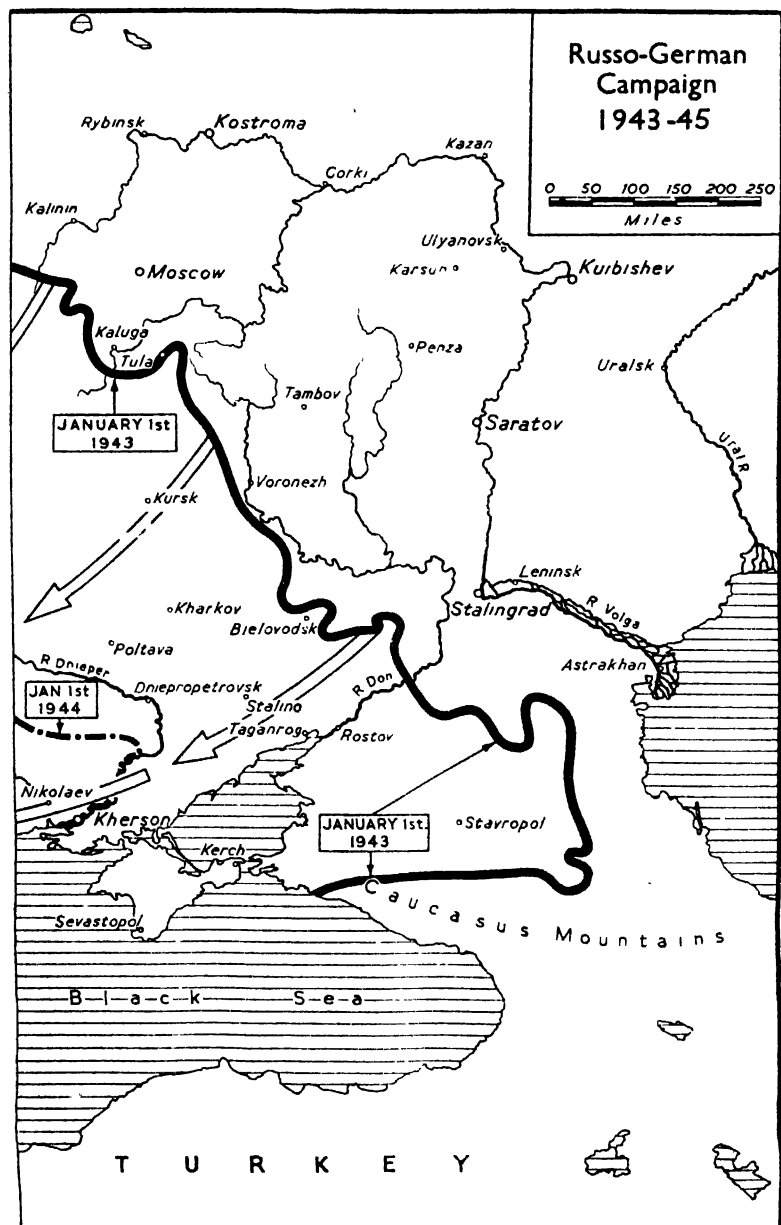

183,000 dead and 25,000 prisoners besides the destruction of 1330 tanks and 22,500 armoured cars. On April 5 Malinovsky brought Odessa's fall nearer by cutting the main route of retreat to Rumania at Razjelnaya junction. In close co-ordination the armies of Zhukov and Konev drove the enemy from Bukovina and took up positions on a 180-mile front from the Yablonica Pass in the Carpathians to a point on the Sereth 50 m. N.W. of Jassy. Thus the Russians had now reached the borders of Czechoslovakia, and among their forces was a strong Czechoslovak brigade under General Svoboda. On April 10 Odessa fell to Malinovsky in a frontal attack combined with a flanking movement. The great Black Sea port had been in Ger. hands since Oct. 16, 1941. On the same day Tolbukhin's Fourth Ukrainian army launched a new offensive against the Crimea from the isthmus of Perekop while Gen. Eremenko's Independent Maritime Army was advancing eastward from the Kerch peninsula. On April 13 Malinovsky took the strongly defended fn. of Tiraspol, 60 m. N.W. of Odessa. The Gers. were now in full flight before the armies of Tolbukhin and Eremenko. The feature of this campaign for the retaking of the Crimea was the rapidity with which the Russians overran the peninsula. The successful operations in the Kerch region under Eremenko were a development of the landings made the previous winter N.E. of Kerch port. Russian marines had then struck inland from the Kerch straits, and gradually forces were accumulated on the beach-head for this general assault. On April 13 Eremenko captured Feodosia on the Black Sea while Tolbukhin took Eupatoria, and then Simferopol, cap. of the Crimea and main base of Ger. resistance covering the ways to the harbours on the S. shores of the Crimea. Tolbukhin then struck straight through the mountains S. of Simferopol to the coast and soon both his and Eremenko's forces were closing on Sevastopol, thousands of prisoners being taken and great havoc wrought by aircraft and ships on the enemy in his vain efforts to stage a 'Dunkirk' evacuation. Stormoviks swept up and down Sevastopol bay and in and out of Balaklava bay and the bays on the W. and S. shores—places which to innumerable Russians recalled holiday memories. But the main object of this whirlwind Russian campaign was not so much the recapture of ter. as the destruction of the enemy divs. rashly left behind by Manstein for the defence of the Crimea. For it was in this aspect that the campaign was most calculated to help the operations in Rumania, where von Kleist was in difficulties over getting sufficient trained units, and where the effect of a possible Ger. failure to defend Rumania might have important political repercussions.

Eremenko captured the port of Yalta, 30 m. from Sevastopol, on April 16 and the battle was now restricted to a struggle for Sevastopol and the Khersones headland. Meanwhile the lower Dniester was forced at many points in the direction of

Kishinev. Bombers of the Red Air Force made a heavy attack on the railway junction of Galatz (April 17). Allied bombers, based on It. airfields, were also attacking places in Rumania and Bulgaria. But it was essential to get Sevastopol and so free the armies of Tolbukhin and Eremenko. Step by step Eremenko's troops were now fighting their way along the winding, overhanging roads leading to the S. exposed side of Sevastopol, and on April 18 they entered Balaklava. The Black Sea fleet also took a hand in the operations by shelling Sevastopol and the neighbouring coast. Tolbukhin's troops had now pushed right up to the city along the railway from Simferopol and captured the heights of Mekenzia, which command a good view of the city and all its fortifications. But advancing along the two chief roads crossing the plateau S.E. of the city Eremenko's troops approaching the port were most exposed. It was ground which the Russian garrison had bitterly contested until the last two days before the city had fallen to the Gers. in 1942. By the 19th the Russians, breaking through precipitous rocks, reached the aqueduct S. of the city, thus completing the arc round its landward sides and bringing the whole city and port under their artillery fire. Hundreds of Ger. and Rumanian troops, driven to the edge of the Crimea near the port, were forced into the sea from the high cliffs above Balaklava. Others trying to get away in high-powered barges from the beaches further S., were drowned in their efforts to escape.

Fall of Sevastopol—German débâcle in the Crimea.—In twenty-nine days the whole Crimean campaign was at an end and the Gers. and Rumanians driven out of the peninsula. Nothing in the Russian advance of 1943-44 was more eloquent of the skill, determination and patriotism of the Russian commanders and their men than this remarkable campaign in which Sevastopol, which earlier in the war the Russians had defended for two hundred and fifty days, fell to Tolbukhin's forces within a week from the moment when the Russians, on May 6, began their attack on the Belbek line. The loss of the Crimea and the destruction of a force of 200,000 men was a Ger. disaster almost as great as that of Stalingrad. The Ger. intention was to hold Sevastopol for a considerable time, with picked Ger. troops, aided by Rumanians under Gen. Jaenecke. Originally Tolbukhin had decided to try to take Sevastopol in his stride, avoiding the error of Raglan in 1854 and Manstein in 1941, when they allowed themselves to be drawn into accepting the burden of a siege. But the unexpected Ger. decision to resist at all costs, coupled with the difficult terrain held up the Russians at the toughest of all the Sevastopol outer defences, which ran from the W. coast along the Belbek riv., over the Mekenzia heights, then E. of Inkerman and along the 5-mile Sapun Ridge to the mts. E. of Balaklava defences which must be taken in any landward attack irrespective of the

introduction of new weapons or modes of warfare. By this time Jaenecke, the Rumanian commander, had been replaced by a Ger., Gen. Almendinger, who announced that Hitler had ordered him to hold Sevastopol at all costs. The Ger. commander had at his disposal some 50,000 men, mostly Gers.; for the Rumanians had either surrendered or been shipped away. The Russians skillfully exploited deceptive tactics. Knowing that the enemy was nervous about the defence of the N. shore of Sevastopol Bay, because its loss would involve that of the railway to Inkerman on the sidings of which lay the bulk of their equipment, Tolbukhin disposed large forces opposite the Belbek line and delivered so formidable a diversionary attack that the Ger. commander was compelled to move northward part of the forces which were stationed on the all-important Sapun Ridge W. of the Inkerman valley, and it was on this powerfully-fortified ridge that the decisive battle was to be fought. Simultaneously the Russians also delivered sharp attacks in the Balaklava area. Then, on May 6, the Russian infantry, following a devastating artillery and mortar barrage combined with Stormovik bombing, opened their general attack. They crossed the paved road between Inkerman and Balaklava, stormed the grim heights, and reached the summit, albeit with unquestionably heavy losses. The breach was decisive. Threatened with being trapped on the N. side of the bay, the Gers. had to withdraw across the Belbek, over the Mekenzia heights and along the S. shore to Sevastopol and beyond. Over fields where the Light Brigade had staged their historic charge Ger. forces were driven from a large Soviet State farm westward. Then Hitler reversed his order and promised to send ships to evacuate the entire force. But now from S. and E. storm detachments of Stalingrad veterans broke into Sevastopol (May 9), while from the N. shore other forces crossed the bay into the city.

Russian offensives in Finland and White Russia—Fall of Minsk and Vilna.—While the Anglo-Amer. forces were invading Normandy in 1944 and advancing northwards in Italy, Stalin was preparing new and decisive blows against the Gers. on the E. front. He began with an attack on the Karelian Isthmus, Finland, in mid-June, to remove the persistent menace to the N. flank of the Russian front. In a week the Mannerheim Line was broken. In June 1944 Marshal Govorov concentrated the weight of his onslaught on the W., thereby avoiding the natural water obstacles along the E. half of the Mannerheim Line, and very soon he had captured Viipuri, where the enemy's chief lateral line of railway met the coast.

A few days later the Soviet armies began a great enveloping movement against the Ger. divs. concentrated in the fortified zone of Vitebsk and, on June 26, after forcing the W. Dvina, they carried by assault the tn. of Vitebsk, an important regional centre. This proved to be the

opening gambit of a Russian attack on a massive scale which was soon destined to have deep repercussions. Already the attack extended from N. of Vitebsk to Zhlobin, a front of 200 m. Along this impressive front from the Karelian Isthmus to the Pripet the order of battle was: Leningrad front (Marshal Govorov); Second Baltic front (Gen. Eromenko); First Baltic front (Gen. Bagramyan); Third White Russian front (Col.-Gen. Chernyakhovsky); Second White Russian front (Col.-Gen. Zakharov) and First White Russian front (Gen. Rokossovsky)—in all six great army groups, not counting that of Meretskov. The importance of Vitebsk was strategic, for it lay between the Russian army groups on the borders of the Baltic States and in White Russia and, after the fall of Nevel, it became the northernmost fortress in the Ger. line defending White Russia, while at the same time it served as an outpost of their Baltic defences. Bobruisk, an important centre of communications and a powerful stronghold covering the approaches to Minsk and Baranovich, was captured on June 29 by Rokossovsky, who was then promoted to the rank of Marshal. This strategic victory, coupled with the forcing of the Beresina river, was of historic importance in Russian eyes in that it provided a parallel with the defeat of Napoleon's army on the Beresina in 1812. Certainly Rokossovsky's blow was a decisive one, for it doomed the Ger. defence at the White Russian cap. of Minsk, besides costing the enemy 16,000 dead and nearly 20,000 prisoners. Indeed, in the six-day offensive by Rokossovsky's armies, culminating in the victory of Bobruisk, the Ger. losses were 50,000 dead and nearly 24,000 prisoners; while on the White Russian fronts as a whole the Ger. dead now numbered 80,000. At the same time Mogilev, an important stronghold due E. of Minsk, on the Dnieper, fell to Gen. Zakharov; while, in the N. Petrozavodsk, cap. of the Finnish-Karelian republic, was occupied by troops of Govorov's command.

Minsk, the great bastion of the German front N. of the Pripet, was captured by the forces of Gen. Chernyakhovsky (promoted June 27) and Marshal Rokossovsky on July 3; while, farther N. still, the Russians had fought their way into Polotsk, pivot of the Ger. positions defending the Baltic coast. On the eve of the Russian liberation of Minsk, when the guns of the approaching Red Army were audible and the Gers. began hurriedly to make plans to leave, the citizens of Minsk rose to arms. It was a spontaneous rising of the people, under leaders unknown. One group attacked the Ger. arsenal, seized it and distributed arms, and violent fighting was in progress in the streets when Russian tanks reached the N.E. outskirts of the city on the morning of July 4.

The swift Russian advance westward threatened the important railway junction of Vilna, the loss of which would disrupt the Ger. Baltic and central fronts and lay E. Prussia, the traditional if mythical home of Prussian militarism,

open to attack by the triumphant Soviet armies. Meanwhile the Red Army was completing the destruction of the Ger. forces trapped E. of Minsk, who now paid a heavy toll in their efforts to escape. Farther S., Kovel fell to the Red Army on July 6. This was an important Ger. bastion to the S.E. of Brest Litovsk; and the Soviet armies' offensive, which was now aimed at positions vital for the Gers. over a front extending from S.E. of Dvinsk to W. of Kovel, was being carried on with the greatest vigour over dusty roads in hot July sunshine. Molodechno, Baranovich, and Lida were the next important positions to fall to the Russians who brushed aside all attempts to delay their onrush with minefields or other obstructions. On July 13 Vilna fell to the Red Army, nearly 10,000 Gers. being killed and thousands more taken prisoner. On the next day the capture of Pinsk and of Volkovysk (two outposts of the Ger. line covering Warsaw) increased the Red Army's threat to the strategic junctions of Bialystok and Brest Litovsk. Farther N. the strongly defended Ger. base of Grodno was in process of being outflanked. Between Dvinsk and Vilna two Russian groups had now joined hands and 25 m. W. of Vilna were marching on Kaunas, which, with Grodno, formed the other great bastion defending the E. border of E. Prussia.

Marshal Konev's advance into Poland.—Fall of Pskov.—In three days' fighting (July 16-18) troops of the First Ukrainian Front led by Marshal Konev—who had assumed command in place of Marshal Zhukov—broke through the Ger. defences E. of Lwów on a 120 m. front and advanced 30 m. Among numerous tns. captured were the large railway junctions of Krasnoye and Brody. Konev outwitted his adversary by opening his great offensive without the usual artillery support. His vanguards overran the enemy positions, and only when they were firmly lodged in the Ger. lines did the Russian guns open up and their aircraft go in. Konev's object was to outflank the important Brody gap and this he achieved by attacking at Zolochov, 20 m. S.W. of Brody and then thrusting N.W. to Krasnoye. Further on July 18 Russian troops N. and S. of Alytus fought for the expansion of their bridgehead on the W. bank of the Niemen. Blows now fell thick and fast along the E. front generally. On the 19th the forces of Gen. Eremenko and of Gen. Bagration broke through strong defences on a 43 m. front towards the Latvian border S. of Ostrov and, towards Dvinsk, penetrated 5 m. inside the border. Further S. Konev's forces in the advance on Lwów completed the encirclement of a large enemy group W. of Brody. In yet another new offensive next day, from Kovel, they made a 90 m. breach in the Ger. defences, and in two days swept forward 30 m. to the W. Bug riv. The Gers. were now in precipitate retreat from long-cherished positions designed to protect the roads to the Baltic, to Warsaw, and to Germany itself. Pskov, the stubborn N. barrier to the Baltic republics,

was taken on July 23, two days after the fall of Ostrov. Pskov, the venerable Russian city near Lake Peipus, had been rendered untenable as the result of the collapse of the enemy line here under the series of blows dealt by Gens. Eremenko and Maslennikov. Its fall marked the liberation of the last city of the Russian Republic from the Ger. invader. (See also Pskov.) July 22-23 saw, indeed, the most remarkable advance of the war, a veritable Russian tidal wave on an immense frontage. All along it tn.-strongholds of the first importance—Dvinsk, Kaunas, Bialystok, Brest Litovsk and Lwów—were now in the utmost peril. The famous fortress of Przemysl, which had figured conspicuously in the First World War, was now coming within striking distance with the advance of the Russians to the San. S.W. of Brody, Konev's strategy had its reward, for here the Russians rounded up the trapped Ger. forces, more than 15,000 being taken prisoner. N.W. of Chelm (Kholm) the Soviet troops retook hundreds of places and broke through into the large tn. of Lublin, where thousands of Jews had been murdered by the Gers. Still further S. and to the W. of Tarnopol, numerous other places were taken. In fact the front was surging forward along virtually its entire length. In the N. the situation was most dramatic, for here, in Estonia, there was every chance of isolating the Ger. divs. under Gen. Lindemann. The Gers. had been holding the line from Lake Peipus to Dvinsk with the greatest obstinacy, knowing that if they lost their hold on the lake their strongly-defended front to the N. of it would become useless. But now, with the loss of Pskov, it looked as though their link with Lake Peipus would soon be snapped, and, if that happened, the Russians could push on towards Riga.

Russians take Przemysl, Brest Litovsk, Bialystok, and Kaunas.—By taking Siauliai (Shavli), the key junction in Lithuania, the Russians cut the main link between the Ger. armies in Estonia and Latvia and East Prussia (July 27, 1944). Dvinsk and Rzekane in Latvia, and Lwów and Stanislawow in Poland were occupied, while at the same time the bridgehead across the San was widened, thus sealing the fate of Przemysl. The next day three more of the remaining Ger. strongholds fell—Przemysl, Yaroslav and Brest Litovsk—a succession of victories which ran like a portent across the darkening sky of Hitler's hopes. In these days of a rapidly-changing front the Ger. High Command was outwitted by the unorthodoxy of Russian strategy. The Ger. generals, unable to be uniformly strong all along the line, especially with dwindling reserves, left those parts of the front more thinly guarded which might seem, from the Russian standpoint, to be unsuitable and costly for large-scale offensives; but it was precisely at these points that the Russians launched their main attacks—at Przemysl, Lublin and westward in a direct line for Warsaw. Earlier the Gers. had given signs that the

Vistula-San line would constitute their main defence barrier upon which they might fall back slowly and in good order if they failed to check the Russians by 'elastic' methods farther E. But hardly had these dispositions been planned by the Gers. when their general situation began to deteriorate in Poland at a more accelerated tempo than ever; for the fate of their great bastions at Brest Litovsk and Bialystok became sealed by swift and irresistible flank advances. Impressive as were the victories at Dvinsk and Pskov at one end of the front and of Lwów at the other, nothing was so spectacular as the tremendous Russian surge into the middle of the Polish plains. This left the Gers. no alternative but to hold Brest Litovsk and Bialystok long after they had been by-passed—especially the former, which, at its downfall, was over 50 m. in the rear of the flanking Russian spearheads. The loss of the Ger. garrison (about 20,000 men) at Brest Litovsk was forced on the Ger. Command by the necessity of engaging as many Russian troops as possible to check the drive on Warsaw and to give the Gers. time to strengthen their defences in front of the Polish cap. and on the Vistula. In the Baltic States Gen. Bagramyan's advance into central Lithuania foiled the Ger. plan to form a strong line on the Dvina and thereby keep open the road for Germany's Baltic armies into E. Prussia. Protecting Bagramyan's right flank was the army of Gen. Eremenko, who captured Jelgava (Mitau), the main communication centre between the Baltic area and E. Prussia. Farther N. other Russian forces crossed the Estonian border and advanced along the Pskov-Riga road and the Valka railway. Kaunas (Kovno), into which very important stronghold Russian troops had broken on July 31, was at length carried by storm on Aug. 2. The Russians were now massing forces on the Vistula and Niemen for the invasion of E. Prussia and, possibly, of Cracow. Meanwhile Rokossovsky's troops were heading N.W. to Warsaw and there was protracted fighting on the outskirts of Praga, the dist. of Warsaw which stands on the r. b. of the Vistula. Very heavy fighting now threatened on the E. front generally. For the prizes at stake were great: two trapped Ger. armies in the Baltic; the 'sacred soil' of E. Prussia; Warsaw, Cracow and Silesia; and the Carpathian passes. The Gers. would not yield any of these without a desperate struggle and they had reinforced all the fronts except in the area S. of Lwów. In this area Sambar, the last Ger.-occupied centre of any importance in the W. Ukraine, fell at this time to Marshal Konev. Drohobycz, the oil centre, was captured by Col.-Gen. Petrov, defender of Sevastopol and victor of Taman, who was now placed in command of forces operating in the Carpathian foothills. In the N. Ger. resistance stiffened considerably on the approaches to Velga, the Gers. here providing powerful air support to their troops defending the Tallinn-Riga railway—an indication, in the desperate condition of

the Luftwaffe, of the importance they attached to the railway. Equally stiff was their resistance W. of Siauliai, around Warsaw, where the partisans were fighting bitterly against the Gers.—and at Sandomierz, S. of Lublin, and at other Russian bridgeheads on the Vistula. Three Ger. divs. surrounded near Sandomierz were destroyed by Aug. 19.

The Battle for Warsaw—Armistice with Finland.—Russian offensives in the Baltic States.—But thereafter came a check to the Russian attacks before Warsaw, against East Prussia, and in the Baltic States. The situation in Warsaw itself was obscure. Relying, apparently, on the approach of the Russian forces, the patriots rose against the Gers. and were soon in possession of many key-points. They were commanded by Gen. Thaidem Bor-Komorowski, known as Gen. Bor, whose appointment to the command of the Polish underground forces was confirmed by Gen. Sikorski a few hrs. before the latter's death. But at this junction the Gers. strongly reinforced their E. front with a great accession of armour, and the attacking Russian forces received a severe set-back. In Latvia, so far from cutting off the isolated Ger. divs. the Russians were themselves held in check for weeks in the Mitau area nor did their troops, for some time, make any appreciable progress from Lake Peipus into Estonia, though they took Tartu on Aug. 25. Riga, too, seemed as unassailable as ever. Nor was any further progress made or perhaps yet intended against E. Prussia on the borders of which the Ger. citizens were driven *en masse* to dig trenches.

In the third week of Aug. a violent battle of armour was raging on the approaches to Warsaw. It extended over the flat ground between the Vistula and the last few m. of the course of the Bug and across the Warsaw-Bialystok railway. The battle was one of sustained violence, the Gers. abating nothing in their efforts to blunt the power of Marshal Rokossovsky's armour. Ger. tanks in groups of 100 strong returned ten times a day to the attack, supported by sev. regiments of infantry. Meanwhile, however, the plight of the Poles in Warsaw was daily growing more desperate. Allied armmen dropped light weapons for their use, but the Russians refused the use of air fields E. of Warsaw to facilitate and increase their supplies. The Russian Command contended that the rising in Warsaw was premature and contrary to their orders; but it is possible that the political conflict between the Polish gov. in London and the Polish Liberation Committee formed in Russia had its influence on the position (*see further under POLAND*). But at the time of the heavy Ger. counter-stroke in July when Rokossovsky had all but entered Praga after an advance of 300 m. behind the Russian marshal were 350 m. of demolished railway track. Stalin therefore made up his mind to suspend action in the Polish salient until the railways behind his armies could be repaired and altered to broad gauge in readi-

ness for a winter campaign. By Sept. 3 troops of Gen. Bor's Home Army in Warsaw had been forced to surrender some of their positions in the Old Town, where half the pop. of about 100,000 had been killed or wounded and where not a single house was undamaged. In other parts of the battered city the Gers. were continuing periodical air, artillery and mine-thrower attacks.

At this date Finland dropped out of the war, an armistice being arranged between that country and Russia on the morning of Sept. 4. The armistice was not actually signed until Sept. 19 when the Finnish delegation reached Moscow. Under its terms Finland lost both Karelia and the Petsamo area—which latter was still held by the Gers.

Meanwhile things were going ill with the insurgents in Warsaw under Gen. Bor. The Russians, however, had captured part of Praga, after some six weeks of battle unmatched in violence or in scale since the beginning of the summer campaign, extending from near the confluence of the Bug and the Narew to the Vistula. But Warsaw as yet was far from falling to the Russians, and on Oct. 3 the Polish underground army gave up the struggle. For sixty-three days they had fought fanatically in an effort to wrest their city from the Ger. leader, but at the end of that time their supplies had become exhausted and both garrison and people were completely starved out. Their casualties numbered over 150,000. Half the city was destroyed beyond repair and an additional third so badly shelled that remnants of structures still standing would have to be razed and rebuilt. But their defence will remain for ever a testimony to the moral strength of the Polish people and their passionate will to an independent life.

According to Gen. Bor's disclosures in 1918 the Soviet armies for sixty days passively watched the destruction of Warsaw and the massacre of its Polish defenders and inhabitants. The prin. difficulty which faced the Polish Home Army of Gen. Bor was that Russia had broken off diplomatic relations with Poland early in 1943 and efforts by Mr. Anthony Eden, as mediator, to re-establish relations in view of the Red Army's approach to the Polish frontier, were unsuccessful because the Soviet Gov. would only discuss renewal with a Polish Gov. 'favourably disposed' towards the Soviet Union and Molotov's reply to Mr. Eden was that neither the Polish Gov. in London nor the Polish commander-in-chief, Gen. Sosnkowski, fulfilled that condition. To justify this attitude Molotov charged the Polish Home Army with 'inactivity' towards the Gers., a charge which was repeated by Stalin at Tehran in President Roosevelt's and Mr. Churchill's presence. In these circumstances the Home Army had only two alternatives—either to suspend all operations until such time as diplomatic relations were restored or to continue to fight the Gers. regardless of Russia's attitude. In that critical hour a difference of opinion arose in London between Gen.

Sosnkowski and Premier Mikolajczyk: the former thought the resumption of relations should be a condition of any further operations on the part of the Home Army, the latter that there was a possibility of compromise with Russia and that the only way to counteract Russia's allegations was to convince them by action. That point of view prevailed with the Home Army, though Bor himself had no delusions about the aims of Soviet policy ever since the occupation of Poland's E. ters. in 1939-41 as the result of the Ribbentrop-Molotov pact. Bor also averred that the Home Army still believed in the unquestioning support of the W. Powers, not realising to what extent the Russian point of view had been accepted. But when, in the autumn of 1943, the Red Army eventually entered Polish ter., Bor again issued an order to all units to avoid friction with the Russians and to do everything to facilitate the Russian advance. On Aug. 1 the city rose against the Gers., not only the date but the precise hour for so doing having been given to the Russians by Mikolajczyk, who was then in Moscow, and the Russian staff was officially notified by the Brit. staff. The real Russian attitude to the Warsaw rising was that of distrust and hatred for the Polish resistance movement, notwithstanding all the tactical advantages which the Red Army derived from its existence and forlorn struggle. Within three days, however, the greater part of the city fell into Bor's hands and the Gers. retained only a few strongholds which they continued to defend in the hope of relief. Then suddenly the Soviet artillery became silent and the Soviet Air Force disappeared from the skies. The Soviet radio, which had continually urged the Polish people to rise and free their capital, became suddenly mute. All Bor's efforts to establish liaison with the Soviet High Command, either directly or through London, were unsuccessful. After that the rising gradually collapsed and inch by inch the Gers. recovered their lost ground. Capitulation followed inevitably, the Polish losses being more than 15,000 soldiers in addition to thousands of civilian losses, which were estimated by Ger. propaganda sources at 200,000.

On the so-called Leningrad Front, in mid-Oct., the Soviet armies began a new offensive in the Baltic states, from 70 m. E. of Tallinn, the Estonian cap., to the outskirts of Riga, the Latvian cap., a distance of 200 m. Tallinn fell to Marshal Góvórov on Sept. 23, the Gers. thus losing an important naval base and port in the Baltic. The Gers. were now fighting hard to stave off disaster in Latvia which threatened from the combined operations of Marshal Góvórov and Gens. Bagration and Maslennikov. All Estonia was now in Russian hands except for the is. of Dagó and Oesel. The Gers. held a strongly-fortified defence zone between the gulf of Riga and the Dvina riv., but by Oct. 5 the Red Army had carried the first line of the Ger. fortifications round Riga. A powerful Russian attack in Lithuania

N.W. and S.W. of Shavli broke through the strongly-fortified enemy defences, and in 4 days fighting the Russians advanced in spectacular manner up to a distance of 82 m., widening the breach in the Ger. front to 175 m. This new Russian offensive under Gens. Bagramyan and Maslennikov, the essential preliminary to an advance on to Ger. soil, was aimed at the destruction of the powerful Ger. groups that had hung menacingly over Gen. Cherniakhovsky's right flank for sev. months and thereby checked that Russian general's advance on the E. Prussian border.

New Russian attacks in Rumania—Armistice with Rumania.—First attack on East Prussia.—Russian invasion of Hungary. — Budapest encircled.—Russian troops under Marshals Malinovsky and Tolbukhin launched new offensives in Rumania late in Aug. with a view to the capture of the all-important Ploesti oilfields and the elimination of both Rumania and Bulgaria from the war. Kishinev in Bessarabia soon fell. Jassy was taken in three days fighting, together with numerous smaller places. At this point (Aug. 23) Rumania sought an armistice which, with the approval of Great Britain and the U.S.A., was granted by the Soviet Union. It now remained for the Russian generals to expel the Gers. and their satellite troops. The Russian advance soon gathered fresh impetus, especially after Malinovsky's troops had broken through the Galatz gap and captured Galatz, Braila fell on Aug. 23, Focsani and Buzau soon afterwards, and the victorious Soviet forces were closing in on Ploesti. This famous oil centre fell on Aug. 30 after a remarkably rapid advance by Malinovsky's troops, while a few hours previously the port of Constantza was captured by Tolbukhin. On Aug. 31 Ger. troops in the Ploesti area were routed and the Russians entered Bucharest. Advancing up the Danube valley parallel with the Bulgarian frontier, the Russians reached that frontier between Giurgiu and the Black Sea. It was now evident that Russia would tolerate no further Bulgarian aid to Germany and that Bulgaria would be compelled to realise that neutrality was not a status that, once lost, could be regained by a simple declaration. Bulgaria's attitude throughout had been treacherous and equivocal. She had long since declared war on Britain and the U.S.A. but had pretended to be neutral towards Russia while giving the Gers. every kind of aid short of sending combatant troops against her. The process of adjusting military relations with the Rumanian and Bulgarian armies might alone have occupied the Russians throughout the month of Sept.; but in fact during that time they had been steadily driving back to the Yugoslav frontier the Ger. forces that had been facing them through the summer on the approaches to the Danube basin—armies which had had to yield 100,000 prisoners in the actions with which this Balkan campaign opened. Events then moved more swiftly toward the overthrow of the Ger. tyranny in the Balkan penin-

sula. Effective co-operation had been estab. between the Red Army's tanks advancing up the Danube and the partisan forces of the Yugoslav National Army of Liberation under Marshal Tito. S. of the Iron Gate Brit. and Amer. land, sea and air forces, too, were co-operating with Tito's army to destroy Ger. escape routes. Meanwhile the other great wave of the Russian advance beating up the barrier of the E. Carpathians had penetrated from the N. into the disputed prov. of Transylvania—of which Rumania had been deprived by the Gers. as a bribe to Hungary. Other columns crossed the Transylvanian Alps and closed in on Cluj the cap., which had a mixed Ger.-Hungarian garrison controlling communications. From W. Rumania strong Russian forces under Marshal Malinovsky were now thrusting into Hungary itself and, by early Oct., were within 100 m. of Budapest. Thus the mt. ramparts guarding central Europe had been largely overcome and the Red Army had penetrated deep into the Hungarian plain. Russia's chief concern about Bulgaria was to cover the flank of the Red Army during its advance towards Yugoslavia and Hungary and therefore war was declared on Bulgaria, which country promptly replied by vainly seeking an armistice. But the next day (Sept. 9) Russian troops crossed the Rumanian-Bulgarian frontier and occupied Rustchuk, Silistria and the Black seaport of Varna. Then at length Bulgaria decided to declare war on Germany and accept Tolbukhin's demands that Ger. soldiers in Bulgaria be handed over as prisoners together with all Ger. ships in Bulgarian ports. These developments left the Red Army forces free to continue their advance through N. Transylvania, for although Rumania was out of the war the Gers. were by no means out of Rumania. There was now in progress a double Russian offensive in Yugoslavia, S. and N. of Petrovgrad, in co-ordination with Tito's operations, which augured well for the early liberation of Belgrade (Oct. 5). On the same day Brit. and other allied forces landed on the Gk. mainland and captured Patras and, soon after, Corinth.

Late in Oct. 1944 Gen. Cherniakhovsky broke through long-prepared defences into East Prussia for some 20 m. on an 85 m. front, his offensive extending many m. N. and S. of the Kaunas-Insterburg-Königsberg railway. But thereafter the offensive was stopped though its main purpose may have been to keep pinned down there great bodies of the best Ger. forces while preparations were made to strike at a more favourable time and only after the most adequate preparations. Meanwhile, at the end of Oct. three groups of Russian armies were advancing in the general direction of Budapest. One group, with Yugoslav allies, was advancing up the Danube plain from Belgrade, which city was taken on October 20. Another was advancing towards Budapest from Debrecen, a large industrial centre of Hungary which fell to Marshal Malinovsky about the same time; while a third group was moving through the Carpathian

Ukraine after one of the bitterest and bloodiest battles of the war for the possession of the mt. passes leading from the Soviet Ukraine into Czechoslovakia. By rapid lunges, the Red Army reached Uzhorod, cap. of the Carpathian Ukraine. Meanwhile the breach of the Ger. defences in East Prussia had been widened to nearly 100 m., but, as indicated above, the Russians had not proceeded further for, before the Insterburg belt of defences could be reached, the Gers. poured in immense masses of tanks and artillery, the tanks being drawn from four picked S.S. divs., and counter-attacked ceaselessly, suffering heavy losses; and there was every reason to suppose that the whole Russian operation on this extremely unfavourable and highly-fortified front, with scarcely elbow room for deployment, was only a diversion which seemed to acquire added importance from the capture of Riga by Gens. Maslennikov and Eremenko some ten days previously.

The Russian offensive in the S.E. had now spread so widely and deeply that it was obvious that the whole of Hungary was the immediate objective. Cluj, the cap. of Transylvania, was taken by Malinovsky on Oct. 11, the Tiza riv. was forced and Szeged, a large economic and administrative centre of Hungary, occupied. Toward the last days of Nov. Marshal Tolbukhin's army crossed the Danube N. of the Drava and broke through on the W. bank of the Danube on a 90-mile front to a depth of 25 m. Pecs, Mohacs and hundreds of smaller places fell. After this followed a month of very obstinate resistance to the Russian invasion of Hungary but, at the beginning of Dec., the Russians pierced the Ger. line in S. Hungary guarding the way to Lake Balaton and the road up to the W. side of the Danube to Budapest. This drive by Tolbukhin from the S. was co-ordinated with the other drives on Budapest from the E. and N.E. Tolbukhin was now advancing northward up the Danube valley supported constantly by fresh forces ferried across the river by a Danube flotilla from the Black Sea. Meanwhile Malinovsky, who had contrived to bring up from the ordnance factories in the Urals a colossal amount of heavy artillery, with which he had now been pounding the Ger. positions for some weeks, had gained control of the S.E. shores of Lake Balaton. It was a considerable achievement to cross the Danube which at this point is a m. wide) by means of pontoon bridges brought up under cover of darkness almost entirely by hand. Thus Budapest was now caught in an encircling movement, for while the combined forces under Tolbukhin and Malinovsky were thus massed S.W. of the cap., fighting was going on N. of the city following the fall of Miskolcz. But the struggle for the city was destined to be bitter and protracted. By Christmas the main forces of the combined armies of the two Russian marshals were investing Budapest, their advanced elements entering the outskirts from the W. and N.W. But still the city did not fall

and on Dec. 28 the battle entered a new stage of stubborn fighting with groups of picked Ger. storm troops, while two Russian armies gripping the city from the W. and the E. massed for the final onslaught.

German occupation of Greece ended.—Civil War in Greece.—In Greece rival resistance groups were fighting one another in the winter of 1943-44—a legacy of the deep suspicion sown among political parties by five years of dictatorship and three of German oppression. The resistance groups were persuaded to cease fighting in Feb. 1944, and in Sept. all Gk. guerilla forces placed themselves under the orders of Gen. Scobie, who had been nominated G.O.C. in Greece. The Gers. evacuated Greece in Sept., their position being hopeless in face of the Russian advance in the Balkans; and when Brit. and Gk. regular forces landed early in Oct. they encountered only rearguards. Before sending troops to Greece the Brit. gov. had obtained guarantees of co-operation from every member of the Gk. gov. and the commanders of the two rival resistance forces—E.D.E.S. (national democratic Greek army) and E.L.A.S. (national popular liberation army, the military wing of the E.A.M. or national liberation front) had also declared their acceptance of the orders of the Gk. gov. and of the supreme allied commander under whose orders the Gk. gov. had placed all Gk. armed forces. Collisions between E.D.E.S. and E.L.A.S. were, nevertheless, still frequent, the latter being communists who, having received arms from the Brit. authorities, did not use them to drive out the Gers. but held them for use later against their political rivals so as to seize the reins of gov. Gen. Scobie therefore announced that the E.D.E.S. and E.L.A.S. forces would be disbanded, and on Dec. 4 he called upon E.L.A.S. troops and police to evacuate Athens and the Piræus by Dec. 6. But the E.L.A.S. then attacked the Brit. naval headquarters and sharp fighting followed between the E.L.A.S. forces and the Brit. troops in Athens, who small in numbers, were for a time hard pressed. The E.L.A.S. committed atrocities on their political opponents of a character rivalling the excesses even of the Gers. Hundreds of hostages, including women and children, were butchered in cold blood. But as the days passed, Brit. reinforcements arrived from the It. front. Street by street Athens was cleared (see further under GREECE—History).

Stalin launches his general offensive in South Poland, Upper Silesia, and East Prussia.—For five months the world watched and waited, wondering at the delay on the E. Front where nothing seemed to be happening beyond the protracted struggle for Budapest and intermittent operations in the Baltic States. But meanwhile preparations were being made on an immense scale behind the Russian lines which, as has been noted, held solid bridgeheads on the Vistula and Narew around Sandomierz and Lomza respectively. By mid-Jan. Marshal Stalin was satisfied that he could maintain the

momentum of an offensive which should have as its immediate objectives the capture of industrial Silesia and the over-running of all W. Poland and E. Prussia, and also the invasion of Brandenburg and Pomerania, with remoter objectives of Stettin and Berlin and the destruction of the whole Wehrmacht. But his first pre-occupation was to draw off Ger. reserves from the central Polish front and in this he was helped by the concentration of the Sixth Panzer Army under von Rundstedt for a decisive onslaught on the Amer. army in the Ardennes in Dec. thereby robbing the E. front of armoured reserves (see WESTERN FRONT IN THE SECOND WORLD WAR) and by the diversion of a considerable part of the remaining Ger. armour to Budapest and Latvia. The defeat of von Rundstedt by Field-Marshal Montgomery and Gen. Omar Bradley prevented the Sixth Armoured Div. from being turned E. for the defence of the E. Front, while the diversion of the floating Ger. armoured reserves to Budapest and Latvia, instead of menacing the S. and N. flanks of the projected Russian offensive, merely resulted in a fatal dissipation of Ger. reserves and in the locking-up of their armies of E. Prussia and the Baltic, while effecting nothing in the attempted relief of Budapest. At the start of the Russian offensive, the Gers. disposed about one-hundred and fifty divs., of which no fewer than fifty were in the Baltic States and on the Danube. The Ger. High Command was well aware of an impending Russian offensive but were surprised by both its weight and speed. For everywhere the Russians in the first two or three weeks of their amazing attack advanced at twice the rate of their advance in the summer or a total average distance of over 200 m. and in that short space of time they had overrun a large part of Upper Silesia, swept through the whole of W. Poland and isolated E. Prussia. They concealed their true intentions as to place and time with much cunning, causing the enemy to displace reserves by deceiving him with wooden tanks, dummy guns and march and counter-march of infantry. The great offensive was opened by Marshal Konev's First Ukrainian Front from the Sandomierz-Baranov bridgehead on the Upper Vistula—a bridgehead he had held since Aug. The point of impact had thus been plainly indicated on the strategic map for many months and indeed the Gers. had, as they believed, prepared sufficiently strong defensive positions. The weight of the Russian artillery barrage on the opening day (Jan. 12) surpassed anything in the previous experience of Konev's troops and indeed impressed both sides as outstandingly terrible, accustomed though they were to the awful cannonades of E. Europe. The Gers.' prepared positions were so completely overwhelmed that in two days the Russians broke through to a depth of 25 m., their armoured spearheads careering clear of the fortified zone so as to win that freedom of manoeuvre which the Red Army commanders had always known how to exploit with such decisive power.

Before Konev's army now lay the open plain of S. Poland, broken only by the low hills N.E. of Cracow—terrain well-suited to the movement of armoured and mechanised forces. Beyond this plain lay the road to the Ger. border and the phenomenally rich industrial region of Upper Silesia, doubly valuable to the enemy's war production on account of its relative immunity from Brit. and Amer. bombs. Two days later Konev took Kielce, one of the biggest Ger. bases between the Vistula and the Ger. frontier and the junction of two main railways running E. from Germany. In three days Konev had advanced 50 m. beyond the Vistula.

On Jan. 14 Marshal Zhukov's First White Russian Front assumed the offensive on two fronts on the W. bank of the Vistula S. of Warsaw from the Pulawy-Warka sector with massive artillery support and soon broke through the enemy's powerful deeply-staggered defences. In three days the two fronts linked up and advanced 37 m., having extended the breach in the Ger. lines over a front of 74 m. while overrunning the strongly-fortified Ger. defence points of Warka, Grojec, Solec, Zwolen and Jedlinsk and occupying more than 1300 other tns. and vils. Soon afterwards Zhukov's troops carried by storm the important industrial and communication centre of Radom, 60 m. S. of Warsaw, and a strong bastion in the enemy's defence system. This immensely powerful blow by the First White Russian group of armies under the famous marshal who had saved Moscow was skilfully co-ordinated with Konev's attacks to the S., so that the two most formidable Russian army groups were now striking W. along a massive front of 120 m. on the shortest road into Germany. Almost simultaneously, with the opening of Zhukov's attack, troops of the 2nd White Army front, under Marshal Rokossovsky, began an attack N.W. of Warsaw, carrying by storm the bastion of Przasnysz and the tn. and fortress of Modlin. The former place being 17 m. S. of the E. Prussian border on the main Warsaw-Königsberg highway indicated that the objectives of this new offensive was to strike at E. Prussia from the S.

Warsaw fell at this time to Zhukov as the result of a co-ordinated triple operation which was only launched when a huge weight of mobile force had been concentrated on the Vistula S. of the city to make a decisive lunge north-westward across the roads to Lodz, and when sufficient force had been concentrated on the Narew to throw the Gers. back towards the Baltic and prevent a counter-offensive against the Russian right flank. This complex operation was conducted with extraordinary speed, the decisive battle being that fought at Grojec, 25 m. S.W. of Warsaw. The combined operation tore the whole Warsaw area from the Gers' grasp and laid bare the road to Lodz. While the Russian infantry were taking the ruined Polish cap., Zhukov's tanks were spread around it at some points as much as 50 m. away on guard for Ger.

counter-blows and all the time pushing outwards to the W. Meanwhile Konev had taken Piotrkow, an important stronghold in the direction of Lodz. Two days later Konev, advancing W. of Czesochowa, broke through strongly-fortified defences on the S.E. border of Germany and advanced into Ger. Silesia on a 60-mile front, capturing Kreuzburg, Rosenberg, Guttentag, Landsberg, and Pitschen—all powerful strongpoints in the defences covering the roads to Breslau. At this date yet another offensive was in progress, this being the advance of the Third White Russian Front under the Jewish general, Marshal Cherniakovsky, who carried by assault Tilsit, the largest tn. in the N. frontier zone of E. Prussia, and Gumbinnen, the important junction and stronghold in the enemy's defences in the Königsberg direction. Marshal Rokossovsky, co-operating with this army, had now crossed the E. Prussian border in the S., and captured Tannenberg, the burial-place of Hindenburg, whose memorial had been previously destroyed by the Gers. Other tns. taken by Rokossovsky included Neidenburg, Allendorf and Jedwabno.

By Jan. 20 Zhukov's group of armies, which included the greatest accumulation of armour ever seen on the E. Front, had passed more than 100 m. from Warsaw and now stood over half way to Poznan, the last of the historic cities of Poland still held by the enemy. Powerful blows by tanks and infantry overwhelmed the garrisons on the way to Torun (Thorn) and Bydgoszcz (Bromberg), tns. of Posen prov. Thus Marshal Zhukov had advanced many m. ahead of the Ger. garrisons still holding out on the right bank of the Vistula, notably at Plock, leaving garrisons there to be destroyed by the oncoming infantry. Lodz fell at the same time, and so swift was Zhukov's advance that the city was taken intact with all its great textile factories. Cracow, too, which fell to Konev at this time (Jan. 22-23) also escaped Ger. demolition and also the tns. and viks. of the entire strategic industrial triangle of Poland were found to have suffered very little. At Cracow the Russians found mines in the famous Wawel castle, in the churches and even in the tombs of the Polish kings. Large gains of ter. were made on Jan. 22 by the Russians in their double advance into E. Prussia from the S. and E. By the capture of Allenstein (Olsztyn), Rokossovsky had reached the heart of the prov. while Cherniakovsky, advancing from the E. captured Insterburg. By the capture of Allenstein the Russians cut the main railway from Berlin to the Baltic States. At the same time the Russians also took Osterode 22 m. S.W. of Allenstein and Deutsch Eylau, powerful Ger. strongholds. Yet a fifth Russian army group, that under Gen. Petrov, was now advancing along the N. slopes of the Carpathians and Tatra Mts. in Slovakia, with the intention of securing the Carpathian passes and reaching the E. approaches of the Morevian gap along the N. slopes of the Beskids. It was through this gap be-

tween the Sudeten Mts. and the W. Beskids region that the Ger. army in 1939 struck one of its most crippling blows at Poland.

Konev reached the Oder on Jan. 23 on a 40-mile front in the area of Breslau. On the same day Zhukov captured Bydgoszcz by a combined frontal and encircling move; while Rokossovsky took many more E. Prussian tns. including Ortelburg, 25 m. S.E. of Allenstein and E. of the Masurian lakes area, scene of the battle of Tannenberg in 1914. Large Ger. forces had taken up positions to challenge the Russian advance S.E. of Poznan but Zhukov by-passed them, leaving them to be forced into the salient between his and Konev's fronts. Nothing could stay the Russian offensive. On the 24th Konev seized Oppeln, the cap. of Upper Silesia and advanced to within 5 m. of Breslau on the S.E. Simultaneously other forces of Konev cut the railway from Breslau to the N. by taking Rawicz and Trachenberg. In Poland Zhukov's troops captured Kallsz, main centre of communication between Poznan and Cracow. Also at this time a new Russian offensive was launched in Slovakia, where Marshal Malinovsky's troops broke through the defences on a 25-mile front and took Rozniava and Yelsava N.W. of Miskolcz. Gradually it was being revealed that the Red Army's triumphs were due not so much to superiority in numbers or to the Ger. blunder in reducing their armour to a dangerously low level as to the advantage the Russians enjoyed in having a better equipped and swifter moving fighting force, commanded by generals of greater ability than the Wehrmacht. On front after front the Gers. were out-generalled, out-maneuvred and out-fought. A feature of the whole campaign was the manner in which infantry and tanks combined in the great vanguards which plunged through the Ger. lines. Tanks never advanced alone. With them went motor borne infantry, sometimes cavalry, and always squadrons of self-propelled guns. Their collision with the Gers. was so shattering that when the main armies lunged forward in the wake of these vanguards they found entire divs. with all the light knocked out of them.

Rokossovsky reaches the Gulf of Danzig.—*Zhukov invades Pomerania and Brandenburg.*—*Fall of Budapest, Danzig, and Königsberg.*—There was still no halt in the forward surge of the Red Army from the Baltic to the Low Tatra when the Russians captured Gleiwitz in the heart of the Upper Silesian region on Jan. 25, and Chrzanow, a large tn. in the Dombrowa coal basin. In a few sectors Ger. resistance stiffened, notably from the region S. of Elbing and from E. of Königsberg; but the Ger. divs. were fighting separately without plan; while in some resistance was stubborn, in others submission was prompt so that great lines of Ger. captives were to be seen trailing along the Polish roads from the scenes of the Red Army's mighty victories. The capture intact of the Insterburg bridges and the failure of later Ger. attempts to destroy them by

long-range artillery enabled the Russians to move numerous batteries across the Pregel so as to crush Ger. counter-battery fire from the Wehlau dist. On Jan. 26 Rokossovsky's forces captured the E. Prussian tns. of Marienburg and Mühlhausen and reached the Gulf of Danzig, thus cutting off the E. Prussian garrison from central Germany. At the same time the other invading army, under Cherniakovskiy, seized Allenburg, Tapiau, Lötzen—strongholds in the Ger. defence zone constructed over a long period and covering the approaches to the central dists. of the prov. In the Breslau area on the same day the Red Army crossed the Oder at sev. places, while Zhukov's armoured forces were now only 100 m. from Berlin. Between Jan. 12-26 Ger. losses exceeded 380,000 men killed or captured. This stupendous offensive had thus carried the Red Army in some places more than 250 m. from their starting points on Jan. 12. There was no hope of a planned withdrawal by the Gers., whose propagandists were dismayed by the serious situation. Yet the Gers. had been well aware that the offensive was coming, and, for sev. months, they had strengthened the fortifications along the entire Vistula line and all over E. Prussia which, with its many lakes and marshes, is pre-eminently suited to defence. But everywhere they failed; everywhere powerful Russian concentrations swept through the carefully-prepared 'defence belts,' and, overwhelmed by the power of the Russian drive, large forces of the Gers., fearing encirclement, fled in the desperate hope of reaching the Oder. How swift was their flight could be judged from the fact that innumerable Ger. units were hiding aimlessly in the Polish countryside, not realising that their front line—in so far as it was a line at all—was now more than 100 m. away. In Lodz Ger. civilians and even soldiers were travelling on tram-cars when the first Russian tanks broke into the city.

Troops of the Fourth Ukrainian Front under Gen. Petrov, continuing their offensive in the Carpathians over difficult mountainous and wooded country, captured Nowy Targ on Jan. 29, 38 m. S. of Cracow and a powerful strongpoint in the enemy's defences. Elsewhere on the same day Zhukov's forces broke into Ger. Pomerania while Cherniakovskiy advanced to within 2 m. of Königsberg. One consequence of the smashing of the stronghold of E. Prussia was the fall of Memel, the garrison of which was being supplied along the Kurland Spit. The Russians found the harbour installations and public buildings of Memel wrecked and almost the whole pop. had been evacuated. The linking up of Rokossovsky's forces and those of Zhukov in the Bydgoszcz area led to an immediate improvement in their positions in relation to the Danzig-Berlin railway. Zhukov's troops on the banks of the Odra in the prov. of Poznan, decisively cracked the Odra defence line, forced the riv. and then advanced rapidly along the Netze valley and across Brandenburg. They burst through the Netze-Drage line

on Jan. 31 carried the Red Army across the Danzig-Berlin autobahn and the main railways connecting the two cities. Despite ferocious Ger. resistance in Pomerania, the main Russian forces bit deeply into the fortified zone extending from Schniedemühl along the R. Netze to Kreuz, frost aiding the offensive. The next places to fall to Zhukov in his advance across Brandenburg and Pomerania were Meseritz, Schwiebus, and Züllichau—all powerful defences covering the approaches to Frankfurt. Zhukov's central army group, striking along the shortest route to Berlin, was now about 30 m. deep into E. Brandenburg and 24 m. from the Oder, the last great water-barrier before the Reich cap. Meanwhile 50 m. behind the front the Poznan garrison was taking terrible punishment as the Russians methodically cleared the city block by block, groups of sev. hundred Gers. being wiped out, the proportion of killed to captives being in some cases ten to one. Torn on the Vistula and an important rail junction linking Berlin, Insterburg, Warsaw and Danzig, which had been surrounded for some time, was taken by Rokossovsky on Feb. 1. On the same date Schniedemühl (90 m. E. of Stettin) was encircled and the destruction of its garrison methodically begun. By estab. themselves at Heldekrug on the Frisches Haff, the Russians had now completed the envelopment of Königsberg from the N. and obtained control of its ship canal. Königsberg's plight was extreme, crammed as the city was with 150,000 refugees. Day and night Russian troops were shelling it at point-blank range.

Marshal Zhukov was now taking the risk of developing a straight break through the centre and on Feb. 1 he came down from Landsberg to within artillery range of Küstrin, the fortress city at the confluence of the Wasta and the Oder, while a parallel column moving from Schwiebus made for Reppon, the last railway station before Frankfurt. On the same day the first big mass of Ger. reserves comprising also Volksturm (Home Guard) was hurled across the path of Zhukov; but the Gers. were beaten out of the field in tank actions. Frankfurt was the centre on the Oder for covering Berlin, but Zhukov with mobile armour forces was also bringing round his right to turn the central defences to the N. The Red Army's advance on canals and railways was now beginning to exercise a stifling grip on the whole of the E. regions of the Reich. Over the entire area E. of a line drawn S. of Stettin along the Oder bank Ger. supply channels were now in great confusion. They were crammed with refugees, columns of army transports and masses of troops whose orders for battle were sometimes changed in a few hours as new road and railway junctions fell. Meanwhile Berlin was preparing itself for grim defence and a system of trenches was being dug around the cap. and strongpoints prepared in the outskirts. A rapid thaw at the beginning of February impeded Zhukov's attempts to force the passage of the Oder, though by capturing Sonnenburg he was only 5 m.

E. of Küstrin. But Marshal Konev crossed the Oder S.E. of Breslau and in three days' fighting extended his bridgehead along a 50-mile front while advancing 12 m. The capture of Fürstenberg put Zhukov only three m. from Frankfurt. Ger. resistance on the Oder in front of his armies had now stiffened very considerably as also in the vicinity of Stargard, 20 m. E.S.E. of Stettin. The Ger. pocket in E. Prussia, which a few days earlier was about a thousand sq. m. in extent, was now shrunk to 600 sq. m. and only some half dozen tns. in the central area of the prov. remained in their hands.

In Budapest the Gers. had now been driven to the foot of the hill on which stood the Royal Palace, and this area above the Danube was under heavy fire. Here, in the gipsy quarter, the Russians found the entrance to a vast underground factory making parts of Messerschmitts, the entrance being disguised as a pottery workshop. From it tunnels, fitted with elaborate machinery and underground roads for motor traffic, stretched for m. Thousands of workers employed there rarely saw the daylight.

By the capture on Feb. 11 of Liegnitz, one of the largest tns. in Silesia, Steinau, Lüben and other tns., the Russians cut the Breslau-Berlin railway, besides almost surroding Breslau. This advance of nearly 40 m. carried Konev's armies across the Oder in great strength, besides widening their breach to 100 m. At the same time troops under Rokossovsky captured Elbing, the second city of E. Prussia; while Cherniakovsky's forces took Preussisch Eylau besides breaking up the strong Ger. defence zone based on that tn. and on Kreutzburg and Landsberg. The fall of Elbing marked the end of a phase in which the Gers. still had some hope of driving the Russians from positions which barred the eastward escape of the Ger. forces penned in the central region of the prov. Preussisch Eylau was the main Ger. resistance point between the Pregel and Alle and it was from there that the Gers. vainly tried to advance northward to reach Königsberg. Most of the forty submarine plants, chemical factories and power plants in the Elbing area were taken intact by the Russians; but the streets were littered with debris and Ger. dead. Meanwhile on Feb. 12 Gen. Petrov, advancing over the broken and forest-covered country of the Carpathians, stormed the tn. of Bielsko an important bastion in the Ger. defences covering the approaches to Moravska-Ostrava, the N. entrance to the famous Morava Gap. Buuzlau on the Bober fell to Konev on the same date, thus taking his forces to within 75 m. of Dresden.

Budapest fell at last on Feb. 13 after six weeks of the most bitter fighting in the difficult conditions of a large city. All organised resistance to Malinovsky and Tolbukhin ceased with the capture of the Royal Palace and of all the little rococo mansions of the aristocratic quarter which extends down the N. side of the hills overlooking the Danube. The enemy clung tenaciously to the large ministerial build-

ings and the Russians had to fight their way to the roofs. Crowds of spectators on the other bank of the riv. watched the final stage of the battle. During the battles in the city the Russians took more than 110,000 Ger. and Hungarian prisoners, while Ger. and Hungarian dead numbered 49,000. The fall of the great city was the culmination of a campaign of which the strategic value was obvious. The vast turning movement, which brought the Red Army through Rumania and up the Danube valley, created a situation in which the Russians were able to sweep across Poland with decisive superiority in armour; for there came inevitably a moment when Malinovsky seemed to be on the point of an advance through the Morava gap and it was then that the Gers. felt compelled to transfer a tank army from S. Poland to Budapest. In fact the Red Army's strategists had given the Gers. no option, and to describe the Ger. decision as mistaken is to withhold from the Russian strategists the credit due to their enterprise.

Having now shattered the Ger. line of defence on the Bober Konev's forces on Feb. 14 captured sev. more Silesian tns. including Neusalz, 75 m. down the Oder from Berlin. Konev's armies now held 150 m. of the upper Silesian industrial basin. The same day Zukov's troops stormed the long-encircled tn. and fortress of Schneidemühl, a powerful support-point in the Ger. defences in E. Pomerania and an important railway junction on the main Berlin-Danzig trunk line 60 m. W. of Bromberg. More than 5000 prisoners were taken and 7000 Gers. were killed. Brit. and Amer. bombers now took a hand in the Silesian campaign by making sev. very heavy attacks on Dresden and Chemnitz on the night of Feb. 13. The night assault was followed by day attacks by 1350 Amer. heavy bombers and 900 Amer. fighters, and 1400 R.A.F. aircraft also took part. At this moment Dresden was a place of vital importance to the Gers. for controlling the defence against Konev whose forces, by capturing Grünberg and Sommerfeld, were within 10 m. of the stronghold of Cottbus and further S. less than 60 m. from Dresden (Feb. 13). Near Züllichau, 12 m. N.E. of Grünberg, Konev's right wing estab. contact with Zhukov's left, and thereby foiled the Gers.' last hope of forcing a wedge between the two fronts.

Russian infantry was now moving up in force to the fortified water barrier of the Nisse protecting Saxony and S. Brandenburg, while armoured units had reached the r. b. of the riv. The Gers. launched strong counter-attacks between Landsberg and Stargard against Zhukov's armies in Pomerania, but suffered heavy losses. The purpose of these attacks was to try and halt the Red Army's converging movement towards Stettin and the Baltic. Gen. Cherniakovsky's troops were advancing through Pomorze along the Bydgoszcz road to Danzig. On the same day (Feb. 18), however, Gen. Cherniakovsky was killed. He was the

youngest group commander in the Red Army and one of its outstanding strategists. The outline of Zhukov's great salient in the centre of the Eastern Front remained more or less unchanged for some weeks. Meanwhile, as has been noted, the main Russian effort was directed towards Stettin, Danzig and the Baltic coast generally. Rokossovsky's purpose, in advancing northward astride the old Polish corridor, was to form up on Zhukov's right and so protect the N. flank of the latter's salient. It was obvious that this flank could not be secure while Schoerner's force still remained in

berg, while 30 m. to the N.E., Rokossovsky's men reached the coast from Köslin, thereby cutting the Stettin-Danzig road and railway and threatening to isolate both Danzig and the Polish port of Gdynia from the rest of Germany. Next day the main weight of Zhukov's armies, having turned westwards towards the lower Oder, captured Stargard, together with Nangard and Polzin, all powerful strongholds and centres of communication in the direction of Stettin. This offensive, besides pinning large Ger. armies against the Baltic coast, forestalled a Ger. counter-offensive which was planned to strike at

RED ARMY CAVALRY CROSSING A RIVER IN HUNGARY

Soviet Weekly

Courland to occupy the attention of Eremenko's and Masiennikov's Baltic armies and thereby to deny to the Russians the use of the ports of Liepaja (Libau) and Ventspils while also limiting the usefulness of Riga. This explains the tenacity with which the Gers. held Königsberg and yet more, Pillau, which latter barred the only outlet from the Frisches Haff. In the S., too, the Gers. were offering a very dour resistance to Marshal Malinovsky on the lower Hron riv. in S. Czechoslovakia. Troops of Zhukov's armies, after a month-long siege and obstinate fighting, at length on Feb. 23, completed the rout of the Ger. forces encircled in Poznan (Posen) and on that day they fully occupied the fortress. During the fighting for Poznan the Russians took 23,000 prisoners; in killed alone the Gers. left over 25,000 on the field.

On March 4 Russian forces, in a spectacular advance of over 60 m., reached the Baltic at two places in Pomerania. Zhukov's troops reached the area of Kol-

berg, while 30 m. to the N.E., Rokossovsky's men reached the coast from Köslin, thereby cutting the Stettin-Danzig road and railway and threatening to isolate both Danzig and the Polish port of Gdynia from the rest of Germany. Next day the main weight of Zhukov's armies, having turned westwards towards the lower Oder, captured Stargard, together with Nangard and Polzin, all powerful strongholds and centres of communication in the direction of Stettin. This offensive, besides pinning large Ger. armies against the Baltic coast, forestalled a Ger. counter-offensive which was planned to strike at

the right flank of the great Russian salient stretching to the middle Oder. A powerful concentration of crack Ger. units had been amassed in Pomerania behind the line which had been hastily improvised after the Red Army had pierced the 'Pomeranian wall' at Schneidemühl, but Zhukov anticipated the Ger. attack by diverting armoured units from Brandenburg. After very stubborn fighting the strongly-defended tn. of Küstrin on the E. bank of the Oder fell to Zhukov. This was the prin. Ger. strongpoint cramping the Red Army's communications (March 11). During this time there was also heavy fighting N.E. and E. of Lake Balaton in Hungary where the Gers. were making frenzied efforts to get back to the Danube, but their attacks were held and Zvolen fell to the Russians on March 14. Russian forces advancing across the Polish corridor from Pomerania, reached Danzig Bay and captured Tczew and Neustadt, outposts of Danzig. Fighting their way along the Frisches Haff to Heide-Waldburg the Russians, on March

15, split the Ger. E. Prussian army group in two.

The main weight of the Russian offensive was now directed to the flanks of the E. Front, the immediate objectives on the N. flank being the Baltic ports of Gdynia and Danzig and the city and fortress of Königsberg, on the S., Bratislava and Vienna. Königsberg, the very symbol of Prussian might, was not lightly to be overwhelmed, the more especially as it had been fortified almost beyond measure and contained a very large garrison which had been swollen by forces pressed back by Cherniakovskiy. The garrison in Feb. had made a very powerful thrust and it was only by mid-March that the Russians restored the position by advancing across the coastal road linking the Königsberg garrison with the small fortified tn. of Brandenburg and by isolating the Ger. garrison in Braunsberg, a powerful strongpoint in the Ger. defences on the shores of Frisches Haff lagoon. Marshal Vassilievskiy (Cherniakovskiy's successor) took Braunsberg on March 20. Danzig was cut off from Gdynia with the capture of Zoppot situated on the coast between the two (March 23). On the 27th Rokossovskiy's troops occupied a dozen suburbs of Danzig and broke into the centre of the city, besides breaking into the tn. of Gdynia. The latter was carried by assault on the next day, thus giving the Russians an important naval base and large port on the Baltic. About 9000 prisoners were taken there. At the end of the month the Russians completed the capture of Danzig, hoisting the Polish flag over the city whose name was changed to the Polish version, Gdansk. Danzig had not been Polish since 1793. Some 10,000 Ger. prisoners were captured and 39,000 Gers. fell during the siege.

Vassilievskiy's troops completed the capture of the city and fortress of Königsberg on April 9. Thus went the most important stronghold in the Ger. defences of E. Prussia. Its capture by the Russians meant that, with the exception of small Ger. groups, the Baltic shore was now entirely cleared, from the German pocket in Courland to the mouth of the Oder opposite Stettin. Now that the city had fallen, the Red Army would be able to bring up large quantities of supplies by sea from the Leningrad area, avoiding the long journey across Russia. During the fighting in Königsberg between April 6 and 10, the Russians took 92,000 Ger. prisoners and, in that period, the Gers. lost in killed alone, 42,000 men. Among the prisoners were four generals and 1819 other officers. Large captures of guns and tanks were made.

Capture of Bratislava and Vienna.—The Battle for Berlin.—Capture of Stettin and Moravska Ostrava.—In the S. the Gers. had staged a tremendous effort to win back ground E. of Lake Balaton, in the vain hope of re-taking Budapest or, at least, to safeguard Vienna, with the view, possibly, of building up an 'impregnable' fortress in the S. of Europe from Munich to Hungary and southward to the It. Alps. Hence armoured forces were squandered

lavishly in all-out attacks on the further side of Lake Balaton. The forces of Tolbukhin 'cushioned' the impact of these hammer-blows which at length in the middle of March began to weaken considerably and, on the 18th, the Russians had struck back in the direction of the Bratislava Gap and Vienna. The speed with which Tolbukhin was able to switch over to the offensive is explained by the fact that the Soviet Command, all through the battles in W. Hungary, kept its operational reserves intact. He struck in Hungary on March 20, and in a week his forces were only 30 m. from the Austrian border, as well as driving along the N. shores of Lake Balaton on the way to Slovenia. In co-ordinated attacks, Marshal Malinovsky, driving along the S. bank of the Danube, took the strongholds of Győr and Komarno on March 28, both being important strongholds in the Ger. defences in the direction of Vienna. Tolbukhin crossed the Austrian frontier 50 m. S. of Vienna on March 30, while Malinovsky forced the river. Hron and Nitra and took a number of strongholds in the defences in front of Bratislava. Wiener Neustadt, railway junction and engineering tn. 22 m. S. of Vienna, was occupied by Tolbukhin on April 3, together with Eisenstadt, cap. of Burgenland, while on the same date Malinovsky took Kremsitz, 90 m. N.E. of Bratislava, and other strongholds S. of that city. This remarkably swift co-ordinated advance was now jeopardising lines of vital importance to the defence of lower Austria. Bratislava, cap. of Slovakia, was carried by assault by Malinovsky's troops on April 4 and its elimination left him free to advance on Vienna from the E., while Tolbukhin was coming up from the S.

Battle was now joined for Vienna, for the Gers., swept back to the very approaches by the night of April 3, were fighting fiercely to save the Austrian cap. Tolbukhin's tanks were then in the Baden area, 12 m. S. of Vienna, where he had to meet Ger. forces augmented by the defeated and fugitive garrison of Bratislava. On April 5 the Russians were at the gates of Vienna and had cut the Vienna-Linz highway. Very soon Vienna was almost encircled, for Malinovsky was swiftly advancing along the N. bank of the Danube. On the night of the 6th Tolbukhin's forces fought their way into Vienna after the city had been under shell-fire for several hours and the Gers. had made a futile broadcast appeal for a last stand by the garrison and people. The bells of St. Stephen's Cathedral, which sounded the tocsin when the Turks were at the gates of the city in 1529 and 1683, were again pressed into service by the Gers. for this broadcast. The relative ease with which the Russians were now advancing was bought in a long series of fierce battles fought mostly between Lake Balaton and the Danube, around and in the heart of Budapest, around and in the heart of the banks of its trib. the Hron. The Gers., having, as we have seen, concentrated large forces, attacked repeatedly, regained

ground on both sides of the riv. and, to the N. drove the Russians out of their hard-won bridgehead on the Hron. Yet neither this local success nor that achieved on a wider front N. of Lake Balaton ever acquired a strategic significance and their essential effect was merely to wear out and deplete the forces engaged to such an extent that they were utterly unable to stand up to the inevitable mighty Russian counterblows, which were delivered with exemplary promptitude. As the Red Army closed in through the Penzing and Favoriten dists. of Vienna and passed through the electric power station and the gasworks on the edge of the Prater, bodies of Viennese workmen and students came to meet them with red flags which 'had lain in hiding since the time when the display of such flags was proscribed.' Thus had the whirligig of time brought its revenge from the days (1934) of Nazi persecution when Dollfus was murdered. Tolbukhin's troops, in co-operation with Malinovsky's, after stubborn fighting in a built-up area W. of the Danube, captured all Vienna, having taken 130,000 prisoners between March 16-April 13, routed 11 tank divs., destroyed 1345 tanks and self-propelled guns and 2250 field pieces. The Red Army's tactics saved most of Vienna's celebrated buildings from serious harm. In fighting for the city the Russians, instead of advancing along the streets, moved through courtyards, breaking down walls where necessary and thereby neutralising most enemy fire-points. Such damage as was sustained by the Schönbrunn palace and Parliament building was due to Ger. incendiary shells. Austrian militiamen assisted the Russians in the administration of the city. After the bitter fighting in the city cemetery Russian soldiers tended the graves of Beethoven and Johann Strauss, laying a wreath of red roses in Strauss's honour. But after the Russians had liberated the city Ger. thermite shells set many famous buildings ablaze and damage was done to the Rathaus, Franz Josef Palace, the opera house and part of St. Stephen's Cathedral. Exploiting their capture of Vienna, Tolbukhin's forces rapidly advanced up the Danube valley, while Malinovsky pushed on between the Morava and the Vienna-Brno highway, the Gers. being hustled back across Lower Austria towards Moravia.

Ger. forces in E. Prussia were now (April 18) confined to a six-mile peninsula enclosing the Frisches Haff and to small parts of the cape between Fischhausen and Königsberg, both areas being packed with men and equipment including what had been evacuated from Danzig and Gdynia. These suffered great damage from Russian artillery, which was also annihilating the remnants of the enemy pressed against the port of Pillau from which, just previously, 9000 prisoners had been taken.

The Battle for Berlin.—Zukov began the battle for Berlin. The building up of the striking-force had been in preparation for two months; but it was not until Himmler's Pomeranian group of armies

had been destroyed, and Danzig captured, that his plans reached their maturity. Reconnaissance activity between April 15-17 increased on the 18th to full-scale battles for the estab. of bridge-heads over the Oder and Neisse. Muskau and Weisswasser, 80 m. S.E. of Berlin were captured by Konev. A Polish army took Rothenburg. Soon afterwards Konev's forces were across the R. Spree 12 m. from Cottbus. Other Russian troops were in the suburbs of Bautzen in Saxony. A second Polish army was across the Neisse. By the 20th, the Red Army was ranged in an arc about 25 m. from Berlin. Two days later Zukov's and Konev's troops had captured many suburbs of Berlin in advances from sev. directions, including Weissensee only 3 m. from Unter den Linden. From E.N.E. and N. the armies of Zhukov and from the S. those of Konev, were inexorably closing all round the doomed Reich cap. During the 22nd, over a dozen suburbs were taken, including Buchholz, Blankenburg, Glienicke, and Lübars, from 3 to 10 m. distant from the centre. Zhukov had brought a huge force of armour, accompanied by veteran assault troops who had fought at Stalin-grad. These were now moving on the E. and N.E. periphery of Berlin and in the teeth of fanatically desperate resistance were challenging the Ger. artillery. Stormovik dive-bombers, operating by day and night, were sweeping the Ger. lines from low altitudes and thwarting counter-attacks. The city's military defence was placed under the command of Lieut.-Gen. Heymann though later, it was asserted that Hitler was directing the defence in person. In an hysterical broadcast Goebbels declared that all who showed cowardice or hoisted the white flag would be treated as outlaws. Confidence was felt in Moscow that Berlin would fall in ample time for May Day celebrations and already Red Army troops swinging round the N. fringe of the cap., were pushing towards Spandau, Charlottenburg and Potsdam to the S.W. But following his usual practice of withholding information until he could announce an accomplished fact, it was not until April 23 that Stalin announced that the Russians had 'broken into Berlin.' Zhukov's forces, after passing to the offensive from their bridge-heads on the W. bank of the Oder, broke through strongly fortified and deeply staggered Ger. defences covering Berlin from the E. and in less than a week had advanced from 40 to 62 m. During this time they captured the tns. of Frankfurt, Wandlitz, Oranienburg, Birkenwerder, Pankow, Friedrichsfelde, Karlshorst, Köpenick Genningsdorf—all at distances ranging from 15 to 4 m. from the centre. Konev had broken into the city from the S. also through deeply echeloned defences, on the Neisse, and had advanced from 50 to 95 m., occupying the important tn. of Cottbus and also Lüben, Zossen, Luckenwalde, Teltow and others. At the same time in the direction of Dresden, other forces of Marshal Konev had reached the Elbe. The assault on Berlin raised the Russian mood to a pitch of exaltation

comparable only to that witnessed in the historic battle for Stalingrad. Guardsmen went into battle with small red flags like a relay-runner's token, passing them on to comrades as they fell. When the first heights were taken these emblems fluttered all along the crest of the hills N.E. of the city.

When, on April 25, the armies of Zhukov and Konev joined hands, N.W. of Potsdam, Berlin was surrounded and all roads leading westward from the cap. were cut. The Red Army was now striking relentlessly towards the centre of Berlin from N., E., and S. Most of the factory dist. was already in their hands, and tank, aircraft and gun factories were captured on the same date. The fighting was bitter in the extreme, each side employing a great amount of artillery, probably greater than was ever gathered together in any battle for a city. Ger. preparations for the defence were designed in the hope of absorbing the Russian forces by attrition at as many points as possible over a wide region of built-up areas. At every cross-road were concrete forts, and among the ruins artillery was widely dispersed, together with heavy machine-guns. But the Russians were skilled and experienced in street-fighting and spread confusion in the Ger. ranks by fighting their way—as in Vienna, through yards, walls, and buildings, where possible thereby avoiding the roads. Next evening (April 26) the Russians took the suburb and radio centre of Königs-Wusterhausen, the industrial centre of Siemensstadt, and Dahlem. That day regiment after regiment of Soviet troops poured into Berlin foregathering for the final assault. The wide four-lane highways converging on the cap. were packed with guns, tanks, lorries and amphibious vehicles. Everywhere, on vehicle, street, wall and fence appeared the slogan 'Dayosh Berlin' ('Let us have Berlin'). From all sides now Russian guns were turned on the centre, while behind the advancing Red Army the subjugated ter. was quiet. The Gers. were using all types of artillery for street fighting and the Luftwaffe was now chiefly in battles over the city in and around the huge column of smoke that was rising from its heart. Ger. civilians sought refuge behind the Ger. lines. They included many workers from the factory dists., some of whom had resisted with arms the attempts of the Gestapo to force them into the city. On the following day (April 27) the Russians took the suburbs of Spandau, Potsdam and Rathenau and, in the cap. itself, the industrial dist. of Neukölln, besides the vital airport of Tempelhof. Gers. and Russians were now using ammunition of a kind far more destructive than ever the Gers. had used against the Russian cities. Under this concentration of fire what remained of Berlin after the allied air raids now suffered tremendous damage. Familiar architectural features were fast disappearing in piles of rubble through which the Russians cleared narrow lines for their infantry. At the end of the sixth day (April 29) of the battle in the streets of the

cap. the Red Army, having taken Moabit bordering on the Tiergarten (Zoological Gardens) and the Anhalter Station, had ringed the inner area and hacked its way through almost to the edge of the Tiergarten. Civilians, crazed with hunger and shell-shock, were looting shops. The police were helpless and many sought safety in surrender. On April 30 Zhukov's troops hoisted the banner of victory on the Reichstag building. They also captured the central post office building, the building occupied by the ministry of internal affairs and 200 blocks of buildings in the central part of the city. Strong Russian units were now massing on the N. bank of the Spree for an assault on the administrative dist. of Berlin. Berlin was now shaken to its foundations by allied bombing and Russian shelling and Ger. artillery fire. It had become a city of cellar or cave-dwellers. In the centre fanatics continued their futile resistance—remnants of the Ninth Army, members of the Schutzstaffel, Hitler's personal guards—sev. divs. strong and lacking nothing in ammunition and weapons. On May 1 the Red Army, hoping to be able to celebrate the day with the full capture of Berlin, turned every gun and mortar they could muster on to the small area into which the Gers. had now been compressed. Dive-bombers and Stormoviks added to the fury. Tanks and mobile guns, which crossed the Spree in the teeth of strong opposition three days previously to lead the attack on the Reichstag building, were now in great force in the Tiergarten. The fire of the Ger. artillery at length began to slacken. The important dists. of Charlottenburg and Schoenberg were cleared the same day. In the midst of this conflict it was announced on the Ger. wireless that Hitler had fallen at his post in the Reich chancellery 'fighting to his last breath against Bolshevism' (May 1) and also that Adm. Dönitz (g.v.) was his successor. It was at this very moment that Himmler (g.v.) had offered immediate unconditional surrender to America and Britain and was expected to follow up his offer by including Russia. Dönitz, however, describing himself as head of the State and commander-in-chief, said that he would continue the struggle 'to save the German people from destruction by the Bolsheviks.'

Meanwhile during this struggle for Berlin other Russian armies were continuing their rapid advance westward. N.W. of Dresden Konev's forces crossed the Elbe on April 25 and, the same day, Vassilievsky's troops at last captured Pillau, large port and naval base on the Baltic. Next day Rokossovsky, after new crossings of the Oder, captured Stettin, the Pomeranian cap., together with many other smaller tns. Prenzlau, 30 m. S.W. of Stettin, fell to Rokossovsky the following day.

It had now for some time been obvious that the W. and Russian Allies would soon meet in Germany and accordingly military arrangements were made for that contingency to be fulfilled without confusion. The actual joining hands

took place on April 27 on the Elbe in the area of Torgau, N.E. of Leipzig and the significance of the juncture was that Germany had now been cut in two. In the S., troops of Eremenko's Fourth Ukrainian Front carried by storm the tn. of Moravská Ostrava, the important Czech industrial centre standing at the entrance to the famous strategic Moravian Gap. (April 30). Next day Russian captures included Stralsund and Brandenburg (cap. of the prov). In the four months ended April 30 or since the opening in Jan. of the final Russian offensive the Gers. lost on the E. front more than 800,000 officers and men in prisoners and about 1,000,000 in killed. During that period the Red Army had captured or destroyed 6,000 Ger. aeroplanes, 1200 tanks and self-propelled guns and more than 23,000 other guns.

Berlin Surrendered.—Fall of Pilsen and Surrender of Breslau and Dresden.—German Capitulation on the Eastern Front.—Liberation of Prague.—The garrison of Berlin surrendered on May 2. Over 100,000 prisoners were taken on that and next day. The destruction of the encircled Ger. groups S.E. of the city was completed the same day. During the battles for Berlin in the previous week Ger. killed numbered 60,000. All through the night of May 2, in the glare of searchlights, columns of Ger. prisoners streamed from the centre of the devastated cap. towards camps on the periphery. Great numbers were half-crazed by the ordeal of shelling and bombing through which they had passed. Shaggy-haired, bearded and grimy they emerged, wearing white armlets, from bunkers, tube-stations, drain-pipes and piles of ruins. Hitler, it was stated by the Gers., had fallen among the defenders. The battles for Berlin had lasted for 17 days and the capture of the city, synchronising with the vast surrenders to Field-Marshal Alexander and Montgomery (see ITALIAN FRONT; WESTERN FRONT) heralded the virtual end of the war in Europe.

But there still remained a number of pockets of resistance, including the Bohemian fortress. Gen. Eremenko, advancing along the E. approaches, took the strong bastion of Teschen on May 3. His group of armies, which till then had been handicapped by the difficulties of fighting on a front riven by formidable mt. ranges, had now reached more favourable terrain. The fall of Teschen, on the Czech-Polish border marked the breakdown of Ger. resistance between Opava and the W. Beskids and cleared the way for a general advance through the famous Moravian Gate. As late as May 6 the Gers. were still putting up stiff resistance in Moravia to the Russian forces of Gen. Eremenko and Marshal Malinovsky. The general advance towards the important tn. and bastion of Olomouc, however, was in full swing. In the N., Rokossovsky took the ls. of Rügen. Elsewhere on the E. Front the operations were marked by the Ger. Army's desperate attempts to disengage in their eagerness to surrender to the Brit. and Amer. forces. In the

region of the Oder estuary they were unable to do so and many prisoners were taken on the Baltic coast, where Swinemünde and Peenemünde were among the last Ger. tns. taken by the Russians in the war. There was bitter street fighting in Prague, but confusion was fast spreading among the Ger. troops, for while some were giving up and being disarmed, others went on fighting and yet others remained in barracks. Allied divisions were fast approaching the city. Gen. Patton approaching from the S.W. near Pilsen and the Russians from the E., but over a hundred miles away, Gen. Patton's tanks rolled into Pilsen early on May 6, the population openly singing the Czech national anthem for the first time for six years. When the tanks first came in Ger. snipers fired under cover of white flags, and street battles between Czech patriots and Ger. snipers continued for some hrs. in the centre of the city. The next day Lieut.-Gen. Majewski, commander of the Ger. garrison of Pilsen shot himself after surrendering with his staff to the Amer. forces. The great Skoda works, which had been at a standstill for some time, were found to have been two-fifths destroyed by allied bombing. There was a citizens' revolt in Prague, and the Czech National Committee issued broadcast appeals for speedy allied help against some 300 tanks which the Gers. were believed to have at their command. Breslau surrendered at last, to Marshal Konev, on May 7, over 40,000 Gers. being captured. The city had sustained a siege of 82 days. It was completely invested on Feb. 14 and since then it had been crumbling to pieces, block by block, in bitter street fighting. Dresden fell to Konev on the following day being the last tn. of any major importance then still held by Ger. forces. On the same day Eremenko captured Olomouc on the Morava. But apart from fighting in a few isolated little pockets, notably in Czechoslovakia, where Patton's forces were marching to join up with the Russians, the end had come on the E. as on the W. Front. The end of Ger. resistance came on May 9 with the final act of surrender to the Allies. (See WESTERN FRONT IN SECOND WORLD WAR.) This was a repetition of Gen. Jodl's surrender at Rheims to Gen. Eisenhower on May 7, but was now made to all the Allies, including Russia. This act of surrender was signed in Berlin by Field-Marshal Keitel, Adm. Friedeburg and Air Col. Gen. Stumpf and it was an unconditional surrender of all Ger. armed forces on land, at sea and in the air to the Supreme Commander, Allied Expeditionary Force, represented by Air Chief Marshal Tedder, Deputy Supreme Commander of that force and simultaneously to the Supreme High Command of the Red Army, represented by Marshal Zhukov. Gen. Spaatz of the U.S. Air Forces, and Gen. de Latre de Tassigny of the French First Army, signed as witnesses.

There was no need for Patton's forces to continue their advance into Czechoslovakia; for Russian tanks under Gens. Rybalko and Leishenko turned from

Berlin in a swift rush southward on May 3. They crossed the Dresden-Leipzig highway W. of the Elbe, thundered through the so-called Saxon Switzerland and broke into Bohemia in an operation of great audacity. There was hard fighting of very varied nature over rivs., through forests and mt. country, the tanks entering Prague from the N.W. in less than six days from their start, a distance of 150 m. Marshal Konev, commander of the forces which had thus liberated Prague, arrived in the city on May 11. Following this operation the Russian tanks drove S. to Pribram to join hands with other powerful Russian forces crossing S.W. Bohemia. Between May 3-12 nearly 500,000 Ger. prisoners were taken between the Sudeten Mts. and the Austrian Alps.

It is now well-known that Patton was prevented from entering Prague in order to allow Soviets the credit for liberation. But he could have entered 3 days before the Russians, and saved many Czech lives.

Eastern Question. The, an expression which derived its origin from the problems connected with the existence of a portion of the Ottoman Empire in Europe. The main aspects of the problem were the struggles of the Christian populations in Turkey to regain their lands and rights and the efforts of Russia to obtain free entry into the Mediterranean Sea through Turkish ter. Connected with the latter aspect was the attitude of other European Powers, who had no desire to see Russia gain a strategic advantage which might in the event of war be turned against the countries bordering the Mediterranean Sea. There was also a strong desire in Greece to regain Constantinople, which had been captured by the Turks in 1453. The question became one of first-class importance to European statesmen in 1807, but the Congress of Vienna failed to make Turkey comply with its terms; from which circumstance Russia gained considerable prestige in view of the fact that she had contended that the question was a purely local one, and this failure appeared to confirm that view. In 1850 France raised the question with Turkey regarding the right to protect Catholics in Turkey and the guardianship of the holy places in Palestine. France considered that she still had these rights, but the matter was contested by Russia, who made a similar

claim. No agreement was reached, and the Crimean War resulted. The Serbs had for ages endured much from the Turks, but in 1862 they drove them from Belgrade, a success which, however, only served to intensify the difficulties among the Christians of Herzegovina. This eventually forced them to revolt against Turkish rule in 1875. Afraid of the intervention of the Great European Powers, Turkey made a show of granting certain measures of reform, but as these were proved to be worthless (and in view of the Muslim massacre of the Fr. and Ger. consuls at Salonika in May 1875), the Berlin Note was sent to the Porte requiring it to give guarantees for the execution of the reforms. As, however, Great Britain did not assent to the Note, Turkey believing she had the moral support of the Brit. Gov., took no action. Bulgaria also revolted against Turkey in 1875, but this was quelled by wholesale massacre. In 1877 Russia, Serbia, and Rumania declared war on Turkey, the battles round Plevna being the most notable of this campaign. The allies swept on to Adrianople, and by Feb. 1878 were in sight of Constantinople, when the Brit. Gov., alarmed at their success and apprehensive of its consequences, sent a fleet to defend Constantinople. The war was brought to a close by the Treaty of Berlin, under which Turkey lost much ter. The E. Q. became acute again in 1895, when Turkey embarked on a career of massacre of the Armenians in spite of strong representations from Great Britain and France.

Just before the First World War the Balkan War (q.v.) of 1912-13 brought about certain territorial adjustments which irritated most countries concerned and were one of the contributory causes of the First World War. The E. Q., as such, however, lost its significance after Turkey had lost most of its European ter. *See also TURKEY.* *See E. A. Freeman, Ottoman Power in Europe, 1877; T. Comyn-Platt, The Turk in the Balkans, 1906; J. A. R. Marriot, The Eastern Question, 1917; E. Eastern Rumelia, *see* BULGARIA.

East Flanders, prov. of Belgium, with Antwerp to the E., Brulaut to the S.E., and W. Flanders to the S.W. It includes the basin of the Scheldt, and under skilful cultivation yields excellent crops, sugar-beet, flax, and hops especially in the Waes dist., which was once barren marsh. There is a considerable trade in flowers and textile manufs. The chief tns. are Ghent, the cap. (pop. 162,400), the second port of Belgium; St. Nicolas (13,600); and Alost (42,000). The area is 1,147 sq. m. Pop. estimated 1,212,000.

East Friesland (*Ost Friesland*) now forms part of the dist. of Aurich in Hanover, Germany. It is bounded on the N. by the N. Sea, and W. and E. by Holland and Oldenburg respectively. Like W. Friesland it is flat and low, but the waste lands have been reclaimed and the

Frisians live by agriculture as well as by fishing.

East Ham, municipal bor. of S. Essex, England. It adjoins West Ham, and is included in greater London. Pop. 143,000.

East Hampton, township of Suffolk co., New York, U.S.A., in the S.E. of Long Is. It is a favourite summer resort and much frequented by artists and tourists during the season. Silverware is manuf. here. E. H. has many old churches and educational establs. Pop. 2000.

Easthampton, tn. of Hampshire co., Massachusetts, with manufs. of textiles, rubber, thread, and fireproof doors. Pop. 10,300.

East India Company, company founded for the purposes of trading with India and the E. Indies. It received its original charter at the hands of Queen Elizabeth in 1600, and this charter, at first granted for fifteen years, was subsequently granted for ever by James I. Companies for similar purposes had been already formed in the great maritime nations of Europe. It was in fact the monopoly of trade by Dutch E. I. C. which led to the foundation of the Eng. E. I. C. in the year already mentioned. The first governor of the company was Sir Thomas Smythe, and the company early estab. a trade, not only with the stations which it founded on the coasts of India, but with the Far E. as well. The early ventures (usually private ones) of the company were entirely successful, and huge profits were realised. The competition of the Eng. aroused the anger and jealousy of the Dutch and led to many quarrels between them. These culminated in the massacre of Ambogna, when the Dutch captured and ill-treated a number of Eng. traders. The indignity was never forgotten, but for the time the Eng. traders confined their attentions to the mainland of India, leaving the is. to the Dutch. The trade with India led to the building of fine merchant vessels, and the palm of mercantile shipping must be given to the E.I.C. up to the nineteenth century. During the seventeenth century the company began to spread and to gain ter. It built fortresses, raised troops, and gained general recognition, but still in quite a small way. This monopoly was interrupted by the advent of a number of interlopers who, feeling that they had equal rights with the company to trade, did so. The company appealed against the interlopers, but it was held that except by special Act of Parliament all Brit. subjects had the right to trade with India (1694). In 1698 one may say a new E. I. C. sprang into being, when by loan of £2,000,000 to the state, the company was reorganised and reinstituted. Quarrels between the rival companies continued down to the reign of Queen Anne, and the gov. only renewed privileges to the original company after obtaining large grants of money. The company still remained merely a trading concern, and its authority, as stated in the charter of Queen Elizabeth, still held good. But during the eighteenth century the rivalry of France and England extended to India,

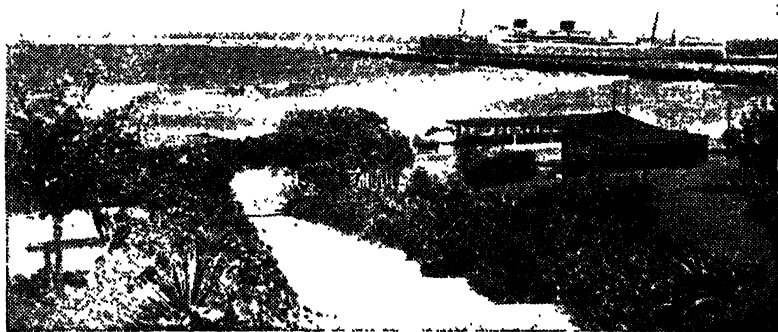

and gradually the company rose, after the victories of Clive, to the position of a ruling power. The company still held unchecked power over its servants and soldiers, until the Regulating Act, 1773, created a governor-general, appointed by the company, but approved of by the Crown. A council of four was also created together with a court of judicature. Pitt's India Bill (1784) created a Board of Control and gave the political, financial and military control into the hands of the gov. Indian policy was no longer a matter for the company but for the gov. Gradually the monopolies of the company were taken away, and the company in this way ceased to be a trading company at all, but merely an administrative body. Finally, after the disaster of the Mutiny (1857), the entire administration of India passed into the hands of the Crown (August 1858). See Florence Bowman and Ether Roper, *Traders*, 1924; W. Foster, *East India House*, 1924; C. Grey, *Merchant Venturers of London*, 1932; C. G. Fawcett, *English Factories in India*, 1936; R. H. Mottram, *Trader's Dream*, 1939; C. Lestock Reid, *Commerce and Conquest*, 1948.

East Indies is opposed in the broadest sense to W. Indies, the name given by early explorers to Is. in the Atlantic which they believed to be off the coast of India. It thus includes India and many groups of Is. in the Pacific. But the name is commonly used of the Malay Archipelago, and especially of the Dutch E. Indies (*q.v.*). This archipelago is the largest cluster of Is. in the world. It lies to the S.E. of Asia, and to the N. and N.W. of Australia, between 95° and 141° E. long., and 6° and 11° S. lat. Borneo—which is larger than the Brit. Isles—the Philippines, Java, Sumatra, and Bali must once have formed part of the Asiatic continent: the shallows about them—nowhere are the surrounding seas deeper than 250 ft.—indicate that they are summits of submerged hills. The investigations of botanists and zoologists all go to prove that the more easterly Is. are closely associated with Australia. It is a curious fact that of the two adjacent volcanic Is. of Bali and Lombok, separated by a narrow but very deep channel, Bali is entirely Asiatic in fauna and flora, Lombok markedly Australasian. In other cases the Asiatic and Australasian characteristics merge in the central Is. and only become marked in those near the continents. Tin, malachite, copper, petroleum, and precious stones are the chief source of mineral wealth. There are many volcanoes, and the soil, as might be expected, is very fertile, yielding sugar, coffee, rice, maize, tea, coconuts, plantains, and spices in plenty. The land is, however, covered, for the most part, in unexploited forest. Java, the most developed of the Is., shows what riches could be produced were they all systematically cultivated. Their natural resources are immense. Java, Sumatra, and Indonesia form part of the Indonesian Union, under the joint sovereignty of the Netherlands and the Indonesian Republic. Parts of Borneo, Timor, and New Guinea are included in the Dutch E. Indies. In 1898

the Philippines were ceded by Spain to the U.S.A. but gained their independence as a republic in 1946; Portugal holds a part of Timor; N. Borneo is a Brit. protectorate, as is Papua, the S.E. part of New Guinea. The N.E. part of that is. was formerly a Ger. possession, but now constitutes, with the Bismarck Archipelago, the Mandated Ter. of New Guinea. The native population includes Papuans or Melanesians and Malays.

East Kent Regiment, see BUFFS.

Eastlake, Sir Charles Lock (1793-1865), Eng. painter, was for some time a pupil of Haydon, a fellow Devonian. He once saw Napoleon, a captive on the *Bellerophon*, in the harbour of his native Plymouth, and later executed a fine life-sized portrait of the emperor largely from sketches made on that occasion. From 1817-30 he lived chiefly in Rome, and became R.A. in 1830. In 1850 he was president of the Royal Academy, and having been appointed director of the National Gallery in 1855, he exerted his influence towards improving the It. schools. In his best work, such as 'Christ lamenting over Jerusalem,' 1843; 'Pilgrims arriving in sight of Rome,' 1828; and 'Byron's Dream,' 1834, it is grace and finish which impress.

East Lancashire Regiment, formerly 30th and 59th regiments, linked in 1881

served in Gibraltar, West Indies, China and Afghanistan. The East Lancashire Regiment served in South African Campaign: raised seventeen battalions during First World War, which served in France, Flanders, Macedonia, Gallipoli, Egypt, and Mesopotamia. In the Second World War the regiment fought on the W. Front and in France. They were engaged in especially heavy fighting in the vicinity of Goch and other tns. in the Rhineland.

Eastland, city of Texas co., seat of E. Co. Centre of oil producing region. Pop. 5000.

Eastleigh and Bishopstoke, two tns. in Hampshire, England. The rolling stock works of the former S. Railway are here. Eastleigh is 2 m. and Bishopstoke 5 m. N.N.E. of Southampton. Pop. of Eastleigh and Bishopstoke 28,000.

East Liverpool, city of Columbiana co., Ohio, U.S.A., on the Ohio R., 44 m. W.N.W. of Pittsburgh by rail. Pottery and earthenware are its chief manufs. Pop. 23,500.

East London, seaport of S.E. Cape Province at the mouth of the Buffalo R. 543 m. by sea from Cape Town, and 253 m. from Durban, 665 m. from Johannesburg

and 1223 m. from Bulawayo. It is the prin. wool port of S. Africa, and has furniture, textile, metal-ware, and food manufs. Its pier is 1289 ft. in length with promenade deck, and the harbour has a turning basin which permits 20,000-ton liners to enter, discharge and load cargoes, and turn about. There are sev. colleges and many schools, and a fine new post office, city hall, and public library. Queen's Park is one of the largest in South Africa and the esplanade one of the finest. The beautiful scenery and excellent bathing make it a popular seaside resort. The site of E. L. was discovered in 1836 by John Baile, an Eng. settler, who reached S. Africa in 1820; and the first steps to founding a settlement there were taken in about 1847 by Capt. Wm. Baker who gave the name of Fort Glamorgan to the place. Pop. (white), 38,300, (coloured), 4,979.

East Lothian, or **Haddingtonshire**, S.E. maritime co. of Scotland, bounded by the frth of Forth and the N. Sea, and the co. of Berwick and Midlothian. Its surface is generally hilly, with the Lamermuir (1500 ft.) in the S., and the scattered peaks of Traprain Law (724 ft.), Berwick Law (612 ft.), and Tarleton Hill (590 ft.). The only important riv. is the Tyne (28 m.). Coal and iron are mined and limestone quarried in various dists., but the chief industries are agric., and the co. has been noted for the richness of its grain and green crops. Fishing is also largely followed. The chief tns. are Haddington, Dunbar, North Berwick, and Prestonpans. The area is 267 sq. m. Pop. 52,500.

East Main, former name of the portion of Labrador peninsula (Hudson Bay Ters.) bounded N. by Hudson Strait, W. by Hudson Bay, S. by Quebec. It is now the Ungava dist. of the dominion of Canada, with a scanty Indian pop.

East and West Malling, two adjoining pars. in Kent, England, in the Medway div. E. Malling is 4 m. W. of Maidstone, and W. Malling 5½ m. W.N.W. The latter has the remains of a Benedictine nunnery founded in 1090. Pop. of rural dist. 38,300.

East Moline, city of Rock Is. co., Illinois, U.S.A., on the Mississippi R., with important manufs. Pop. 12,300.

Easton: (1) Cap. of Northampton co., Pennsylvania, U.S.A., on Delaware R., above the rapids, at the confluence of Lehigh R., about 60 m. from Philadelphia. It is on various railways, and connected with New Jersey and South E. by bridges. The fine public buildings include Lafayette College (Presbyterian, 1826). There are important and various manufs., including steel, cement, slate, silk, doors, pianos, fire-escapes, furniture, pumps, dental supplies, and machinery. The bell rung to summon the people to hear the Declaration of Independence still hangs in the court house. Pop. 33,500. (2) Tn. of Bristol co., Massachusetts, U.S.A., 9 m. from Taunton. There are iron foundries and manufs. of automobiles, shovels, and wire goods. Pop. 5,100.

East Orange, city of Essex co., New

Jersey, U.S.A., adjoining Newark, 12 m. from New York, of which it forms a suburb. It has wide, well shaded streets and many attractive houses. There are electrical works and manufs. of pharmaceutical supplies. Pop. 68,900. See Whittmore, *The Founders and Builders of the Oranges*, 1896.

East Palestine, city of Columbiana co., Ohio, U.S.A., manufs. automobile tyres, china wares, etc. Pop. 5,100.

East Pittsburgh, bor. of Allegheny co., Pennsylvania, U.S.A., 12 m. S.E. of Pittsburgh. Manufs. electrical apparatus. Pop. 6000.

East Point, suburb of Atlanta, Georgia, U.S.A. Pop. 12,400.

Eastport, city and port of entry of Washington co., Maine, U.S.A., on Moose Is. in Passamaquoddy Bay. It is on the U.S. eastern frontier; Fort Sullivan defends the harbour. Fishing and lumber trade are the chief industries, and it has sardine canning establs. Pop. 3,900.

East Providence, tn. and post vil. of Providence co., Rhode Is., U.S.A., separated from Providence by the Secok (Blackstone) R., on Narragansett Bay. It is a summer resort. Oysters are shipped and there are chemical, paper, and electric works, and a bleachery. Pop. 32,100.

East Prussia, formerly the detached easternmost prov. of the Free State of Prussia, Germany, with an area in 1939 of 15,043 sq. m. and a pop. of 2,280,000. It is now divided between Russia, as part of the R.S.F.S.R. and Poland, known as Masuria. Its pre-war cap. was Königsberg, renamed Kaliningrad in 1946. Other chief tns. are Tilsit, Insterburg, Elbing (Elbląg), Braunsberg (Braniewo), Allenstein (Olsztyn), Gumbinnen Osterode, and Marienburg (Malbork). Oats, rye, potatoes and flax were the chief products and horses and cattle were bred; there was much fishing, and amber was found in some localities. A large part of E. P. is forest, moor and bog, and wolves and lynxes still survive. Unprejudiced examination does not bear out the tradition that E. P. was the home of 'Prussianism' or the *fons et origo* of Ger. militarism. It was a typical Eastern Ger. prov., with great estates rather less predominant than elsewhere, and like all Germany E. of the Elbe it was colonial land or land reconquered in the last six hundred years from the Slavs. But unlike the 'march' lands won back by secular princes, E. P. was the relic of a crusading order, the Teutonic Knights, who, in the early fifteenth century, were finally defeated by the Poles at the great battle of Tannenberg (q.v.), and their ter. reduced to the land round their two great crusading castles Marienburg and Königsberg or roughly the modern ter. of E. P. It is sometimes thought that the crusading militarism of the Teutonic Knights was the source of Ger. ruthlessness in war, but the theory has no warranty in hist. In the seventeenth century the landowners of E. P., far from manifesting a habit of militant servility, pursued a constitutional struggle with the Elector of Bran-

denburg. In the nineteenth century, far from aiding the Prussian militarists to dominate Germany, E. P. took the lead against them and the liberals of the Prussian Parliament who resisted Bismarck's unconstitutional system were largely unrepresentatives of E. Prussian rural constituencies. In fact the Ger. farmers and traders from E. P. showed the rough independence and courage which not seldom characterise a colonial people. Later the Junker landowners and liberal farmers composed their differences and united in an agrarian organisation known as the Landbund. In the nineteenth century E. P. was not notably or aggressively nationalistic in the conflict with the Poles, and in fact produced the few Ger. radicals who wanted to co-operate with the Poles in a common war of liberation against Russian Tsardom. After 1919 when W. Prussia and Pomerania were incorporated in Poland, E. P. became the isolated advanced post of Ger. nationality in E. Europe for the first time since the awakening of national consciousness, and its frontier nationalism tended to be magnified as a symbol of the national struggle, mainly by the propagandist immigrants rather than by the E. Prussians themselves. No doubt some of the Prussian military families came from E. P. but they are scattered all over Germany E. of the Elbe and few have an exclusively E. Prussian origin. Depriving Germany of E. P. or even of a great part of it spares her the strategic problem of defending an isolated prov. besides reversing a Ger. advance at Slav expense sev. centuries ago, but it involves also the difficulty of shifting a great number of Gers. to other parts of the country.

In the First World War the Russians advanced into E. P. in 1914 as far as Allenstein when Hindenburg routed them in the region of the Masurian Lakes at the Second great Battle of Tannenberg (Aug. 26-30, 1914). By the treaty of Versailles (1919) a part of E. P. was ceded to Poland. In the Second World War, the Russian armies invaded E. P. in January, 1945. Marshal Rokossovsky advancing northward against the prov. while simultaneously Gen. Tcherniakovsky attacked from the E. By Jan. 21 Tilsit, Insterburg, Allenstein, and Tannenberg had been taken and a few days later Rokossovsky's forces had advanced to the Gulf of Danzig. On April 9 the Russians took Königsberg. (See under EASTERN FRONT OR RUSSO-GERMAN CAMPAIGNS IN SECOND WORLD WAR.) After the defeat of Germany the Berlin or Potsdam Conference (July 17-Aug. 2, 1945) agreed, on the proposal of the U.S.S.R., that, pending the final determination of ter. questions at the peace settlement, the section of the W. frontier of Russia which is adjacent to the Baltic should pass from a point on the E. shore of the Bay of Danzig to the E. N. of Braunsberg-Goldap, to the meeting-point of the frontiers of Lithuania, Poland, and E. P. It was also agreed that ultimately the city of Königsberg and the area adjacent to it as described above should be transferred to Russia. The

transferred portion includes the Kurisches Haff, Gumbinnen, Tilsit and Insterburg, but excludes Elbing, Braunsberg, Allenstein, Osterode and Marienburg, all of which were included in that part of E. P. which was assigned to Poland.

E. P. has now completely lost its old identity on the map. Its N. third—including Memel and Königsberg—is now part of the R.S.F.S.R.; the rest, some 14,000 sq. m., is part of Poland, where it does not even constitute a separate prov. By 1917 some 300 collective farms had been set up in Russian E. P., and 50,000 Ukrainians settled there; cattle are bred, but only oats and potatoes are grown. The cities suffered widespread destruction, but there are some paper mills and the port of Königsberg (Kalinograd) has been largely restored as Russia's only ice-free port in the Baltic. Poland's share of E. P. consists largely of agric. land, often poor. Under German ownership before the war E. P. was maintained as a grain-growing country only with the aid of high protective tariffs and gov. subsidies. The soil is so lacking in good qualities that, even if the Poles had all the necessary fertilisers, they would not spend them on E. P. Compared with the remarkable progress of the W. part of Poland's recovered ter., the process of transforming E. P. from a Ger. into a Polish prov. is slow. On the battlefield of Tannenberg, in Polish E. P., still stand the ruins of the gigantic eight-tower Ger. memorial; around the ruins in 1947 mostly untilled fields. Many of the tns. and vlds. around here were completely destroyed in the war, and some tns. were burned down by the Russians as an act of revenge—not realising that the prov. would never again be Ger. soil. Moreover, the fighting in E. P. throughout the winter of 1944-45 was exceptionally ferocious; no country was better adapted for defence than E. P., with its large forests and its network of lakes and canals, its mills and ravines and its solid farm buildings of stone and brick. With the exception of Olsztyn, most of the larger cities and notably Marienburg and Elbing are still (1949) in ruins. In the Olsztyn area, with a pre-war pop. of 800,000, over 600,000 Poles have already been settled some being autochthonic Poles, who despite Bismarck's Germanisation policy retained their traditional characteristics. Some 10,000 are Gers. allowed to stay in E. P. on declaring loyalty to Poland. Most of the land in Polish E. P. had been brought under cultivation by mid 1918, while some of the fallow land (which totals about 20 per cent) is scheduled for afforestation. Owing to its military traditions E. P. had few industries and these few were almost all destroyed together with the tns. in which they were located. By 1948 sev. brick, china, textile, and other factories had been rebuilt. Plans have been made for a cellulose factory in the Olsztyn dist. and for dockyards in Kiblag, whose submarine plant was removed to Russia. There is much activity in the restoration of saw-mills, and special schemes are under way to utilise the large timber resources for furniture making. The large and beau-

tiful Masurian Lakes provide the best fish-breeding centres in all Poland. The roads are probably the best in Poland to-day. Almost all the bridges destroyed in the war had been repaired by 1948, and railways restored to operation. The many military barracks, which were so forbidding a feature of the pre-war prov., have been converted into schools and homes for the labouring classes. Throughout the regained ters. there are numerous traces of a former bond with Poland and the Poles. This is evident in the cathedral of Allenstein (Olsztyn) and the churches in Elblag, Malborg, and Frombork (Fravenburg). Most of the castles are in ruins but their walls still bear the names of their Polish builders or owners under Polish kings of old. The famous Gothic castle of the Teutonic Knights in Malborg is practically in ruins, together with the cathedral and the city of Malborg itself. Attempts are being made (1949) to preserve what remains of Malborg castle and of other historic buildings in E. P. In Olsztyn castle, which is undamaged, there is still to be seen the chamber where Copernicus lived and worked between 1516 and 1521, he then being canon and administrator of the dist. on behalf of his uncle, the bishop of Ermland. Some 50 m. farther N. at Frombork, a small township completely ruined by the war, is the house in which Copernicus lived and the cathedral where he was buried. Facing the gate of the cathedral is the tower 70 ft. high from which he studied astrophysics and here he wrote his *De revolutionibus orbium coelestium* on the heliocentric theory of the universe. The cathedral, an austere-looking Gothic structure, was spared in the war, but no trace of the remains of Copernicus has yet been found. See T. A. R. Marriott and Sir C. G. Robertson, *The Evolution of Prussia*, 1915; C. von Lörck, *Herrenhauser Ospreussens*, 1933; W. Franz, *Geschichte der Stadt Königsberg*, 1934; S. Srokowski, *East Prussia*, 1934; J. A. Wilder, *The Economic Decline of East Prussia*, 1937.

East River, strait connecting New York Harbour with Long Is. Sound, E. of New York City, U.S.A. It is 15 m. long, $\frac{1}{2}$ to $\frac{3}{4}$ m. wide. By its N. arm (Harlem R.) and Spuyten Duyvil Creek it is connected with the Hudson R. It separates the bors. of Manhattan and the Bronx (W. and N.) from those of Brooklyn and Queens (E. and S.). Among its is. are Blackwell's, Randall's, Ward's, and Riker's. The channel at Hell Gate (between Ward's and Long Is.) has been made navigable by blasting the rock. Brooklyn, Williamsburg, and two other suspension bridges span the E. R.

East Saginaw, see SAGINAW.

East St. Louis, city of St. Clair co., Illinois, U.S.A., on Mississippi R., opposite St. Louis, connected with it by steel bridges. It is an important railway terminus, has large stockyards, mule and horse markets, mills, railway car construction, and the manuf. of iron and steel products, food preparations, baking powder, glass, paints and refined petroleum. Pop. 75,000.

East Surrey Regiment, see SURREY REGIMENT, EAST.

Eastwood, par. and urban dist. of Nottinghamshire, England, about $8\frac{1}{2}$ m. from Nottingham, with coal mines. Pop. 5000.

East Yorkshire Regiment, see YORKSHIRE REGIMENT, EAST.

Eaton, Arthur Wentworth Hamilton (1849-1937), Canadian writer; b. in Kentville, Nova Scotia; eldest child of Wm. E., schoolmaster and school-inspector. He graduated from Harvard in 1880, entered the episcopal ministry, and was rector of St. Andrew's Church, Chestnut Hill, Massachusetts, 1885-87. He was the author of: *The Heart of the Creeds and Historical Religion in the Light of Modern Thought* (1888), *Acadian Legends and Lyrics* (1889), *Tales of a Garrison Town* (with C. L. Betts 1892), *College Requirements in English* (1900), *The Lotus of the Nile and other Poems* (1907), *The History of King's County, Nova Scotia, Heart of the Acadian Land* (1910), *The Famous Mather Byles* (1914), *The Eaton Family of Nova Scotia* (1929), and *Acadian Ballads and Lyrics in Many Moods* (1930).

Eaton, Herbert Francis, see CHEYLES-MORRE, BARON.

Eaton, Long, see LONG EATON.

Eaton, Margaret O'Neill (1796-1879), 'Peony O'Neill'; daughter of Wm. O'Neill, who kept a tavern in Washington, D.C. About 1823 she married John B. Timberlake, purser in the navy, who committed suicide in 1828 in the Mediterranean. In Jan. 1829 she married John Henry Eaton—appointed secretary of war that year. It was reported that she had had relations with Eaton while Timberlake lived. Wives of Cabinet Ministers refused to recognise her. President Jackson on this account reconstructed his Cabinet, favouring Van Buren who was friendly towards Mrs. Eaton. She was popular in Madrid society when her husband was ambas. in Spain 1836-40. Her husband dying in 1856, she next year married Antonio Buchignam, an It. aged about twenty. He squandered her money, and was separated from her.

Eaton Socon, vil. of N.E. Bedfordshire, England, on the R. Ouse 2 m. S.E. of St. Neots, Huntingdonshire. It is noted for its fourteenth-century par. church of St. Mary the Virgin, which was almost totally destroyed by fire in 1930. By 1932, the building was restored to its original form by vil. craftsmen, a remarkable re-creation of medieval Gothic, recalling the finest work of the medieval guilds. Dedicated by the bishop of St. Albans, June 25, 1932.

Eaton, Theophilus (c. 1590-1658), Eng. colonial governor, son of an Eng. clergyman. Educated in Coventry, where he formed an enduring friendship with John Davenport, the Puritan divine, through whom, later, he was influenced to settle in New England. Prior to migrating he had a successful mercantile career under the East Land Company who made him their 'deputy governor' or representative in N. Europe. Following the religious

persecutions in England, he accompanied Davenport to Holland and thence went to America and interested himself in settlement. He became governor of New Haven, and was active in procuring the charter for Massachusetts in 1629. His administration was, however, embittered by the disputes between Eng. and Dutch colonists.

Eau Claire, city of N.W. Wisconsin, co. seat of Eau Claire co., with many manufs. including paper mills, a state teachers' college, tuberculosis hospital, hospital for the insane, and a municipal auditorium seating 2000: 300 acs. of parks, with boating and fishing. Pop. 30,700.

Eau Cr  le, a fine Fr. liqueur made in Martinique by distilling the flowers of the W. Indian wild apricot or mannee apple (*Mammea Americana*) with pure spirit of wine.

Eau de Cologne, celebrated perfume, probably invented by Johann Maria Farina (1685-1766), who came from N. Italy and settled in Cologne (1709). Some forty firms at Cologne bearing the name of Farina claim to possess the original recipe for its manuf. The main ingredients are pure distilled alcohol and various essential aromatic oils (neroli, orange, rosemary, citron, bergamot), so blended as to yield a refreshing odour. It relieves headaches, and is very occasionally taken as a stimulant.

Eau de Javelle, one of the earliest bleaching solutions obtained, so called because first made at Javelle, near Paris. It is a poisonous solution of hypochlorite of potash, used as an antiseptic and to remove stains from muslin, linen, and white marble. It is usually adulterated with bicarbonate of potash.

Eaux-Bonnes, health resort of Basses-Pyr  nes, France, about 3 m. from Laruns. There are seven warm medicinal springs used for drinking, especially in cases of diseases of the respiratory organs and rheumatism. It was a favourite resort of the Empress Eug  nie. Pop. 450.

Eaux-Chaudes, or **Aigues-Chaudes**, com. and watering-place of Basses-Pyr  nes, France, 3 m. from Eaux-Bonnes. It is in the gorge of the Gave d'Ossau, at the foot of the Pic du Midi d'Ossau (about 9500 ft.). Its warm sulphur springs are much used for bathing. Pop. 220.

Eavesdrip, or **Eavesdropping**, literally the dripping of water from the eaves of a building. The term is chiefly used in connection with the A.-S. custom preventing any one from erecting a house at the extremity of his estate, lest the eavesdrip should injure his neighbour's land. This custom corresponded to the *stillicidium* or urban servitude of the Romans. The right to permit rain-water to fall from one's roof upon a neighbour's ground is in the nature of an easement (*q.v.*). In a derivative sense, eavesdropping means loitering about to overhear private matter with intent to repeat it.

Ebbesfleet, hamlet on the I. of Thanet, Kent, England, about   m. from Pegwell Bay. The Saxons are supposed to have landed here under Hengist in 449. It was also the landing-place of St. Augustine (597).

Ebbw Vale, urban dist. in the co. of Monmouth, England, containing the works and collieries of the E. V. Steel, Iron and Coal Co., with a pop. of 31,700.

Ebeling, **Christopher Daniel** (1741-1817), Ger. man of letters, was prof. of hist. and Gr. at the gymnasium of Hamburg and chief librarian in that city for over twenty years. He lavished his best years on a voluminous *Geography and History of the United States of North America* (1777), a work which earned for him the public thanks of Congress.

Ebenaceae, a natural order of tropical Dicotyledons, consisting of about 300 trees and shrubs. The inflorescence is solitary or cymose, and the flowers are usually dioecious.

Ebenezer (Heb., stone of help), name of the monument which Samuel raised to God after the victory of the Israelites over the Philistines (see 1 Sam. vii. 12). The site is not exactly known, but is thought to be near modern Deir Aban.

Eberhard I. im Bart (1445-96), Duke of W  rttemberg, succeeded his elder brother, Louis II. duke of W  rttemberg-Urach, in 1457. He lived a careless, dissolute life till 1468, when he went on a pilgrimage to Rome, and on his return proved himself to be a capable ruler. In 1482, by the treaty of M  nsingen, he brought about the reunion of Stuttgart and Urach, and granted to W  rttemberg its first constitution in 1492. He was raised to the rank of duke by Maximilian I. in 1495. He founded the Univ. of T  bingen (1476), and was a patron of scholars. See lives by W. Zimmermann, 1832, and A. Bosserst, 1884.

Eberhard, **Christian August Gottlob** (1769-1845), Ger. writer, who is now only remembered by his *Hannchen und die K  chlein* (1822), a long narrative poem, and *Der Erste Mensch und die Erde* (1828), an epic poem on the Creation written in hexameters.

Eberhard, **Johann Augustus** (1739-1809), Ger. philosophical and theological writer, b. at Halberstadt. His first work, *Neue Apologie des Sokrates* (1772), advocated a broader theological outlook towards those who have not accepted the tenets of Christianity. His prin. works are: *Amyntor, eine Geschichte in Briefen* (1782); *Versuch einer allgemeinen Deutschen Synonymik* (1795-1802); and *Handbuch der   sthetik* (1803-05). See study by F. Nicolai, 1810.

Ebers, **Georg Moritz** (1837-98), Ger. Egyptologist and novelist, b. in Berlin. He became lecturer of Egyptian at Jena (1865), and prof. at Leipzig (1870). The famous Papyrus Ebers, which he discovered during his travels, was pub. in 1874. He also wrote *  gypten und die B  cher Moses* (1868), and *  gypten in Wort und Bild*, a descriptive work (1878). In 1876 he resigned his professorship through ill-health, and began a series of instructive historical novels with the object of popularising Egyptian lore. The chief of these are: *Uarda* (1877), *Der Kaiser* (1881), *Serapis* (1885), and *Kleopatra* (1894). Many of his tales have been trans. into Eng. His *Gesammelte Werke* were pub. in 25 vols.

(1893-95). See his *Die Geschichte meines Lebens*, 1893, and a study by R. Gosche, 1887.

Ebersbach, tn. in Saxony, Germany, 14 m. S.S.W. of Bautzen, with one of the finest organs in Saxony. Pop. 9500.

Eberwalde, tn. of Germany, 28 m. N.E. of Berlin, has a fourteenth-century church, remains of tn. walls, school of forestry, iron foundries, rope works, etc. In 1913 one of the largest treasures of prehistoric gold objects in Germany was discovered here (1050-850 B.C.) and presented to the state museum for pre-hist. at Berlin. Pop. 30,000.

Ebert, Friedrich (1871-1925), first president of the Ger. republic; b. at Heidelberg; son of a poor Catholic tailor. He was apprenticed to a saddler in his native city at the age of fourteen. He became a travelling journeyman saddler, and helped to found a saddlers' union. Married and settled in Bremen. In 1894 he became editor of the Bremen *Bürgerzeitung*, a socialist paper which he gave up to become secretary of the Bremen branch of the party. For a while he kept an inn. He unsuccessfully contested the Hanover dist., 1905. In 1912 he was elected for Eberfeld-Barmen—a seat his party had lost in 1907, and in the following year was elected president of the party in succession to Bebel. He supported the gov.'s demand for war-credits in 1914, in view of the Russian danger. He was at the Socialist Peace Conference at Stockholm, 1917. When the overthrow of Kaiserism was seen to be inevitable in 1918, and when Prince Max of Baden called in the Socialists to share the gov., E. was in favour of a limited monarchy. When Scheidemann had proclaimed the republic, Prince Max commissioned E., as chancellor, to form a gov. He was violently attacked by minority Socialists for insisting on constitutional procedure; and in Jan. 1919 he made a display of force against them in Berlin. On Feb. 10 the National Assembly at Weimar made him President. He reaffirmed his socialism—which, in his case, was coupled with agnosticism. After the Kapp 'putsch' had been defeated, E. put forward, in June 1920, a request that the presidency should be regulated according to the Constitution, which required popular election. He renewed this request in 1921; but the Reichstag passed a resolution permitting him to retain office till 1925. He was much overworked, and died in West Charlottenburg sanatorium, Feb. 28, 1925. He was of very striking appearance—not much above middle height, stout, bull-necked, with prominent eyes and angular eyebrows; an impetuous speaker, yet always trying to follow the rule of common-sense.

Ebert, John Arnold (1728-95), Ger. poet. As a translator, whether the work were Young's *Night Thoughts* or Gk. epigrams, he was eminently successful, but in his own poetry his deficiency in original force is at once apparent. His compositions include drinking songs, lyrics, epistles, and some much-admired epigrams. A representative of the school of Saxe, he

faintly recalls Horace and Anacreon in his pictures of rural scenes and praise of simple pleasures.

Ebingen, tn. of Württemberg, Germany, on the Schmiecha, a trib. of the Danube, 21 m. S. of Tübingen, with textile manufs. Pop. 14,200.

Eblonites (Heb. *ebion*, poor man), name probably applied at first to all Christians, later used particularly of an ultra-Jewish party who, though Christians, remained outside the Catholic Church. Their gospel was a form of that known as the Gospel according to the Hebs.; they strictly adhered to all the customs and ordinances of Mosaic law, thus regarding Paul as an apostate whose epistles they rejected; and some of them did not believe in the miraculous birth of Jesus Christ. The chief authorities as to their early history are Irenaeus, Hippolytus, Origen, and Justin. Those who lived E. of the Jordan held Essene doctrines, which gave rise to the 'Clementine' literature.

Eblis, or *Iblis*, of Muslim demonology, a fallen angel (*Azazil*), who attained the characteristics of the devil, and became chief of the Jinn.

Eboli (*Evoli*), tn. in the Campagna dist., Italy, 13 m. from Salerno, with a commanding view over land and sea. Has an ant. castle of the Princes of Angri, and between the tn. and the Sele riv. are the ruins of the ant. *Eburi*. A fine Roman bridge spans the riv. The tn., together with the Battipaglia, suffered much damage during the Salerno landings of 1943. The roof of the nave of the Church of St. Francis of Assisi collapsed; and the Church of San Giovanni dei Greci was destroyed. Pop. 20,000.

Ebonite, see RUBBER.

Ebony (Gk. *ἔβνος*, Lat. *ebenum*), an extremely hard wood of various species of the genus *Diospyros* (order Ebenaceae), the genus of the Date Plum and allied genera. The best quality is deep black in colour, consists of heart wood only, and is very durable. It is yielded by *D. Ebenum*, a tree that flourishes in S. India and Ceylon. Various kinds of E. are procured from *D. tomentosa* in Bengal, *Brya ebenus* in the W. Indies, *D. dendo* in Angola, and *Dalbergia melanocorylon* in Senegal.

Ebony Heart, tree of Queensland, Australia. The *Elaeagnus laurosticta*, belonging to the order Tiliaceae, gives a hard enduring wood, somewhat like lignum vitae and used for much the same purposes. Yields a fruit resembling a plum, which is used for food.

Ebra, see EVORA.

Eboracum, see YORK.

Ebrides, see HEBRIDES.

Ebro (Lat. *Hiberus*), riv. of Spain which rises at Fuentibre in the prov. of Santander and flows into the Mediterranean Sea. Its chief tribs. are the Ega, Aragon, Gallego, and Segre on the l. b., and the Jalon, Martin, Guadalupe, and Matarrifa on the r. b. The prin. cities on its banks are Logroño, Calahorra, Tudela, Saragossa, Mora, and Tortosa. It is navigable for small vessels from Logroño, but navigation is difficult, for the riv. is

blocked with sand and its course obstructed by many rapids. Length, 470 m.; area of basin, 32,000 sq. m.

Ebsambui, *see* IPSAMBUL.

Ebullition (boiling of fluids), *see* under FLUID.

Eburi, *see* EBOLI.

Ecbatana, or Agbatana (Heb. *Ach-melha*), cap. of anct. Media, founded according to Herodotus by Darius (about 700 B.C.). It was captured by Cyrus (549 B.C.), and became the seat of gov. and the favourite summer residence of Persian and Parthian kings. It was surrounded by seven walls, within which lay the royal castle, built of cedar and cypress wood, covered with gold and silver. The city was plundered by Alexander the Great and Seleucus I. The modern Hamadan is built on its site.

diseases of the blood and blood-vessels. A fresh E. has the appearance of a group of pin-pricks.

Ecclefechan, vil. of Dumfriesshire, Scotland, 5 m. N. of Annan. Thomas Carlyle, who was born and buried here, introduces it into *Sartor Resartus* under the name 'Entepfuhl.' Pop. 610.

Eccles, municipal bor. of Lancashire, England, and a suburb of Manchester. It was incorporated in 1892. There are engineering works, cotton mills, and manufs. of ginghams and fustian goods. E. cakes take their name from the neighbourhood, where they are largely made. Pop. 45,000.

Ecclesfield, civil and eccles. par. partly included in the bor. of Sheffield, England. There are large collieries and iron and steel works, and manufs. of cutlery and

THE EBRO AT LOGROÑO

Ecce Homo (Lat., 'Behold the Man'), the title given to pictures representing Christ crowned with thorns. One, by Correggio, hangs in the National Gallery, London, and one of the best known of such pictures is a Titian of 1543, belonging to the Imperial Gallery at Vienna.

Eccentric, a contrivance for taking an alternating rectilinear motion from a revolving shaft, and consists of a disc connected eccentrically with regard to the shaft, which in rotating carries the disc with it in a circular movement, thereby actuating a connecting rod and giving it a regular to and fro motion. The distance between the centre of the shaft and that of the disc is called the 'throw,' and is one half of the resultant rectilinear motion.

Eccentric Club, social club (founded in 1890), 11 Ryder St., London, S.W. 1. Drama and the arts are discussed especially.

Eccentricity, *see* under CONIC SECTIONS.

Echymosis, or Bruise, a discoloration of the surface of the skin, caused by an effusion of blood below. It occurs as a result from a blow or violence of some kind, but sometimes it is met with in

nails. Pop. of civil par. 22,944, of eccles. 6000.

Ecclesia (Gk. *ἐκκλησία*, from *ἐκ*, out, and *καλεῖν*, to call), the name given to the general assembly of all freemen of the state in Athens. After the reforms of Cleisthenes, it was known as the E. when it met for political purposes, and 'Hellas' when it had judicial business in hand. It is not thought that the E. had any definite form before the time of Solon, though some such institution was doubtless in existence. The reforms of Solon are not known exactly, but there is no doubt as to their general effect, which was to give the Thetes, the lowest class, a voice in the E., and the power of criticising and exercising some check over the actions of the Eupatrids, the governing class. All citizens of Athens over eighteen years of age were eligible to appear in the E., save those who had for any reason suffered loss of civil rights. The meetings were of three kinds, ordinary, extraordinary, and those convened by special messengers; the last were held only when the attendance of the country members was desired. The proceedings were opened by various religious formalities, and if the omens were unpropitious, or the weather was bad, no

meeting was held. The voting was as a rule by show of hands, or, on special occasions by ballot. The practice of payment for attendance was instituted some time in the fourth century B.C. The E. was the sovereign power in Athens throughout the time of her greatness, though being an untrained body it could not initiate laws; this was done by a committee of the Boule (*q.v.*). In 308 B.C. Demetrius of Phalerum curtailed the power of the E. by instituting Guardians, who could prevent it from voting on an illegal motion. As a governing body the E. perished when Athens became a *civitas libera* of Rome.

Ecclesiastes ('the Preacher'). This is one of the O.T. books (Heb. *qobeleth*), the fourth of the five Megilloth in the ordinary Heb. Bible. The Gk. title, from which the Eng. is derived, means 'a member of assembly'; the Heb. has occasioned some discussion, as it only appears in this book, and seems to mean the 'herald' who summons an assembly. On the whole, Luther's trans., followed by the Eng. version, is fairly satisfactory, the purpose of the book is hortatory, and the form of the word implies an assembly; the trans. *der Prediger* ('the Preacher') combines the two ideas.

Scope and contents.—A similar literary form was adopted by Browning in *The Ring and the Book*, a monologue which conceals a real dialogue. In matter it is the narrative of a series of speculations and spiritual experiments of the 'highest good.' It is proved that if the individual makes it his aim to attain merely and solely his own personal happiness, whatever the sphere be in which he makes the attempt, the result is 'Vanity of vanities, all is vanity.' The epilogue is the necessary conclusion of the whole matter. 'Fear God and keep his commandments, for this is the whole duty of man'; not pleasure, but duty, is man to make his purpose of life.

Language.—The Heb. of E. is unlike that of any other portion of the O.T. No other book has so large a proportion of words, phrases, and senses of words peculiar to itself. In its vocabulary and many of its constructions, it is related to the 'Mishna.' We need only remark on the preference for the short relative, the rare use of the 'vav,' 'conversive,' and avoidance of the sign of the accusative. At the same time it must be observed that most of the linguistic peculiarities have analogues in classic Heb.

Date and Authorship.—No one without violence to facts can maintain the Solomonic authorship. The author assumes the name of Solomon as Browning speaks as 'Abt Vogler' of 'Fra Lippo Lippi.'

Canonicity.—It formed part of the Alexandrian Canon when the younger Strabon went to Egypt. In the time of Josephus it was in the Canon of Judea. The Talmudic stories about the Council at Jabne are of historic value.

Versions.—The LXX. is slavishly close to the Heb. The Peshitta is much freer. The Targum is very diffuse, but supplies

the Jewish interpretation which is very interesting. The Vulgate is fairly accurate.

Commentaries.—The full list up to 1860 is given in Ginsburg's *Cohleth*. Since then there have been commentaries by W. Wright (1865), O. Zockler (1881), and G. Barton (1908).

Ecclesiastical Commissioners, body appointed in 1835 as a perpetual corporation to examine into the temporal affairs of the Church of England. They made five reports, recommending alterations in the number of bishoprics, and the appropriation of part of the revenues of charters and collegiate bodies to parochial purposes. Some of their recommendations have been adopted since that time. E. C. were also appointed for Ireland to receive and apply the incomes of the suppressed bishoprics in that kingdom under an Act passed in 1833. The E. C. are composed of certain bishops and other church dignitaries, together with certain laymen. They exist now to administer church property, to create new ecclesiastical parishes, and to sanction repairs and improvements in churches or church buildings. When an incumbent dies or resigns they are the body to settle any questions of dilapidations that may arise. One of the chief aspects of their general power of administering church property lies in the direction of enhancing the value of the smaller livings so as to provide the worst paid clergy with more substantial incomes. In this work they have been assisted by the efforts of other societies, lay and clerical, and by the organisation of funds outside, like the 'Bishop of London's Fund.' A scheme for the administration of a pension fund for facilitating the retirement of aged or infirm clergy holding poor benefices was framed in 1907 and enlarged in 1915.

Ecclesiastical Courts are courts in which the canon law is administered and causes ecclesiastical determined. Formerly those courts had a wide criminal and civil jurisdiction over laymen as well as clergymen, embracing among civil matters divorce, probate, and suits for tithes, and among criminal, blasphemy (*q.v.*), apostasy from Christianity, and brawling within the precincts of a church. Gradually the common law courts have usurped almost the whole of this jurisdiction so far as laymen are concerned, while as to clergymen, the jurisdiction of a more purely civil and temporal character exists only to provide spiritual sanctions in the shape of suspension or deprivation. Their jurisdiction in practice, if not in theory, is for the most part over purely spiritual causes, *i.e.* in matters of church discipline and the correction of offences of a spiritual kind. The principal E. C. are: (1) The Bishops' Consistory Court, presided over by the bishop's chancellor (*q.v.*), which can try clergy for uncleanness and wickedness of life, but not for doctrinal offences. Some authorities believe it can still try laymen guilty of heresy or incest. Since the passing of the Incest Act, 1908, made the offence of incest a crime cognisable by the ordinary courts, it may be assumed that

jurisdiction of the consistory courts over laymen is obsolete, although theoretically it can punish laymen by refusing them the Sacrament and prohibiting them from entering a church for such offences as the above, and for brawling. In exercising quasi-criminal jurisdiction the chancellor is assisted by five assessors who act as judges of fact. (See also *CLEGGY DISCIPLINE ACT*, 1892.) The bishop can veto the prosecution of a clergyman for uncleanness and wickedness of life; the civil jurisdiction of the court relates principally to the grant of faculties for alterations in churches, questions of repairs to church fabric, and with disputed rights to pews. (2) The Court of Arches, presided over by the Dean of Arches. This court hears ecclesiastical appeals from the consistory courts of the bishops of the prov. of Canterbury, and has jurisdiction over the thirteen peculiar par. in the diocese of London. It also has the transferred jurisdiction of the old Provincial Court of the Archbishop of Canterbury. The court tries also doctrinal offences and practices under the Public Worship Regulation Act, 1874. (3) The Provincial Court of the prov. of York, which hears appeals from the consistory courts in the diocese. (4) The Court of the Archbishop, presided over by the archbishop or his vicar-general, which has jurisdiction to try bishops for eccles. offences. The Court of the Bishop sitting in person, the Provincial Court of the Archbishop of Canterbury, and the Court of the Archdeacon are obsolete. The judicial committee of the Privy Council is the supreme court of appeal in all eccles. matters.

Ecclesiastical Dilapidations, in Eng. law, comes under the heading of waste. In England the incumbent of a benefice is compelled to keep his residence and its outhouses in a proper state of repair, i.e. free from dilapidations. If he be rector he is further obliged to take charge of the fabric of the chancel, though he is not compelled to supply the ornaments or painting thereof. The holder of a benefice who fails to fulfil these obligations is liable for an action for dilapidations to be instituted by his successor, the money so recovered being applied to the repairs. On entering a benefice where the parsonage house, etc., are dilapidated, the new incumbent must carry out all repairs under the instruction of the bishop, issued on receipt of a complaint from the archdeacon, rural dean, or patron of the benefice. Each diocese has a surveyor of dilapidations, who reports on the condition of church property. In Scotland the heritors are under the obligation to repair manse, except in the case of 'free manse'.

Ecclesiastical Law, law administered by the eccles. courts (*q.v.*), the principles of which are derived mainly from the canon law and civil law (*q.v.*). In England E. L. never gained that ascendancy over the municipal law of the state which characterised countries where the traditions of the Holy Rom. empire were so deep-rooted as to subordinate the state to the papal see. The revival of the study of

Rom. law, or the new learning as it is called, in the eleventh century, at the time Irnerius lectured at Bologna, had no permanent effect on England; it found a small, homogeneous, well-conquered, much governed kingdom, a strong legislative kingship. It taught us much, and then there was healthy resistance to foreign dogma' (Professor Maitland). The assimilation in part of the principles of canon and civil law may be said to have been due to the fear of the Church that the revival of learning in the eleventh century would crush the monarchy of theology over the intellectual world; and the Church to save itself vivified its teaching in law much in the same manner as the fathers imported some of the philosophy of Aristotle into the Bible. E. L. in England was always useful in overcoming the inelasticity of the common law, the principles of which for centuries allowed of no testamentary disposition of lands, and at a time when personal property was of little importance. E. L. governed also wills of personality, through the jurisdiction of the lord-ordinary. E. L. also prevailed in all kinds of matrimonial causes. But although many of the principles of E. L. are still retained in probate, divorce, and matrimonial causes, the jurisdiction of the ecclesiastical courts in these matters has passed to the High Court. See also **ECCLESIASTICAL COURTS**.

Ecclesiastical Titles Act, Act passed in 1851 to prohibit the assumption by any unauthorised person of a title from any place in the United Kingdom, whether or not such place were the seat of an archbishopric, bishopric, or deanery, and declaring null and void all acts done by them, or gifts made to them under such titles. The Act was the legislative expression of the hatred of papistry, which was so rife during that period. The immediate cause of the Act was the Oxford Movement led by the celebrated Mr. (afterwards Cardinal) Newman, whose followers, the so-called Tractarians, endeavoured to prove that the doctrines of the Church of England were essentially similar to those prevalent in the primitive Catholic Church. The people, as a whole, took this revival of religious energy to be no more than a reconciliation with Rome, and the prevalent excitement consequent on the secessions from the Estab. Church to the Church of Rome led to Lord John Russell securing the passing of the E.T.A., which, however, through the weakness of its provisions, remained nugatory. It was repealed in 1867. In this connection we may note that the Statute Book still contains an Act passed in 1829 which prohibits the assumption by any persons other than the person authorised by law, of the name, style, or title of an archbishop, bishop, or dean of the Church of England.

Ecclesiasticus ('the wisdom of Jesus, the Son of Sirach'), the church book, an apocryphal (deuterocanonical) work to which this name was given by the Rom. Church. The Gk. name is 'the wisdom of Jesus, Son of Sirach,' or, more briefly, 'wisdom of Sirach.' The original name

is said to have been 'Proverbs' in Heb., though it was known to the Rabbis under the name 'Book of Ben Sira'. The original was in late Heb., and only a few verses are preserved by the Jewish oral tradition in a very mutilated condition. But if its prologue may be trusted, the Gk. trans. was made by a descendant of the author and, it is thought, from an autograph copy. This is the only case in Biblical literature in which the family tradition of a book has been preserved.

Authorship.—The statement of the translator fixes the date of the author approximately as being in the third century B.C. Josephus makes mention of it, but he can never be taken with safety as a guide to historical facts, and a date about 200 B.C. is generally accepted as the date of this work.

Contents.—The Book of Ben Sira is upon much the same lines as the Biblical Books of Psalms, Proverbs, and Ecclesiastes, and as such contains hymns, prayers, rules of conduct, and speculations on a variety of subjects. It would seem that the book was at first intended for the author's family, as the precepts are often addressed 'my son, my children.'

Relation to canonical books.—The author appears to have a thorough knowledge of the O.T. books, and quotes very freely from them; and although he omits the names of Daniel, Ezra, and Esther from his list of Heb. heroes, some of his phrases seem to be taken from the Book of Daniel. He appears to have been unacquainted with the Chronicles.

Language and style.—Late Heb., with the rabbinical terminology well developed.

History of the text.—Josephus's silence about the work is attributed to the supposed antipathy of the author to the Maccoean and Herodian dynasties. The original text existed as late as the fourth century A.D., because Jerome claims to have seen it. It is supposed to have been destroyed by the Jews owing to the similarity of the sayings of Jesus of Sirach and Jesus of Nazareth. Many attempts have been made to restore the original, but up till now none have been successful.

Ecclesiology, the science and study of church archaeology, architecture, and decoration. It also comprises church hist., as revealed by these.

Eccremocarpus, a genus of Bignoniaceæ, contains three species of handsome Peruvian plants. *E. scaber* is climbing and half-shrubby in habit; it grows in thickets and hedges of its native country, and will live in the open air in the milder parts of England.

Echegaray y Elizaguirre José (1832-1916), Sp. politician and dramatist. In 1858 he became a prof. of mathematics and pub. sev. valuable scientific works. It was not till he was forty years of age that he turned his attention to the writing of dramas and comedies. His works, which were issued under the *nom de plume* of Jorge Hayaseca, satirise the vices of society, and were very popular. Among his works may be mentioned: *La Esposa del vengador* (1874), *En el pilar y en la cruz* (1878), *Muerte en los labros* (1880), *Dos*

Fanatismos (1887), *Mariana* (1892), and *El loco Dios* (1900).

Echelon (Fr., ladder), military term used of a regiment, the formation of whose troops resembles a ladder; that is, the diva. march in parallel lines, not exactly behind each other, but each to the right or left, of the preceding one.

Echidna, or Spiny Ant-eater, name given to two species of mammals in the order Monotremata; these are *Echidna aculeata*, or common E., and *Proechidna bruijnii*, or three-toed E. The former, which has five toes on each foot, all clawed, inhabits Australia, Tasmania, and New Guinea, while the latter is found only in N.W. New Guinea. Both are fossorial and mainly nocturnal animals, frequenting rocky dists. and subsisting chiefly on ants. The upper surface of the head and body is covered with a mixture of stiff hairs and short thick spines. It has a long, slender, beak-like snout, with the elongated, cylindrical tongue common to all ant-eaters. The E., and the Duck-billed Platypus (*Ornithorhynchus*), which together constitute the Monotremata, are unique amongst mammals in their mode of reproduction, by the laying of eggs.

Echinidæ or Echinoidæ (Gk. *ἐχίνος*, hedgehog), the sea-urchins, form a class of Echinodermata (q.v.) which also includes the star-fish and sea-cucumbers. They live off rocky coasts and move by means of their spines and their tube-feet. The spines also serve as organs of protection, and some sea-urchins have a poison-gland attached. Some species cover themselves with bits of rock and seaweed, and so move about unobserved; others bore their way into holes and remain there. The common *Strongylocentrotus* is a boring urchin, and when the waves wash into the hole it sets its spines against the rock and retains a rigid position. *Echinocardium*, the shield urchin, *Brissonia*, the heart urchin, and *Diadema*, which is said to be covered with compound eyes, are other well-known genera. The hollow external skeletons of *Echinus miliaris* are often to be found on the seashore; *Echinus esculentus* is an edible species. Palæo-Echinoidæ, the fossil forms, appear in the Lower Silurian rocks.

Echinocactus, genus of Cactaceæ, contains about two hundred species, most of which are natives of Mexico and the W. Indies, but a few occur in Brazil. Many of the flowers are large and conspicuous for their beauty.

Echinococcus, name given to certain Cestoda in the cystic or bladderworm stage. *E. polymorphus*, or *E. velerinorum*, is found in sheep, in domestic animals, and occasionally in man; in its mature or tapeworm stage it infests dogs. The bladder, which is known as a hydatid cyst, occurs in the liver, brain and other places; it may reach the size of a football and calls for surgical intervention. See CESTODA, TAPEWORM HYDATID DISEASE, and BLADDERWORM.

Echinococcus Disease, see HYDATID DISEASE.

Echinodermata (Gk. *ἐχίνος*, hedgehog, and *δέρμα*, skin), name given to the great

branch of invertebrate animals which includes Holothuroidea, the sea-cucumbers; Echinoidea, the sea-urchins; and Asteroidea; the star-fishes, etc. They are exclusively marine, and feed chiefly on small animals; their main characteristic is the water-vascular system, which is connected with the tube feet, and provides the means of progression and respiration. Many of the E. have the power of casting off and regenerating different parts of their bodies. The Echinoidea are predominantly globular, but a few are discoid. The body is enclosed in a shell of polygonal plates, accurately arranged in double rows, and covered with knobs or spines, and small stalked outgrowths, pedicellariae, some provided with 2, others with 3, blades, between which they seize any foreign particles or small animals and remove them, so keeping the shell clean. There is a complicated masticating apparatus, formed by the 3 teeth and 15 other pieces, and known as Aristotle's lantern. The animals move generally with the

and are mostly fixed to the sea-bottom, or rock surface, by a jointed stalk; they are also very common as fossils. The feather-star swims by movements of its 'arms' and alights by means of small leg-like outgrowths on them. Most E. lay small eggs in the sea, and these develop into larvae of various types. E. in the colder seas retain the eggs in the body-cavity, or swallow them and keep them in the stomach until they develop. In a few cases, after their release, the young are protected by the mother, and lie in depressions or among the spines on her body. The Blastoida and Cystidea, extinct classes of E. are found in the Lower and Upper Silurian and some Cystides in the Cambrian rocks.

Echinolampas, generic name of certain species of echinoderms in the family Cassidulidae. They are heart-urchins, with the anus on the under-surface.

Echinophora, genus of umbelliferous plants, is to be found in the Mediterranean. *E. spinosa*, the sea-parsnip, is an inhab. of sandy sea-shores, and has pinnate spinose leaves.

Echinorhynchus, name given to a genus of parasitic worms belonging to the Nematoda, and grouped under a special class, Acanthocephala.

Echinus, see SEA-URCHINS.

Echites, name of a genus of Apocynaceae. The species are bushy plants with large and brilliantly coloured flowers, and came originally from India.

Echium (botany), see VIPER'S BUGLOSS. **Echmiadsin**, meaning in Armenian, 'the only begotten Son came down.' A celebrated monastery in the Armenian S.S.R. Since 1441 the seat of the Armenian 'Catholicos' and the religious centre of the Armenian Church. The monastery consists of three walled enclosures, each with a cathedral. The oldest is the principal cathedral, dating from the year 305; the most famous from an architectural point of view is that of St. Ripsimi, built in 518. Near by is an archeological and ethnographic museum. A motor road leads to Erivan. E. was long under Persian rule, but was ceded to Russia in 1828.

Echo, in Gk. mythology, was a nymph who repelled the advances of Pan; the god, in revenge, caused the shepherds to tear her to pieces till only her voice remained. Another version, related by Ovid, is that E. was a nymph whom Zeus employed to talk to Hera in order to prevent her from discovering his amours. Hera, discovering the ruse, changed E. into a person who could only repeat the last words of somebody else's speech. E. then fell in love with Narcissus, and pined away in despair till only her voice remained.

Echo, imitative sound produced by the waves of sound when reflected from something denser than the aerial medium. Sound obeys the same laws as light, and is reflected at the same angle as it strikes the reflecting object. Since the velocity of sound is 1125 ft. per second, an observer situated at a distance of 562 ft. from a reflecting surface at right angles would hear the E. in one second, and would hear

ECHINODERMATA

Left, Asteroidea. Right, Holothurian.

mouth directed towards the ground. There are two orders: 1. Paleoechinoidea, comprised solely of extinct and fossil forms, the oldest members being found in the Upper Cambrian. 2. Euechinoidea, including all living and some extinct species. The Asteroidea is typified by *Asterias rubens*, the common five-rayed starfish, whose native haunt is the floor of the ocean at great depth, but which is often seen in shore pools at low tide. Allied to this class are the Ophiuroidea, or brittle-stars, whose arms, however, branch out more abruptly from the central part. Like the Echinoidea, the Asteroidea have outgrowths of spines and pedicellariae. At the end of each arm there is a bright red spot, the 'eye,' which is sensitive to light. Starfishes feed on bivalves, flattening the tube feet on the two halves of the shell and then widening the arms of the star so that a steady pull on the muscles is exerted. The water-vascular system communicates with the exterior by a short canal, the stone canal, and an opening, the madreporite, which in Echinoidea and Asteroidea is represented by a porous plate. The Holothurians differ at first sight from other E., as they have a plump, cylindrical body and a soft, leathery skin, in which is embedded a series of calcareous plates. Holothurians are generally sedentary. They live on the sea floor, and can crawl by means of their tube feet. These are not developed in species which burrow in the mud. The Crinoidea, featherstars or sea-lilies, grow together in great masses,

as many words as would last for that space of time. Various natural peculiarities of configuration have made the Es. in many different parts of the world famous.

The modern 'Echo sounder' is a machine which records electric impulses 'bounced' off the sea-bed. It is now in use by the Hydrographic Dept. of the Admiralty in recharting the oceans.

Echo de Paris, a daily newspaper of Paris. It was founded in the year 1884 by Aurelian School. The paper was managed with skill, and numbered among its contributors many men of versatility, wit, and talent. At the time of the Dreyfus affair it was noteworthy as espousing the cause of the army. Among the best known of its editors have been Jules Lemaitre and Quesnay de Beaurepaire.

Echowe, see **ESHOWE**.

Echternach, tn. of the Grand Duchy of Luxemburg. It stands on the R. Sure, about 20 m. N.E. of the city of Luxemburg. The inhabs. are chiefly engaged in the manuf. of damask, linen, porcelain. It is famous for the ann. procession on Whit-Tuesday, in gratitude for the ending of the penitential dance mania which raged in this neighbourhood in the eighth century. There is a famous abbey here, founded by the A.-S. Willibrord, Bishop of Utrecht, and a thirteenth-century par. church. E. was the southern point of von Rundstedt's desperate counter-offensive in the Ardennes (Dec. 1944-Jan. 1945). By the time the Ger. drive was halted the enemy had breached a 45-mile gap in the Amer. lines from E. to Monschau. (See also **WESTERN FRONT IN SECOND WORLD WAR**.) Pop. 3500.

Echuca, tn. of Victoria, Australia, situated on the Campaspe and Murray rvs., 156 m. N. of Melbourne. A bridge 1905 ft. long connects E. with Moama on the New S. Wales side of the Murray. It trades in wool, wine, red-gum, timber, etc. Pop. 4000.

Eclja, or **Ezija**, tn. of Spain, in the prov. of Seville. It is situated on the l. b. of the R. Genil, or Jenil, a trib. of the Guadalquivir. The dist. is extremely fertile, and the corn crops are good. Fruit is also cultivated, and wine is one of the chief products. A small amount of cotton is also grown. The manufs. are woollens, flannel, silk, linen, leather, and shoes. The climate is very hot, and this has earned for the tn. the nickname of the 'frying pan of Andalusia.' Pop. 30,000.

Eck, or **Egg**, **Johann Maler von** (1486-1513), Ger. scholar and theologian, b. at Egg, in Swabia. He excelled in controversy, and attacked Luther's thesis on indulgences, and defended the Catholic doctrines in the celebrated congress of Leipzig in 1519. Thenceforward he was one of the bitterest opponents of the Reformation; in 1525 his exposition of Catholic dogma appeared in answer to *Leuz theologiques* of Melancthon, and was very successful. He took a prominent part in the congresses at Baden and Augsburg, and in 1530 sent a refutation of the Protestant confession to Charles V. In 1537 he pub. a Ger. N. T., and took part

in the meetings at Worms in 1540, and at Ratisbon in 1541.

Eck, **Loch**, an inland loch of Scotland, situated in Argyllshire. It is about 6 m. long and enclosed by mts. Salmon and trout abound.

Eekart, or **Eckehart**, **Johannes**, see **ECKHART**.

Eckermann, **Johann Peter** (1792-1854), Ger. writer b. at Winsen an der Luhe, and a friend of Goethe; known principally through his *Conversations with Goethe* (1837), trans into Eng. by Margaret Fuller (1889).

Eckernförde, tn. of Schleswig-Holstein, Germany, on the Baltic between Kiel and Flensburg, with fishing trade, and manufs. of tobacco. Pop. 10,200.

Eckersberg, **Carl Christopher Vilhelm** (1783-1853), Dan. historical, marine, and portrait painter, b. at Varnäs, Slewig. He became a pupil of Abildgaard and afterwards of David, and later, Thorwaldsen. It has been stated by his native admirers and critics, that he first 'created a Danish colour.' His landscape scenes are clear and definite and the outlines natural, while his figures are conventional.

Eckhart, **Eokart**, or **Eckehart**, **Johannes**, very generally styled **Meister** (1260-1329), Ger. mystic, and one of the first of speculative thinkers, b. at Hochheim bei Gotha. Very little is known concerning his life. He entered the Dominican order, and studied and taught in Paris. After being made prior at Erfurt, he was vicar of his order in Thuringia. He was made vicar-general of Bohemia in 1307, and a few years later he preached at Frankfurt, Cologne, and Strasburg. His reputation for learning was very high, and he assisted in a controversy between Pope Boniface VIII. and Philip of France. In 1327 his enemies caused him to be summoned at Cologne before the Inquisition on a charge of heresy, where he partly recanted. Two years later he was again accused, and extracts from his works condemned, but he died before the bill against him was pub. His sermons and tractates written in Ger. and Lat. are all that remain of his works. In his teaching he was an Aristotelian. He began with his doctrine of the Divine nature, following it by the relationship of God and man. His style was curt and abounded in symbolic expressions.

Eckhel, **Joseph Hilary** (1737-98), an Austrian numismatist, b. at Enzersfeld, Lower Austria, who, in 1773 was made prof. of antiquities and numismatics at Vienna Univ. His chief work is *Doctrina Nummorum Veterum* (1792-98).

Eckington, par. and tn. of Derbyshire, England. The tn. is situated 7 m. S.E. of Sheffield. There are saw-mills, and manufs. of agric. implements. Pop. 13,000.

Eckmühl, or **Eggenmühl**, vil. of Bavaria, situated on the Isar, 15 m. S. of Ratisbon. It is noted as the scene of a battle fought there in 1809 between the archduke of Austria and Napoleon I., in which the former was defeated. Pop. 400.

Eclampsia (from the Gk. *εκλάμνω*, 'to call aloud'), term applied to a form of epileptiform convulsions occurring in

pregnant women, with an associated condition extremely dangerous to the child, and not free from danger to the mother. It is due to changes in the kidney, which can be detected only by chemical examination of the urine. E. is a haunting dread before and during confinement, as suddenly a woman, in apparently perfect health, may be seized with convulsive attacks which may end fatally. E. is prevented by checking the longings of pregnancy, leading a quiet healthy life, and giving careful attention to hygiene.

Eclecticism (Gk. ἐκλέγω, I select), in philosophy is the principle of selecting and adopting views from various systems of philosophy, and uniting them into one composite system of thought. Among the earliest eclectics must be numbered Cicero, the Peripatetics, and the Neoplatonists. The eclectic system of philosophy has gained great popularity in France, owing to the teaching of Victor Cousin, Adolphe Garnier, and others. Cousin asserted that 'Each system is not false, but incomplete, and in reuniting all incomplete systems we should have a complete philosophy, adequate to the totality of consciousness.'

Eclipse, see *under* MOON, OCCULTATION, SAROS, STARS, and SUN.

Ecliptic. The path which the sun takes in its apparent yearly journey from west to east among the fixed stars. This path lies through the middle of the constellations known as the Signs of the Zodiac (*q.v.*). Of course the E. is only the apparent path of the sun, for the earth revolves around the sun. If it were possible to view the earth from the sun, it would be found that the earth's orbit lay along the E. The E. lies at an angle to the equinoctial of $23^{\circ} 28'$ at the time of the sun's greatest declination, and cuts the equinoctial at two opposite points, called the 'equinoxes,' at about March 21 and Sept. 23.

Ecolite, **Eklogite**, or **Disthene Rock**, rock formation, crystalline in character, and composed of smaragdite and red garnet. Occasionally feldspar, quartz, iron ores, etc., form a part of this exceedingly beautiful rock. It is not found in any great abundance, but it is seen among the Alpine mts., the Fichtelgebirge, at Baden, etc. The garnets in E. are frequently surrounded by a covering of bright green hornblende.

Elogue, name given to a short pastoral poem in verso. The derivation of the word is obscure, the most common one being from ἐκλέγω, to choose, E. thus being selected poem; another derivation is from αἶς, a goat, and λόγος, speech, the word thus being a dialogue of shepherds. In the first form, dialogue was not indispensable to an E.; it was owing to the grammarians, who reserved the term E. to the bucolica of Virgil, which were in the form of dialogues, that E. came to mean only a poem in such a form. The first poet to write Es. was Theocritus, of whose works in this form there are about thirty extant; they are written in the Doric dialect, and mostly in hexameters. Then Virgil wrote his Es., which he pur-

posely called bucolica in order to challenge comparison with Theocritus. Other writers of Es. in Lat. were Calpurnius Siculus and Nemesianus. In the sixteenth and seventeenth centuries the writing of Es. was again practised; Alexander Barclay (1514) was the initiator of the fashion. The most successful of the Eng. writers of Es. was Spenser, whose *Shepherd's Calendar*, of 1579, was much admired. From this period until the time of Pope, Es. were produced at intervals. Among the collections pub. may be mentioned Drayton's *The Shepherd's Garland*, *The Shepherds' Pipe*, by Browne, Wither, Brooke, and Davies. Pope and Ambrose Phillips pub. vols of Es. in 1709, but both were outclassed by the *Shepherd's Week*, 1714, of Gay. Since then Es. have not been written, except by John Davidson in *Fleet Street Eclogues* (1893-96). The treatment of most of these Es. is akin to pastoral, and for a fuller description of peculiarities of form, etc., see the article on PASTORAL POETRY. Of foreign Es. those in Fr. of J. R. de Segrais (1624-1701) are noteworthy, and those in Span. of Garcilaso de la Vega (1503-36). In fact, the latter's *Se dulce lamentar de los pastores* is one of the finest poems of its kind, ant. or modern. See E. C. Knowlton, 'Pastoral in the Eighteenth Century,' *Modern Language Notes*, xxxii., 1917; M. K. Bragg, 'The Formal Eclogue in Eighteenth-Century England,' *Maine University Studies*, 1926.

Ecology (Gk. οἶκος, house or abode, λόγος, discourse) is the study of the organism as a whole in relation to its environment. Since land plants are stationary, the study of plant E. is much easier, and consequently much more advanced, than that of animal E. On the other hand, plants and animals are so closely interdependent that investigation of the E. of one group involves that of the other. There are two main subdivisions of E. (1) Autecology, concerned with the separate environmental factors and their effect on individuals. (2) Synecology, dealing with the combined effects of these factors on plant and animal communities. The chief environmental factors governing the distribution of plants and animals are temp., humidity, climate, soil, the intensity of light, the nature of the food, and interaction with other plants and animals. The individual effect of each separate factor is studied in the laboratory; the combined effects are seen out of doors, in woods, fields, swamps, lakes, seas, and other habitats. Generally speaking, animal communities are determined by plant communities—that is, by plants growing together and forming groups with a certain individuality. Any particular type of community is described as an association, and the general appearance of a plant association is determined by dominant species, e.g. the pine tree is the dominant species of a pine-wood association: in a mixed wood, oak and beech may be co-dominants. Associations having only one dominant species are called consociations. Plant associations show stratification; in a wood, trees constitute the

uppermost strata, bushy undergrowth the next, herbs the third, and mosses and liverworts the fourth. Beneath these are soil algae, fungi, and various bacteria, and protozoa, which by effecting changes in the soil affect the plants growing in it. Further change is effected by the constant addition of humus to the soil, and as a result of such changes the character of the plant community gradually alters, other organisms better adapted to the changed soil gradually replacing the earlier ones. This process is termed ecological succession, and is concomitant with an ecological succession of animals. By studying the changing conditions as the level of Lake Michigan falls, Shelford has been able to predict, with regard to beetles of the genus *Cicindella*, the succession that will be determined by further fall in level. Since within limits animals can choose their habitat, behaviour is an additional factor of animal ecology. Animals form strata in a different manner from plants. The bottom stratum may be regarded as composed of animals forming food for those of the next stratum, and so on, until at the top are animals which have no enemies or are able to defeat them by virtue of size or skill. Thus spiders eat flies; small birds eat spiders; larger birds eat smaller birds. In this way animals form food chains, those forming the first link being far more numerous than those of the last. The first link consists obviously of herbivores capable of reproducing in enormous numbers, while the animals of the last link have limited means of reproduction and reduce competition between themselves by sharing out food areas. Other important factors in animal E. are the size of food and the status of the animal in the community, and interesting problems are presented by the phenomena of symbiosis and the specialisations of parasites. The extensive field of E. provides interesting material for the amateur who makes careful observations and keeps accurate records. See C. Elton, *Animal Ecology*, 1927; A. Tansley, *The British Isles and their Vegetation*, 1939; A. S. Pearse, *Animal Ecology*, 1939; also articles in *The Journal of Ecology* and *The Journal of Animal Ecology*.

Economic Blockade, see BLOCKADE; **DECLARATION OF LONDON**; **ECONOMIC WARFARE**, **MINISTRY OF**.

Economics, term (*οικονομία*) by which the anc. Gks. used to signify the art of prudent and systematic household management, with particular reference to income and expenditure, and to the labour and satisfaction of the wants of the members of the household. Political economy, now generally described as E., later came to signify the art of directing carefully the production and consumption, the incomes and expenditures of the state and its subjects. It was not commonly conceived as a neutral science till the nineteenth century, when it became the science of wealth and exchangeable values. In the theoretical treatment of the matter some economists proposed to limit the term 'political economy' to the narrow science of wealth; but in about the middle of the

nineteenth century, the Historical school (Roscher and others) maintained that the subject of the study was not wealth, but man's relation to wealth; that it was part of general social science and could not be detached from ethics and politics. Following Adam Smith, and popular interpretations of the term, political economy may be defined as the ordered knowledge of the social phenomena arising out of man's activity in the acquisition and use of wealth. Wealth means things possessing value of some kind which usually cost labour, and which satisfy human wants, and exist in quantities below the demand, so that each unit of them possesses distinct importance to man.

The hist. of economic thought begins with the anc. Gks., who confided everything to the power of the state, which resulted in the subordination of the individual to the state, and consequently in the subordination of E. to ethics and politics. The Gk. philosophers condemned interest-taking, and were prejudiced against trade and commerce. The Romans followed the Gks.' ideas, and also made important studies on particular economic problems; but failed to estab. a dominant system of economic thought. Christianity strengthened in general the prevalent Aristotelian system of economic philosophy, its condemnation of usury and the pursuit of wealth in trade, its assertion of the superiority of agriculture, and its support of status. Christianity thus strengthened the subjection of E. to ethics, but weakened the subjection of E. to politics. The early fathers, in their condemnation of avarice and their exaltation of fraternal love, sometimes used expressions which, taken by themselves, imply an utter condemnation of private property and an advocacy of communism among the faithful, but this was only an ideal, and private property was early recognised as a necessity resulting from the fall of man. The effect of this ideal, however, appears in the accepted doctrine, that the maintenance of the poor was not a matter of philanthropy, but an obligation. The scriptural attitude towards wealth led to an emphatic statement of the moral superiority of agriculture and handicraft over trade and commerce as a means of earning a livelihood, and the early writers seemed almost unanimous in the belief that what the seller made by trade the buyer necessarily lost.

With the increasing temporal power of the Church and the great development of commerce which marked the eleventh century, came the necessity of harmonising the doctrines of the Church with the obvious requirements of commerce, and many concessions were made by the later canonists. Thomas Aquinas (1226-74) concedes that it is lawful to trade for a simple livelihood, or in order to supply a country with the necessary articles which it does not produce, or when the profits of the trade are devoted to some honourable purpose, such as the assistance of the poor; but that, save in exceptional circumstances, a seller is bound to reveal a fault in an article, and that it is not

permissible to sell an article for more than its worth. The fundamental axiom, in accordance with which all these conclusions are reached, is that every commodity has a fixed and objective value, which can readily be ascertained, and which determines its just price. The distinctively ethical standpoint of the canonists is shown in the prohibition of usury, which was based upon Scriptural injunctions against it and upon Aristotle's argument that money being barren, it would be extortion to charge for its use. As the growing commerce of the Middle Ages made the need of borrowing capital more and more imperative, the canonical theory had to be stretched so as to accommodate many ingenious forms of contract for what was practically, though not nominally, usury. In the latter half of the fifteenth century the Franciscans themselves instituted the *Monts-de-piété*, or charitable banks, for lending money to the poor at a small rate of interest to defray expenses of management.

Ethical considerations dominated medieval economic theory; political necessities that of the early modern period. The new national govts. had to secure greater revenue and in a liquid form. Ready money was necessary for the up-keep of armies and navies; and to meet the other requirements of a national power. It was imperative to find or create some better sources of revenue than the backward agriculture of the time. These necessities led to the development of a mercantile system. The restrictive regulations, discriminating laws, and state interference which Adam Smith and his immediate successors described as the essential features of mercantilism have been, in a sense, incidental. State interference was a minor consideration, as it was not the problem at issue. The mercantile system resulted not in a loss; but in a net gain of individual freedom. Along with the imposition of those external restrictions which mark the mercantile economy went a rapid and extensive abolition of internal restrictions, which had been far more numerous, brutal, and destructive than the new external regulations which succeeded them. The economic and political unit had merely increased in size.

Mercantilism was the most important phenomenon of economic thought in the sixteenth and seventeenth centuries, but it constituted no more than a part of a widespread and eager investigation of concrete economic facts. These studies became materials for Adam Smith's work. Money, banking, the rise of prices, poor relief, etc., were extensively discussed in brochures and monographs. The maintenance of the poor was a constant subject of pamphlet and tract; Sir Thomas More, in his communistic *Utopia*, gives striking evidence that the problem of poverty occupied the attention of the best thinkers of the time. True, economic study had been separated from ethics and theology, but men like Bodin, Grotius, Pufendorf, Hobbes, and Locke developed it into an essential part of a general political philosophy.

After mercantilism with its undue preference for commerce and industry and for a favourable balance of foreign trade there was bound to be a reaction in favour of agriculture. Mercantilism was the economic expression of nationalism: agriculture was now to find favour with the broad principles of natural law and liberty expounded in the works of Grotius, Pufendorf and Locke.

The preference for agriculture and industrial liberty found expression in the doctrines of the so-called physiocrats, the originator of which may be considered to be François Quesnay (1694-1774). The fundamental creed of the physiocrats was the subjection of economic and political phenomena to 'natural law,' which, as interpreted by them, gave rise to the familiar political doctrine of radical individualism, and a certain materialistic conception of

ADAM SMITH

wealth which somehow explains their peculiar economic theories. Adam Smith found that the physiocrats treated not only of political economy, but of every other branch of the system or civil government, and that their political and economic theories were indissolubly fused in their general doctrine of a beneficent law of industrial freedom, according to which the largest production and most just distribution of wealth would be best secured by permitting each individual to 'pursue his own interest in his own way,' so long as he did not infringe on the liberty of others. This theory has been perpetuated and popularised by Adam Smith, and has influenced subsequent thinkers more than any other economic doctrine ever formulated. The physiocrats exposed the mercantilist error of confusing wealth with the precious metals, but they themselves fell into the error of confusing wealth with material objects, by identifying the production of wealth with the production of raw materials, whereby they concluded that manufs. and

commerce, which merely change the position or form of raw materials, are barren and unproductive, though useful and desirable when strictly subordinated to agriculture; that the value added to raw materials in the process of trade and industry is equivalent merely to the cost of production, while agriculture yields a net surplus over and above the cost of production. Quesnay considers the large agric. employer to be the real producer of wealth, not the agric. labourer. Agriculture being thus the sole source of national revenue, simplicity, economy, and justice demand that the state revenue be obtained by a single direct tax levied upon rent. Accordingly the physiocrats were the first who stated the epoch-making theory of surplus value, and the theory also that the product of industry contains a certain value, due to the co-operation of natural factors, which is in excess of the minimum remuneration required to elicit the toil and sacrifice of industry, and which constitutes, on this account, a satisfactory source of taxation.

Adam Smith (1723-90) whose *Wealth of Nations* appeared in 1776, may well be considered as the greatest of economists and the Father of Economics. His influence hastened Free Trade, and popularised and dignified the systematic study of wealth; but his most important service was in divorcing political economy from ethics, and partly from politics. Such appears clearly in the delineation of his lectures, divided into four parts: I. Natural Theology; II. Ethics (included in his *Theory of Moral Sentiments* 1759); III. Justice and Jurisprudence; IV. Political Economy. He has been accused of treating man as merely a wealth-producing animal, in whom altruistic motives are wholly absent; but in his *Theory of Moral Sentiments* the motives of duty and sympathy are fully recognised, and the desire for wealth is treated as only one of the worthier objects of ambition. Further, in the *Wealth of Nations* he opposes piecework as calculated to excite the labourer to over-exertion, and voices the necessity for rest, diversion, and even 'dissipation.' His whole attitude is essentially this: 'Assuming that the object of the study is to increase the national wealth, this object will be most effectually secured by perfect industrial liberty.' On the other hand he did not succeed in separating politics from E., because his ultimate purpose was to prove the supreme efficacy of the doctrine of *laissez-faire*. Before being able to lay down maxims for the increase of wealth, he had to inquire how wealth was actually produced and distributed. It was his passionless analysis of production, value, and distribution which had the greatest effect upon the economists who followed him, and led to the attempt to formulate a non-partisan science of political economy, which should pass no ethical or political judgments.

It must not be forgotten that Adam Smith was not always consistent in the development of his theories. He advocates 'perfect industrial liberty,' yet he

does not hesitate to recommend the regulation of banking by the state. The same inconsistency, which was in reality due to breadth of thought, is visible in his method of investigation. Withal the fact remains that with economists immediately following him the science itself became increasingly theoretical, deductive, and abstract. His great quality was 'universalism.' His work dealt with the wealth of nations, not of a single state; his confidence in the existence of a natural law of universal application became a creed.

Malthus and Ricardo stand out among early followers of Smith and, with Bentham and other writers of the early part of the nineteenth century including McCulloch and James Mill, have been variously designated as the Classical, Orthodox, Ricardian, or Eng. school. Their general system of thought is harmonious, but they differed upon points of economic doctrine. They are deductive in method, pessimistic in tone, utilitarian and materialistic in assumptions, and cosmopolitan in the sense that their ultimate scientific ideal was the discovery of universal economic laws applicable at all times and to all nations. In France, J. B. Say may be placed in this group. He taught that supply creates its own demand (*Loi des Debouchés*) and his *Traité d'Economie Politique* (1803) was a major means of spreading the Smith views. The ethical framework of classical economy is due to Jeremy Bentham (1748-1832) through his formulation and continuous propagation of utilitarian philosophy. Bentham put it that 'To obtain the greatest portion of happiness for himself is the object of every rational being.'

The materialism and pessimism of the Classical school seem to be intensified in Malthus's famous *Essay on the Principle of Population* (1798). His theory that pop. tends to increase faster than food became the very backbone of classical economy, and modified almost every dept. of human thought.

David Ricardo (1772-1823), in his theory of distribution, made the most important use of the Malthusian proposition. He held that as a country grew and pop. increased, society would be forced to resort to poorer and poorer soils to obtain its supply of food, the law of diminishing returns would operate, and as the margin of cultivation was forced down, an increasing share of the product of industry would go to the landlord in the shape of economic rent—the difference between the natural productivity of the better land and the worst land in cultivation. Excluding rent, the div. of the remainder of the product between the labourer and the capitalist was determined by a corollary of the Malthusian principle—the 'iron law of wages.' This theory of distribution is fully developed as an integral part of his famous cost-of-production theory of value. When Ricardo said at times that all the expenses of production could be resolved into the toil and sacrifice of labour, he supplied the communists with their celebrated labour theory of

value, according to which labour is the sole cause of value, and consequently is entitled to the whole produce of industry, and Henry George (1839-97) with his doctrine that progress means poverty as long as private ownership of land is legal.

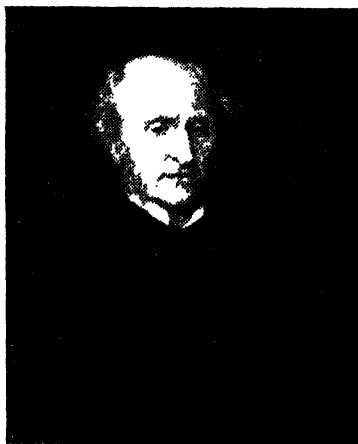

The most influential of Eng. economists between Ricardo and the younger, and greater, Mill, was N. W. Senior (1790-1864). He propounded the abstinence theory of interest; and formulated the famous doctrine of the wages fund 'that the average rate of wages is the quotient secured by dividing the number of workmen into the fund of capital set aside by the capitalists for the employment of labour.'

John Stuart Mill (1806-73) was a thorough reformer, and typifies the transition in England from the Classical to the Modern school of economic thought. He was first entirely under the influence of Ricardo, but in later years he followed Auguste Comte and the socialistic tendencies of his time. Fettered by the Ricardian E., but moved by the warm desire conceived in his maturer years, to find some means to improve the condition of the masses, his mind struggled hard to find a compromise between the two systems. The outcome of this mental battle appeared in 1848 under the title, *Principles of Political Economy, with Some of their Applications to Social Philosophy*. This book was brilliantly written and became widely popular. It exercised an enormous influence upon the subsequent development of Eng. economic thought. He preserved the old doctrine of rent and profits, and advocated *laissez-faire* as a general principle of political expediency, but made so many exceptions that at times they seem more important than the rule.

Since 1850 Eng. economic thought has been deeply affected by the reaction against the classical system. The logical successors of Ricardo and Senior were Cairnes, Hagahot, Fawcett, and, perhaps, Professor Marshall. All of them have been defenders of the Orthodox school, though they have recognised and expounded its limitations as a theoretical science. Thorold Rogers, Cliffe Leslie, Arnold Toynbee, Ashley, and Cunningham were historical economists who have more or less endorsed the general views of the Historical school (see below). A psychological school of political economy was founded by Jevons. He, Edgeworth, and others, made important contributions in every branch of the science, particularly in statistics. Eng. economists now use all schools or methods, be they deductive, historical, psychological, statistical, or mathematical.

The reaction against the school of classical economy began earlier in U.S.A. than in Germany, where it came to perfection. The first to stir up the hornet's nest were Alexander Hamilton, Daniel Raymond, Friedrich List, and some others. Raymond was the first to advance a distinctively Amer. system of political economy, which he exposed in his *Thoughts on Political Economy* (1820).

He holds, unlike Adam Smith, that wealth is not an aggregation of exchange values, but the capacity or opportunity to acquire the necessities and conveniences of life by labour. In his opinion the Eng. political economy, and the laws of wealth given by Adam Smith, were a study on exchange values, of private economy, as opposed to national economy, and untrue of a nation conceived as a unity. He is clearly as opposed to the doctrine of *laissez-faire*, as in favour of protection. The second period of Amer. E. belongs to the most influential of the earlier Amer. economists, Henry C. Carey (1793-1879). He was the most ardent apostle of protection, the

The painting by G. F. Watts.

staunchest opponent of Ricardo, and may be considered as the originator of the present economic system of the U.S.A. He flatly denied the Malthusian principle and the law of diminishing returns, and drew his lessons from Amer. experience alone. His teachings were applicable exclusively to the America of his time, but he clearly showed that the fundamental premises of classical economy were not universally applicable. Later Amer. economists largely accepted the positive doctrines of the Ger. Historical school. Henry George and Francis A. Walker have exerted a world-wide influence upon economic thought.

The general development of economic thought since 1850 is to be considered as a series of reactions against the dominant doctrines of the classical system. Through Karl Marx communism acquired a positive theory deriving from Ricardo's theory of value and distribution. The claim is that, as labour is the sole cause of value, the labourer is entitled to the whole

produce of industry. Capitalism, it is asserted, is but a temporary stage in industrial evolution, and must inevitably give way to collective production. Marx's theory of value has met with but little favour, but his doctrine, that the underlying causes of social currents, such as religion, literature, and art, are economic in character (he calls this doctrine the 'materialistic conception of history'), has dominantly influenced economic science, particularly in Germany.

Auguste Comte (1798-1857) is the father of modern sociology. His influence was immense. He was the first to protest against the Ricardians' aim at an abstract science of rigid precision and universal of application. Comte was the precursor of the Ger. Historical school, which undertook the most influential reaction against classical economy, and is usually dated from Lorenz von Stein's *Der Socialismus und Communismus des heutigen Frankreichs* (1842), and, perhaps more justly, from Wilhelm Roscher's *Grundriss zu Vorlesungen über die Staatswirtschaft nach geschichtlicher Methode* (1843). Bruno Hildebrand and Karl Knies, must both be associated with Roscher and Stein in the introduction of this method, which not only has entirely transformed economic science in Germany, but also has deeply affected it all over the world. The positive doctrines of Roscher and his disciples maintain the propositions that E. is a social or political science which can be profitably pursued only in connection with the other sciences of political or social life, particularly administration, law, and hist. Thus they replaced a universal political economy by an historical national economy. The nationalistic spirit of the school was first expressed in Friedrich List's economic publs. (1789-1846). Roscher and his disciples made predominant use of the inductive method and adhered closely to actual economic phenomena; they held an intermediate attitude between protection and free trade; and they had discriminating sympathy for the claims of socialism. Generally they prefer state initiative to that of individuals for the solution of the problem of poverty, and have thus earned the nickname of *Kathedersocialisten* or State Socialists, as contrasted with the Social Democrats, whose programme they refused to endorse.

The theory of marginal utility has been most thoroughly developed and most widely applied by a group of Austrian economists, of which Menger, Wieser, Sax, and Boehm-Bawerk may be considered to be the leaders. They are commonly called the Austrian School of E., though the theory itself was propounded almost simultaneously in 1871 by Jevons in England, and Menger in Austria. The disciples of this school hold that the utility, or power, of satisfying want possessed by a commodity decreases per unit as the amount consumed increases, and the value itself expresses the utility of the last or marginal increment of the commodity supplied for consumption. The former unit of real value—i.e. the pain and sacrifice of labour—has made way for a unit of

utility; the cost of production theory of exchange has been replaced by a wider conception which holds that value determines the expenses of production, rather than the expenses of production the value, that capital receives its value from the finished product, and not *vice versa*. The tendency of this theory has been to shift the centre of gravity in E. from the capitalist to the consumer, and to block the movement to confine political economy to a study of exchange-value.

Political economy depends perhaps more upon hist. than any other science; but the extremists of the Historical school, who hold that, until a larger store of historical results is accumulated it is of little use to attempt broad theoretical generalisations, would confine E. meantime to the philosophy of economic hist. John Keynes (1883-1946) classifies the functions of economic hist. in connection with economic theory, as follows: First, to illustrate and test conclusions not themselves resting on historical evidence; secondly, to teach the limits of the actual applicability of economic doctrines; thirdly, to afford a basis for the direct attainment of economic truths of a theoretical nature.

Psychology is the alpha and omega of political economy, since any study beginning with human effort, and ending with the satisfaction of human wants, begins and ends with psychology. Psychological considerations are fundamental whatever approach is made to economic argument.

Economists employ diverse methods to come to their conclusions. Predominating are the deductive and inductive methods. The deductive method is appropriately so called because with it are employed the familiar processes of deductive logic. It is alternatively called hypothetical or abstract or speculative. Cliffe Leslie and others of the Historical school have characterised the conclusions of Eng. theory as inapplicable either to the explanation of existing conditions, or the solution of practical problems. Such antipathy to deductive theory is unjustified. The two methods are complementary and neither can well be pursued to the exclusion of the other. Verification by observation is in practice exceedingly difficult; as Mill found when he attempted to apply Ricardo's theories.

The inductive method is 'to observe the effects of a cause coming singly in action while all other forces remain unaltered.' There are two inductive processes: the method of difference, and the method of agreement. The method of difference requires that circumstances be compared with exactly similar ones, minus one factor. Such a condition seldom arises even approximately, and instances enough may be cited in which the method has been abused. The method of agreement is used to generalise, and to establish uniformities: it is somewhat speculative and needs to be used with discrimination. If little is to be done without the inductive method it nevertheless seldom convinces. The great difficulty of

induction in E. is the complexity of economic phenomena. The following percentage figures, given by Prof. J. W. Scott in *Self-Subsistence for the Unemployed* shew the increase in United Kingdom exports per head for five-year periods from 1840-44 and the decrease in such exports from 1870-74:

Five-year periods	1840-44	1845-49	1850-54	1855-59	1860-61	1865-69	1870-74
Exports per head	100 %	109 %	158 %	213 %	245 %	308 %	381 %
Five-year periods	1870-74	1875-79	1880-84	1885-89	1890-94	1895-1900	
Exports per head	100 %	81 %	90 %	84 %	82 %	81 %	

What economic truths do these statistics yield? The Corn Laws were repealed in 1846 and by 1860 the United Kingdom had complete Free Trade. These facts may largely account for the top percentages; but do they account in some way for the bottom figures? Around 1850 gold discoveries in California and Australia began to flood the world with great quantities of the metal. After 1873 gold production, though still high, slackened off somewhat; whereas in 1871 the world's demand for gold had risen steeply. This was due to Germany joining the United Kingdom on the Gold Standard and requiring huge amounts of gold for coin and reserves. Soon most of Europe followed Germany's lead; and later most of the world.

How far do the percentages reflect the increase in gold supply and, from 1871, the increase in demand? How far do they reflect other causes? One new important fact from 1871 onwards was the rising number of countries which had, as effect, a common currency—gold. Another was the increasing degree of industrialisation in Europe, America and elsewhere. The complexity of the relevant economic phenomena is not measured by the few facts mentioned, and it is safe to say that, whatever the true answers may be, inductive methods alone will scarcely provide them.

In 1914, before the First World War, the outstanding problem was unemployment. Linked with this was the hotly-debated question of Free Trade versus Protection. The Gold Standard was largely taken for granted. After two World Wars the unemployment problem has been solved in principle: Free Trade had become Multilateralism, and the subject of important international agreements under the auspices of the United Nations; while the Gold Standard had been twice abandoned, substitute arrangements being likewise brought within the scope of United Nations agreements.

In 1914 men went in fear of the Trade Cycle and recurrent slumps. When the First World War broke out they had already come to regard unemployment as a more or less unavoidable economic scourge and they were the more impressed at its disappearance during the war. They were further impressed by the freedom with which money flowed in wartime; and by the apparently bottomless state purse where war requirements were concerned. Fears or hopes that the First

World War would 'stop within six months' because of financial exhaustion proved fruitless. There were shortages of this material and that; but no shortage of money. As soon as the war was over the urgent cry of economy was heard and people felt it strange that while we could afford anything and everything to wage

a war, reasonable requests for highly desirable amenities and improvements in well-being were met with the blunt statement that there was no money available. While it was reasonable to suppose that a devastating war would scarcely increase well-being, people nevertheless could not but be impressed with the 'money for war; no money for peace' contrast.

People had heard stories about banks making money—creating money—in the war—and they were ready to believe that such powers should be used in peace-time to create money to be spent on the good things of life. And when, after the war, unemployment arose once more and reached unprecedented levels the 'short of money' argument seemed to run contrary to commonsense. It was contrary. Whilst, given full employment with full efficiency and no increase of saving every additional pound created must be inflationary, with unemployment in excess of minimum levels there is clearly not enough spending and we must either spend faster the money we have or create money to spend. This seems obvious enough now; but after the First World War there were still elementary misconceptions about the role of money.

Since barter made way for monetary transactions money had been of first, if not fully realised, importance in the economic field. A barter transaction was a complete exchange of goods for goods (or services). But a sale of goods for money is only a 'half' transaction which leaves the seller free to postpone indefinitely the exchange of his money for his ultimate satisfaction in the shape of goods. The vital effects of postponed spending, of saving, were not understood. In particular the effect of underspending on the national income—our aggregate income—was not recognised. It was not appreciated that the national income can rise only if someone spends more and fall only if someone spends less. There was a confused identification of the separate acts of saving and investment (spending). In dispersing this confusion lay the clue to the unemployment problem.

Unorthodox people were, however, stressing the need for more spending both to cure unemployment and to utilise 'the unclaimed wealth'—to banish 'poverty in the midst of plenty'—not always with due regard to the difficulties which emerge as a state of full employment is approached. There was often undue optimism, too, as regards the effect of money

creation on the taxpayers' burden (even if bank-money creation were also harnessed in relief of taxation, as was proposed). Yet the official view, as stoutly maintained by the Treasury, was that little or no employment could be created by state borrowing or expenditures. It was not until Keynes in 1936 pub. his great work *The General Theory of Employment, Interest and Money* that first the academic world and then official circles began to show serious interest in the practicability of governing aggregate spending and so sustaining employment and the general income. In his book Keynes pays tribute to Malthus, Gesell, Hobson and others. He refers indeed to 'orthodoxy having no valid reply to much of (the) destructive criticism' of Maj. Douglas, of Social Credit fame. In 1944 the Brit. Gov. White Paper on Employment Policy officially accepted the obligation to ensure adequate spending. Moreover in the same year by the Bretton Woods Agreement (q.v.), a United Nations Conference agreed that 'The purposes of the International Monetary Fund (include) the promotion and maintenance of high levels of employment and real income . . . It may be objected that the International Monetary Fund pronouncement looked to 'the expansion and balanced growth of international trade' to contribute to this end rather than the reverse; but the Havana Charter for an International Trade Organization (March 1948) goes further. The Charter's first objective is 'To assure a large and steadily growing volume of real income and effective demand, to increase the production, consumption, and exchange of goods, and thus to contribute to a balanced and expanding world economy.' Further quotations emphasise that it is not a question merely of the expansion of international trade contributing to high employment and income in individual countries but that the argument is now firmly put the other way round:—

Article 2 states that 'The Members recognise that the avoidance of unemployment or underemployment, through the achievement and maintenance in each country of useful employment opportunities for those able and willing to work and of a large and steadily growing volume of production and effective demand for goods and services, is not of domestic concern alone, but is also a necessary condition for . . . the expansion of international trade, and thus for the well-being of all other countries' and that 'The members recognise that the avoidance of unemployment or underemployment must depend primarily on internal measures taken by individual countries . . .'; while Article 3 states: 'Each Member shall take action designed to achieve and maintain full and productive employment and large and steadily growing demand within its own territory . . .'

The discovery of the practicability of a country deliberately maintaining its total spending and income is the outstanding achievement of modern E. and it is a matter for satisfaction that this great

international trade document embodies the idea in such substantial fashion. The idea that each and every nation could, and should, 'assure' its income and effective demand—effective spending—could not have been included in an international instrument at the end of the First World War. But it was the experience of the First World War and its aftermath of unparalleled unemployment that led the way to the solution of the problem of recurrent unemployment.

It will be convenient to consider the Gold Standard before pursuing the question of Free Trade versus Protection. As stated above we have twice left the Gold Standard since early 1914. The £ is now 'pegged'—other currencies too—and we hear of 'scarce dollars.' The Gold Standard did not peg the £ but, by its adjusting mechanism, kept it steady within narrow limits. Under the Gold Standard if £s looked like being scarce abroad, a loan from London soon put matters right. A nation on the full Gold Standard buys and sells gold freely and arranges that its currency unit shall contain a certain fixed amount of gold. Britain was on such a standard before the First World War, the gold content of the sovereign being about $\frac{1}{4}$ oz. If wages and prices were too high, imports rose and exports fell off; the £ fell to its lower limit, where it became profitable to export gold; the Bank rate was raised and in the first place attracted gold and in the second place, protected the Bank of England's gold reserves, on which the nation's money and credit structure was based, by setting in train a long-term deflationary effect that has the result of reducing wages and prices and making Brit. goods again competitive in the world's markets. Not every Bank rate rise, of course, was held long enough to have the secondary effect. The great advantage of the Gold Standard was that the merchant worked on the confident expectation that (e.g.) the £ would be worth 25.22 francs year in year out and that the effective price of goods ordered now would be unaffected three months, six months or more ahead by the rate of exchange. Under a Free Exchange on the other hand, while the merchant's requirements may be satisfied by the device of buying forward exchange, this solution is not available for long-term loans. While, however, under the Gold Standard the long-term lender may get his proper interest and return of cap. In full gold value, the value of gold itself has over the years varied considerably.

There are modifications of the Gold Standard (i.e. Gold Bullion Standard and Gold Exchange Standard) and at the opposite pole—the Free Exchange, with inconvertible paper currency. A paper £ not convertible into gold would exchange for what it was worth from day to day—the rate at any time depending on the number of pounds actually and prospectively on offer and demand. Features of such a Free Exchange are:—(1) Free Exchange acts as a sort of tariff. If we over-import the exchange goes against

the £ and so discourages imports and encourages exports. This is what is wanted and the remedy has the advantage of being automatic and immediate. (2) The brunt of the adjustment is borne by the buyers of the foreign goods whereas the brunt of the Gold Standard adjustment tends to fall on workers thrown out of employment. (3) We retain budgetary freedom: we can decide on deficit financing in pursuit of full employment; and we can aim either at a stable £—buying always about the same amount of goods—or a £ which will buy more goods as science and machinery increase production. Under a Gold Standard a nation's freedom to indulge in deficit financing is limited, and it must 'keep in step' as regards what its unit will buy: it must be careful to avoid any risk of inflation as distinct from reflation. (With a universal currency a nation loses all budgetary freedom. Universal currency—i.e. a single currency for the whole world—has an attractive sound and is to-day being suggested as a cure for our currency and trade troubles. A European currency is an alternative suggestion with similar disadvantages.) The 1914 war forced Britain off the Gold Standard (along with other nations) although formally the break did not come until 1919. A paper currency was introduced and, since the heavy war expenditure was covered only in part by tax and loan, the number of £s steadily increased—the value of each £ decreasing of course as the total issues rose. Had it been practicable to pay the full costs of the war by means of taxation and savings the paper £ could have retained its full value. In fact the value of gold itself had fallen in May 1920 to 10 per cent of its 1913 value. It rose steeply soon after.

The word 'profligating' will recall the high prices that prevailed after the 1914-1918 War; but the gradual increase in goods aided by a deflationary policy raised the value of the £ until in 1925 it could 'look the dollar in the face' and Britain returned to the Gold Standard but not to a gold currency; i.e. to a Gold Bullion Standard. This was in line with the recommendations of the Genoa Conference of 1922. Assuming the wisdom of an early return to the Gold Standard it remains a question whether it was wise to have imposed deflation with all its dread effects on trade and whether instead of making the £ look the dollar in the face it would not have been better to have reduced its gold content. It was generally accepted that after 1925 our trade was labouring under the handicap of an over-valued £. Relief was to come in the 'economic blizzard' of 1931-1932 when Britain was forced off the Gold Standard after making the most strenuous efforts to avoid that contingency. No sooner were we off the Gold Standard (Sept. 21, 1931) than it was discovered that exchange freedom has its compensations—in particular it was found that our main suppliers were most anxious to continue to supply their best customer and were prepared to accord us the most favourable

terms rather than lose their traditional market. The freeing of the exchange was soon followed by an expedient which bid fair to give us the best of both worlds: the Exchange Equalisation Account was established. This provided a fund to steady the exchange by ironing out minor fluctuations. It seemed to offer the quick 'natural protection' of the Free Exchange with as much steadiness as was permitted by underlying conditions. In fact, the E.E.A. perhaps aimed rather at holding the rate than at merely ironing out temporary fluctuations. In 1936 came the Tripartite Agreement with the U.S.A. and France, aimed at maintaining the basis of international exchange. France was one of the few countries still on gold after 1931 but was finally forced off in 1936 (following the enactment of the 40-hour week), its trade having grievously suffered from the franc's over-valuation. The U.S.A. had itself in 1933 deliberately devalued the dollar—the oz. of gold making \$35 instead of only \$20.67. Meanwhile Hitlerite Germany was manipulating its exchange to provide marks at different rates according to the purpose for which they were to be used.

The Second World War broke out in 1939 and soon led to the pegging of the leading currencies—the £ at 4.03 dollars. It had been pegged in the First World War at 4.76 dollars (falling afterwards below 3.50 dollars) but much had happened since, including the dollar devaluation. Again, the nations failing to pay their way with taxation and savings, the end of the war found all the participants with depreciated currencies in terms of goods. The £ declined to 4/7 of its pre-war value—as measured by wholesale prices. The Cost-of-Living Index did not measure the fall in value since many of the prices were controlled and subsidised. After the First World War we set about raising the value of the £ and after much effort and many changes in Bank Rate succeeded in restoring the Gold Standard. After the Second World War the position is very different and is dominated by the International Monetary Fund (I.M.F.). Bank Rate has been kept at the 'cheap money' rate of 2 per cent since 1939 and the £ continues (under the I.M.F.) to be pegged at \$4.03. The I.M.F., whose main purpose is to keep exchange rates stable, or reasonably stable, requires every member country to fix the par value of its currency in gold, or gold dollars. The I.M.F. is clearly inspired by the Gold Standard but, with its machinery for co-operative action, is far removed from the old Gold Standard system, with each country managing its own affairs albeit with regard to the 'rules of the game.' In the past, while all Gold Standard nations might be faithfully keeping in step, the value of gold itself might be unstable—might be going up or down—with good or bad results. Under Article IV, Section 7, the I.M.F. should be able to counter this outstanding defect in the old system. The I.M.F. aims at sustained national incomes all round and its machinery is there both to reduce the need for

internal adjustments and to cushion them when inevitable. In the old days unemployment was often the adjusting factor for an over-valued currency and if the I.M.F. plays a major part in promoting less harsh methods of adjustment it will have deserved well of mankind. Adjustment there must be. No country can go on indefinitely living beyond its means. Equally, no country can, without serious effects on world trade, go on living below its means unless it is prepared to give away the surplus, and that promptly.

Through the International Monetary Fund and the Havana Charter, the United Nations are attacking unemployment throughout the world and through the I.M.F. they are seeking exchange stability by means short of returning to the pre-war Gold Standard. In both the I.M.F., and the Charter the United Nations have as a prime objective the expansion of international trade. Multilateral trade is the ideal and reciprocal or bilateral trade only be countenanced in so far as it can justify itself. The simple pre-war issue of Free Trade versus Protection has become more complicated. Multilateralism combats not only high tariffs but other trade barriers of all kinds, a whole paraphernalia of restrictions—quotas, subsidies, exchange controls, etc.—which, along with state trading, have grown up since 1914. In 1914 men were asking themselves whether the lead which this country had had in international trade—first in the field with the Industrial Revolution—was not already far spent and, if so, how this island was to modify its policy or practice to meet the situation. The Free Trade answer is not in doubt—if one trade can no longer stand up to foreign competition, even with full efficiency, then resources must move to other trades that can. Arguments for and against Free Trade went largely into cold storage during the First World War; although in 1915 the McKenna duties on luxuries made a breach in the Free Trade position. After the war international trade was over-shadowed by the problem of reparations—‘making Germany pay.’ There were conflicting aims—keeping Germany economically weak enough to prevent her making war again and getting her economically strong enough to pay large amounts in reparations. Moreover the problem of unemployment was there to bedevil the reparations question—while there was a general demand that Germany should not escape paying tribute, no one was anxious that she should supply goods which might threaten employment in his own trade. After a short post-war boom a deflation policy brought this country prematurely back to the Gold Standard in 1925. In 1929 a financial crash in the U.S.A. ended a long run of prosperity there, and led to the biggest slump in history in 1931–32. Unemployment rose to record heights in this country, but was far worse in the United States. In the general *saucis qui peius* nations made what arrangements they could to protect their trade with little regard for the truism that a world reduction of imports is a

world reduction of exports. Britain, which was still substantially a Free Trade country although a number of protective tariffs had been introduced since 1914, was impelled to impose a general tariff on manufs. and to extend Imperial Preference. In Germany the severe unemployment helped the rise of Hitler who soon had the country at work preparing for war and whose bilateral arrangements with neighbouring countries gave ‘bilateralism’ a bad name.

Trade generally was improving haltingly when rearmament, soon followed by the Second World War, again began to take charge of the industrial situation.

Press Portrait Bureau

LORD KEYNES

The First World War had seen total war for the first time—nations mobilising all their industrial strength in the struggle for victory. The Second World War was to see this carried to even greater lengths, with the nations geared to war as never before. The resulting distortion of the world's economy together with the heavy destruction of cap. left an economic problem of the first magnitude—a problem superimposed on the general problem of Free Trade versus Protection which had perforce been shelved during hostilities. One aspect of the general problem had grown to disturbing proportions. The primary countries of the world are no longer content to be merely the world's producers of food and raw materials: they want to develop manufs. of their own.

This tendency, greatly developed under the stress of two World Wars, makes an obvious problem in adaptability for predominantly manufacturing countries like the United Kingdom.

The U.S.A. which has supplied prodigious quantities of war material to the Allies emerged from the war as the outstandingly rich country in contrast to the impoverished countries of Europe. Lend-Lease ceased abruptly in 1945 at the end of the Jap. war; but was followed by loans from the U.S.A. and Canada followed in turn by Marshall Aid (European Recovery Programme) from the U.S.A. which looked to see the countries of W. Europe standing on their feet by 1952. But 'America helps those who help themselves' and the benefiting countries were urged and helped to restore both their industry and their mutual trading. At America's suggestion an Organisation for the European Economic Co-operation (O.E.E.C.) was set up for this purpose; and was intended at the same time to continue as a permanent body.

The Amer. loan to this country (£938 millions) was not granted without conditions. The U.S.A. besides being anxious to see the world again 'on gold' was keen to push multilateral trade as against reciprocal trade such as Imperial Preference and to reduce or abolish restrictions in general. A policy on these lines is embodied in the Bretton Woods trade agreements (International Monetary Fund and International Bank) and the Havana Charter for an International Trade Organisation.

Freedom of Trade with exchange stability is in the Brit tradition, but our acceptance of the Bretton Woods agreements and our endorsement of the U.S. 'Proposals' which led to the drafting of the Charter were in fact conditions of the loan. The International Monetary Fund aiming at exchange stability is discussed above. The International Bank makes or guarantees long-term loans for the development of resources of particular regions in the general interest. The Havana Charter provides for the establishment of an International Trade Organisation whose aim besides the assurance of income and demand, and the fostering of general economic development is to promote good commercial practice generally and in particular 'To promote on a reciprocal and mutually advantageous basis the reduction of tariffs and other barriers to trade and the elimination of discriminatory treatment in international commerce.' The Charter is not yet ratified. A Geneva Agreement on Tariffs and Trade made preliminary rules which—with cuts in tariffs and preferences—are meantime accepted by many leading countries.

In sum, the Free Trade versus Protection problem has emerged from the Second World War very much the child of events. The U.S. sees her multilateral trade ideals being substantially accepted by the United Nations in conference and is at the same time providing W. Europe with the means to repair the devastation and distortion of war and

approach a state of sufficient economic normality to allow of such ideals being put more fully into practice. On the one hand the world is paying tribute to the ideals of multilateralism, on the other the countries of W. Europe in particular are bending their energies to increase their exports and reduce their imports so as to secure a balance; and, since multilateralism cannot be relied upon to close the import-export gap, restrictions on imports and reciprocal arrangements to ensure exports have never been so rife. It is true that the international agreements themselves recognise fully that the world is in no condition for immediate multilateralism and provide for return to normality only as conditions permit. If some countries have an excess of imports it follows that other countries must have an excess of exports. The U.S.A. is outstandingly such a country and if the rest of the world is to reach normality, must herself close that gap either by gifts (as now) or loans or by increasing her own consumption of imports.

Multilateralism has suffered one notable setback. Britain had been able to pay for much of her war effort by the accumulation of sterling balances, to the extent of over £2000 millions, and was as a further condition of the U.S. loan to make sterling convertible at what proved to be a far too early date. A Brit. memorandum to O.E.E.C. (Cmd. 7572) stated: 'The impossibility of maintaining the convertibility of sterling which was attempted in 1947 made it necessary to embark upon a system of bilateral agreements in order to secure the continuance of as large a volume of international trade as possible.'

It emerges that the real test of how far multilateralism can be pressed to solve the trade problems of the world—even the world outside the E. European countries under Soviet influence—is postponed. In Soviet Russia, now one of the world's leading industrial countries, the state plans all activities. Socialism too—the faith of a few enthusiasts in 1914 but now holding the reins of gov. in this and other countries—is a planner of domestic trade. Since planned domestic trade would seem to march with planned foreign trade it may be that present bilateral arrangements will tend to persist. In any case the conquest of unemployment cannot fail to ease the effects of too little multilateralism—or too much; 'conquest in principle' rather, since it is too much to hope that the new technique will be applied without a hitch. Moreover, it has its own problems. Apart from danger of inflation there is also the danger of impaired incentive—although employment well below 100 per cent is consistent with the conquest of unemployment. Social security, too, has its risks of impaired incentive; but on the other hand, it helped to sustain spending-power here in the 1931-32 slump and may be deliberately used to sustain it in future. Trade unions exist for the protection of their members' best interests. Acceptance of multilateralism with mobility of labour

requires trade unionism as a whole to take the widest views of the means of achieving this protection. Both trade unionism and socialism must face and solve the incentive problem. Between the wars there was 'poverty in the midst of plenty'; to-day the war has abolished plenty; and even to-morrow a good day's work will be an essential of 'plenty' under any régime. Memories of unemployment die hard: perhaps ten years' experience of 'full employment' will be necessary before people realise that to work 'all out' is to benefit one's neighbour and not to endanger his livelihood.

Economics and Political Science. The London School of, a school which provides special courses of training for men and women, for examinations in economics and political science, also in commerce and industry. Estab. in 1895, it is suited for business men, civil and municipal servants, journalists, etc. In connection with the British Library of Political Science, courses of lectures are provided on the methods of investigation, etc., and studentships of a value of from £25 to £200 are awarded. Preparation is also given for the B.Sc. and D.Sc. degrees in Economics of the London Univ. The School of Sociology and Social Economics has been merged in the above school. The average ann. number of regular, as opposed to occasional students, is 1000. The increase in recent years of regular students reflects a growing recognition of the importance of the studies in the school.

Later developments include the estab. in 1930 of a Chair of Imperial Economic Relations, and a Research Chair of Social Biology. Another recent feature is the department of Business Administration Research and Training, the scheme of which supplements the general Commercial Degree. A standing committee has been set up to co-ordinate the school's activities with those of the Royal Institute of International Affairs and to act as a centre of communication with similar committees in other countries. The school is situated in Houghton St., Aldwych, W.C.

Economic Warfare. Ministry of, formed on the outbreak of the Second World War, 1939, to prevent vital war materials from reaching Germany. Its counterpart in the war of 1914-18 was the ministry of blockade, but its functions were wider. Control bases were set up at Weymouth, the Downs, Kirkwall, Gibraltar, Aden, and Haifa, at which all shipping bound for the enemy or for neutral ports having access to enemy ter. had to submit to contraband control. The Fr. Gov. used the term 'blockade' for their analogous ministry, which co-operated closely with the M. of E. W. Shipping companies, in order to avoid delay, were encouraged to send advance copies of their vessels' manifests, giving details of all cargo carried, and names of shippers and consignees. One of the chief difficulties of the M. of E. W. was to prevent contraband goods consigned to neutral countries being resold to Germany since it was no part of Brit. policy to ruin

neutral trade with Germany, but only to prevent the entry of essential war materials, such as lead, nickel, copper, fats, etc., and in carrying out this task the M. of E. W. received information from its agents abroad, who reported upon the ultimate destination of contraband shipped to neutrals. While the M. of E. W. was responsible for answering inquiries about ships and cargoes detained by the contraband control authorities, the procurator-general became responsible as soon as the cargo had been seized and applications for release were made to that authority. Applications to bid for prize goods at auction were made to the Admiralty Marshal. Altogether the staff of the M. of E. W. numbered at most about 600.

Economist, *The*, London weekly jour., founded in 1843 'to discuss financial questions in their wider social and commercial aspect.' James Wilson was the founder and editor of it from its inception until 1877, when he was succeeded by Walter Bagehot. *The E.* has always been a force in politics; it was a strong advocate for the repeal of the Corn Laws, and later was opposed to indiscriminate laudation and extension of the railways. General commercial information for the current week is also to be found in *The E.* One of the greatest critiques ever paid to a weekly jour. was rendered to *The E.* at its centenary luncheon celebration in London on Sept. 2, 1943, the guests including representatives of the Brit. dominions, and Indian govs. the Bank of England, and other banks, merchants, railway magnates, economists, authors and the London daily and weekly press. The toast of *The E.* was proposed by Sir Kingsley Wood, chancellor of the exchequer, and seconded by Sir Montagu Norman, governor of the Bank of England, both of whom recalled the name of a former ed., Walter Bagehot, under whose direction the jour. became, what it had since remained, one of our national institutions. Bagehot (said the latter) did more than any other single individual to promote and direct the transformation of the Bank of England into a Central Bank operating as a public institution with a unique function, and he did it as ed. of *The E.*

But, generally, one result of the policy of anonymity is that the world knows very little about the men who, besides the eds., have actually written *The E.* throughout the century. Herbert Spencer was one of the first and most distinguished, Nassau Senior and Sir Robert Giffen are two other distinguished names on record; but the most distinguished occur in the middle period—Herbert Asquith and Alfred Milner. Geoffrey Crowther became ed. in 1938. See Oxford Univ. Press, *The Economist*, 1843-1943, 1943; and *The Economist* of Sept. 4, 1943.

Econonus, or **Econonus**, hilly cape on the S. coast of Sicily, situated between Agrigentum and Camarina. It was the site of a battle fought in 311 B.C., when the Syracusan Agathocles suffered defeat at the hands of the Carthaginians.

Economy, township of Beaver co., Pennsylvania, U.S.A., on the Ohio R., 17 m. N.W. of Pittsburgh. Until 1904 it was owned by a communist sect, the Harmony Society. It came to an end owing to the celibacy of the communists. Pop. 1100. See also RAPP, GEORG.

Ecrins, *Barre des* or *Poiate des*, the termination of the Dauphine Alps. Until 1862 it was regarded as belonging to Mont Pelvoux, but F. F. Tuckett in that year estab. its separate existence. It reaches a height of 13,463 ft.

Ecstasy, or **Trance**, term which can be used to describe a morbid state of mind, or a condition, when the mind, having temporarily lost all self control, is ruled by one idea, object, or emotion. Hysteria and catalepsy are similar forms of the disease, if such it can be called. It often accompanies religious mania, and the patient may lie as in a trance, or be convulsed in movement. But E. in relation to the exalted state of the mystic is not to be confused with trance. On its practical side mysticism maintains the possibility of direct intercourse with the Being of beings or 'Highest'—an intercourse not through revelation or oracles but by a kind of ecstatic transfusion in which the individual becomes a very true 'partaker of the divine nature.' The E. of the mystic is exemplified in the visions of St. Teresa of which she gives an account in her autobiography, and in the beliefs of her coadjutor, St. John of the Cross and of Plotinus.

Eothyma, anct. Gk. medical term applied to a condition of the skin, which at various times and in various languages has had different meanings. It is best understood as an angry-looking sore, the origin of which is due to infection at the start, or later when the surface is broken, as in *impetigo contagiosa*.

Ectropion, curving outwards of the eyelids, resulting from chronic, long-continued irritation. This produces an unsightly condition, which comes under the category of 'blear-eyed.'

Ecuador (so called because the equator crosses it), republic of S. America, bounded on the S.E. and S. by Peru, on the N. and N.E. by Colombia, and on the W. by the Pacific. The boundaries between E. and the neighbouring countries were definitely settled only in 1944, the question having been referred to arbitration. The country is triangular in shape, and may be divided into three sections, the narrow, low-lying coast-land, the mt. region, and the vast plains to the E. These dists may be called the Cis-Andine, Inter-Andine, and Trans-Andine respectively. The prin. peaks of the Andes which are situated in E. are Chimborazo (20,702 ft.), Cotopaxi (19,498 ft.), Cayambe (19,186 ft.), Antisana (18,864 ft.), Iliniza (17,405 ft.), Cotacachi (16,301 ft.), and six others with an altitude of over 16,000 ft. The prin. port of the country is Guayaquil, the cap. and seat of Quito; and Cuenca, Ambato, and Riobamba are important cities. The chief rvs. are the Esmeraldas, the numerous streams that combine to form the Guayaquil; those

flow to the Pacific. Trans-Andine E. is watered by the upper waters of many tribes of the Amazon. The fauna include deer, tapirs, peccaries, parrots, humming-birds, and numerous reptiles; the condor, which inhabits the slopes of the Andes is the most remarkable bird. The climate of the country is hot and unhealthy save in the valleys of the middle region, where it is cool and salubrious. Vast areas of the country are clad in virgin forest, rich in rubber, cinchona, dyewoods, and other valuable timbers. Most of this forest area lies in the Amazon basin, but the Pacific slopes of the Andes up to an altitude of 5000 ft. are also forest clad. In the coastal regions and lower riv. valleys tropical farming is carried on, and cocoa, coffee, cotton, tobacco, sugar, and rice are grown; among the foothills and mt. valleys is land suitable for grazing and dairy-farming and the cultivation of potatoes, cereals, and temperate fruits and vegetables. The output of cocoa, E.'s staple produce, is declining owing to competition, but it is still the most important export. The *Witchbroom* disease, which appeared in 1921 in the cocoa plantations, has had a disastrous effect on E.'s agric. wealth. Coffee, ivory-nuts, wild rubber, rice, caoutchouc, cinchona bark and fruits are other vegetable exports. Panama hats are another article of trade. E. is the world's chief supplier of balsa wood. Petroleum is the chief mineral; considerable quantities of gold are found, and silver, copper, lead, iron, and coal are known to exist; sulphur is another important mineral product. Quicksilver is also mined, and emeralds and rubies are occasionally found. Communications are bad, roads being very poor; there is riv. transport in some dists. and some 700 m. of railroad. There is no state religion, and toleration prevails; education is fairly well provided for, though methods need improvement. There are univs. at Quito, Guayaquil and Cuenca, and a law college at Loja.

The gov. is in the hands of a president, a council of state, a senate, and a chamber of deputies. There are two senators for each of the 18 provs., and a deputy for every 50,000 inhabs. elected by universal suffrage; the president is elected for four years. No privileges of rank or race are recognised. In 1926 an Amer. Financial Mission arrived in E., and made recommendations which were enacted as laws, but these have since been considerably changed. A new customs tariff, prepared by the Mission came into force in 1927, but sev. amendments were made in this tariff in 1935, increasing the duty on numerous articles by 50 per cent, while surcharges were imposed on goods from countries with unfavourable trade balances; and preferential tariffs were also estab. The area of E. cannot be definitely given, but is probably in the region of 175,000 sq. m. The Galapagos Is. have an area of 2868 sq. m. The Incas of Peru conquered this area towards the end of the fifteenth century, and were in their turn conquered by the Spaniards under Pizarro. For 200 years the country remained part

of the Sp. state of Peru; then, in 1822, a revolutionary war gave it independence, it becoming a part of the republic of Colombia. In 1830 there was a civil war in this newly-created republic, and the presidency of Quito became the republic of Ecuador. Warfare arising out of the border question continued, however, between E. and Peru nearly 100 years; and in 1941 Peru invaded the prov. of El Oro. The dispute was settled by the arbitration of Argentina, Brazil, and the U.S.A., and agreement reached in 1912. The pop. of 3,089,000 is composed chiefly of aboriginal Indians, descendants of the Span. conquerors and people of mixed blood. Span. is the language of the country. See L. Ternaux-Compans, *Histoire du royaume de Quito. Traduite de l'Espagnol* (Velasco, *Historia del reino de Quito*), 1840; C. Cevallos, *Compendio del resumen de la historia del Ecuador*, 1885; and *Resumen de la historia del Ecuador* (Guayaquil), 1886; W. Reiss and A. Stübel, *Hochgebirge der Republik Ecuador*, 1892-98; C. Ecumenical, see (ECUMENICAL).
Eczema, see under SKIN—Diseases; (domestic animals, under DOGS and HORSES).

Edam, one of the so-called Dead Cities of the Zuyder Zee, Holland, but still very much alive, with a large Gothic fourteenth-century church, a museum in a house in the likeness of a ship built by a sixteenth-century sea-captain, and a bell tower with a very musical chime. The country round is noted for its cheese, to which the tn. gives its name. Pop. 8000.

Edda ('great grandmother'), the name of two anct. Icelandic works, which are authorities for N. mythology. The first, or the 'Elder Edda,' was compiled during the thirteenth century. It was discovered about 1643 by Brynjolf Sveinsson, who attributed it erroneously to Sæmund Sigfusson, an Icelandic priest (1056-1133). The poems in the compilation date from the ninth, tenth, and eleventh centuries. They are thirty-three in number, and consist of epic tales of the Scandinavian gods and goddesses, and narratives of Scandinavian popular heroes. The verse of the pieces is all typical alliterative Scandinavian poetry; two forms are employed. The first part of the book is written in epic metre, or *kriðubúttir*, the verses in this part are divided into strophes of eight lines. The second part is written in *godhabattir* or didactic metre, and in strophes of six lines. The other compilation of poems, or 'Younger Edda,' was discovered in 1628 by Arngrim Jonsson, and arranged by Snorri Sturluson. The actual date of composition is about 1150. This book may be divided into five portions; it is the princ. authority on N. mythology and poetry. The first part is the preface or *Formall*: this is of a comparatively modern nature, and gives an account of the beginning of the world, etc., on

orthodox Christian lines. The second part is entitled *Gylfaginning*, the delusion of Gylf, and is a kind of prose synopsis of N. mythology. The third part is a continuation of the second; it is entitled *Bragnarökur*, 'the sayings of Brag', which consist of further legends of deities. The fourth part is called *Skaldskaparmál* or Art of Poetry and is a treatise on Scaldic poetry and versification. The last part consists of three poems in honour of Haakon, king of Norway (died 1263), with a running technical commentary, and is entitled *Hattatal*, a system of prosody.

Eddington, Sir Arthur Stanley (1882-1944), Eng. astronomer and physicist, b. at Kendal and educated at Owen's College, Manchester, and Trinity College, Cambridge, where he was Senior Wrangler in 1904 and Smith's prizeman in 1907. He was made a Fellow of his college in 1907, and after seven years' work (1906-1913) as chief assistant at the Royal Observatory, at Greenwich he was elected Plumian Prof. of Astronomy at Cambridge, his tenure of the chair being combined with the directorship of the Univ. Observatory, and elected a Fellow of the Royal Society in 1914. E.'s main work was not that of an observational astronomer, his time at Greenwich being mainly taken up with statistical examinations of stellar motions, and his researches in this sphere led to the pub. of his *Stellar Movements and the Structure of the Universe*, which appeared in 1914. His original fields of research were the investigation of the stellar system, the study of the internal constitution of the stars, the interpretation of the theory of relativity and the estab. of the relationship between atomic structure and cosmogony. In 1916 he took up the study of the radiative equilibrium of the stars and reached the conclusion that big stars were tenuous and small stars dense. One of his most striking discoveries was a correlation between the mass and luminosity of stars (1924): he showed that the absolute luminosity of a star increased with its mass and that the luminosity per unit mass also increased. This law enabled astronomers to calculate the masses of the thousands of stars whose luminosities could be correctly measured. He extended his work to cover the Cepheid variables. He confirmed Einstein's theory of relativity by observation and extended it mathematically. His especial contribution to relativity was a generalisation of Weyl's theory—by which electromagnetic phenomena are included with gravitation in the geometry of the world—giving a conceptual representation of physical phenomena which allowed a new understanding of them. The chief feature of his generalisation is the idea of a unit of interval at every point of space-time; what is called a metre at any place and in any direction is a constant fraction of the radius of curvature of space-time for that place and direction. The last ten years of E.'s life were occupied with research for precise connections between the cosmological constants and those of atomic

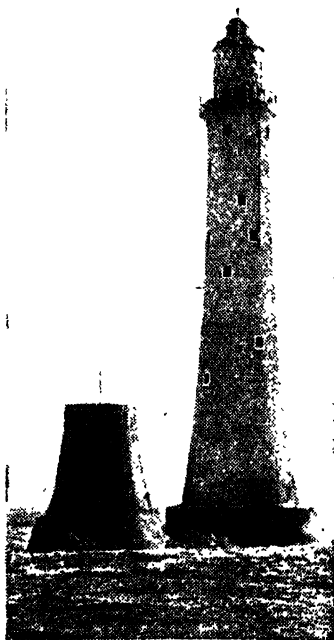

physics and in 1933 he pub. his popular book *The Expanding Universe* in which he developed his views of phenomena that might be expected in a finite expanding spherical universe of the type suggested by Einstein. In 1943 he pub. a complete account of his researches in his lectures before the Dublin Institute for Advanced Studies, entitled *The Combination of Relativity Theory and Quantum Theory*. His great book on the *Relativity Theory of Protons and Electrons* (1936) is controversial and its value cannot be assessed yet; but his adversaries cannot deny his capacity for advancing startling ideas and for the brilliant working out of their consequences. In addition to the above mentioned great books E. was the author of many other works. One of these was *The Nature of the Physical World* which was based on the Gifford Lectures delivered at Edinburgh in 1927 (Everyman's Library, 1935). E. was an accomplished astronomer whose original theories and powers of mathematical analysis undoubtedly benefited his science; he was a brilliant expounder of physics and astronomy with the gift of being able to impart the most abstruse conceptions in the simplest and withal most fascinating language—as may be seen in his *Space, Time and Gravitation* (1920) and *Stars and Atoms* (1927); and finally he was an able interpreter to philosophers of the significance of the most recent scientific discoveries. He received many honours. In 1924 he was awarded the Gold Medal of the Royal Astronomical Society and in 1928 he was the Society's Royal Medallist. Many univs. honoured both him and themselves by the conferring of honorary degrees. He was elected a Fellow of the Royal Society in 1914, knighted in 1930 and decorated with the O.M. in 1938. See A. D. Ritchie, *The Philosophy of Sir Arthur Eddington*, 1948.

Eddoes (E. Indian species of Araceæ), see Cocco.

Eddy, see WHIRLPOOL.

Eddy (Mrs.), Mary Baker (1821-1910), discoverer and founder of Christian Science and author of its text-book, *Science and Health, with Key to the Scriptures*, and other works on Christian Science. Mrs. E., whose maiden name was Mary Baker, was born to Congregational parents of Puritan ancestry at Bow, New Hampshire, U.S.A., July 16. She was thrice married. After a frail youth and middle age, most of which time she devoted to study, writing, and experimenting in the various systems of therapeutics in order to discover if possible the cause and cure of disease, Mrs. Eddy, who was a profound student of the Bible, as the result of the instantaneous healing of the effects of an accident considered fatal, discovered in 1866 what she declared to be the divine principle underlying Jesus's works. On this discovery she founded her healing system and named it Christian Science. In 1875 she pub. *Science and Health, with Key to the Scriptures*, founded the first Christian Science Church, in Boston, Massachusetts, in 1879; estab. successively the Massachusetts

Metaphysical College in 1881, *The Christian Science Journal* (monthly), *Sentinel* (weekly), *Herold* (monthly in German), and *Monitor* (daily). Other writings include *The Science of Man* (1870), *The People's Idea of God and Christian Healing* (1880), *Rudimental Divine Science* (1891), *Church Manual* (1895-1910), *The First Church of Christ, Scientist, and Miscellany*, (posthumously 1913). The most thorough authorised biography of Mrs. E. is that by Sibyl Wilbur, *Life of Mary Baker Eddy* (1913)

Topical Press

THE EDDYSTONE LIGHTHOUSE

In it the reader will find details of Mrs. E.'s early life; of her struggles to gain a hearing for her ideas and her book and to protect them and herself from persistent attacks made from various sources—pulpit, Press, and medical—which involved some misrepresentation of both; of her final triumph in which she saw her Church grow, prosper, and become a power. Mrs. Eddy left the bulk of her estate, valued at \$2,000,000, in trust for the extension and promotion of Christian Science as taught by her. Suits were brought against the executors of her will by a son and adopted son of Mrs. Eddy,

but these were finally withdrawn. See also CHRISTIAN SCIENCE.

Eddystone Lighthouse, light in the Eng. Channel erected to mark a group of rocks which lie in the fairway from the Start to the Lizard, and are visible only at ebb-tide. The lighthouse is situated about 9 m. from the Cornish coast, and 14 m. S.S.W. of Plymouth. The present structure is the fourth which has been erected. The first was in the form of a wooden polygon 100 ft. in height with a stone base; it was built by Henry Winstanley in 1696 and carried away by the storm of 1703. The second was also of wood on a stone base; it was erected by Mr. Rudyard in 1706, was 92 ft. high, and was burned down in 1755. The third edifice was rebuilt by John Smeaton and was built of blocks of Portland oolite encased in granite and dove-tailed together. It was 261 ft. at the base, 15 ft. at the top, and 85 ft. in height. The rock on which it was built was undermined, so the structure was taken down and re-erected on Plymouth Hoe; the first floor was left on its site. The present lighthouse was designed by Sir J. N. Douglas and completed in 1882; its lamp has a dioptric apparatus and gives a light equal to 358,000 candles. The light gives a double flash every half minute and can be seen for 17 m., being 133 ft. above the water.

Ede, James Chuter (b. 1882), Eng. statesman, b. at Epsom, son of a grocer there; educated at local national schools; Dorking High School; and at Christ's College, Cambridge, having won a scholarship from the Battersea Pupil Teachers Centre. Assistant master in Surrey elementary schools until 1914; Assistant Secretary Surrey Co. Teachers' Association, 1919-45. M.P. (Labour) Surrey (Mitcham div.) 1923; S. Shields 1929-31 and from 1935. Home Secretary since 1945. Chairman, London and Home co-ops. Joint Electricity Board 1934-40. President, Brit. Electrical Development Association 1937. For thirty years a co. councillor of Surrey. Not an active Fabian but a great exponent of Fabian political methods. Often called upon to act as deputy leader of the Commons.

Edelink, Gerard (1649-1707), Fr. engraver, b. at Anvers. He was a pupil of Polity. Louis XIV. entrusted to him the execution of sev. important works. He was the first engraver to change the material on which he engraved according to the object represented, so giving tone and colour to the engraving. Among his works, which number over 300, his 'Holy Family,' after Raphael, is one of the best known.

Edelweiss, or *Leontopodium alpinum*, well-known species of Compositae which occurs in its wild state in Switzerland, but can be cultivated in Britain. The dense involucre consists of outer female florets and inner male florets, and these are surrounded by hairy bracts.

Eden, riv. of England, which rises among the Pennines, on the borders of Westmorland and Yorkshire. It flows in a N.W. direction, through Appleby, Eden-

hall, and Carlisle. After a distance of 65 m., it forms a wide estuary at Rockcliffe, in the upper part of the Solway Firth.

Eden, Anthony (b. 1897). Eng. statesman, son of Sir William E., of Windlestone Hall, Bishop Auckland. Served in the war of 1914-18, on the staff of Gen. Plumer, being wounded during the Ger. offensive of 1918. After the war he went to Oxford Univ. In 1923 he was elected M.P. for Warwick and Leamington, which constituency he still (1949) represented. Parl. under-secretary for foreign affairs in the first National Gov., having rendered good service at the abortive Disarmament Conference. Lord privy seal, 1934. On the reconstruction of the National Gov. in 1935, he was appointed minister for League of Nations Affairs, and took a leading part in the Brit. efforts to follow the policy of collective action against Mussolini's aggression in Abyssinia. On the resignation of Sir Samuel Hoare after the rejection of the Hoare-Laval Pact on Abyssinia, E. replaced him as foreign secretary. Sponsored and carried out the policy of non-intervention in the Span. civil war; but in 1938, he resigned as a result of differences of opinion with the Prime Minister, Mr. Neville Chamberlain, over proposals for an Anglo-Italian pact. (See also *EUROPE—History*.) In 1939, on the outbreak of war with Germany, he was recalled to the ministry, becoming secretary of state for dominion affairs. He flew to Egypt in 1940 to receive the Australian and New Zealand Expeditionary Force on its arrival at Alexandria. He was appointed secretary of state for war in Mr. Winston Churchill's cabinet (May, 1940), but became in the same year foreign secretary again, which office he held until 1945, when the Labour gov. assumed office. In the most critical years of the existence of the League of Nations, before the outbreak of the war, E. tried to avert war by bringing the machinery of the League to bear against Germany and Italy. His campaign failed in those days of 'realistic views', about the Ger. and Its., but the principles for which he fought then were those for which he worked throughout the war. With no taint of Chauvinism, he is a stout defender of what the Brit. Empire and the Commonwealth have done for the world.

Eden, George and William, see AUCKLAND, BARON.

Eden, Garden of (Heb. 'delight'), the Biblical first home of man, and the dist. in which the Garden of Paradise was situated. There has been much discussion regarding the exact site of Eden, and many futile efforts have been made to reconcile the mythical geography of Genesis with modern knowledge. Recent discoveries, however, have shown that *Edin* was the Sumerian name for the plain of Babylon, and at the S. end of it was the city of Eridu, and near it a beautiful garden containing the Tree of Life. The accepted modern location appears to be El Qurnah, in Iraq. It would seem, from all accounts, that the Garden was in Eden, and the riv.

with its four heads, spoken of in Genesis, must have been the Persian Gulf, which the Babylonians regarded as a riv. The idea of the 'tree of life' situated in the Garden of Eden would appear to have existed in the *Vedas*, in which the first man is represented as leading men to the garden of immortality where he dwelt in fellowship with the gods. It may also be traced in Babylonian and Assyrian monuments; but the idea of the primeval state of man, as in the biblical account of Paradise, is of a more religious and ethical nature than any of the earlier forms. See the commentaries on Genesis and F. Delitzsch, *Wo Lag das Paradies*, 1881, and *Im Lande des einstigen Paradieses*, 1903.

Edenbridge, mkt. tn. of Kent, England, 10 m. W. of Tunbridge Wells. Haver Castle, near by, was the home of Anne Boleyn, and is now the country seat of Maj. Astor, owner of the *Times* newspaper. Pop. 3000.

Edenhall, vil. and mansion in Cumberland, England. The vil. is situated on the R. Eden, about 3½ m. N.E. of Penrith. The mansion is the family seat of the Musgraves. There is a spring in the grounds named St. Cuthbert's Well, around which a pretty legend is told, connected with an anct. goblet, called the 'Luck of Eden Hall'.

Edentata, order of mammiferous animals characterised by the absence of teeth in the front of the jaws and by the simple structure of their cheek-teeth, which are composed solely of ivory and cement, without any trace of enamel. They are of a low degree of organisation, although many of them are specialised for particular modes of life. All Edentates are either aboreal or terrestrial, and sev. of animals. The typical forms of this the carnivorous forms are burrowing order are the sloths, ant-eaters and armadillos.

Edenton, city of N. Carolina, U.S.A., co. seat of Chowan co., with many historic associations. On Oct. 24, 1774, fifty-one ladies at the 'Edenton Tea Party' signed resolutions that they would not use tea or anything manufactured in England until the tax on tea should be repealed. The royal governors lived here. During the eighteenth century the N. Carolina Legislative Assembly met here, and many important statesmen lived near E. Pop. 3500, of whom one half are negroes.

Ederle, Gertrude, Amer. swimmer, the first woman to swim across the English Channel, which she did from France to England in 1926 in 11 hr. 34 min.

Edessa: (1) anct. city of Asiatic Turkey, the modern Urfa. In 137 B.C. the cap. of an independent kingdom, it was made trib. to Rome; later it was a seat of Christian learning between the fourth and fifth centuries. From 1097 until 1144 the Crusaders held it, and it was destroyed in 1147 by the Turks, into whose possession eventually it came. The modern tn. is surrounded by walls and a moat and has an anct. citadel, and is in the centre of a wheat industry. Pop. 35,600. (2) Splendidly situated tn. of Greece, cap. of the

prov. of 'Pellis on the railway from Salonika to Monastir, with 13,000 inhabs.

Edfu or **Idfu**, tn. of Upper Egypt, situated on the W. bank of the Nile, in lat. 24° 59' N. It is the anc. Apollinopolis Magna, and is noted for its remarkable sandstone temple of E., which is the most complete Egyptian temple existing. It was begun by Ptolemy XIII. in 57 B.C. and took over 180 years to complete. It is approached by two great pylons of great antiquarian interest. The tn. of E. stands 484 m. S.S.E. of Cairo, and has manufs. of earthenware. Pop. 15,000.

Edgar, or **Eadgar** (c. 942-975), surnamed 'The Peaceable,' an A.-S. king, succeeded at the age of seventeen to the kingdoms of Mercia and Northumbria, but enlarged his dominions by degrees until he ruled over all Britain. In spite of the war-like propensities of his neighbours he lived in peace, hence his title of 'The Peaceable.' Yet he was a man of unbridled passions when once aroused; he snatched Wilfreda from her convent by force, and later killed Athelwolda the husband of Elfrida, because he stood in the way of his desires. During his reign wolves were largely destroyed in England.

Edgar Atheling (fl. 1066-1107), grand-nephew of Edward the Confessor. In spite of being the heir-presumptive, he was thought by the witenagemot to be too young on the death of Edward. They accordingly chose Harold, Earl of Godwin, to succeed; Harold was slain at the battle of Hastings, and E. was thereupon chosen king by the citizens of London. As soon as Wm. the Conqueror appeared in England, however, E. placed the crown in his hands, and retired into obscurity, from which he emerged only to place one of his nephews on the throne of Scotland.

Edgumbe, Sir **Edward Robert Pearce** (1851-1929), Eng. politician, traveller, and writer. Was pioneer of the small holdings movement. His works include: *Zephyrus, or Travels in Brazil and on It. Plata* (1887), *Popular Fallacies regarding Bimetallism* (1895).

Edgehill, hilly ridge in Warwickshire, England, 7 m. from Banbury. It is noted as the scene of the first battle of the Civil War in 1642. A huge figure of a horse is cut out on the hillside, and the spot is called the 'Vale of the Red Horse.'

Edgeworth, Henry Essex (1745-1807), known as 'Abbé Edgeworth,' b. at Edgeworthstown, Ireland, where his father was rector. In 1748 the latter was converted to Catholicism and went to Toulouse. E. entered the priesthood, and when he was ordained took the surname of De Firmont. He was made confessor to the Princess Elizabeth in 1791, and in 1793 to her brother, Louis XVI., whom he attended to the scaffold. In 1796 he went to England, and was made chaplain to Louis XVIII., who was in exile there. He died at Milan of a fever caught whilst attending the Fr. prisoners.

Edgeworth, Maria (1767-1849), Eng. novelist, b. at Hare Hatch, near Reading, was the daughter of Richard Lovell E., an author of some note in his day, by the first of his four wives. She does not seem

to have had any precocious call to letters, but in 1782 she translated Madame de Genlis' *Adèle et Théodore*. In London, where her early years were spent, she mixed with her equals; in Ireland, where she spent the next years, she acquired a considerable knowledge of the habits and ways of thinking of the peasantry; and her acquaintance with these sections of society was useful to her when she began to write fiction. Novels, however, were not her earliest literary output. Her first publ. was *Letters for Literary Ladies* (1795); her second, 3 vols. of stories for children entitled *The Parent's Assistant* (1796). In 1800 she pub. anonymously *Castle Rackrent*. Her *Popular Tales* appeared in 1804, and then came a succession of books, *Leonora* (1806), *Tales of Fashionable Life* (2 series, 1809, 1812), *Falconer* (1814), *Harrington and Ormond* (1817), and *Helen* (1834). She was a friend of Walter Scott, who much admired her Irish characters, and declared that it was after reading her books he set himself to do for the Scots what she had done for the Irish. Her works on education had a considerable vogue, and the popularity of her children's stories endures to this day. See studies and lives by Helen Zimmern, 1883, and E. Lawless, 1904; A. J. C. Hare, *The Life and Letters of Maria Edgeworth*, 1894; A. Paterson, *The Edgeworths*, 1914; S. H. Romilly (ed.), *Romilly-Edgeworth Letters*, 1936.

Edgeworth, Richard Lovell (1744-1817), Irish writer, father of Maria E. Remarkable for his powers of mechanical invention. He was a member of the last Irish Parliament before the Union. He educated his children in the spirit of Rousseau's teaching, and wrote on *Practical Education* (1798) in collaboration with his daughter.

Edgren, or **Edgren-Leffler**, **Anna Carlotta** (Cajanello, duchess of) (1849-92), Swedish authoress, b. at Stockholm. She married Judge E. in 1872; he did not share her advanced views, and she obtained a divorce in 1889. In the following year she married Pasquale del Pezzo, duke of Cajanello. She pub. her first vol. of stories in 1869, entitled *By Chance*; later she wrote plays, of which the chief are *The Struggle for Happiness* (1887) and *How One Does Good* (1895), etc. All her works reflect her keen observation and her modern views; her dramatic method may be said to lie between Ibsen and Strindberg.

Edgware, vil. of Middlesex, England, lying partly within the Hendon U.D. and partly within the Harrow U.D., 11 m. N.W. of London. A portion of the old Watling Street crosses the par. and it is said that Handel composed his *Harmonious Blacksmith* one rainy day in a forge which once stood in the vil. Pop. 5000.

Edict of Nantes, edict signed by Henry IV. of France in April 1598. It allowed the Huguenots free exercise of their religion, gave them definite rights of public worship, threw open to them all the offices of state, and estab. a Protestant chamber in the Paris Parliament, and

joint chambers in the local govs. This measure did much to promote the concord and prosperity of France, but unfortunately, in Oct. 1685, Louis XIV. formally revoked it. As a consequence religious rivalry was again stirred up, riots took place, and 400,000 of the most intelligent and industrious section of the community had to flee the country. They settled down in Protestant countries, many in Holland and Great Britain, and

tion attached is sent to the keeper of E. Cs. at the Edinburgh General Register House.

Edinburgh, cap. of Scotland, and one of the most anct. and finest cities in the United Kingdom. It is situated within 2 m. of the S. shore of the frith of Forth, 390 m. N. of London, and 105 m. from Aberdeen. Three eminences which run from E. to W. form the site of the city, which is surrounded on all sides, save the

C.O.I. : Crown copyright

PRINCES STREET, EDINBURGH, FROM THE EAST

On the left is the Castle, and in the centre the Scott Monument.

were an acquisition to whatever country they went.

Edicta (Lat. *edicta*), were proclamations made by all the higher magistrates at Rome, such as the praetors, tribunes, curule aediles, censors, etc. All these had the *ius edicendi*, and made known on their entry into office certain rules which they proposed to follow in administration. Since they had the *ius dictio*, the praetors in particular developed new legal principles in their edicts, and the latter played an important part in the evolution of the Rom. law.

Edictal Citation, term of Scots law used to describe a citation where personal service of the summons is impossible, as in the case of a non-resident debtor. Originally a proclamation was made, and an edict or order of the court was posted up in a public place. Now, however, a copy of the summons with a schedule of the cita-

N., by hills. The steep ridge descending from the castle rock to Holyrood constituted the anct. city, and on it the High Street is built. To the N. of this ridge was formerly the Nor' Loch. The New Town lies on the ground which rises beyond the valley of the Nor' Loch, now occupied by Princes Street gardens and railway lines. As viewed from the Calton Hill, the following is a bird's-eye view of the city. On the right may be seen the New Town, with its wide streets and stately houses stretching down towards the shore. Princes Street, nearly a m. long, lies opposite ; whilst the serried masses of houses forming the Old Town stretch on the left as far as the castle. There are still further streets on the S. towards the Braid Hills, and on the E. to Arthur's Seat ; whilst the northward view from the Calton Hill includes Leith, the frith of Forth, and the hills of Fifeshire. The valley which

formerly was the Nor' Loch, separates the New Town from the Old Town. The former occupies a ridge which is broader and not so steep as that which forms the site of the Old Town. The slopes on both sides of the hollow are laid out as public gardens. This quarter of the city has many attractions, though it does not possess the historical character and interest of the older portion of the town. The streets and squares are well planned, and the buildings, most of which are built of a handsome white freestone which is quarried in the vicinity, are magnificent. The extensive pleasure grounds in this quarter of the city are another attraction. The most noteworthy streets in the New Town are Princes Street, George Street, and Queen Street, which all run parallel to each other, eastward and westward. At the W. end of Princes Street are the Caledonian Railway Hotel and Station, St. Cuthbert's Church, and St. John's Episcopal Church; at the E. end are the Waverley Station and Hotel, one of the largest in Great Britain, the General Post Office, and the Register House (1774). Calton Hill forms the E. extremity of the street; this is a rocky eminence studded with monuments, including the Nelson Column and the unfinished National Monument. Salisbury Crags, a huge belt of precipitous rock nearly 580 ft. in height, rises beyond the E. extremity of the city; whilst behind this is Arthur's Seat, a conical hill, roughly in the form of a lion, 822 ft. high, with a narrow rocky summit. On the slopes of the Calton Hill are situated the Royal High School (founded in c. 1518), the Burns' Monument, and St. Andrew's House, a modern building occupying the site of the old county prison, the headquarters in Scotland of the Scottish Office. George Street, which is bounded by St. Andrew Square and Charlotte Square, has many fine statues and houses with literary associations. Queen Street contains the National Portrait Gallery and Antiquarian Museum, presented by J. R. Findlay; charming views of life may be obtained from its cross streets. The Water of Leith at Canonmills and Stockbridge forms the boundary of the New Town; many famous buildings and places are situated in this neighbourhood, including Donaldson's Hospital, Fettes College (founded 1870), and Stewart's College (founded 1855). A feature of E. is the number of Georgian buildings in the old town. This may be seen in the work of Robert Adam which includes a large part of the univ., the N. side of Charlotte Square (recently restored to its original state), the tomb of David Hume, and the Register House.

The prin. street in the Old Town is that built on the steep ridge which extends from the castle rock to Holyrood. This old street is more than a mile in length, and is called, at different points, Canongate, Netherbow, High Street, Lawnmarket, and Castle Hill, the whole being often termed 'the Royal Mile.' The aspect of this backbone of Old E. is quite in keeping with its traditions; the houses are all very anct. and very lofty. The High

Street opens into Parliament Square on the right hand side, going E.; the latter contains the old Parliament House and St. Giles' church, a large and anct. edifice in the later Gothic style of architecture, which was renovated in 1830. The anct. cross of E. which was removed in 1756, but in 1885 was restored at Gladstone's expense, now stands near the E. end of the church. The site of the Netherbow port, one of the anct. gates of the city, is a little further on, adjoining the house in which John Knox lived. John Knox's grave is situated in the graveyard cemetery near Parliament Close, to the rear of St. Giles'. Many other historic sites are situated in the High Street, including Burns's lodgings, Riddell's Close, Ramsay Lodge, Flesh-market Close, Old Fishmarket Close, and World's End Close. Past the Netherbow the street is called the Canongate; at one time all the nobility of E. lived here, and the Moray House and the Huntly House still remain. The Old Canongate Tolbooth and the Canongate church may also be seen in the Canongate; the closes off this street are as historically interesting as those of the High Street, though at the present time it is hard to realise its former splendour. The closes are numerous narrow lanes which descend laterally in regular rows from the main street; they are not as a rule more than six feet wide at the entrance, and those which admit of the passage of a carriage are called 'wynds.' The old street called the Cowgate runs to the S. of and parallel with the High Street, and opens at the W. end into the Grassmarket. 'The Palaces of the Cowgate' was a common term in olden times, as the palaces belonging to the princes of the land were there; it is now noted mainly for old-clothes shops. George IV. Bridge and South Bridge cross the Cowgate at a height of two or three stories; the univ. is the chief ornament of the latter, whilst the Carnegie Free Library stands on the former. The castle of E. is one of the most interesting of the public buildings. The fortress contains accommodation for 2000 soldiers. The old piece of ordnance called 'Mons Meg,' built of malleable iron casks, stands on a small flagged area which occupies the summit of the castle. The earliest portion of the castle, the old Parliament Hall, was restored in 1888-89; the room in which Queen Mary gave birth to James VI. is situated at the E. end of the S.E. side of the castle. Holyrood Palace, standing at the lower end of the street leading to the castle, does not date in any part from earlier than 1528, whilst the greater portion of it was built in the time of Charles II. The apartments occupied by the hapless Queen Mary are in the N.W. angle of the building. The ruins of the chapel belonging to the Abbey of Holyrood, founded by David I. in 1128, adjoin the chapel of Holyrood Palace on the N. side. The Parliament House, the building in which the Scottish Parliament met before the Union, is a magnificent hall, with a lofty roof, and contains various marble statues of celebrities. The Advocates' Library founded in 1683, and since 1925

the National Library of Scotland, and the Signet Library are adjoining buildings to the Parliament House.

Among the other noteworthy public buildings of E. are the Royal Institution, the National Gallery, the Surgeons' Hall, the General Post Office, the Museum of Science and Art, the Theatre Royal, the Tron Church, the Bank of Scotland, and the Royal Astronomical Observatory. The monument to Sir Walter Scott, situated on the S. side of Princes Street, and designed by G. M. Kemp, is the finest in the city. The seated figure of Scott is of marble and the monument is in the form of an elaborate Gothic cross 200 ft. in height. Other monuments in the city are to Burns, David Hume, Allan Ramsay, James Watt, Livingstone, William Pitt, Dugald Stewart, John Playfair. The Scottish National War Memorial was opened by the Prince of Wales on July 11, 1927. The actual memorial, which reposes in a Shrine in a noble structure on the apex of the rock on the site of the old barracks, consists of books containing the names of over 100,000 Scots who fell in the First and Second World Wars. The E. Cenotaph or Stone of Remembrance was unveiled by Prince Henry the same year.

The most important industries of E. are brewing and distilling, for which it has been noted for more than 200 years, and printing and publishing with the connected industries of paper-making, book-binding and map-making. Other manufs. are rubber, biscuits, hosiery, and knitted goods, paper-making machinery and electrical appliances. Lesser manufs. include rope and sail cloth, glass and sealing wax. There is shipbuilding and ship-repairing at Leith, which was incorporated in the city of E. in 1920. Nearby is the Turnhouse Airport. Several magazines of a high standard have been, or are, pub. in E.; the *Edinburgh Review* (1802), *Blackwood's Magazine* (1819), and *Chambers's Journal* (1832) were all started there.

The educational and cultural sides of E. are the most important; in addition to the univ. (for which see separate article) it has many schools. Amongst them may be mentioned the College for educating theological students of the United Free Church, the Edinburgh High School, Edinburgh Academy (1824), Fettes College (an endowed high school), Loretto School, near E. (founded 1827), and the training colleges for teachers. The Heriot Trust and the Merchant Company are represented by such institutions as the Heriot-Watt College (1885), the Heriot Technical School (1885), George Watson's College (1738), Merchiston Castle (1833), and the Queen Street and George Square colleges for ladies. A notable event in the cultural life of E., and indeed of Great Britain, is the E. Festival, first held in 1947. The city returns six members to Parliament (including the member for Leith), has an area of 32,402 ac., and a pop. of 408,500 (estimated). The city is governed by a tn. council of 71 members.

The advisory committee on city development, appointed by the E. Corporation

in 1943 to report on the general considerations governing the development and redevelopment of E. as the cap. of Scotland and the preparation of planning schemes, recommended for immediate action: the creation of self-contained communities, each flanked by main roads, each with its own school, open spaces, shopping centre, etc.; the estab. of an industrial estate organisation to attract new industries to the E. area and to encourage existing industries; the selection of a site for at least one aerodrome for E.; the selection of a central bus station; a scheme for unifying the academic area of the city instead of leaving the univ. (like that of London) permanently broken into widely scattered and separate parts; the selection of a suitable design for the Princes Street frontage and the conversion of the present frontages of the shops and other premises to that design; and the reconstitution of the High Street and Canongate area. In brief, the Committee recommended that E. should emulate the example of 1752 (when the creation of the New Town was initiated) and at the same time profit from the lessons of its defects. Their report places housing in the forefront and points out that to cope adequately with the problem of over-crowded and slum houses a detailed survey of the city is called for. In opposing an extension of the city's boundaries, the Committee says that from its inquiries, it considers that a city of half a million persons forms a sufficiently large local gov. entity. On the subject of Princes Street, the committee says: 'In the minds of many the jumble of buildings along this street is now irremediable. But in our view the site is of such importance that an attempt should be made to solve the problem. . . that new design should avoid the monotonous uniformity of the original and the chaotic confusion of the modern frontage. We further recommend that ultimately the Corporation should promote a re-designing of the whole of the Princes Street frontages as was done in Regent Street, London.' To meet the cost of reconstruction the report recommends the creation of a reservation trust with power to raise the necessary funds to finance the schemes.

The origin of E. is involved in obscurity, like most tns. whose hist. extends for a long way into the past. The most probable account of the origin of the name E. is that it was derived from the Northumbrian King Eadwine; it had obtained the name Eadwinesburg or Edwinesburg as early as the beginning of the seventh century. After this time very little is known of the hist. of E. until the reign of Malcolm Canmore (the son of Duncan I.), when Donald Bane besieged E. Castle after Malcolm's death. In the year 1128, E. is called by David I. 'his burgh of Edinburgh'; David lived more at E. than his predecessors had done, and this custom was followed by his descendants. By the treaty of Falaise, in the reign of William the Lion, E. was ceded to England, but was restored as part of Ermengarde de Beaumont's dowry when she married Wm.

Though E. had been frequently used as a royal residence, it was by no means the cap. of the country yet. King Robert Bruce held a parliament at Holyrood in 1327, and his last parliament was held in E. in the following year, but the chief importance of the tn. was from a military point of view. E. was held by the Eng. for sev. years, but with the outbreak of war between England and France in 1338, the Scots gained their lost ground. A new era began for E. with the accession of James I. E. may be called the cap. of the Stuarts; it shared the vicissitudes of that dynasty, and sank into comparative unimportance when they deserted it. It was not a walled tn. until the middle of the fifteenth century. The first printing press was erected in the beginning of the sixteenth century; in the succeeding reign E. was recognised as the undisputed cap. of the country. At an early period of the Reformation E. was converted to the Protestant faith; and in succeeding ages the great majority of its inhabitants adopted the Calvinistic creed and adhered rigidly to the Presbyterian form of worship. The Union of England and Scotland aroused great excitement in E., and attempts were made to intimidate the members of the Scottish Parliament who were favourable to the Act of Union, but the Act was eventually passed without bloodshed. An unsuccessful attempt was made by the Jacobites to surprise the castle in the rebellion of 1715. In 1745 the Jacobites were more successful, and were masters of the tn. from Sept. 15 to Oct. 31, but could not reduce the castle. The Porteous affair of 1736 was a remarkable occurrence; the populace lynched the captain of the guard, Porteous, who had fired on the crowd and killed six persons. The city was ordered to pay £2000 to the widow of Porteous; the ringleaders were never discovered. In 1779 a mob burnt one Catholic church and plundered another during the parliamentary discussions on the subject of Catholic claims. The societies which were formed in E. about the time of the Fr. Revolution in sympathy with the principles prevailing in France were put down with great severity. George IV. visited E. in 1822, and won great popularity by wearing the Highland dress. He was the first sovereign to visit the city since 1650. Holyrood was granted as a residence to the exiled King of France, Charles X., in 1830, and in 1842 Queen Victoria and Prince Albert visited the city. See O. Smeaton, *The Story of Edinburgh*, 1907; G. Home, *Edinburgh*, 'Mine own Romantic Town,' 1927; R. Chambers, *Traditions of Edinburgh*, 1929; K. Grierson, *Things seen in Edinburgh*, 1925; Rosaline Masson, *Edinburgh*, 1931; I. Lindsay, *German Edinburgh*, 1948; Chiang Yeo, *The Silent Traveller in Edinburgh*, 1948; S. Sitwell and F. Bamford, *Edinburgh*, 1948.

Edinburgh, Dukedom of, was first conferred in 1786 by King George I. on his eldest grandson, Frederick, who became Prince of Wales on the king's death 11 months later, but did not live to wear the crown. The choice of the title was no doubt influenced by the fact that the

much more historic Scottish dukedom of Albany (which had been borne by Darnley as King Consort) was still vested in George I.'s brother, the bishop of Osnaburg. The dukedom having merged in the Crown by the accession of Frederick's son as George III., an earldom of Edinburgh was subsequently held by two Hanoverian dukes of Gloucester, and the dukedom itself revived for Queen Victoria's second son, Alfred, in 1866 (see ALFRED ERNEST ALBERT). It became extinct by his death in 1900, his only son having predeceased him, and he was succeeded as duke of Saxe-Coburg by his nephew, Leopold Charles, Duke of Albany (see ALBANY, LEOPOLD GEORGE DUNCAN ALBERT, DUKE OF). The title of duke of Edinburgh was again revived in 1947, being one of those conferred, together with the prefix 'His Royal Highness,' on Lieut. Philip Mountbatten, R.N. (formerly Prince Philip of Greece and Denmark, which title he relinquished on being naturalised in Feb. 1947), on the occasion of his marriage (Nov. 20, 1947) to Princess Elizabeth, the elder daughter of King George VI. and Queen Elizabeth and Heiress-Presumptive to the throne. The other titles conferred on him at the same time were baron Greenwich and earl of Merioneth, one of the new dignities, therefore, being derived from England, one from Scotland and one from Wales. The heir to the dukedom (and second in succession to the throne) is Prince Charles Philip Arthur George, b. Nov. 14, 1918.

Edinburgh Review, The, or Critical Journal, Whig quarterly, founded in 1802 by Francis Jeffrey, Sydney Smith, F. Horner and Henry (afterwards Lord) Brougham. Smith gives this account of its beginning: 'I proposed that we should set up a Review. This was acceded to with acclamation. I was appointed editor, and remained long enough in Edinburgh to edit the first number of the Review. The motto I proposed for the Review was: "*Tenui Musam meditatur arem*" (We cultivate literature on a little oatmeal). But this was too near the truth to be admitted; so we took our present grave motto from Publilius Syrus ("*Julex damnatur cum nocens absolvitur*"), of whom none of us had, I am sure, read a single line.' It was the earliest of the great reviews, and has had a far-reaching influence on literature and politics. Sydney Smith was the first editor, and he was followed by Francis Jeffrey (1803-29), Macvey Napier (1829-47), Professor Empson (1847-52), Sir G. C. Lewis (1852-55), Henry Reeve (1855-95), A. R. D. Elliot (1895-1922), and H. Cox (1922-29). Its early literary criticisms were amazingly savage, notably in the case of Wordsworth and Southey, and gave rise to Byron's satire, *English Bards and Scotch Reviewers*. It ceased pub. in 1929.

Edinburgh University, the youngest of the Scottish univs., having been founded in 1582 by a charter granted by King James VI. of Scotland. In 1621 an Act of the Scottish Parliament ratified the charter and granted the univ. all the privileges and immunities which were enjoyed

by the other univs. in the kingdom; this Act was confirmed at the time of the Union. In 1858 the Univ. Court and a body of curators were created, and various regulations were made for governance and discipline. The university is a corporation, consisting of the chancellor, the lord rector, the principal, the professors, graduates, and undergraduates. Its gov. is in the hands of the Univ. Court, the Senatus Academicus, and the General Council. The lord rector is elected by the undergraduates, the principal is the resident head of the college and president of the Senatus Academicus for life. The Senatus Academicus is composed of the principal and the whole body of profs., as well as a certain number of Readers and Senior Lecturers. There are six faculties at the Univ.: arts, science, divinity, law, medicine, and music; the arts and medical courses having the greatest number of students, music the least. Among the principal univ. buildings are the Old College, dating from 1789; the Univ. New Building (School of Medicine) built between 1878 and 1883; the McEwan Hall (1888-1897); the King's Buildings (chemistry) begun in 1919 and completed in 1924; the depts. of agriculture, forestry and entomology, erected in 1914; and the Engineering Dept., opened in 1931. There are also dissecting rooms and 28 laboratories, mainly medical; the Royal Botanical Garden, a natural hist. museum, anatomical museum, and about a dozen smaller specialised museums. The Library contains about 400,000 printed vols. and 8000 MSS., many of which are of great value. The separate Theological Library has 10,000 vols., and there are about a dozen departmental libraries. Numerous bursaries and scholarships are given, many being restricted to students bearing a particular Scottish surname or residing in a certain locality. The univ. unites with St. Andrews, Glasgow, and Aberdeen as one constituency to send 3 members to Parliament. The rector, elected in Oct. or Nov. by matriculated students, holds office for three years. Mr. Winston Churchill was elected Rector for the period 1929-32. Sir J. Donald Pollock was elected in 1939 and re-elected in 1942. Lord Tweedsmuir (John Buchan) was chancellor from 1937 till his death in 1940. Mr. Alastair Sim, the actor, was elected chancellor in 1949.

Edinburghshire, see MIDLOTHIAN.

Edingen, see ENGHJEN.

Edirne, formerly Adrianople (Gk., city of Hadrian), is in European Turkey, at the confluence of the Tunja and Maritza (anc. Hebrus). The Rom. emperor Hadrian embellished it and gave it his name; from 1361 to 1453 it was the residence of the Turkish sultans. It was occupied by Russians (under Gen. Diebitsch) in 1829, and again in 1878. The mosque of Sultan Selim II. is a magnificent building, while the mosque of Sultan Mourad I. and the bazaar of Ali Pacha are worthy of note. Its manufs. are silk, wool, cotton, perfumes, and it has some dye-works and tanneries. During the Balkan war it was besieged and taken

by the Bulgarians and Serbians, but in spite of the treaty of London, it remained in the hands of the Turks. By a secret treaty between the Central Empires and Bulgaria, the latter, as the price of her entry into the First World War on the side of those Empires, was promised, at the expense of Turkey, a strip of land along the Maritza, controlling both that riv. and A. Restored to Turkey after the war. Pop. (village) 185,000; (tn.) 36,000.

Edison, Thomas Alva (1847-1931), Amer. inventor, b. at Milan, Ohio, was of Dutch origin on his father's and Scottish on his mother's side. Beginning life at the age of twelve as a newsboy on the Grand Trunk line running to Detroit, he owed all his distinction and advancement to his own faculties. After printing and circulating the *Grand Trunk Herald*, the first newspaper to be issued from a railway train, he eagerly assimilated the principles of telegraphy from a friendly station-master. From 1871 he was superintendent to the New York Gold and Stock Company, till in 1876 he set up his own works at Menlo Park, New Jersey. Here his extraordinary inventive genius had full scope. The following is a mere catalogue of some of the more important of his 1000 patents: The duplex, quadruplex, etc., system of telegraphic transmission, the printing telegraph for gold and stock quotations, a microtasmeter (for detection of small changes in temp.), the aereophone, the megaphone, the phonograph, or gramophone, the incandescent light, the kinetoscope, and the carbon telephone transmitter. It was an observation made by E. in one of his experiments, which led to the invention of the thermionic valve, used in radio-telegraphy and radio-telephony. This valve, so essential to radio-telegraphy, was at first known as the 'Edison effect.' E. also invented a system of wireless telegraphy to and from moving railway trains. He is also credited with a part in the invention of motion pictures and the alkaline storage battery. During the First World War he designed and operated benzol plants and plants for carboic acid. See *Dickson, Life and Inventions of Edison*, 1894.

Edmer of Canterbury, see EADMER.

Edmonton: (1) Cap. of Alberta, Canada, on the North Saskatchewan R., an important railway centre with large railway car shops. It is served by twelve branch railways. Market for Central and N. Alberta, N. British Columbia, and N.W. Territories. The prin. industries are meat-packing, coal-mining (1½ million tons per annum), lumbering, building supplies, garment making, manuf. of metal goods, biscuits, chemicals, boats, flour, butter and cheese, etc. The Edmonton City Dairy is the largest in Canada. E. is a great shipping point for livestock, and for seed grain. It is the seat of the prov. univ., and of many colleges. It is surrounded by numerous beautiful lakes and summer resorts. Pop. 79,000. (2) N. suburb of London, 10 m. N.N.E. of Liverpool Street station, situated in the Enfield parl. div. of Middlesex. Charles and Mary Lamb are buried here, and

the poets Keats and Cowper resided in the neighbourhood. The par. church is an anct. structure, containing sev. interesting monumental brasses and tablets. Pop. 80,000.

Edmund, St. (840-870), king of E. Anglia. He succeeded to the throne when quite a boy. In 870 E. fought the Danes, but was beaten and killed. The date of his canonisation is unknown, but his shrine was famous in every part of England, and his saintly reputation extended all over Europe.

Edmund (Rich), St. (1175-1240), Eng. ecclesiastic, *b.* at Abingdon, near Oxford; he studied at Oxford univ., and later in Paris. In 1233 he was elected Archbishop of Canterbury at the suggestion of

Canute taking the north and E. the south. Soon afterwards E. died.

Edmunds, George Franklin (1828-1891), Amer. senator and political leader, well known as a constitutional lawyer. He was a member of the Vermont house of representatives, and a republican member of the United States Senate. In 1883-85 Edmunds was President *pro tem.* of the Senate. He was the author of the Act for the suppression of polygamy in Utah, and of the anti-trust law of 1890.

Edom (Heb. 'red,' Gk. 'Ἰσχυρία'), an extent of country to the S. of Palestine, some 100 m. long by 20 m. wide, extending southwards from the Dead Sea to the gulf of Akabah. Its name is probably derived from the ruddy colour of the sandstone

Canadian Government

PARLIAMENT BUILDINGS, EDMONTON

Gregory IX., and at once leapt into prominence by the outspoken way in which he rebuked Henry III. for encouraging foreign favourites; the king appealed to Rome for a legate who at once opposed and thwarted E. at every point. In 1240 he withdrew to Soissy, and he died the same year. He was canonised in 1247.

Edmund I. (d. 946), king of the Eng. He succeeded to the throne in 940, but had already played a prominent part in the battles of the previous reign. E. had many battles with Anlaf, King of Northumbria, but a reconciliation was brought about by Odo of Canterbury, and Wolfstan of York. In 945 E. ravaged Strathclyde. He was killed by a robber, who had been previously banished from the court. E. was buried at Glastonbury Abbey.

Edmund II. (Ironside) (980-1016) king of the A.-Sa. He attempted to resist Canute when the latter invaded England, but was obliged to submit. On the death of Ahtelred the citizens of London chose E., but the witan elected Canute as their king. There was fierce warfare between the two rivals, until E. was persuaded to accept a reconciliation. He and Canute swore friendship, agreeing to divide the kingdom,

and its name appears thus under an Assyrian form in a tablet of the second century B.C. It was originally inhabited by the cave-dwelling Horites, but it later came into the possession of Esau, who received the surname of Edom, the derivation of the name being made from the red pottage given him by Jacob (Gen. xxv. 29 ff.). The Esauites did not entirely drive out the conquered race, but intermarried with them to a certain extent (Deut. ii. 22 and Gen. xxxvi. 20-21). The relations between the Israelites and Edomites were generally hostile, and the O.T. tradition dates the commencement of this hostility from the time when the Edomites refused the Hebs. a passage through their country to the land of Canaan (Num. xx. 14 ff.). Under David and Solomon the Hebs. brought their anct. foes into apparent submission, but there were frequent rebellions. The Edomites remained subject to Judah until the reign of Jehoram, when they successfully rebelled. But they were again subdued by Amaziah and Uzziah. They regained their freedom after the fall of Judah, and waged war without much success with Judas Maccabæus. They were later completely subdued by John

Hyrcanus at the end of the second century B.C. From about 300 B.C. the E. part had been in the hands of the Nabathæans. After the Rom. Conquest, E., Judea, Samaria, and Galilee were united as a procuratorship under Antipater the Idumean, founder of the Herodian dynasty. The religion of the country was polytheistic. Chief tns: Selah (later Petra), Maon, Punon, and Bozrah (now Buseirah).

Edoni, Thracian tribe noted for some skill in music, literature, and the working of gold and silver. They inhabited the region from Olympus to the Pangean dist.

Edred (d. 955), king of the A.-Ss. The youngest son of Edward the Elder, he succeeded to the throne in 946. In revenge for the inconstancy of the Northumbrians, who after tendering him their submission shortly afterwards broke their pledges and acknowledged Eric Bloodaxe, the Norwegian, for their king, E. ravaged the whole country and enforced compensation. His public policy was greatly influenced by his friend St. Dunstan.

Edriophthalma (Gk. ἑδρία, seat, and ὀφθαλμός, eye) is the name given to a group of crustaceans with sessile eyes, sometimes called the Arthrostraca. They are widely distributed individuals of large size, being four especially in the Arctic seas. The group is divided into three orders: Anisopoda, which contains *Cyamus balenarum*, the whale-louse; Isopoda, containing sev. parasitic genera, both terrestrial and aquatic, as *Cymothoa*, which breeds on fishes, and *Oniscus* and *Porcellio*, the woodlice; and Amphipoda, containing *Gammarus pulex*, the common fresh-water shrimp, and *Talitrus* and *Orchesta*, two genera popularly called 'beach fleas'.

Edrisi, or Idrisi, Abu Abdallah Mohammed El- (1099-1170), Arabian geographer, who under the patronage of Roger II. of Sicily wrote a description of the 'inhabited earth' from observations, and not merely from books. Embassaries were sent into various countries to obtain information which E. inserted in the new geography, entitled *The Rogerian Treatise*. This contained a full description of the world as far as it was known at that time. Little is known of the life of E., but as a courtier of a Christian prince he was regarded by strict Moslems as a disgrace to Islam.

Education. The term E. in the widest sense may be held to include the whole process of development through which a human being passes from infancy to maturity, gradually adapting himself to his physical and social environment; but the more definite sense in which the term is ordinarily employed is restricted to those influences which are *designedly* brought to bear upon the younger by the adult portion of the community for the purpose of maintaining and, if possible, of raising the level of culture attained, and it is to this sense of 'schooling' that we must confine ourselves in this article. In the earliest stage of development of mankind, the training given to the young was of a purely incidental character: manners

and customs were at first acquired by a process of imitation rather than by any consciously designed instruction.

As the arts of life, in the civil and military sphere, became more complex, provision was made for them and with the invention of letters, requiring a special training for the mastery of the symbols, and encouraging the accumulation of knowledge far wider than provided by the immediate environment, schools as formal institutions came into existence. The Jews always held E. in great esteem, and it is probable that instruction in the arts of reading and writing was generally given at a very early period. Moral training and the care of the body were considered of paramount importance. The priestly tribe of Levi had special professional schools, but there is no evidence of schools being estab. for the people until after the captivity, E. being regarded as a family affair, and the father undertaking the duties of teacher. Among the Spartans the E. given aimed simply at the development of soldier citizens. Gymnastics formed the greater part of the training, while music (*μουσική*), including reading, writing, and easy arithmetic represented the intellectual side of the curriculum. The art of stealing was also taught as a training in resourcefulness and judgment; the Spartans believing that any disregard for the rights of others which might result would be outbalanced by the intensely moral and social character of their educational system as a whole. In the *Republic* and *Laus* of Plato will be found a representation of the ideal of E. at Athens, and of the importance given to dialectic and music, and to gymnastic exercises for the body. The moral influence of gymnastics, and especially of music, upon the character was a cardinal feature of Plato's educational theory. There was practically no state regulation of schools for boys until they reached the age of seventeen years, when they entered the *ephebea*. The younger boys were sent by their parents, in charge of slaves, to professional teachers, who were of three kinds: the *grammatis* who taught reading, writing, and arithmetic; the *choristes* who taught singing and playing on musical instruments; and the *paidotribes* who trained the boys in wrestling, boxing, running, jumping, etc. During the early period of the Rom. Republic E. was left entirely to the parents. The boy was taught to read, to reverence the gods, and honour the state, and was trained in hardihood of body. With the influence of Gk. culture schools began to spring up under professional teachers who were for the most part Gks. In these the boy was instructed in the three Rs. by a master known as *litterator*. On attaining the age of twelve or thirteen he was sent to another master, *litteratus*, under whom he studied grammar (including the form and content of literature), poetry, hist., philosophy and Gk. Schools of rhetoric were also estab. restricting themselves to training in oratory, the value of which is insisted upon by Quintilian and Cicero. In Quintilian's

Institutio Oratoria we are given a discussion of the whole of E. from the cradle upwards, from which it would appear that the E. given by the *litteratus* was much as in Eng. grammar schools up to the eighteenth century.

With the rise of Christianity schools were instituted for instructing the young in the Christian faith; the method of teaching was entirely catechetical, and among the early Christians no attention was paid to the cultural studies of the pagan schools. As men of culture were attracted to the Christian church, however, the question of adapting pagan culture to Christianity caused serious discussion. St. Augustine and St. Jerome contended that the study of literature and rhetoric was good so long as kept subservient to Christian life. The contentions which raged fiercely over this question had, temporarily, a very disastrous effect on E. As Christianity grew the old pagan schools gradually disappeared and their place was taken by schools mainly connected with monasteries, which prepared young men for the monastic life. The chief monasteries generally had, however, external schools for pupils not proposing to enter the order, as well as the internal schools for novices. By degrees the curriculum was widened to include the seven liberal arts, relics of the old Rom. E., known as the *Trivium*—grammar, logic and rhetoric (including the study of law)—and the *Quadrivium*—geometry (which corresponded rather more to physical geography than what is now understood by the term geometry), arithmetic, music, and astronomy. The development of city life and trade guilds led to apprenticeship in the arts of the counting house and the workshop. During the latter part of the eighth century the famous palace school (or *Palatine Academy*) was estab. by Alcuin (735–804) under the patronage of Charlemagne. During the eleventh and twelfth centuries, contact with Eastern civilisation, consequent on the Crusades, and with the highly civilised Moors in Spain, produced an intellectual revival which found expression in the formation of many univs., and a great increase in the numbers of, and attendance at the monastic and grammar schools. The desire for E. penetrated even to the lowest classes of the people, and elementary A.B.C. schools came into existence, generally presided over by the parish priest, to give instruction to the children of the poor in reading, writing, and easy arithmetic. The most famous univs. were at Paris—the chief centre for philosophy and theology, which formed the model on which the univs. of Oxford and Cambridge were organised; at Salerno, at which the study of law took first place, and at Bologna, for the study of medicine. The need for acquiring a definite status induced most univs. to apply to the Pope or the Emperor for recognition, though a few of the greater univs. did not find it necessary to do this. Charters were granted by Henry III. to the two Eng. univs., Cambridge in 1231 and Oxford in 1248. The Ger. univs. were of later foundation, and were mostly estab.

by civic authority; Prague was estab. in 1348, and Vienna in 1365, and obtained charters from the Emperor later. Though univs. were intended mainly for more advanced E. of men, the distinction between them and grammar schools was not everywhere clearly marked, and young boys frequently attended.

As has already been noted, the rise of the Christian Church and the barbarian invasions of the Middle Ages had led to a break in the study of classical literature.

Although great attention was paid to logic, scholastic theology, and law, the church discouraged the study of literature as such, and the time given to it, together with free-thinking philosophy and classical philology, was looked upon as wasted. The Renaissance, however, led to a free and unfettered study of all that appealed to the intellect of man. The movement originating in Italy, which consisted in going back to the ancients, and reviving the free study of all classical writers, both Lat. and Gk., assimilating their reasoning, and making a philological study of their language, is termed the *Revival of Learning*. Such literature was styled *litteræ humaniores* and those who advocated its study were called *Humanists*. Vittorino da Feltre (1378–1446) was perhaps the most famous of the early It. humanist schoolmasters. His ideal was the patriotic and well-equipped citizen rather than the self-contained scholar. Another great humanist of the period was Guarino da Verona (1370–1460), who worked under the patronage of the Estes at Ferrara. Classics naturally formed the foundation of the curriculum in the humanist schools. In addition to their value in stimulating literary taste and culture, they provided a disciplinary training much more than at the present day. The grammatical rules had to be acquired from careful observation of the literature read, there being no formal grammars, and plain texts provided a more valuable intellectual study than the modern text-book in which all difficulties are eliminated by the aid of notes. The classics were also looked upon as providing practical text-books, such as Cæsar for war, Virgil for agric., etc. But in addition to the classics, the curriculum embraced mathematics, astronomy, hist. (Gk. and Rom.), music, natural philosophy, and natural hist. The later humanist theories of E., which the schools continued to follow generally for two or three centuries, were taken mainly from Erasmus (1467–1536) and Melancthon (1497–1560). To Erasmus Humanism, which in the eyes of the Its. was an end in itself, was only the means to the propagation of truth. Melancthon was a great supporter of the claim of the classics to impart a culture not otherwise attainable, and was also the author of sev. school text-books. The Lat. *gymnasien*, founded at Strasburg by Melancthon's friend Sturm (1507–89), became the model which the grammar schools of Protestant Europe strove to copy. In this school practically the whole of the time was given to acquiring a mastery of

the Latin language. In England Humanism did not spread so quickly until it was adopted by the univ., where it encountered less opposition than in Germany. St. Paul's School, founded in 1512 by Dean Colet, provided for a distinctively Humanistic E. In Catholic countries the church retained entire control of E., and the Society of Jesus, founded in 1540 by Ignatius Loyola, estab. many schools which were extremely successful. The curriculum in these Jesuit schools was purely Humanistic, and a particular feature was the attention paid to the individual character of each pupil.

While Lat. was accepted as the medium of learning, and so long as new branches of knowledge were not discovered, the schools remained in harmony with the culture of the day; but during the seventeenth century the difference between the needs of life and the E. furnished by the grammar and other classical schools grew gradually wider, and many schools, owing to the rapidly decreasing numbers in attendance, fell into decay. Indeed, in England many of the old grammar schools degenerated into elementary schools of a very poor and inefficient character, and at the beginning of the eighteenth century organised E. was at a very low level. But there was no lack of educational theorists and writers. Comenius (1592-1671), the author of *The Great Didactic: the whole Art of Teaching all Things to all Men* (1657), and a number of text-books on original lines, takes first place amongst the realists, of whom J. H. Pestalozzi and F. W. A. Froebel were latter-day disciples. The realists maintain that things, not words, must provide the organon of E., and that the child must be brought into contact with the concrete before proceeding to the abstract. John Locke (1632-1704) on the other hand is to be classed among the naturalists who hold that the duty of the teacher is to treat the child as an individual who is being prepared for life by living. He does not, however, appear to concern himself with any but the children of the wealthy, for he declares roundly in favour of a home E., under a private tutor, as opposed to that given in public schools. During the eighteenth century E. became more and more to be looked upon as the property of the select few. The individualistic rationalism of Voltaire (1694-1778) and the Encyclopaedists, derived from Locke, resulted in an extreme of selfishness among the aristocratic classes, an example of which may be seen in Lord Chesterfield's *Letters to his Son* (1737-68). In 1762 appeared Jean Jacques Rousseau's famous *Emile*, the underlying motif of which is an appeal for a return to nature. According to Rousseau the essence of life lies in the gratification of desires and impulses of the moment. He would abolish all moral training, and free the child to the reactions of the physical world upon his activities. With all its violent paradoxes *Emile* exercised a wonderful influence on E. Rousseau also made a special plea for child-

study. At this time Pestalozzi (1746-1827) was a young student at Zürich. Though by method a realist, he drew his inspiration from Rousseau, and this early influence is traceable in his ardent belief that an important factor in E. had hitherto been insufficiently considered—the child himself. In spite, however, of his belief in the value of psychology, Pestalozzi made little use of it in his own teaching, in which, indeed, he was thoroughly unmethodical and unpractical. Froebel (1782-1852), however, succeeded in constructing a complete and consistent system for Pestalozzi's scheme. 'The boy,' says Froebel in his *Education of Man* (trans. 1891), 'has not become a boy, nor has the youth become a youth, by reaching a certain age, but only by having lived through childhood, and further on, through boyhood, true to the requirements of his mind, his feelings, and his body.' The duty of the teacher consists in clearing the way for nature to do her proper work: to stimulate and direct the child's self activity, without in any way interfering with it. To this end he devised his scheme of gifts and occupations. Froebel's ideas as regards young children, though his native land has never given him due recognition, have been largely accepted outside his own country.

Similar conclusions—that given the right conditions, children love work as much as play, were reached by Dottorossa Maria Montessori (*q.v.*). The child from its very first years is essentially a spontaneous 'absorber' of what he finds in his environment. In her view, consequently, the art of education consists in preparing for the child a special environment which shall contain what we wish him to absorb in forms found experimentally to hold his attention, and establishing a dynamic relationship between the child and this environment. This involves giving the child freedom to 'live his own life in this experimentally prepared environment free from adult interference in accordance with the laws of development.' Chief amongst the laws of development is Montessori's doctrine of Sensitive Periods. As the child grows he passes through certain stages or epochs, each of which is characterised by a special but transient sensibility to take in mentally certain aspects of his environment. Such for instance is the sensitive period for language which lasts from birth up to about 6 years. During this period the child has power to absorb a language from his environment in all its complexity of grammar and pronunciation 'simply by living,' a feat impossible to the adult. Such again is the sensitive period for 'order' (1-3 years), and for 'social development' during adolescence.

If the child's life is arranged on these lines in accordance with the sensitive periods the whole process of education is transformed. Instead of having a teacher who is constantly drumming information into passive pupils the Montessori system has a 'directress' who protects and supervises the natural flow of children's energies into creative channels. Through

self-activity or auto-education the children, at one and the same time, construct their personality and acquire the elements of culture. Education is thus primarily a help to life. In the Montessori system, every subject which has to be learned (as for instance the 'three R's') is presented through a series of carefully graded occupations, each of which has been determined experimentally by the reactions it

They become quiet, self-controlled and orderly in their movements; serene and joyous in disposition; competition gives place to mutual aid, and the love of possession to a communal respect for a common environment; whilst self discipline takes the place of external control. A practical point is that the Montessori system can be successfully applied to a class of forty children under one directress.

Stevenage Studios, Hitchin

A CLASS IN THE MONTESSORI DEPARTMENT OF ST. CHRISTOPHER SCHOOL, LETCHWORTH

A Montessori classroom creates an environment suited to the needs of the child and provides him with the opportunity for spontaneous activity. The children work individually, the teacher showing the correct use of each piece of didactic apparatus.

evokes in the child. It is the spontaneous and individual activity of the children with these occupations which brings about that concentration on their work which leads to mental development on the one hand and mastery of school subjects on the other. The directress is the 'living link' between the children and the teaching occupations in the prepared environment. It is her function to initiate them into the exact use of the materials. Within well-defined limits (*e.g.* they must not disturb others or misuse the apparatus) the children are free to choose their own occupations and to work at them for as long as they like. It is claimed that this form of education brings about a remarkable change in the character of the children.

The effect of the Montessori movement on modern education in every civilised country has been, and is, most marked. The 'Individual Work System' so prevalent in infant schools to-day is largely the result of it; whilst the Dalton system owes much to the same source. The Froebel methods, however, have found more widespread acceptance for children beyond the 'Kindergarten' (*q.v.*) ages. The Decroly Class system, introduced by the Belgian Ovide Decroly (*q.v.*) differs from the Montessori method in that it does not employ experimentally determined apparatus.

One of the great influences, too, in E. at the present time is that of Johann Friedrich Herbart (1776-1841) the pupil

of Fichte and successor of Kant. The most important of the pedagogical applications of Herbart's opinions are the recognition of the value of apperception, the concentration of studies, and the 'formal steps.' Great importance is attached by Herbartians to what are called the 'five formal steps,' the successive stages in every lesson given in what they consider the only right way: (1) preparation, (2) presentation, (3) association, (4) formulation, (5) application.

Another important recent educational influence has been that of Rudolf Steiner, distinguished founder of Anthroposophy. His pioneer school at Stuttgart (founded 1919) has been the inspiration of similar experiments in many countries, including Great Britain. These schools have had particular success in dealing with mental defectives, along original lines in which the arts are therapeutically employed.

The relation between the state and the individual in the matter of E. has long been a favourite theme of discussion and controversy. It is, however, now generally recognised that the state has the duty of providing and the right of prescribing E. for all its children. Even Adam Smith and John Stuart Mill, the apostles of 'natural liberty' and *laissez-faire*, admitted the exception of E. Adam Smith was in favour of state-controlled elementary E., though he hardly disguised his disapproval of state interference in higher E. Mill, on the other hand, advocated that the state should provide for both elementary and higher E., and that elementary E. should be made compulsory. England for long lagged behind most of the other great civilised nations in this respect, and it was not until 1880 that elementary E. was made compulsory, but secondary E. was left practically untouched by the state until 1902.

The various stages of growth from infancy to maturity require, and have created in most modern civilised states, a graduated system of schools adapted to the needs of each particular period. As has already been asserted, for the sub-primary stage, i.e. during the first six years, the child's proper place is the home, but the complexity of modern life, especially in congested areas, where the mother has to go out to work, has made the kindergarten and infant school indispensable institutions as places of refuge for children whose parents are unable to fulfil their proper parental functions. In England children are permitted, though not necessarily encouraged, to go to school at three years of age; in France there are the *écoles maternelles*, and in America the work of the kindergarten has received the serious attention of many able teachers and educationists. In Germany on the other hand, no official cognisance is taken of children under six years of age. It is generally accepted at the present time, however, that neither at home nor at school should there be during this period any question of formal instruction. The next stage in school life covers the period between the ages of six or seven and thirteen or fourteen. In nearly all

civilised countries compulsory attendance for children between these ages is now enforced. Corresponding to the 'elementary school' of England there is the *Volkschule* of Germany, the *école primaire élémentaire* of France, and the 'common school' of the U.S.A. In these schools the E. given is designed to meet the needs of the poorer classes of the community, who are unable to extend the period of E. for their children. The former higher elementary schools of England the *Höhere Bürgerschule* of Germany the *école primaire supérieure* of France, are designed to continue for one or two years the work of the primary school in a practical direction. Parallel to the public elementary schools there are also in England private preparatory schools of various types, generally designed in order to secure continuity in the course of study for pupils proposing to proceed to secondary schools. These together with the preparatory and junior forms of secondary schools provide primary E. for the children of wealthier parents.

Parallel to the public secondary schools there are the so-called Public Schools, private foundations, often originally of a religious or philanthropic character, some of them of long standing (Winchester 1382, Eton 1440), the majority dating from the nineteenth century. They number about 150; being predominantly boarding schools, they cater chiefly for the wealthier classes. Since 1850 they have been responsible for educating the great majority of Eng. diplomats, lawyers, bishops, high gov. officials, and directors of companies. Features common to them all are religious teaching, corporal punishment, a high regard for team games and the prefect system. Their supporters claim that they are true schools of Christian character, their critics that they make for class-isolation and conventionality of outlook. There are also Public Schools of the same type for girls. Boys and girls remain at such schools until the age of eighteen or nineteen, many of them then proceeding to a univ.; at second-grade schools, the pupils usually leave at sixteen or seventeen. In addition to these two types of secondary school, the public and the Public, there are other schools offering special training for vocational needs: in England the technical and agricultural schools, in Germany the *Gewerbeschulen*, and in America the industrial schools. (For mixed schools and experimental co-educational schools see UNDER CO-EDUCATION.)

GERMANY.—In Germany state intervention in E. began at the time of the Reformation, and towards the end of the sixteenth century two states, Saxony and Württemberg, had organised fairly complete educational systems in connection with the church. The Thirty Years' war had a disastrous effect on E., but in the eighteenth century the state system was revived in the two states above mentioned, and their example was followed by Hanover and Prussia. As early as 1717 a law was in force in Prussia requiring all children to attend school wherever

schools were accessible. In 1806, when Prussia lay at the feet of Napoleon, the control of E. was all that was left to that state by her conqueror, and in response to Fichte's appeal in his *Address to the German Nation*, a thorough system of national E. was founded by von Stein in 1807. In 1850 a law was passed making elementary E. free, and the teaching profession a branch of the civil service. The basis of Ger. elementary E. in its present form is the Prussian Code of Regulations of 1854, as modified by the Falk Laws of 1872 and later laws. Attendance is compulsory on all children between the ages of six and fourteen. By the law of 1920, children must receive a four years' course of instruction in the *Grundschule* or foundation school. The next highest school for elementary E. is the *Volksschule* or people's school, supported partly by the State and partly by the municipalities. Besides the *Volksschule* there is the *Mittelschule* or middle school, in which instruction is given in Eng. and Fr. There are two types of secondary schools, the *Gymnasium* or classical and the *Realgymnasium* or modern school. These again are divided into schools with a nine years' course and those with a six years' course. The *Gymnasien* are the most fully developed classical schools. The *Pro-gymnasien* differ from the *Gymnasien* only in not having the highest classes. The *Realgymnasien* specialise in mathematics, natural science and modern languages, but also teach classics. The *Oberrealschulen* give instruction in mathematics, natural science and modern languages, but not in classics. Two other kinds of schools have been estab. experimentally—the *Deutsche Oberschule* and the *Aufwandschule*, the former to provide intensive E. in Ger. subjects and in languages, the latter an intensive high school to further clever scholars of elementary schools. For girls there are *Lycen*, *Oberlycen*, and various other educational institutions which prepare for the univs. There are a number of technical high schools with the right of granting degrees. All are State-aided.

FRANCE.—In France, as in most Catholic countries, state intervention was longer delayed. Elementary E. was practically non-existent before the Revolution, and the higher schools formed a bone of contention between the church and the gov. The Revolution, however, made a clean sweep, and a strongly centralised system of E. was established. There is now a very complete system of E. under the control of the minister of public instruction. All schools, *primaire*, *secondaire*, and *supérieure*, are examined by the state. The system of elementary E. in force was organised in 1886. Public elementary instruction is free, and attendance is compulsory on all children from 6 to 13 years of age. Teachers, in all but the largest tns., are state servants. Religious instruction in state schools has been abolished and replaced by moral instruction according to official curricula. In addition to the *écoles primaires élémentaires*, there is a very efficient system of

higher elementary schools, *écoles primaires supérieures*, admission to which is accorded only to those who have obtained the elementary school leaving certificate. Secondary E. is carried on at the *lycées*, which are largely subsidised by the state, and *collèges* which are generally maintained by local authorities and are of a second-grade character. In 1902 the scheme of studies was reorganised. The course extends for 7 years, divided into two periods of 4 and 3 years. The first period provides two kinds of curricula: (1) Lat., obligatory, and Gk., optional; (2) No Latin. At the end of the first period a state *certificat d'étude secondaire du premier degré* is granted. The second period provides a choice of four courses: (1) With Lat. and Gk.; (2) Lat. and modern languages; (3) Lat. and science (these three continuing course 1 of the first period), and (4) Modern languages and science, continuing course 2 of the first period. There are also many technical schools and univs.

In Denmark, Norway, Sweden, Austria, Switzerland, Holland, and Belgium, elementary E. is free and compulsory. Switzerland has an admirably organised system, and the management of the schools is in the hands of each canton. Primary and secondary schools are provided in every district, and there are also numerous technical schools and sev. univs.

UNITED STATES OF AMERICA.—E. in America is under popular control, and there is very great local freedom. Each state, and many of the large cities, has its own system, and provides its own schools and teachers. Compulsory attendance is in force in most states. The schools are of three kinds; primary for children from 6 to 10; grammar schools for those between 10 and 14 (these are grouped together as 'common schools') and high schools from 14 to 18. In all states E. in the first two grades is free, and some states provide free E. in the high schools also. The curriculum is very similar to that of Eng. schools, but more attention is paid to hist. and citizenship, and in the high schools physical science and modern languages receive more attention than in secondary schools of the same type in England. The length of the school year varies considerably in the different states, and is generally longer than in England because the school term is nine continuous months with none of the long holiday breaks that are customary in England. The main holiday is for the three summer months, due to the great heat of that period. An interesting plan has recently been adopted by the city of Cleveland, where the public elementary schools are kept open through the summer vacation, and backward children are required to attend for four quarters of the year instead of three to make up their deficiencies. School buildings generally in the U.S.A. are equipped with the most up-to-date educational appliances. Normal schools for the training of teachers are provided by many states, but there is no national standard of qualifications, each state granting its own diplomas, and special training in normal schools is not

necessarily indispensable to obtain these. Many of the states have their own tax-supported state univs. which are free to the youth of the states.

ENGLAND.—In contrast with the complete systems which have been conceived and estab. during comparatively recent times in other countries, the educational system in vogue in England is the result of growth and adaptation, and also particularly of sectarian rivalry to obtain control of the young.

Secondary Education.—Even before the Reformation it seems probable that there was a fairly complete system of endowed schools, and although most were connected with eccles. orders, such as the monastic schools, chantry schools, and choristers' schools, there is reason to believe that there existed also many schools supported by secular foundations. At the Reformation the dissolution of monasteries reduced the number of schools very considerably, many of the schools attached to these institutions perishing irretrievably, though a few lingered on though deprived of their endowments. But the spirit of the Reformation unquestionably inspired a considerable amount of individual educational effort, and many schools were founded, and in many instances the old foundations were renewed. The Act of Uniformity (1662) and the Five Mile Act (1665), prohibiting all teaching in public or private schools, except by Church of England men, had the effect of creating large numbers of private schools, as it was held in the courts that the law could only be enforced in the case of endowed grammar schools. The endowed schools were under the sole control of the church, with the result that at the end of the eighteenth century they were in a worse condition than at any time in their hist. The Endowed Schools Act of 1869 remedied this state of affairs very considerably by the removal of religious disabilities and by widening the curriculum. In 1874 the control of the endowed secondary schools was transferred to the Charity Commissioners. In 1889 the Technical Instruction Act gave powers to county, bor., and urban dist. councils to levy a rate not exceeding a penny in the £ in aid of technical or manual instruction. The Dept. of Science and Art, formed in 1851 to supervise and administer grants to the science and art classes, which were being estab. all over the country, was also aiding secondary E. by grants towards mathematical, scientific, and even literary studies. In 1899 the Dept. of Science and Art was united to the E. dept., which then became the Board of E. with a president and parl. secretary, and the powers of the Charity Commissioners in regard to educational endowments were transferred to this new board, but it was not until 1902 that any real steps towards organising secondary E. were taken. The E. Act of 1902 (repealed by the E. Act of 1921) provided the local authorities with power 'to take such steps as seem desirable, after consultation with the Board of E., to supply or aid the supply of E. other than

elementary, and to promote the general co-ordination of all forms of E.' By the E. Act of 1918 (repealed by the E. Act of 1921) the limit of the rate to 2d. in the £ was repealed, which Act also provided that the state's contribution should not be less than one-half of the approved expenditure of the local E. authority. After the Acts of 1918 and 1921, great progress was made in secondary E. Before then no public provision for secondary E. as such had been made, though indirect financial aid had been given under The Technical Instruction Act. In 1907 greatly increased grants were placed at the disposal of the Board of E. for the purpose of secondary E. In order to qualify for the higher grant which was then offered, schools were required to provide 25 per cent of free places for scholars from public elementary schools. A secondary school, as defined by the Board (prior to the Education Act of 1944) was a school which offered to each of its pupils a progressive course of instruction (with the requisite organisation, curriculum, teaching staff, and equipment) in the subjects necessary to a good general E. on lines suitable for pupils of an age-range at least as wide as from twelve to seventeen. The number of secondary schools recognised as efficient by the Board of E. in the years immediately preceding the First World War included 862 schools in receipt of grants, and 96 schools dispensing with the grant. In 1939 the number of secondary schools in receipt of grants was nearly 1400; the number of full-time pupils in 1937 was 464,000 (53 per cent boys, 47 per cent girls). Of these 76.4 per cent were ex-public elementary school pupils and 46.4 of the total were non-fee paying pupils. Before the Second World War the amount of the grant had been increased from £5 each pupil over 12 years of age to £7; while in addition, there were special grants in respect of advanced courses. Official inspection is an essential condition of the grant and this inspection extended to all the activities of the school. In 1947 there were about 40,000 boys and 30,000 girls at Public and Private Schools. There were 6212 Univ. profs. and lecturers, educating 47,000 men and 18,000 women students at the eleven degree-giving Univs. and five univ. colleges. In addition, there were 117,000 students at London County Council evening classes. There were 145 local authorities administering the public system of E.

Technical Education.—As has already been seen, technical E. since 1851, was greatly assisted by the Science and Art Dept., which instituted examinations in the various branches of technology, but it was not until 1878, with the foundation of the City and Guilds of London Institute for the Advancement of Technical E., that it was organised to a large extent. This institute extended the examinations and estab. many schools and the great Royal College of Technology since incorporated in the Imperial College of Science and Technology (q.v.). The Technical Instruction Act of 1889, giving local authori-

ties permission to raise a penny rate for the purpose and the allocation of 'whisky money' to the extent of three quarters of a million to technical instruction, resulted in the estab. of flourishing institutions

Keystone

TECHNICAL EDUCATION: ASHFORD NORTH COUNTY MODERN BOYS' SCHOOL

devoted to this form of E. all over the country.

Examinations.—The confused and elaborate system of external examination which has gradually grown up to provide a test for the relative efficiency of E. in Eng. secondary schools is the result of state neglect in this as in other depts. of secondary E. The Dept. of Science and Art, founded in 1851, instituted examinations, which were, however, of too specialised a character to affect many schools other than the science schools which that dept. estab. In 1853 a chartered association of schoolmasters, the College of Preceptors, began to examine pupils in Lat., Fr., Eng., hist., geography, mathematics, drawing or one science subject, and Gk., and laid the foundation of much useful effort. In 1857 Sir Thomas Acland and Dr. Temple held an examination at Exeter which proved so successful in its results that in the same year the univ. of Oxford appointed delegates to conduct similar examinations on a permanent footing in the future. Thus were instituted the Oxford Local Examinations, and the following year Cambridge Univ. followed suit. Both univs. issue junior, senior, and honour certificates, open to candidates of all ages (with the exception of honours certificates, which is restricted) and, since 1870, to both sexes. The example of the older has since been followed by the newer univs. The more important secondary schools, however, demanded a more specially directed effort on the part of the univs., and in 1870 the Headmasters' Conference appointed a committee to confer with the older univs. upon

the institution of leaving examinations corresponding to the *Abiturienten-examen*, provided by the state in Ger. This resulted in 1873 in the formation of a joint board granting upon examination certificates exempting pupils from the first or matriculation examination of the univs. In 1878 this examination was extended to girls' schools, and in 1883 a lower certificate for younger candidates was instituted. This examination has perhaps more than any other agency stimulated and raised the efficiency of Eng. Public schools. The Northern Univs. have also adopted a similar plan of an exemption certificate. The Univ. of London, founded in 1846, has also provided by its matriculation examination a recognised certificate, which serves as a preliminary qualification for many professions. The univ. has also done excellent work in the inspection of schools. Following the publication of the Norwood Report of 1941, but largely ignoring its recommendations, the Board of E. proposed some significant changes in the examination system, which were to take effect in 1950-1. The School and Higher Certificates are to disappear, and be replaced by papers at three levels, ordinary (roughly equivalent to School Certificate), advanced (equivalent to Higher Certificate), and scholarship. The most sweeping change is the abolition of the demand for compulsory subjects or groups of subjects—an innovation which the teaching profession greets with general approval though it carries with it certain obvious dangers of specialisation. The least intelligible feature of the new Act is the demand that no pupil shall enter for the 'ordinary' examination before the age of 16, to be increased to 17 when more adolescents stay at school up to that age.

The Spens Report.—Far-reaching reforms in the national educational system were recommended in the Report of the Consultative Committee on Secondary E., with special reference to Grammar Schools and Technical High Schools, issued at the end of 1939 by the Board of E. This report is complementary to the Hadow Report (1926), which dealt with the organisation and curriculum for public elementary schools for children above 11 years of age. The chairman of the committee was Mr. (later Sir) Will Spens and the terms of reference stressed the question of the E. of pupils who did not remain at school beyond the age of about 16. The report contains two major proposals: (1) for the provision of a new type of school—the Technical High School—for boys between the ages of 11 and 16, which will have the same status as a grammar school; such schools would provide courses of study of a realistic and practical character parallel to the existing academic courses of study in the secondary (grammar) schools; (2) for the drastic remodelling of the traditional curriculum of the secondary (grammar) schools. As a first step to establishing technical high schools the report recommends that a number of existing junior technical schools, orientated towards the

engineering and building industries, should be converted into technical high schools of equal status with schools of the grammar school type. Close relations should exist between grammar and technical high schools, so that an opportunity of transfer at about the age of 13 should exist for those pupils whose later development makes it clear that they would be better suited by an alternative form of E. The reforms proposed in secondary E. are based on the assumption that the existing arrangements for the whole-time E. of pupils above 11 years of age no longer correspond with the structure of modern society or with economic realities, and, on this hypothesis, the committee makes, *inter alia*, the following recommendations: the core of the curriculum should be the study of Eng. and Eng. subjects; schools should have a 'careers master'; a 'tutorial system' should be tried in all types of secondary schools; pupils not going to the univs. should be encouraged to stay on at school and special courses should be arranged for them; the School Certificate examination should follow the curriculum, not determine it; all possible freedom should be left to schools to select their studies; all pupils should be given the chance to learn at least one foreign language; Lat. should be taught so that something definite is gained by pupils who do not continue it after 16; mathematics should be taught 'as one of the main lines which the creative spirit of man has followed in its development.' Taught with this purpose, it will not be necessary to devote the time now thought necessary to teach it; aesthetic subjects, including music and art, should have a more prominent place in the curriculum; scripture should be taught primarily to show what the various books of the Bible were in fact intended to mean by their authors for their original readers; specialised vocational training should come towards the end of school life; economics should not be included as a separate subject before the age of 16; no home-work should be set to Junior forms in which most of the pupils are under 11. Finally, it may be noted that the Committee make a number of recommendations with a view to ensuring parity between all types of secondary schools—the principal being the adoption of a new Secondary Code governing all these types of school and provisions that the salary of the teacher shall no longer depend directly upon the type of school in which he or she serves; for the abolition of fees as the national finances render this possible; and an eventual minimum leaving age of 16, as is now the rule in grammar schools.

Elementary Education.—Prior to the Reformation what little E. for the poor existed in Eng. was oral instruction in the doctrine and duties of the Faith, given by the par. priest. The conception of elementary E. adapted to the needs of the masses of the people was unfamiliar, E. being regarded as a privilege of the select few. With the rise of industrialism, however, during the seventeenth century, the

need for some form of elementary E. became very apparent, and a universal system of elementary schools was advocated by Hoole and Petty. In 1699 Dr. Bray founded the Society for Promoting Christian Knowledge, and by 1741 nearly 2000 charity schools had been estab. throughout the country by the agency of this society. In 1784 Sunday-schools were founded by Robert Raikes, which for many years provided all the E., both religious and secular, which many children received. In addition there were numerous private 'schools,' kept by dames who received and 'minded' the children for a small weekly fee. The beginning of the nineteenth century saw the rise of voluntary societies for the E. of the poorer classes, chief among them being the Brit. and Foreign Schools Society and the National Society for Promoting the E. of the Poor in the Principles of the Estab. Church. In 1802 Joseph Lancaster, a Quaker, pub. a pamphlet in which the wretched condition of the schools existing for the children of the poor is described: in this pamphlet he tells how he founded his school in the Borough Road in 1798, and invented the monitorial system, by which the older boys, under his supervision, were organised to teach the rest. About the same time Dr. Andrew Bell had been led to adopt the same method of employing pupils to instruct one another in a school in Madras. From these institutions were founded the Royal Lancasterian Society (1808), later known as the Brit. and Foreign School Society, and the National Society (1811). The National Society had ample funds at their disposal, and their schools were soon spread all over the country. The first real step towards state intervention in E. was not taken until 1883. But in 1839 a committee of Council on E., presided over by the Lord President and four other ministers, was formed to administer par. grants for the purpose of elementary E. in England and Wales. In 1840 the right of inspection of schools was made a necessary condition towards qualifying for a grant, but it was agreed that all Church of England schools should be inspected by clergymen approved by the Archbishop of Canterbury, while the Brit. Schools should be visited by laymen approved by the Society. In the same year a training college for teachers was estab. at Battersea, to which in 1842 grants were obtained from parliament. This college was taken over by the National Society in 1843. In 1853 the Council on E. was formed into the E. Dept. with a staff of officials and clerks, and in 1856 a vice-president of the Council was appointed, who should be responsible to the House of Commons for the distribution of grants, which had until then been dispensed on the responsibility of a departmental committee. In 1882 Robert Lowe, then vice-president of the Council, introduced the famous 'Revised Code,' which made 'payment by results' the basis on which grants were to be made, the test being an examination in reading, writing, and arithmetic. The year 1870 marked a revolution in the elementary

educational system of this country. In that year Mr. Forster, the vice-president of the Council, carried an Act, providing that in any district where, within a certain period, sufficient school accommodation was not provided, a school board, under the control of the E. Dept., was to be formed with power to raise money from local rates for the purpose of supplying such school accommodation. The Act also provided that in all public elementary schools whatever religious teaching was given should be imparted either at the beginning or end of the school session, and that an unbroken period of two hours in each session should be given to secular instruction; in all schools provided or maintained by public school boards religious instruction was to be entirely undenominational in character. In 1876 the power to enforce compulsory attendance became general and the leaving age was raised from 13 to 14, unless the child passed the examination standard for exemption before that age. In 1880 an Act was passed making it compulsory on school authorities to enforce attendance. By the code of 1882 the curriculum of the infant school was enlarged by the inclusion of object lessons and kindergarten occupations; while in the senior schools the grants for such subjects as Eng. hist., geography and elementary science were graduated according to the quality of the instruction given. The general efficiency of the school, as well as the number of passes obtained in examination, was also taken into account in awarding the grant. In the Code of 1890 (which resulted from the recommendations of the Royal Commission appointed in 1886), the grant was based upon the average attendance. The following year elementary E. was made free to all children between the ages of 3 and 14. In 1900 the system of making grants for individual subjects was abolished (except in the case of domestic and manual instruction), and a block 'grant' per head was instituted. The annual examination was also abolished in favour of inspection without notice. By the Act of 1902 (repealed by the Act of 1921 which re-enacted various sections and was itself repealed by the E. Act, 1944) all elementary schools were placed under the local authority: in urb. dists. with a population exceeding 20,000 the urb. council is the local authority for E.; in bors. of more than 10,000 it was the bor. council; and elsewhere the co. council was the authority. The council was required to appoint an E. committee in accordance with a scheme approved by the Board of E. The chief duties of the councils as E. authorities related to (1) the management of schools; (2) the appointment and direction of teachers; (3) financial control over educational machinery. Each school was required to have a board of managers not exceeding six in number, four of whom were appointed by the E. committee of the council, and two by the minor local E. authority (where such existed) in the case of 'provided' schools, i.e. schools taken over from the old school boards; in the

case of 'non-provided' schools four of the managers were appointed under the trust deed of the school and two by the E. authority. In 1906 and 1907 power was given to local authorities to provide for the feeding of necessitous children in England and Wales and for the medical inspection of all children in elementary schools. The Act of 1902 classified elementary schools as 'provided' or 'voluntary,' the former being those built and maintained by the local E. authority. No religious catechism or religious formula which is distinctive of any particular denomination might be taught in a provided school (a prohibition which re-enacted the Cowper-Temple clause, *q.v.*); in non-provided or voluntary schools the character of the religious instruction must be in accordance with the provisions of the trust deed and under the control of the managers (the Kenyon-Slaney clause). In provided schools the teachers are appointed and dismissed by the local E. authority; in voluntary schools, by the managers subject to the consent of the local E. authority.

The Fisher Act.—The E. Act, 1918, frequently called the H. A. L. Fisher Act, repealed in 1921, and re-enacted as part of the Consolidation Act of that year, made several important changes in the educational system of Great Britain. The Act, as shown by its preamble, aimed at 'the establishment of a national system of education for all persons capable of profiting thereby'; and local authorities, called upon to prepare suitable schemes under the Act, were advised to consult parents and other persons locally concerned in order that the most convenient arrangements might be made. The Act also gave local authorities power to establish nursery schools for children from the ages of 2 to 5. The most revolutionary part of the measure was the change in the age for compulsory school attendance. This was not only raised from 12 to 14 years, but powers were granted to local authorities to extend this age to 15 in those places where such an extension might seem desirable. Part-time attendances were entirely abolished, and in order to carry this into effect the Act declared that 'no child should be employed in a factory unless legally so employed.' This section was among those which were not repealed in 1921, but later legislation on the point is to be found in the E. Act of 1944 which empowers local E. authorities to prohibit or restrict the employment of children attending county, auxiliary or special schools where it would be prejudicial to the children's health or E. Provision was made for the estab. of central schools for more intelligent children with the evident intention that there should be a possible avenue for the really brilliant scholar from the humblest position to the univ. Local authorities were also encouraged to provide means by which suitable children could be transferred and prepared for higher E., and with this object in view the Act removed the limit on contributions from the rates for all E. other than elementary. The Act estab.

the principle that E. should not cease before the age of 18, and provision was made for the estab. of schools for young persons between the ages of 14 and 18, the compulsory hours of attendances to be not less than 32 in the year. The Act also urged on authorities the importance of physical training and gymnastics as well as adequate medical supervision. Special provisions were also contained in the Act for the supply and training of teachers. The passage of this Act synchronised with much discussion on the payments and pensions of teachers and in 1920 many changes were made under a National Scheme which improved the outlook of teachers in all state-aided schools, the Burnham Scale of Pay, as the new rates were called from the fact that Lord Burnham (*q.v.*) was chairman of the Scheme. The duty of preparing older children for work in technical occupations has received increasing attention by the educational authorities. Such schools as Sibford School in Oxfordshire where technical E. forms a large part of the curriculum have influenced both elementary and advanced E. (see TECHNICAL EDUCATION). The post-1918 period gave a great impetus to univ. training both in the modern univs. and in the two historic centres of learning, Oxford and Cambridge. Broadly speaking, this new enthusiasm was practically all centred in scientific and practical studies. Great extensions took place in Liverpool, Bristol, Leeds and Manchester, while such cities

Leicester College of Art

THE ARTS

A woman student of bookbinding is turning-in gold lines with a wheel tool or fillet

as Southampton, Reading, Nottingham, and Exeter made definite movements toward securing their own Charters. In any educational review of that post-war period it is important to recognise the great influence of the commercial world upon higher E. (See also ADULT EDUCATION).

Educational reform.—The pre-1944 publicly-provided system of E. in England and Wales was characterised by overlappings and inconsistencies. Nor can

it be urged that it was based on any fundamentally sound principle, even a misconceived one. The outbreak of the Second World War appears to have been a spur to educational reform and it is not too much to say that, despite the distractions of war, public discussion of educational reform went on with such rising intensity in the two years preceding the pub. of the gov. White Paper of July, 1943, that it was certain that a Bill founded on the proposals of the White Paper would meet with little, if any, opposition, particularly as, for the first time since 1870, an E. Bill was projected which was not a mere re-writing of a previous Act. Educational reformers in these years of discussion were quick to point out that the very use of the phrase 'the English educational system' was misleading. We often talk about 'the Eng. educational system' as though it were one and indivisible. Nothing could be farther from the truth. There are in fact at least seven or eight educational systems in the country, each with a different aim and a different ethos (or in some cases no ethos at all), and each unhappily having a different social status. There are the elementary school system, the secondary school system, the technical school system, the Public School system, the private school system, the univ. system, and the adult E. system. Within those systems further subdivisions can be made—almost all based, as are the main divisions, not on educational considerations, but on considerations of social and economic status—and it is equally feasible on the same ground to draw a distinction between the day school system, the boarding school system, and the night school system. It is true that the elementary, secondary, and technical school systems are component parts of the State educational system, but their ideals, their objectives, and their social standing are so dissimilar that it is almost true to say that theirs is little more than an administrative unity. And even that is far from being complete because each of those systems is administered under a different code of regulations prescribing different standards of buildings, amenities, and teaching staff. The state educational system is, truly, 'not so much an organic unity as a collection of parts, each of which retains to a greater or less extent the imprint of the State of social development which attended its birth' (H. C. Dent, *A New Order in English Education*, 1942). As Dr. F. H. Spencer pointed out in an earlier work, 'the truth is that popular education has been successively for the governing class and many others a matter of philanthropy, a measure of 'ransom', an insurance against the dangers of an illiterate democracy, a necessary consequence of developing industrial methods and increasing and transformed office employments. It has never, by our statesmen, been conceived as the most important means among others of producing a noble race. It must be so conceived. Our new society will recognise this, or it will fail and fade like the shadow

of another dream' (F. H. Spencer, *Education for the People*, 1941). The Churchill gov.'s proposals for recasting the E. service of England and Wales, as set out in Cmd. 6458 (pub. on July 16, 1943) recognised the principle that E. is a continuous process conducted in successive stages. The reforms proposed in this White Paper included some to be achieved by legislation and others to be effected by administrative action. The former included: (1) the improvement of the facilities for the training of children below compulsory school age by the provisions of nursery schools; (2) raising of the school-leaving age to 15 without exemptions, with provision for a later raising to 16; (3) completion of the re-organisation of the public elementary schools, so that well-designed and equipped primary schools may be available for all children up to 11, and secondary schools with varied facilities for advanced work, for all children over that age; (4) an amendment of the existing law so as to emphasise the position of religious instruction as an essential element of E.; and to enable the schools provided by voluntary bodies to play their part in the proposed developments; (5) introduction of compulsory part-time E. in working hours for young persons up to the age of 18; (6) provision of adequate and properly co-ordinated facilities for technical and adult E.; (7) extension of facilities for securing the health and physical well-being of children and young persons; (8) introduction of a system of inspection and registration of all independent schools which catered for children of compulsory school age; and (9) adjustment of the existing system of local educational administration to the proposed new educational layout. The changes to be effected by administrative action included: (i) a progressive decrease in the size of classes in primary schools; (ii) abolition of the Special Place examination and adoption of the arrangements for the classification of children when passing from primary to secondary schools; (iii) introduction of a common Code of Regulations applicable to secondary schools of all types so framed as to secure that standards of accommodation and amenities were raised to the level of those of grammar schools; (iv) remodelling of the curriculum of secondary schools; (v) further expansion of the Youth Service; (vi) improvement of the facilities for enabling poor students to proceed to the univs.; and (vii) reform of the methods of recruiting and training teachers. The bases of these proposals were equality of opportunity and diversity of facilities. With these aims in view the gov. proposed that the statutory system of public E. should cease to be severally administered for the purpose of elementary E. and higher E. respectively and should be organised in three progressive stages, to be known as primary, secondary and further E. A duty would be placed on each local E. authority to contribute towards the mental, moral and physical development of the community by securing the provision of efficient E. throughout

these stages for all persons in the area capable of profiting thereby. The parents duty would no longer be confined to causing his child to be efficiently instructed in the three It.'s; it would be to cause the child to receive efficient full-time E. suitable to the child's age and aptitudes. The gov. held that there was nothing to be said in favour of a system which subjected children at the age of 11 to the strain of a competitive examination on which not only their future schooling but their future careers might depend. In future children at the age of about 11 should be classified, not on the results of a competitive test, but on assessment of their individual aptitudes largely by such means as school records, supplemented, if necessary, by intelligence tests, with due regard to parents' wishes and the careers they had in mind. Three main types of secondary schools were proposed: grammar, modern and technical, but these would not necessarily remain separate and apart but different types might be combined in one building or on one site and conditions in the different types must be broadly equivalent. Authorities would be empowered to establish boarding schools and hostels. It was intended that the raising of the school leaving age to 15 should be brought into effect as soon as possible after the war. A duty would be placed on local E. authorities to provide such variety of instruction as might be desirable in view of the different ages and aptitudes of the pupils and of the different periods for which they might be expected to remain at school.

Education Act 1944.—The Bill embodying a great part of the proposals in the White Paper described above was presented to Parliament by Mr. R. A. Butler, president of the board of E., on Dec. 15, 1943, and passed on Aug. 3, 1944. The Act substitutes a ministry of E. for the Board (which of course never met). The minister now has the benefit of the advice of two Central Advisory Councils, one for England and one for Wales, whose duty it is to advise him upon such matters connected with educational theory and practice as they think fit. The new ministry is charged with the duty of securing the effective execution by local E. authorities of the national E. policy, instead of with the mere "superintendence of matters relating to education in England and Wales." This change does not involve any diminution in the responsibility of local E. authorities, to whom wider opportunities will be afforded than ever before. What is involved is a recognition of the principle that the public system of E., though administered locally, is the nation's concern, the full benefits of which should be equally available to all alike, wherever their homes may be. Every child is offered the opportunity to pass through primary, secondary and further stages, the secondary stage being designed to give all children over 11 an opportunity to make the most of their natural aptitudes. Thus the old division of E. into two fields, elementary and higher, comes to an end. Instead, the system of public E. is organised

as a continuous process conducted in three successive stages—primary, secondary and further—and each local E. authority is required to secure the provision of efficient E. at all stages. This change necessitated a revision of the pre-1944 system of local educational administration. That system, established by the Education Act of 1902, provided for two different types of local E. authority—authorities for elementary E. only (certain boroughs and urban districts and councils) and authorities for both elementary and higher E. (county boroughs and councils). In those areas which came under the first-named authorities the responsibility for higher E. rested with the county council. To-day the local E. authority is responsible for all types of E. They now comprise only the county and county borough councils, except where considerations of economy and efficiency make it desirable to combine the areas of two or more county or county borough councils; and in such cases a joint E. board, consisting of representatives of the councils concerned, are established as the local E. authority for those areas. Provision is made for a system of delegation of the functions of the county local E. authority to divisional executives in order to evoke and maintain local interest in E. in the county districts, and schemes for the delegation of functions are prepared by the county councils in consultation with the county district councils, which latter have the right to make representations to the Minister who may modify the schemes. The clauses of the Act dealing with the Dual System (provided and non-provided) and the giving of religious instruction follow generally the lines of the White Paper and indeed to some extent those of previous Education Acts. The financial liability of the managers or governors of aided schools is now limited to half the cost of alterations and improvements of buildings and of external repairs, the remaining half being met by the Minister. In all primary and secondary schools the school day begins with a corporate act of worship and religious instruction is to be given. This instruction may be given at any time. The former statutory provision restricting it, in the case of elementary schools, to the beginning and end of the school session, no longer applies. In the county schools the instruction is in accordance with an agreed syllabus drawn up by representatives of the established Church (except in Wales and Monmouthshire) and other religious denominations, the teachers and the local E. authority. Neither the corporate act of worship nor the religious instruction required to be given may include any catechism or formula distinctive of any particular religious denomination (repeating the Cowper-Temple clause). Parents who wish their children to receive denominational religious instruction may withdraw them for that purpose and it is also open to parents to withdraw their children entirely from religious observance and instruction. In aided schools the religious instruction is still in accordance with the trust deed or previous practice, and under the control of the managers or governors. In controlled

schools (those conducted entirely at public expense) the religious instruction is in accordance with an agreed syllabus. Under the Act of 1944 the Minister is empowered to raise the school-leaving age from 14 to 15 and eventually to 16 (it may be noted that the Education Act of 1936, repealed by this Act, raised the compulsory school age to 15). School authorities are required to provide nursery schools and classes for children from 2 to 5 years before the compulsory stage is reached. Smaller classes are planned for primary schools, and provision made for junior grammar and technical schools. Backward children receive special attention and E. authorities are instructed to provide meals and milk for children under their charge. One of the most important features of the Act, the abolition of school fees, came into force on April 1, 1945. The fees are abolished in all schools that take financial assistance from local E. authorities as distinct from schools that are financially independent and those which take their grant direct from the Ministry; the two latter categories are exempt from the requirement that fees be abolished. But fees may be charged for extra tuition, given in some secondary schools, usually outside school hours, in such subjects as the violin, piano, dancing or elocution. A feature of the new Act is the institution of continuation schools, at first named, in the White Paper (Cmd. 6158) and Bill 'Young People's Colleges,' afterwards amended to 'County Colleges,' where E. is to be continued up to the age of 18. The principles of this institution formed the main innovation of the Fisher Act of 1918, and they were embodied in Sect. 75-79 of the 1921 Act, but were never implemented. Adequate facilities are conferred on E. authorities to provide playing fields and play centres. The barrier against married women teachers is abolished. Managers of denominational schools are given approximately the same powers to borrow money as are conferred on local E. authorities.

Hitherto, broadly speaking, the grammar school has been the only school that offered attractive amenities, such as small classes, playing fields, and well-developed social activities, and this has always been a great incentive to get the child into these schools, whether the academic E. provided was the best for him or not. The abolition of fees, however, will probably change this state of affairs, for the Minister has stated that there are to be secondary schools with all these advantages available for every child, but the school curriculum has to be adjusted in accordance with the child's ability and aptitude. This means that the grammar school will no longer have all the advantages. There will be a levelling up, and the parents of the practical-minded child will no longer have the same incentive to get him into the grammar school because other schools can offer equal amenities with an alternative curriculum—which, however, complicates the problem of ascertaining what the demand for grammar school E. will be.

The provisions creating the Ministry (Part I.) and the supplementary provisions (Part V.) came into operation on the passing of the Act: Part II. (Statutory System of E.) and the general provisions in Part IV., on April 1, 1945; the remaining Part IV. (Independent Schools) come into force on a day to be named by Order-in-Council. The cost of the reforms is reflected in the increasing Estimates: for 1943-44 the total for the Board of E. was £60,075,795; for 1944-45, £61,898,150. The Ministry's estimates for 1945 (including Supplementary Estimates) were: (net) £89,940,780 (of which total, grants to local E. authorities amounted to £31,596,000); the estimates for 1946 were £104,980,112 (grants to local E. authorities being £91,534,000) and for 1946-47 (England and Wales) £173,000,000. For details of finance, see Cmd. 6781 of 1946, H.M.S.O.

WALES.—Until recent years Wales was included with England for the purposes of educational administration, but the remarkable national revival witnessed towards the end of the nineteenth century led to a demand for a national system of higher E., and the Welsh Intermediate Education Act of 1889 provided for the estab. of joint E. committees, nominated by the co. council and the lord president of the council in every co. in Wales, which for this purpose was held to include Monmouthshire. These committees had power to raise money by a halfpenny co. rate, to which was added a treasury grant not exceeding the amount raised, for the purpose of establishing intermediate and technical schools. These E. committees were superseded by the local E. authorities estab. by the Education Act of 1902. The revised regulations relating to secondary schools were applied to Wales in 1908. The system of E. beyond elementary before 1914 was much the same as in England, though the schools were under earlier statutory provision, and were called 'Intermediate' in many cases. There was a Central Welsh Board for Secondary E. A Welsh dept. of the Board of E. was estab. in 1907, with a permanent secretary and a chief inspector. The E. Act of 1944 (Ch. 91) enables the Minister of E. to continue to pay to the Welsh local E. authorities the special grants payable under Sect. 9 of the Welsh Intermediate E. Act, 1889. Consequent on this and other changes the Act of 1944 includes provisions for preserving the existing financial position of the Central Welsh Board.

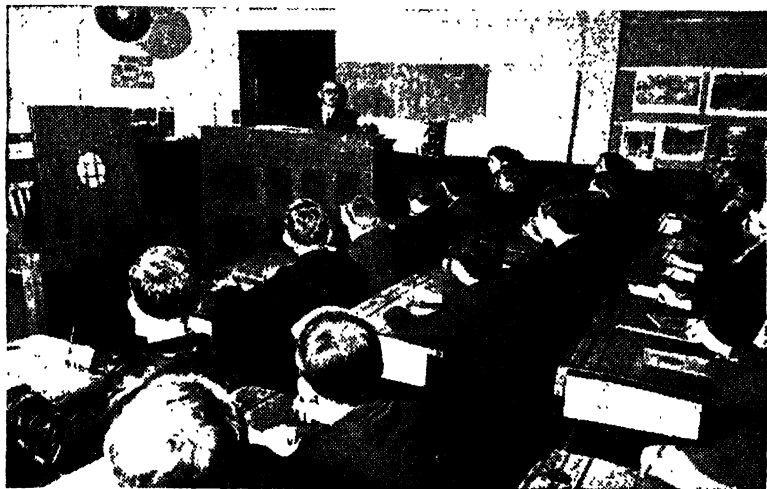

IRELAND.—In Ireland state intervention in E. began with the foundation of schools by the Elizabethan gov. in pursuance of their Anglicising policy. Until 1802 there was a great lack of local effort in E., but in that year the Catholic Society of the Christian Brothers was instituted, which continues its great educational efforts. In 1811 also was founded the Kildare Place Society, which attempted to provide schools upon a compromise between the Catholic and Protestant religions. Both societies received grants from the Treasury in aid of E. until 1833,

when a national system of elementary schools was estab. under a board of commissioners, among whose powers were those of aiding in the erection of schools, appointing inspectors, and awarding grants to teachers, of providing a training college, and of issuing text-books. In 1861 special provision was made that the membership of the board should be equally divided amongst Catholics and Protestants. The schools are now almost entirely denominational, either Catholic or Protestant. In Eire primary E. is directed by the state. Secondary E. is in private hands, and is for the most part conducted by Religious Orders. School attendance is compulsory for children from 6 to 14 years. State grants to Irish Univ. institutions were transferred from the Treasury to the Irish state govts. (Free State and N. Irish) as from April, 1922. In N. Ireland there are some 900 public elementary schools, and about seventy-two preparatory, intermediate, and secondary schools recognised by the Ministry of E.

SCOTLAND.—E. has always received marked attention in Scotland. Even as early as 1494 freeholders were required by a statute of King James IV. to send their heirs to school to acquire 'perfect Latin.' In 1560 the Church Assembly decreed, under the influence of John Knox, that every church in 'any town of repute' should have attached to it a Lat. school, and in every par. of country diots. there should be a teacher of 'first rudiments.' In large tns., moreover, there was to be a college for 'logic, rhetoric, and the tongues.' In 1696 par. schools in connection with the Estab. Church of Scotland were set up by parl. statute, and a tax was levied upon landowners for their support. The burgh schools or academies were also estab. in most tns., and came under the control of the municipal authorities. In 1839 the system of inspection and annual grants to schools was estab. in England and applied to Scotland. Until 1872 educational legislation extended to both countries alike, though slight modifications and allowances were made in the actual working of the schemes in Scotland. In 1872 the Scottish Education Act made the provision of school boards universal and the property and control of the existing schools, burgh and parish, were transferred to them. Compulsory attendance for all children from 5 to 13 was enforced. The age raised to 11. The Act also distinguished three types of school, the elementary school, the higher grade school, and the higher class school, all of which had primary depts. Powers were also given to school boards to provide meals and medical attendance, defray cost of conveyance in outlying parts, etc., and the Act enabled them to make bye-laws requiring attendance at continuation classes up to 17 years of age. In 1885 the Scottish and Eng. E. Depts. were separated, and the former has since had its own committee and secretary. In 1888 a state system of leaving certificate was introduced into the higher class schools,

and was soon extended to all schools doing higher work. There is also a qualifying examination for transition from primary grade to the intermediate course provided by the higher grade and higher class schools, and the supplementary course provided by the elementary school, and an intermediate certificate for transition from the intermediate to the post-intermediate course of the higher class school. In Oct. 1944 the Sec. for Scotland introduced the Education (Scotland) Bill which was to apply to Scotland (with the necessary modifications) the national policy for

The boys co-operate with the broadcaster, tapping out the beats with pencils at his instruction

E. provided by the Education Act for England and Wales. See also ADULT EDUCATION; FOLK HIGH SCHOOLS; TECHNICAL EDUCATION; etc.

BROADCASTING TO SCHOOLS.—Among the specialised programme services provided by broadcasting, the most important are perhaps the broadcasts to schools. In Great Britain the value of educational broadcasting was established as early as 1927, when a year's experiment was conducted among the schools in Kent. Twenty years later over 12,000 schools were registered as listening regularly to the Brit. Broadcasting Company's schools broadcasts. In the U.S.A. education by radio has also achieved a prominent position, educational broadcasts being provided by the Amer. companies for nearly 100,000 schools. In 1949 the Brit. Broadcasting Corporation conducted experiments in teaching by television.

Education, Ministry of. State dept. in the United Kingdom, known until 1944 as the Board of Education. This Board had its origin in the appointment in 1886 of a minister responsible to parliament. This office was originally held, according to the provisions of the Bill passed in the above-mentioned year, by the vice-president of the Committee of Council on E., and at the same time as a minister was made responsible the dept. of science and art was taken from the hands of the Board of Trade and given to the control of the committee. The Board of Education Act of 1899 abolished this office of vice-president of the council and created a president of the Board of Education, which was the dept. of education and of science and art united in one committee. In addition to the president there was also a parl. secretary appointed. The Board underwent a further change in 1902, when it was divided into three definite divisions, to control respectively, primary, secondary, and technical education. The M. of E. was estab. by the Education Act of 1944. The minister is of cabinet rank, and has a salary of £5000.

Education, Technical. See TECHNICAL EDUCATION; EDUCATION.—*The Spens Report*.

Edward the Confessor (1004–10 to 1066), apparently the second son of Æthelred the Unready and his wife Emma of Normandy. His surname was given on account of his reputation for superior sanctity. The greater part of his early life was spent in exile, since on the death of his father the throne of England passed into the hands of a Dan. dynasty. His mother married Canute (Cnut) after the death of Æthelred the Unready, and by him had two sons, Harold and Hardicanut. In 1041 Hardicanut invited Edward from the Norman to the Eng. court, an invitation which carried with it recognition of his claim to the Eng. throne. In 1042 Hardicanut died, and E., not without some opposition, was elected king of England. His reign was one long story of England struggling against the influence of Normandy. His long exile in Normandy had made him more Norman than Saxon, and the atmosphere of his court was almost entirely Norman. The most prominent Eng. family, the Godwins, struggled against this, but recognition of the Saxon point of view meant recognition of the unspoken claim of Harold, Godwin's son, to the throne of England. E.'s reign is chiefly noted for the rule of the Godwins

and the visit of William the Bastard of Normandy, to whom E. is alleged to have promised the crown. He died Jan. 6, 1066, after practically nominating Harold to the Eng. throne. He was canonised, with the title of Confessor, in 1161 by Pope Alexander III. Had he lived within the shadow of the cloisters his life might easily have been of value and service, but as a king he was feeble, and, having no administrative ability, the real gov. of the kingdom during his reign was placed almost entirely in the hands of favourites.

Edward I., the Elder (d. 924), king of the W. Saxons. E. was the second son of Alfred the Great; he succeeded his father in 899. After a succession of battles with the Danes, E. was chosen as 'father and lord' by the Scottish, Northumbrian, and Welsh kings.

Edward II., the Martyr (926–978), king of the Eng., whose short reign was mostly marked by the anti-monastic reaction. His assassination at Corfe Castle in Dorset was probably arranged by his step-mother, Ælthyth, who was anxious to place her own son, Æthelred, upon the throne. Shortly after his death he was popularly esteemed to be both a saint and a martyr.

Edward I., king of England, and eldest son of Henry III., was b. in June 1239 at Westminster. He was married in 1254 to Eleanor of Castile, and on the occasion of his marriage was invested with the baronies of Gascony and Wales. It was in Gascony that he first received that training as a warrior which was to stand him in such good stead later on. During the baronial troubles of his father's reign, his attitude may best be defined as defending the royal claims and prerogatives, whilst at the same time realising the justice of the claims of Simon de Montfort, and later incorporating them with his own views. He was at an early age distinguished as a warrior and a general, and took a prominent part in the Baronial Wars. He was responsible for the overthrow of the Royalist forces at Lewes, since by the wild charge which swept his sworn enemies, the Londoners, from the field, he so weakened the Royalist force that on his return from the pursuit he found his father's forces had been defeated, and surrendered. He made his escape from prison in 1265, and defeated Simon de Montfort at the battle of Evesham (1265). After the Dictum of Kenilworth had virtually ended the civil strife, it may be said that E.'s reign begins, since he was influential enough to prohibit the misrule of the earlier days of his father's reign. In 1270 he set out on a crusade, and returning to Europe in 1273, after a narrow escape from death at the hands of an assassin, he learnt of his father's death. The principle of primogeniture was estab. by his recognition as king of England during his absence. He was crowned in Aug. 1274 having spent the two intervening years in settling affairs in Italy, France and Gascony. E. was regarded by his subjects as their first truly Eng. king, and certainly his policy was thoroughly Eng. even though his speech and ideals

were not. He was a handsome man of great stature, on which account he was nicknamed 'Longshanks.' His reign is important from every point of view. He instituted, or caused to be instituted, numerous legal and social reforms. He adopted an ideal and essentially insular home policy. He carried out to the best of his ability a foreign policy which redounded to the honour and glory of England. His first trouble at home came from Wales, and he was able to commence his policy of creating a 'united Britain' by annexing Wales after the second Welsh war, which ended in the overthrow and death of the last Llewellyn (1282). The Statute of Rhuddlan made Wales an Eng. possession. Between 1284 and 1290 the time was occupied with the initiation of new legislation. E. was determined to be king not only in name but in reality, and his legislation tended towards that end, incorporating perhaps also to a certain extent the ideal of 'what touches all should be approved of all.' His chief measures in this direction were: The abolition of the office of Justiciar, leading to the organisation of the three common law courts, the Assize of Winchester (a nation in arms at the disposal of the king), the Statute of Mortmain, and *Quia Emptores* (a means of preventing subinfeudation). It is perhaps merely coincidence that all the great legislative reforms should cease with the death of Badnell, the chancellor, and that by far the most stormy period of E.'s reign should follow that death. The next great trouble of the reign was the interference of E. in Scottish affairs. In 1286 Alexander III. had died, leaving as his heir the Maid of Norway, his grand-daughter, who was only six years of age. In pursuance of his ideal of a united Britain, E. planned a marriage between the Maid and his son, Edward of Carnarvon. The marriage was accepted in Scotland, but in 1290 the Maid died, and the affairs of Scotland became chaotic. E. as arbitrator at Nottingham chose John Balliol as king of Scotland, out of a dozen claimants, the most prominent of whom was Robert Bruce. Balliol did homage to E. as his over-lord, but the Scottish people, resenting keenly the attitude of E., forced Balliol into open rebellion, and E. invaded Scotland. By the end of 1296 he had reduced Scotland, and at Brechin had forced Balliol to surrender the crown. He appointed his own regents for Scotland and departed southward, taking with him the famous Stone of Destiny. In 1297 Scotland, led by the hero Wallace, was again in rebellion. N. England was harried, and at Stirling Surrey and Cressingham were totally defeated. E. hurried back, and in 1298 overthrew Wallace at Falkirk. The struggle still continued, but E. may be said to have been master of Scotland between 1298 and 1306. In the meantime affairs at home and abroad had not been going well. In 1295 was called the Model Parliament. In 1297 and 1298 came his troubles with the clergy under Winchelsea, and the barons under Boyd and Bohun. The taxation of the period was excessive, and strong though E. was,

the barons and the people wrung from him the *Confirmatio Cartarum* and the *De Tallagio non Concedendo*. In 1299 he had married the sister of the King of France. In 1305 Wallace was captured and executed, and in the following year Bruce murdered Conyn, and seized the crown of Scotland. E. hurried northward, but he was falling fast in health, and in July 1307 he died at Burgh-on-Sands. He ordered his body to be borne before the army until Scotland was conquered, but his graceless son sent it down to Westminster for burial. On his tomb is inscribed *Edwardus Primus Malleus Sclotorum hic est*. He may best be described as a man of stern character, jealous of his honour and of the honour of his country, true to his word when it suited his end, and only then. When it was necessary, E. did not hesitate to break his pledged oath, and his motto, *Faciam serua*, may be almost regarded as a fine ideal which the spirit of the age made it impossible for him to attain. See lives by R. B. Seeley, 1860, and E. Jenks, 1902.

Edward II., king of England, was b. in April 1284, and was the first of the Eng. crown princes to bear the title of Prince of Wales. He succeeded his father in July 1307, and disobeyed his last command to continue the war with Scotland. Weak and incapable, his reign is one long record of his struggle with the barons. His favouritism of Piers Gaveston was most unpopular, and the honours showered upon the favourite cost Gaveston his life. The barons, forming a committee, drew up the Ordinances which E. was forced to accept (1318). Two important constitutional points were settled in this reign: (1) That grants of aid should be preceded by redress of grievances; (2) that the consent of parliament consisted not only of the consent of the barons but of the people as well. In 1326 Isabella, the queen, who had been in France with her son (Edward), returned, landed at Orwell, and marched against the king. The Despencers, favourites for the moment, were captured and executed, and the king was deposed. In 1327 he was brutally murdered in Berkeley Castle. Outside England, E. had shown his weakness in the total defeat of the Eng. army at Bannockburn in 1314, a victory which was followed up by the capture of Berwick, and resulted in the practical independence of Scotland. See T. F. Tout, *The Place of the Reign of Edward II. in English History*, 1911.

Edward III., son of Edward II., b. in 1312 and crowned in 1327. In 1328 he married Philippa of Hainault. During the early years of his reign Isabella and Mortimer retained the real power, until in 1330 he banished his mother and executed Mortimer. He then made peace with France in order to turn his attention to Scotland, where in the early years of his reign (1330-36) he fought three campaigns, in which he defeated the Scots (notably at Halidon Hill on July 19, 1333) and forced Edward Balliol to do homage to him. After each campaign, however, the Scots rallied, and E.'s attacks on Scotland were

stopped by the outbreak of war with France. His formal claim to the throne of France in right of his mother was correctly regarded as a pretext. The war was essentially a commercial war, and was fought by Edward because he desired to retain the Flemish woollen trade, and also because he was deeply imbued with the ideals of chivalry and regarded himself as a warrior king. He also probably adopted the style of king of France in order to obtain the allegiance of the Flemings. The war opened with the battle of Sluys (1340), a naval victory for England. The next few years were not so successful, but in 1346 was fought the battle of Crécy, which resulted in the overthrow of the Fr. army, the vindication of the tactics of the Eng., and the downfall of feudalism on the Continent. In the following year Calais fell into the hands of the Eng., and in the previous year the battle of Neville's Cross had delivered David, King of Scotland, a prisoner to the Eng. queen. The Black Death in England in 1349 put an end to the war for some time, and resulted also in the changing of the labour market in England. The relationship between the lords of the manor and the inhabitants changed, and although the Statute of Labourers purported to fix wages, its provisions were found to be unworkable. In 1355 war was renewed, and Edward the Black Prince won a great victory at Poitiers. The Fr. king, John, became prisoner and was taken to England. In 1360 the treaty of Bretigny was signed, and E. gave up his pretensions to the Fr. throne and received Aquitaine and Ponthieu as a sovereign prince. The Scottish king had been released in 1357 on the payment of ransom, and the Fr. king in 1360. The latter, however, finding it impossible to raise the ransom, returned to England, and died there a prisoner in 1364. War again broke out in 1369, and dragged on not very successfully until 1377. In that year Edward the Black Prince died early in June, to be followed by his father towards the end of the month. The latter years of his reign had been years of decadence. E. had fallen under the influence of Alice Perrers, his mistress, and the power had passed largely into the hands of John, duke of Gloucester. But the reign had been distinguished for the setting up of a sound commerce and for the beginning of the revolt against the Rom. Church. The Statute of *Præmunire* showed the setting of the current towards separation from the Rom. Church. E.'s reign is very important in the hist. of constitutional progress. Although the enthusiasm aroused by the Fr. war sometimes enabled the king to levy illegal taxes, Parliament succeeded in placing important restrictions on the royal power, as e.g. when the king declared in 1352 that the levy of tallage should cease and again when the prerogative of purveyance (see under *PRE-EMPTION*) was abolished in 1362 except for the personal needs of the king and queen. Parliament also asserted its complete control over customs, such as tunnage and poundage, by the Statutes of 1362 and 1371 which enacted that neither merchants nor

any other body should impose a subsidy or charge on wool without parl. consent. Again the right of the Commons to deliberate on questions of peace and war was clearly established in this reign. In judicial matters, two important privileges were won: the Commons asserted their right to impeach the ministers of the Crown (1376) and the Lords confirmed their claim to trial by their peers alone. See lives by W. Longman, 1869; W. Warburton, 1875; and J. Mackinnon, 1900.

Edward IV. (1442-83), son of Richard, duke of York, and Cicely Neville, b. at Rouen on April 28. He bore in his youth the title of Earl of March, and spent the greater part of his early life on the Marches. He took part in the first unsuccessful struggles of the Yorkists, and retired to Calais, whence he returned with the other Yorkists in 1459. He was on the Marches of Wales when he heard of the overthrow of his father at Wakefield. He marched towards London, winning on the way the battle of Mortimer's Cross, where he routed Gaspar Tudor, and then, by threatening London, prevented the victorious Lancastrians from entering, and himself entered it in March 1461. He was proclaimed king, and immediately marched N. again where in March he established his position by the great victory of Tewton. He owed his position more to his relatives the Nevilles and especially to Warwick, the king-maker, and at first showed his gratitude by practically allowing Warwick to rule the country. He showed, however, that he was essentially ungrateful by twice flouting Warwick's policy of foreign marriages. Especially was this seen when he disclosed his marriage to Elizabeth Woodville when Warwick had advocated and practically arranged a marriage with a Fr. princess. Still matters did not come to a head until Warwick, acting in conjunction with Clarence imprisoned E. in his castle at Middleham. He escaped, and Warwick retired to France, only to appear in the next year with an army which forced E. into exile in Burgundy. After some little difficulty he received assistance from Charles of Burgundy and returned, defeating Warwick at Barnet and Margaret of Anjou at Tewkesbury (1471). He was still troubled by the intrigues of Clarence, who was murdered in 1478. E. died on April 9, and was buried at Windsor. In character he was reckless and dissolute, yet not devoid of ability. After the Lancastrian struggles he was strengthened by the wealth which he obtained by confiscation and by his recognition of the fact that England needed a breathing space after her century of war. He is sometimes regarded as a precursor of the Tudor autocrats. He was a typical product of the Renaissance period; tyrannic in rule, but a patron of learning and of the new discoveries. He was a patron of Caxton. See *Historie of the Arrivall of E. IV. in England, and the final recoverye of his kingdomes from Henry VI.*, 1471, ed. J. Bruce (Camden Society), 1838; C. L. Scofield, 1923.

Edward V. (1470-83), elder son of Edward IV. His uncle, Richard, Duke

of Gloucester, was appointed regent for him. With feigned reluctance Richard accepted the crown of England for himself. The king and his brother were at this time living in the Tower, and when an attempt was made to release them the news spread that they were dead. The manner of their death only became known some twenty years later, when it was established, practically beyond doubt that they had been smothered in the Tower by order of their uncle, Richard III. See lives by Sir T. More, 1641; Sir C. R. Markham in *The English Historical Review* (vol. vi), 1891.

Edward VI. (1537-53), only son of Henry VIII., and the only child of Henry by his third wife, Jane Seymour, who d.

EDWARD VI.
After Holbein

twelve days after his birth. He was given a sound and careful education, but from his birth it was recognised that he would probably not live long. He was never created Prince of Wales, but bore the title Duke of Cornwall from his birth. He succeeded his father when not quite ten years of age, and as was natural, the power of gov. was exercised by regents, first, the duke of Somerset, and second by the duke of Northumberland. He was practically a nonentity during his short reign, the famous Acts assigned to him being the work of the regents. He was brought up in the Protestant faith, and gave promise of becoming a fanatic. He left a will when he died which was obviously the work of Northumberland. By it he set aside the will of his father and left the throne to Lady Jane Grey and her heirs male. Lady Jane Grey had but recently been married to the eldest son of Northumberland. Edward died in July and was buried in Henry VIII. Chapel. See life by Sir C. R. Markham, 1907, and J. C. Nichols (ed.), *The Literary Remains of King Edward VI.* (Including diary, 1549-52), 1857.

Edward VII. (1841-1910), Albert Edward, King of Great Britain and Ireland and of the Brit. dominions beyond the seas,

Emperor of India, was the eldest son and second child of Queen Victoria and Prince Albert, and was born at Buckingham Palace on Nov. 9. In the Dec. following he was created earl of Chester and Prince of Wales. He was educated under private tutors, and in 1859 went to the Univ. of Edinburgh. From here he went first to Christ Church, Oxford, and later he was attached to Trinity College, Cambridge; resided at Madingley Hall, 4 m. out, rooms being allotted to him for occasional use at Trinity Lodge by Dr. Whewell the Master. In 1858 he had been made a Knight of the Garter, and a colonel in the army. In the following year, travelling under his first formal incognito, he visited Italy and Spain, and in the following year travelled through Canada and the U.S.A. He had already impressed the people whom he had met with his good-fellowship and charm, but his early life was passed under many restrictions, which did not lessen in severity after the death of his father the Prince Consort. He returned from America, having left there a very favourable impression, to continue his univ. course, after which in 1861 he went to Ireland to the Curragh, where he joined his regiment the 10th Hussars. In the Sept. of the same year he met for the first time the Princess Alexandra of Denmark who was ultimately to become his wife. The year 1861, however, was a sad one for the prince. Early in the year his maternal grandmother died, and on Dec. 13, the prince, hastily summoned from Cambridge, was present at the death of his father. In 1862 he went, under the guidance of Dean Stanley, for a tour through the Holy Land, and early in 1863 was admitted a member of the Privy Council and took his seat in the Lords as duke of Cornwall. On March 10, in the same year, he married the Princess Alexandra. He was granted an income of £40,000 a year in addition to the revenue of the Duchy of Cornwall, and Sandringham was purchased for him, whilst Marlborough House became his tin. residence. His eldest son, Prince Albert Victor (Duke of Clarence), was born 1864, Prince George Frederick Ernest Albert (George V.) 1865, Princess Victoria Louise, 1867, Princess Victoria, 1868, Princess Maud (Queen of Norway), 1869.

After his marriage the Prince of Wales played an important part in the social life of the nation. The death of the Prince Consort had been an overwhelming blow to the queen, and for many years following it she lived in practical retirement. The prince, however, fulfilled his duties admirably; he was always ready to help forward charitable movements, and he played an important part in the linking together of the empire by his various foreign tours and visits. He had already visited France, and had formed a lasting friendship for that country, a friendship which did not waver in spite of many political incidents. Amongst his more important visits may be mentioned, Egypt, 1869; Ireland, 1871; Russia, 1874; India, 1875; Ireland, 1885. In

1871 he was struck down with typhoid fever, and for a time his life was despaired of, but gradually he recovered, and in Feb. 1872 a public thanksgiving was held at St. Paul's. In 1892 his eldest son, Prince Albert Victor, on the eve of his marriage to the Princess May Victoria of Teck, died after a very brief illness. In the following year the marriage of his son, Prince George, took place, his bride being the Princess May Victoria of Teck. In 1894 a son, Prince Edward of Wales, was born to the duke of York. In 1897 the Prince of Wales took a leading part in the arrangements and the actual events of the queen's Diamond Jubilee. In the following year whilst paying a private visit to Baron Ferdinand de Rothschild he broke his knee cap, an accident from which, however, he entirely recovered. Whilst passing through Brussels in the next year he was fired at by a youth named Sipido, but fortunately no injury was done.

Early in 1901, his mother, Queen Victoria, died, and the prince succeeded with the title of Edward VII. In May 1902 the war in S. Africa was brought to an end. The personal popularity of the king was seen from the very beginning of his reign. He took an active part in the political and social life of his people; but he refrained always from showing any marked political bias. He was continually visiting in various parts of the country, and he undoubtedly kept well in touch with the opinions of his people. He was thoroughly constitutional, and though much has been written to the contrary, his outlook on foreign policy was evidently capable and statesmanlike. In spite of his continual visits to various parts of the country, he always spent at least three months of every year abroad, where he was always extremely popular. The early part of his reign was clouded by his illness just before his coronation, but he recovered and was crowned on Aug. 19, 1902. In 1905 the Conservative gov. resigned and was succeeded by a Liberal one. The year 1909 was one of grave political crisis, the budget of Lloyd George, Chancellor of the Exchequer, created unprecedented excitement in the country and was rejected by the House of Lords. The gov. resigned, but the Liberals were again returned to power, this time with the abolition of the veto of the House of Lords as the foremost plank of their platform. The speech from the throne containing the words, 'in the opinion of my ministers,' was the formal speech of the prime minister, and had not been altered in any way by the king. The king supported his ministers in their demands, as by the constitution he was bound to. Early in 1910 the king was taken ill, but recovered, but again on May 5 he was reported to be suffering from bronchitis, and on the following day he died of heart failure. In spite of his lack of political training, and on that point there is no contradiction, E. won for himself speedily the affections of his people. Whether he was great as a foreign statesman, or whether his policy was but the policy of his ministers, by his subjects he

was unanimously hailed as Edward the Peacemaker. See *Lives* by Sir E. Dacey, 1910, and Sir Sidney Lee, 1925-27.

Edward VIII. (Edward Albert Christian George Andrew Patrick David), king of Great Britain, Ireland etc., from Jan. 20 to Dec. 10, 1936; eldest son of the duke and duchess of York (afterwards George V. and Queen Mary) b. June 23, 1894, at White Lodge, Sheen. He was created Prince of Wales on his sixteenth birthday and, before attaining his majority, in 1912, he had completed his naval education at Osborne and Dartmouth, being gazetted midshipman in 1911 on the *Hindustan*, where he earned a reputation for hard work. He went into residence as a commoner at Magdalen, Oxford, in Oct. 1912. Was promoted to Lieutenant in March 1913. Was attached to the staff of Sir John French (later Earl Ypres) on the Western Front in 1914. Appointed staff captain with the Mediterranean Expeditionary Force in 1916, and became D.A.Q.M.G. in the same year. In 1917 he paid a visit to the I. front. Became colonel-in-chief of the Cadet Corps in 1918, his challenge shield being a much coveted trophy among cadet boxing teams. In 1917 was appointed colonel-in-chief of the 12th Lancers and of the Royal Scots Fusiliers. Made a freeman of the City of London and high steward of Plymouth in 1919. Visited Canada, where he had a ranch at Calgary, and also the U.S.A. in Aug. 1919, being enthusiastically welcomed in both countries. Visited Australia, 1920, India, 1921, Africa, 1925, and Canada again in 1923 and South America in 1925 and 1931. On his second Canadian visit was made a Privy Councillor for that Dominion. Made president of the Brit. Association at Oxford in 1926. Assumed the title of Master of the Merchant Navy and Fishing Fleets, 1928. He also held the titles of earl of Chester (1910-36), duke of Cornwall, earl of Carrick, baron of Renfrew, Lord of the Isles, and Grand Steward or Seneschal of Scotland, Knight of the Garter, 1911, of the Thistle, 1922, and of St. Patrick, 1927. He succeeded to the throne on his father's death, but abdicated uncrowned, because of manifestations of widespread distaste in regard to his proposed marriage to Mrs. Wallis Warfield (formerly Mrs. Ernest Simpson and now duchess of Windsor), an American citizen. He left England immediately afterwards and married her at the Château of Condé, France, on June 3, 1937. After his abdication he was created duke of Windsor.

Edward, the Black Prince, see BLACK PRINCE.

Edwardesabad, tn. of N.W. Frontier Prov., Pakistan, India, now called Bannu and Dhulipnagar. It lies in the valley of the Kuram R., and was noted as the base for all punitive expeditions to the Tschil Valley and Waziri frontier. Pop. 23,000.

Edward Medal, an award for acts of heroism performed by miners and quarrymen or to those who rescue them when in

danger; estab. in 1907 by King Edward VII.

Edward, Lake, formerly **Albert Edward Nyanza**, lake of Central Africa, and one of the Nile's W. reservoirs. It was discovered by Stanley in 1889, when he succeeded in tracing the Semliki—the one and only outlet of the lake—to its source, and by him named Albert Edward after the Prince of Wales, who became Edward VII. It was agreed by the Anglo-Ger. Boundary Commission of 1902-4 that it lay within the sphere of influence of the Congo Free State. The lake forms part of the W. boundary of Uganda Protectorate. The total length of L. E., which is oval in form and scarcely at all indented, is 44 m., the breadth never exceeding 32 m. Lake Dweru, which is connected by a narrow stream with the N.E. extremity of L. E., was discovered by Stanley as early as 1875. This smaller sheet of water is formed chiefly by the Mpango, which flows from the E. ridges of the Ruwenzori range, whose S. slopes form in the distance a splendid background to the N. fringes of the larger lake. E. L., which is fed by the Ruchuru—a headstream of the Nile—is wreathed during the dry seasons by dense mists. But when the rains come, these roll away, disclosing to view the splendid amphitheatre of hills to W. and N. Vegetation is scarce. See S. Baker, *Albert Nyanza*, 1906.

Edwards, Amelia Ann Blandford (1831-1892), Eng. novelist and Egyptologist, was a Londoner by birth. She pub. over fifteen novels, the best of which are usually admitted to be *My Brother's Wife* (1850), *Debenham's Pow* (1870), and *Lord Brackenbury* (1880). Her lectures on Egypt appeared in print under the title of *Pharaohs, Fellahs, and Explorers* (1891), but her most universally appreciated book was one of travel entitled *A Thousand Miles up the Nile* (1877). In 1882 she founded, and was long an honorary secretary of, the Egyptian Exploration Fund.

Edwards, Henri Milne, see MILNE-EDWARDS, HENRI.

Edwards, John Passmore (1823-1911), newspaper proprietor, a man of humble origin, became a journalist and a lecturer on temperance and the corn laws. Coming to London in 1845, he was one of the promoters of the Early Closing Association, and was active in his advocacy of a peace society. Five years later he began to found newspapers, but it was not until 1862, when he purchased the *Building News*, that he began to prosper in his affairs. In 1876 he acquired the *Echo*, the first halfpenny newspaper, which, though it had been eight years in existence, was not prospering. The *Echo* and the *Weekly Times* were the foundation of the great fortune he made. The bulk of this fortune was distributed in his lifetime in gifts of free libraries and institutions in various parts of England. In his lifetime he was much honoured as a philanthropist, and he was offered a knighthood by Queen Victoria and again by Edward VII., but on both occasions he declined the distinction. In 1905 he printed privately an autobiography, entitled *A Few Footprints*.

Edwards, Jonathan (1703-58), Amer. divine, b. at S. Windsor, Connecticut, was the son of a clergyman, and was himself ordained in 1727. For nearly twenty-four years (1727-50) he was associated as minister with Northampton, Massachusetts. Here he successfully piloted his people through the great wave of Revivalism, which swept his parish among so many others after the preaching of George Whitefield. But his vigorous crusade against the circulation of immoral literature and, above all, his insistence on admitting none but true converts to the Holy Communion, forced him to give up his pastorate. His *Enquiry into the Freedom of the Will* (1754), has estab. him as one of America's foremost metaphysicians, whilst his spiritual nobility shines out in his book, *True Nature of Christian Virtue*, in spite of the cloud of a somewhat austere Calvinism. He has been called the 'Spinoza of Calvinism.' See life by A. V. G. Allen, 1889; F. H. Foster, *Genetic History of the New England Theology*, 1907; V. L. Parrington, *Main Currents of American Thought*, vol. 1, 1927.

Edwards, Richard (c. 1523-66), Eng. musician and playwright. He was appointed a gentleman of the Chapel Royal, and master of the children. In the Christmas of 1564 he produced a play which was acted by his choir boys, and later his *Palamon and Arcite* was played before Queen Elizabeth. In his day E. was highly esteemed. He is supposed to have written his poem, *The Soul's Knell*, when he was dying.

Edwardsville: (1) tn. in Luzerne co., Pennsylvania, U.S.A., on the Susquehanna R. Its chief industries are mining and brewing. Pop. 7900, of whom nearly half are of Welsh extraction. (2) City in Illinois, U.S.A., 18 m. N.E. of Saint Louis, with coal mines and manufs., and nearby the co-operative vil. of Coclair. Pop. 8000.

Edwin, Edwin, or Edwine (585-633), king of Northumbria, and the son of Ella of Deira. E. was favourably disposed towards Christianity. On the day of the birth of his daughter, his life was attempted by his enemy Cwichelm, king of Wessex. E. vowed that, should he conquer his enemy, he would abstain from worshipping the gods of his race. He was killed by Cadwallon of Wales at Hatfield.

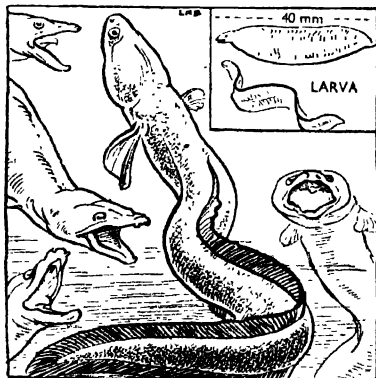

Eeckhout, Gerbrand van Den (1621-74), Dutch painter, b. at Amsterdam; he was a pupil of Rembrandt. His chief subjects are biblical, and of these his small pictures are the best. Some of his pictures are: 'Tobit,' in the Brunswick Gallery; 'The Woman taken in Adultery,' at Amsterdam; 'Simeon in the Temple,' at Dresden; 'Christ among the Doctors,' at Munich.

Eeckhout, Jacob Joseph (1793-1861), painter of historical pictures and portraits, b. at Antwerp. He imitated Rembrandt and is considered one of the most famous painters of the Dutch school. His best works are: 'The Death of William the Silent,' 'Peter the Great at Zaandam,' 'The Departure of the Recruits of Scherpeningen,' 'Collection de

Portraits d'Artistes modernes, nés dans le Royaume des Pays-Bas, 1822.

Ecclou, tn. in Belgium, 11 m. N. of Ghent. The chief manufs. are cotton, linen, and wool. Pop. 14,000.

Eeden, Frederik Willem van (1860-1932), Dutch poet and novelist, b. at Haarlem. He took his degree in medicine at Amsterdam in 1886 and for a time followed the medical profession. He was, however, in the van of the literary movement in Haarlem in the eighties and relinquishing medicine for literature became the editor and co-founder of the paper *De Nieuwe Gids*, which was the organ of the younger literary group. In this he pub. his first novel *De Kleine Johannes* (1887; Eng. trans. *Little Johannes*, 1895), a religious story in which he expressed his own deep religious mysticism. This led him to start a community centre at Bossum which he named Walden in honour of Thoreau. It was not however a success. Eventually he was converted to Rom. Catholicism. Soon afterwards he wrote the mystical poem, *Ellen* (1889). His greatest poetical work is, however, *De Broeders* ('The Brothers,' 1894), a realistic drama of a feud between two brothers to which is given a deep spiritual significance. He wrote a number of plays for the theatre. His best known novel was pub. in 1900, *Van de Koele Meren des Doods* (Eng. trans. *The Deepes of Deliverance*, 1902). His jours. which illumine his spiritual life have been pub. since his death.

EEL

Eel. The *anguilla*, or fresh-water Es. belong to the family Murenidae, a group of soft-rayed osseous fishes, distinguished by the presence of an opening to the air-bladder, and the absence of the pelvic fins. The name is also applied, popularly and scientifically, to other genera, notably the *Conger*, which is usually larger than the true E., and lives in the sea. In 1904

Dr. Johannes Schmidt estab. that the fresh-water eels of Europe and America migrate to the sea to spawn once in their life, and have a journey of 3000 miles to the breeding grounds which lie between the Leeward Islands and Bermuda. It is characterised by an elongated form of body, by the rudimentary scales buried in the skin and by the rounded fall-fin confluent with the median fins. There are no accessory breathing organs; the stomach has a blind appendage; the vent is generally situated far back, but may be near the pectoral fins; and the ovaries have no ducts. In the skeleton the pectoral arch is unconnected with the skull and attached to one of the earlier vertebrae. The true Es., congers and murenas, or large marine Es., are marked by a normal structure of the upper jaw, which is formed in front by the premaxilla, and laterally by the toothed maxilla. All the family of Murenidae are predatory and voracious, and feed on almost any animal food they can obtain, living or dead, the conger being especially fond of squid, the fresh-water E. devouring carrion of all kinds.

Eel-pout, see BURBOT.

Eesti Vabariik, see ESTONIA.

Effendi, Turkish title of respect corresponding to the Eng. 'sir.' It follows the personal name, and is generally given to physicians or members of the learned professions when they have no higher title.

Effervescence. The extent to which gases are soluble in water depends upon pressure and temp. When the temp. is low and the pressure great, the gas is more soluble, consequently when the temp. is raised or the pressure lowered, the gas escapes in small bubbles. This phenomenon is called E. The term is also applied to the tumultuous upheaval of any liquid by a gas produced in it, giving it the appearance of boiling (Lat., *fervere*, to boil). The similar phenomenon *frothing* is often a nuisance during distillation; it may be partly or wholly prevented by adding bits of broken unglazed earthenware to the liquid undergoing distillation.

Efficiency. In any method of transmitting energy from point to point, or of transforming one kind of energy into another, some of it is dissipated or become useless. The ratio of the energy available at the end of the process of the total energy supplied is called the E. of the process. Thus, in transmitting mechanical energy by means of shafting, some of it is used in overcoming friction of bearings, etc. The numerical value of the Es. of machines varies very widely. In a simple machine, such as a pulley, the E. may be as high as 80 per cent and in a screw jack, as used on motor cars, as low as 36 per cent. It must be remembered, however, that the loss of E. is compensated by the fact that the friction prevents the screw jack running backwards when left free. In transmitting electrical energy, some of it is used in the wires or cables which carry the current. As this loss is proportional to the current, it is advisable to transmit energy at high

voltage when the current will be low. In processes for transforming energy from one kind to another, the Es. show wide variations, and the object of most improvements in 'transformers' or engines is to increase the E. A locomotive engine may transform less than 10 per cent of the heat of the coal burned into available mechanical energy. But in transforming mechanical energy into electrical energy, or *vice versa*, the Es. are usually greater, as much as 92 per cent of the energy supplied being available for use after transformation. The term E. is sometimes used in speaking of electric lamps, where it expresses the candle power per unit of electrical energy supplied.

Efflorescence, in chemistry, is the term applied to the crumbling to powder of crystals, caused by the loss of water originally present in them. It occurs whenever the vapour pressure of the water in the crystal is greater than that of the moisture in the surrounding air. Glauber's salt and ordinary washing-soda are good examples of efflorescent substances. The converse of E. is deliquescence (*q.v.*).

Effusion of Gases, *see* GAS and GASES.

Effusive or Eruptive Rocks, *see under* IGNEOUS ROCKS.

Elreet, *see* AFRIT.

Eft. The terms E. and nowt are applied to almost all species of lizards found in the Brit. Is. *See* NEWT.

Ega de Queiroz, José Maria (1845-1900), Portuguese author, b. either at Villa do Conde or at Provoa do Varzim; son of a retired judge. Educated at the Univ. of Coimbra. Collaborated in *As Farpas* (satirical sketches), 1871. Consul at Havana, Newcastle, Bristol (1876), and Paris (consul-general 1888). Died in Paris. Pubs. include the novels: *O crime do Padre Amaro* (1874, rewritten 1880); *O primo Basilio* (1877), *A Reliquia* (1886), *Os Maias* (1888). His short stories are particularly admired. *The Sweet Miracle* has been trans. into both Eng. and Irish. He is considered the greatest modern Portuguese writer and is certainly the only one whose books have been considered worthy of trans. into many languages. *The Crime of Father Amaro*, his masterpiece, created great interest in its Ger. trans.

Egan, Pierce, the Elder (1772-1849) Eng. author, principally remembered for his *Life in London* (1821), which, illustrated by George and Isaac Cruikshank, presented a general survey of life in the metropolis. This book is further interesting in that it was the first work of fiction to be pub. in monthly parts. Its popularity was so great that in 1828 E. issued a sequel, *Finish to the Adventures of Tom, Jerry, and Logic*. E.'s other works included *Horiana, or Sketches of Ancient and Modern Pugnism* (1818-24); and *The Life of an Actor* (1825). In 1824 he founded *Pierce Egan's Life in London and Sporting Guide*, a weekly newspaper that afterwards merged into *Bell's Life in London*. His son, Pierce Egan, the Younger (1814-80), was the author of many novels, none of which, however, have survived.

Egbert, king of Wessex from 802 to 836,

when he died. He was commonly called Egbert the Great, was the son of Ethelmund, and a direct descendant of Cedric. In his youth he was driven from England and sought refuge at the court of Charles the Great. The first nine years of his reign were a period of peace, but he then attacked Cornwall and Devon, and reduced them to submission in 813. In 823 he defeated Beornwulf, king of Mercia, and soon after Kent and Essex submitted to his rule. Northumbria acknowledged E.'s supremacy in 829, and in 830 Wales was reduced to submission. E. was then made bretwalda, being the eighth Saxon king to receive that dignity. The last years of his reign were marked by invasions of the Danes, but they were defeated at Hengistdune in 835.

Egede, Hans Pövelsen (1686-1758), Dan. Protestant missionary, b. at Harstad in Norway. He studied theology at Copenhagen Univ., and was appointed pastor at Vaagen in 1707. In 1721 he went to Greenland, where he remained for fifteen years, working zealously among the people. On the death of his wife, in 1736, he returned to Copenhagen, but continued his work for the Greenland mission, of which he became bishop in 1740. He wrote a book on the natural hist. of Greenland.

Eger, *see* CHEB.

Eger (Czech Cheb), tn. and also riv. of Czechoslovakia. The tn., situated on the R. Eger, at the base of a spur of the Fichtelgebirge, is close to the Bohemian borders, and was an important fortress until 1809. It is the cap. of the Egerland, Bohemia, inhabited by Gers. It is an important railway centre, with many high-gabled houses. Wallenstein was murdered by an Irishman in the tn.-hall, which is now a museum, on Feb. 25, 1634. Schiller lived in the 'Schiller haus' in 1791. Wallenstein's generals were murdered in the Kaiserburg built by Frederick Barbarossa. The Gothic church of St. Nicholas dates from 1230 to 1270, and two others from the thirteenth century. The manufs. include textiles, bicycles, agric. machines, earthenware, meal, beer, and a substitute for coffee. Pop. 30,000 (mostly Ger.). There is another tn. of the same name in N. Hungary, which manufs. wine and soap, and has a pop. of 30,000. The R. Eger rises in the Fichtelgebirge at a height of more than 2300 ft. Its general direction is E. There are numerous catnacts and an abundance of fish. After flowing 190 m., it joins the Elbe 30 m. N.W. of Prague.

Egerdir: (1) Tn. of Asiatic Turkey, situated on Lake E., in the vilayet of Konieh, or Konia, 84 m. to the W. of that city. The ruins of Antioch, in Pisidia, are in the vicinity. It exports opium, skins, and leather to Singapore. Pop. 25,000. (2) Lake E., lake of Konieh, Asia Minor, situated in lat. 38° N., between the Taurus range and the Sultan Dagh. It is about 30 m. long, and drains S. into the Mediterranean.

Egeria, in Roman legend, was a nymph. She was the wife of Numa, and was worshipped both in Rome and Aricia as the goddess of childbirth. She was connected

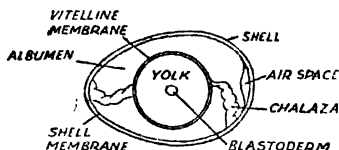

with the Camenae (water nymphs), who were worshipped in Italy before the Muses.

Egerton, Francis, see BRIDGEWATER.

Egerton, Frances Leveson-Gower, see ELLESMERE, EARL OF.

Egesta, see SEQUESTA.

Egg (Old Eng. *æg*; Ger. *Ei*; Swedish *ägg*, probably also Gk. *ová*), the female reproductive cell which develops into a new individual. In all but parthenogenetic animals, this process only takes place after fertilisation by the male gamete. When the word is used in this sense, it is directly parallel to the Lat. word *ovum*, and applies to the intra-maternal as well as the extra-maternal existence of the cell. In common speech the word only applies to the extra-maternal *ovum*. Es. vary very greatly in size. In all cases the essential embryo is very small, but variations occur in the amount of yolk present, and in the thickness and structure of the surrounding parts.

THE EGG OF A HEN

Eggs of birds.—Birds lay on the whole the largest Es. The Es. of the extinct *Archyornis* have a cubic content of over two gallons. The ostrich lays the largest Es. of any extant bird. One weighs about as much as twelve hens' Es. At the other end of the scale is the E. of the humming bird which only weighs a few grains. The shell of a bird's E. is mainly composed of carbonate of lime. It is often coloured, the colouring being specific to the particular variety of bird. Several different pigments have been separated from the colouring of Es. Their origin is still obscure, but they are probably derived from the hæmoglobin in the blood, and may be in some way similar to bile-pigments. The significance of the colour of Es. is difficult to understand. It probably depends upon the environment of the nest. Thus snakes and such birds as deposit their Es. in holes and in domed nests lay white Es. In such cases coloured Es. would be invisible, and they would be in danger of being broken by the mother. Es. which are laid in open nests, or on the bare ground, are coloured to imitate their surroundings. The brilliant Es. are always found in nests with elaborate protective devices, or in ones that are carefully hidden.

Eggs of mammals.—Only two mammals are oviparous: the *Echidna* or spiny anteater, and the *Ornithorhynchus*, or duck-billed platypus. The *Echidna* carries her Es. in a pouch such as the kangaroo has.

Eggs of reptiles.—These are always white or yellowish. They are smaller than birds' Es., but yet possess a good deal

of yolk. The shell is nearly always membranous, but in tortoises, turtles, and crocodiles it is calcareous like a bird's. A few lizards and snakes are viviparous.

Eggs of fishes differ greatly in size and appearance, and some extraordinary varieties are known. Most fishes lay enormous numbers of Es. The sturgeon lays 7,000,000 Es., the turbot over 14,000,000. The number always depends on the risk of destruction, and this rule applies to all animals. For further particulars, see BIRD, POULTRY, REPRODUCTION.

Egg Island, see EGG.

Egg, Johann Maier von, see ECK.

Egger—Moths belong to the *Lasiocampidae*, and *Eriogaster* and are well known in Great Britain. They are of large size, covered with scales, are all of a reddish brown colour, and possess a highly developed hind-wing. The length across the wings may vary, as in the genus *Suana*, from 1½ to 4½ in. The walls of the cocoons have sometimes a smooth, shell-like appearance, hence the name.

Eggishorn, or **Eggeschhorn**, mt. of the Alps in Switzerland, situated in the canton of Valais, near the head of the Rhône valley, and on the S. slope of the Bernese Oberland. It rises to an altitude of 9625 ft.

Eggleston, Edward (1837-1902), b. in Vevay, Indiana. He was pastor of the Church of Christian Endeavour, Brooklyn, from 1874-79. After this date he devoted his time to literature. His works afford a picture of the life, manners, and dialect of the Central West, and his *Hoosier Schoolmaster* was so popular that it was trans. into Fr., Ger., and Dan. Among his works are: *Mr. Blake's Walking-Stick*, for children; *The Graysons*, a novel.

Eggmühl, see ECKMÜLL.

Egham, par. and vill. of Surrey, England, situated on the r. b. of the Thames, 8 m. from Windsor, and 20 m. from London. The par. adjoins Berkshire, and has an acreage of 7786. The Royal Holloway College for women, with 200 students, is here, and was opened by Queen Victoria in 1866. In the neighbourhood is the historic Runnymede. Pop. 14,000.

Egidio Colonna, see COLONNE.

Egin, or **Ekim**, tn. of Asiatic Turkey, in the vilayet of Mamuret-el-Asis, situated on the Euphrates. It is built in a picturesque manner in a kind of elevated basin surrounded by steep rocks. The houses are of stone, and the streets resemble stone ladders. Wine, silk, and fruit are produced and wax, hides, and carpets exported. Pop. 19,000.

Egina, see AGINA.

Eginhard, see EINHARD.

Eglantine, old Eng. name for *Rosa Eglanteria*, the sweet-briar rose. It is misapplied to the honeysuckle by Milton in the lines from *L'Allegro*:

'Through the sweet briar, or the vine,
Or the twisted eglantine.'

Eglinton and Winton, Archibald William Montgomerie, Earl of (1812-61), b. at Palermo. He was descended from the famous family of Montgomerie, which

dates back to about 1150. In 1859 he was made earl of Winton, and was twice lord-lieutenant of Ireland. He took a great interest in racing, and won the St. Leger in 1812, and the Derby in 1849. He is also famous for the tournament which took place at Eglington Castle in 1839, and in which Prince Louis Napoleon took part. This is described by Disraeli in *Endymion*.

Egmont, Lamoral, Count of, Prince of Gavre (1522-68), *b.* in Hainault. He served as a soldier under Charles V. at Algiers in 1541, and in 1546 was made a knight of the Golden Fleece. In 1551 he went as ambas. to England to arrange a marriage between Philip and Mary, which was afterwards solemnised at Winchester in his presence. For his successes at St. Quentin in 1557, and at Gravelines in 1558 (where he was in charge of the cavalry), he was made governor of Flanders and Artois, and in this position he took up the cause of the Netherlands, who were opposed to the Catholic policy of Philip. In consequence of this, in 1568, he was accused of treason and beheaded at Brussels.

Egmont, Mount, extinct volcano of New Zealand, in the S.W. portion of N. Island, in lat. 39° 15' S. and long. 171° 13' E. It is about 18 m. S. of New Plymouth, and is exceedingly beautiful in form. Perpetual snows cover its summit, which reaches a height of 8280 ft., the highest point in the is.

Ego, term used in philosophy, denotes the individual considered abstractly and not in connection with the world and other persons. It is used in two senses which are termed by Kant 'pure' and 'empirical'; the latter term signifies the self in a more concrete sense and includes some part of experience, *i.e.* an object, while the former, the 'pure ego,' is the conscious subject only, and denotes that everything is referred to a self which experiences it.

In the language of psychology the E. is the object-self of the individual consciousness as distinguished from another (the *alter*). The antithesis of E. and alter necessarily restricts the meaning of E. to the object-self inasmuch as it is in relation to the alter, which is the object of thought. The interpretation of the ego-alter relation has been variously attempted. Some psychologists have developed the thought that the E. is a reproduction of traits first discovered in 'alter' personalities. This view is united with the theory of 'ejection' (some one else thought of in terms of the thinker's own consciousness of himself) by J. Mark Baldwin in the 'dialectic of personal growth.' The self-thought tends to a general form which includes two poles, one the E. the other the alter. The elements of content, at first 'projective' in the social environment (*i.e.* cognised as objects but with no antithesis to subject), are taken up by imitation, thus becoming 'subjective,' a part of the ego and being then ejected into the other, constitute the alter. See J. Mark Baldwin (ed.), *Dictionary of Psychology*.

Egotism (Lat. *ego*, I), term used in ethics, generally signifying a system in which the happiness of the individual is

the main object in view. Another form of the word, 'egotism,' in direct contrast to 'altruism,' means selfishness. The ethical doctrines consider that the self consists of an individual and those things in which he is interested, the self being all-important in the application of moral principles, the egoist, seeking the ideal for himself, standing in direct contrast to the altruist, who seeks it for others. But the distinction between altruism and E. is complicated, seeing that the two are often combined, *e.g.* Christian ethics enjoin duty to self and duty to others, while a truly egoistic system can very rarely be carried out. Indeed those who have studied human character assert that men in general are egoistic, seeing that they aim at the gratification of their personal aims and desires.

Egorievsk, see YEGORIEVSK.

Egremont: (1) Tn. of Cumberland, England, situated on the Eden, 6 m. from Whitehaven. E. Castle, built in the twelfth century, is now in ruins. Pop. 6500. (2) Par. and tn. of Cheshire, England, on the Mersey. The tn. is almost opposite Liverpool, and is a steamboat station. Pop. 13,000.

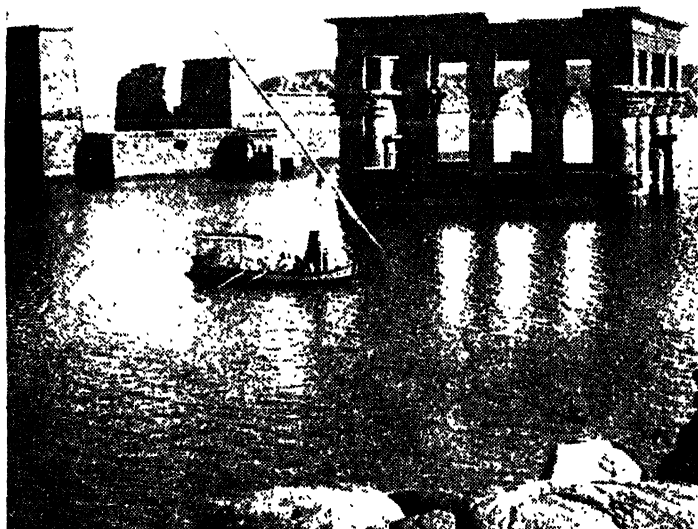

Egret, term applied to sev. species of white herons with long tufts of feathers on the head or neck. The great white E., or the European white heron, is *Herodias* (or *Ardea*) *alba*; and the little E. is *Garzetta* (or *Ardea*) *garzetta*, a native of Europe, Africa, and Asia, which is occasionally to be met with in Britain. See HERON.

Egripos, see EUBCEA.

Egypt, country forming the N.E. shoulder of Africa, bounded on the N. by the Mediterranean, S. by the Anglo-Egyptian Sudan, E. by the Red Sea, and W. by Tripoli and the Sahara. The W. frontier cannot be very clearly defined; the line properly taken is from the gulf of Sollum, skirting the oases of Siwa in the Libyan desert and following S. to Wadi-Halfa, so that the oases of the Libyan desert are included. The N.E. frontier is a direct line from Taba, the head of the gulf of Akaba, following up the boundary of Palestine to the Mediterranean Sea, the peninsula of Sinai being included in E. The area is 100,000 sq. m., a large part of which is desert. The country is divided into Upper and Lower E.; Upper E., or *Es-Said*, the happy or fortunate, being the Nile valley, and Lower E., or *Er-Rif*, the fertile, being the delta. The chief features of E. are the R. Nile and the desert. Without the Nile, E. would never have existed. The riv., with its rich deposit of alluvial soil carried down from the highlands of Abyssinia and given to the land annually during the overflow, has transformed the desert into the fertile strip of valley and the delta. E. and W. of this cultivated land lies the waste of deserts with occasional oases. The delta is a fan-shaped plain, formed of a deep layer of mud and grey sand, lying on the yellow quartz sands, gravel and clay, which were laid there in prehistoric times by the sea. It is an extraordinarily fertile stretch of land, watered by the two branches of the Nile, the Rosetta and the

Damietta, and intersected with canals. The valley of Upper E. is narrow, and the fringe of mts. on either side are of no great height, so that the landscape varies but little and might appear to be monotonous but for the rich and wonderful colouring of all the scenery, the vivid green of the fields, the rich red-brown of the riv., the bright yellow of the rocks with overhead a deep blue sky and brilliant sunshine.

gradually in June and continues rising until the middle of Sept. ; it then remains stationary from two to three weeks, rising again until the end of Oct. ; it is then at its highest level and commences gradually to fall, until by May it is once more at its lowest. The riv. rises from 21 to 28 ft. ; when it did not reach this level the crops failed, and when it exceeded it the land was overflowed and ruin faced the people.

D. McLeish

THE TEMPLES OF THE ISLET OF PHILÆ, ON THE RIVER NILE

The beautiful temple is surrounded by the waters of the Nile. It is at times almost completely submerged owing to the action of the dam at Aswân

The coast-line of E. covers about 600 m., and except at the delta is rock-bound, possessing no harbours worthy of mention. The delta coast-line is low and forms two bays, one being the bay of Aboukir. The source of the Nile (*q.v.*) is Lake Victoria (Victoria Nyanza) discovered by Speke, 1858. The riv. flows into E. proper N. of the second cataract, a little S. of Wadi-Halfa. The Blue Nile, which rises in Lake Sana, joins the Nile at Khartoum ; this stream brings down an immense quantity of red mud. The trib. Atbara joins 200 m. below Khartoum. The cataracts are six in number (*see NILE*). The important feature of the riv. is its annual inundation. At the end of May the riv. is at its lowest level ; it rises

Nowhere in the world is there such a large pop. depending solely on the produce of the soil. As the climate is exceedingly dry, the annual rainfall averaging about 1.50, irrigation became as early as the second Dynasty (about 4514 B.C.) an object of national importance. All through the ages can be marked the tireless persistence and mechanical ingenuity employed in the problems of irrigation. During the nineteenth century, Mehmet Ali Pasha began a gigantic system of canals, locks, and weirs. A Fr. engineer of considerable ability, Mougél Bey, was employed to carry out this difficult task ; his great barrage across the Nile, at the apex of the delta, is still a very impressive work ; unfortunately the system was a failure.

Later, Brit. engineers undertook the management of irrigation, and in 1902 the Nile dam, at the head of the first cataract above Aswân, was completed. It had been planned to raise the dam to such a height that the beautiful temples on the islet of Philæ would have been submerged; for five years they were spared, but in 1907 the dam was raised, and during several months of the year the ruins are no longer visible. The chief lakes of E., from W. to East, are Marcotis, Edku, Burlus, and Menzala; these lie only a few m. from the coast and are shallow and brackish. The seven famous natron lakes lie in a valley in the desert, 80 m. W.N.W. of Cairo. In the prov. of the Fayum is the Birket-el-Kerim, 30 m. long and 5 m. wide, forming the remains of the Lake Moeris, which Herodotus believed to have been artificially constructed. Certainly Amenemhat III. completed what his fathers had begun by building a vast embankment and reclaiming an area of 40 sq. m., also carrying out a scheme of irrigation in connection with this great natural reservoir. The climate is extremely dry. E. lies in an almost rainless area. The days are warm and the nights are cool. Jan. is the coolest month. On the coast rain falls during the winter months, but snow is unknown. In Sinai, snow occasionally falls during the winter, and heavy storms of rain occur which flood the rocky ravines and drown both men and beasts; these, however, are only occasional and irregular. One interesting feature of the climate is the continuous N. wind, which blows throughout the year, and the sailing boats are thus able to ascend the Nile against the strong current. During the spring the *Kamsin* occurs, a hot, dry S. wind laden with sand, forming a yellow stifling fog almost obscuring the sun; it lasts from one to three days. There are 5 large oases or fertile places in the W. desert, Siwa, Baharia, Kharga, Dakla, and Farafra. These have been occupied since 1600 B.C. Kharga possesses a temple of Ammon, built by Darius I., and also other interesting ruins of the time of the Ptolemies. Siwa contains the oracle temple of Jupiter Ammon, consulted by Alexander the Great. The tn. is built on the rocks and has the appearance of a fortress. It was used for many years as a place of banishment for criminals.

Minerals.—Gold and precious stones were formerly found and mined in the hills by the Red Sea. The Moslem conquest caused the abandoning of this industry. The turquoise mines of Sinai are still productive. The first Dynasty of Egyptian kings, about 4777 to 4514 B.C., possessed these mines and had them worked, and from that time down, through all the centuries, the turquoise from Sinai have been famous. There are emerald mines at Jebel Zuhara. Salt is obtained from Lake Marcotis in large quantities; alum is found in the W. oases; carbonate of soda is taken from the natron lakes; hæmatite iron is obtained in considerable quantities from Sinai and the Red Sea hills. Porphyry quarries once existed,

with granite quarries, at Jebel-el-Fatira, and during the Rom. occupation were extensively worked. Gold-mining began once more in 1905 at Um Rus and Um Garalat. The riparian dists. of the lower valley of the Nile are ill-provided with workable mineral deposits, with the exception of abundant building materials. The mineral resources of E. are therefore situated in its otherwise barren deserts, and this fact has retarded exploration and development, though in recent years much progress has been made. The prin. mineral products in 1946 were petroleum (1,282,000 metric tons), phosphate rock (294,047 tons), manganese ore, gypsum, natron, and sodium sulphate.

The flora of E. is not of a great or large variety. There are no forests or woods, and all available land is use for agric. purposes. Date palms grow wherever they are allowed, together with the sunt tree and tamarisk, the mimosa, the eucalyptus and the cypress, also some few others. The rose grows freely, and the violet and many kinds of daisies and poppies. Jasmine is largely grown, being much loved by the Arab and Egyptian. The famous papyrus is not now grown in E., and the lotus flower (a water lily) blooms no longer on the Nile, though found in the delta and cultivated in private gardens.

Fauna.—The camel and the ass are the common domestic animals of E. The camel is not indigenous, but was introduced at an early period. Horses are few and of very inferior type. There are not a great variety of wild animals; the hyena, jackal, and fox are numerous, and wild boars are still found in the delta. Wild cats and hares abound, and snakes and reptiles of various kinds are exceedingly numerous. The crocodile and the hippopotamus, once famous and sacred, no longer dwell by the Nile in E. The bird life is rich; vultures, eagles, hawks, and buzzards are found in quantities, and water fowl in large varieties, but the sacred ibis has gone. The five most familiar animals and flowers, usually associated with anct. E., are no longer common, i.e. the crocodile and hippopotamus, the papyrus and the lotus, and the sacred ibis; the sixth most familiar object, the beetle (the scarabæus), still flourishes in many varieties.

The population of E. according to preliminary figures of the census of 1917, was 19,090,000 the number of males being only 200,000 less than females. There are three distinct elements in the native pop. The largest or 'Egyptian' element is a Hamito-Semitic race, known in the rural dists. as *fellahin* (ploughmen or tillers); a second element is the *Bedouin*, or nomadic Arabs of the Libyan and Arabian deserts, of whom about one-sixth are true nomads, and the remainder semi-sedentary tent-dwellers on the outskirts of the cultivated land and of the Nile valley and the Fayum. The third element is the *Nubian* of the Nile valley between Aswan and Wadi-Halfa, of mixed Arab and negro blood. The fellahin are chiefly Mohammedan in faith, though

the Copts (*q.v.*), also natives of E., have kept their Christian belief. The fellah is a hard-working and industrious person, of big build, with a fine oval face, smooth black hair (the head is usually shaved), and well-formed features. The women are often of great beauty, both in form and feature, though they lose their youth early. The Copts are racially the purest descendants of the anct. Egyptians. The colouring of the fellah varies from a fair yellowish shade in Lower E. to a deeper tone in Middle E. and in Upper E. the majority are a deep bronze. The Hamitic tribes speak a language of their own, are probably descended from the Blennuycs, preserving many non-Islamic religious practices and regarding the serpent as sacred. The foreigners (numbering in 1937 about 240,000) are mainly Gks., Turks, Its., Brit., Fr., Syrians, Levantines, and Persians. Of the total pop. some 80 per cent are illiterate and live in great poverty. Malnutrition and disease are rampant. A very high percentage of the people suffer from trachoma which often ends in blindness; more than half have disabling parasitic diseases; some 15 per cent are malarial and almost as many suffer from various forms of venereal disease. Before the Second World War expenditure on public health averaged no more than 8s. per head, compared with £7 in Britain. In religion 9 out of 10 Egyptians are Muslims, a fact which in part explains the remarkable resignation and even cheerfulness with which the masses endure their lot. Most of the people live in squalid hamlets of flat-roofed huts, without sanitation, clean drinking water or conveniences of any kind. The nearby riv. or canal is the public well, washing place and receptacle for every kind of refuse. Black-robed veiled women crouch at their doors pounding grain in mortars or performing other primitive chores while the fellah labours in the flat fields, where the rich dark soil is threaded by irrigation ditches. Desperately ignorant and fanatically conservative, the fellahin are the silent, suffering beasts of burden who uphold the glittering façades of Cairo and Alexandria. Thanks to the modern systems of irrigation the production of cotton has increased in E. by more than half in forty years and the country is now also self-supporting in food; but whether this increase in food production can offset the steady rise in pop., without a drastic reduction in the more profitable cash crop, cotton, from which the great landlords draw much of their wealth, is one of the problems of the future. The chief *tus.* of E. are Cairo (*q.v.*), the cap., on the E. bank of the Nile, built by the Arabs at the head of the delta about 12 m. from the div. of the riv., pop. 2,100,400; Port Said (*q.v.*), 178,400; Alexandria (*q.v.*), chief seaport, 928,200; Damietta (*q.v.*), 53,800; Rosetta (*q.v.*), 28,800; Suez (*q.v.*), S. entrance to the canal, 108,200. In the interior of the delta are a few flourishing *tus.*; the chief is Tanta, 139,800. The chief *tn.* in Upper E. is the cap. of the prov. of Fayum, Medinet-el-Fayum,

72,400. Other large *tus.* are Mansûra, 102,500; Asyût, 88,700; Zagazig, 82,900; Mahalla el Kubra, 115,500; Dammanhur, 84,900; Minya, 69,600; Beni Suef, 56,300; Giza, 66,200; and Qena, 39,600. Many of the modern *tus.* are built upon the sites of anct. cities referred to later in the section on antiquities. The great industry of E. is agric. About 4,000,000 acres are under perennial irrigation, and from these, two to three crops can be annually harvested; the land under basin-irrigation covers 1,750,000 ac., and only one crop can be grown in the year. Cotton, rice, and sugar are the main summer crops, and maize, millet, wheat, barley, and flax form the winter crops. Although modern iron ploughs and other agric. machines have been introduced, the native wooden plough is still largely used. In the Fayum there are fields of roses, grown for rose-water and perfumes; saffron, indigo, and henna are also grown. The cotton industry is increasing every year, the average over 1897 to 1905 was ££14,000,000; over 1924 to 1928 ££15,777,088. In 1936-37 the cotton crop exported was nearly 11 million qantars (1 qantar of unginced cotton equals 315 lb.; of ginced cotton, 100 lb.), and supplied nearly 75 per cent of the total value of the exports of E. The common fruits are the date, fig, orange, citron, grape, banana, peach, and apricot. In smaller quantities melons are grown and mulberries, also olives. The date is the most valuable of all the fruits, forming one of the chief foods of the people.

The *currency* is based on a gold standard. The Egyptian pound equals £1 0s. 6½d. sterling, divided into 100 piastres. There are silver piastres, value 20, 10, 5, and 2, and nickel pieces of 1, ½, ¼, and ⅛ of a piastre, and in bronze 5 and 2.

For purposes of local gov. the chief *tus.* constitute 5 governorships, and the remaining country is divided into fourteen provs., further divided into dists. The provs. in Lower E. are: Beheira, including the oasis of Siwa, Gharbiya, Minûhiya, Daqahliya, Qalûbiya, and Sharqiya. In Upper E.: Giza, Beni-Suef, Fariyûm, Minya, Asyût, Gurga, Qena, and Aswâh. For the Anglo-Egyptian Sudan, under a governor-general appointed by the king of Egypt with Brit. approval, see SUDAN.

Education on native lines has long been given in elementary vernacular schools. The native system of education is completed by the more promising pupils at the Azhar Univ. in Cairo. There are nearly 4000 *maktabs* (elementary vernacular schools) with nearly 400,000 male and 240,000 female pupils. The gov. primary schools give a four years' course and prepare for admission to secondary, agric., and other special schools. There are 2 univs. with colleges of medicine, law, engineering, fine arts, commerce, science and agric. at Cairo. Much assistance is given to education by private enterprise and benevolence, and foreign schools abound. *Justice*.—The old native tribunals presided over by the *Qadis* now have jurisdiction only in matters of personal law, such

as marriage or succession and, particularly, in *wakfs*, i.e. charitable foundations. The *Mogalis Hasbiya*, reorganised in 1925, deal with matters of guardianship; but in matters of personal law other than intestate succession, non-Moslems are, in general, subject to their own Patriarchate. In other matters, nationals are justiciable before the National Courts estab. in 1883; these are summary tribunals for the most part with civil jurisdiction in matters up to a low pecuniary limit and criminal jurisdiction in offences punishable by imprisonment up to three years or by fine. The *Judicial Delegations* have similar jurisdiction. They are presided over by one judge. There are also some thirteen *Central Tribunals*, each of the chambers of which consists of three judges; and three *Courts of Appeal*, at Cairo, Assût, and Alexandria. Civil cases not within the competence of the Summary Tribunals are heard in the first instance by the Central Tribunals, with an appeal to Courts of Appeal. The Central Tribunals also hear civil and criminal appeals from the Summary courts. Serious crimes are tried at the Central Tribunals by three judges of the Court of Appeal sitting as an Assize Court. In 1931 a separate *Court of Cassation* over and above the Courts of Appeal was set up. The so-called 'Cantonal' Courts, numbering over two hundred, and composed of vil. notables with a general civil jurisdiction in suits involving no more than £5 and a petty criminal jurisdiction were suppressed in 1930 and their jurisdiction transferred to the Summary Tribunals. The Capitulations (*q.v.* and see *infra*) were abolished by the convention of Montreux, which came into force in 1937.

The police force, which is administered by the Ministry of the Interior, embraces city and provincial police. The city police muster some 300 officers (75 Europeans), about 500 European constables and nearly 6000 men, and the strength of the provincial police is returned at 369 officers and 6160 men.

The Egyptian army.—The fellah, as a soldier, is useless without capable officers: when under good control he is excellent. The anct. conquests have been attributed mainly to mercenaries. For centuries foreign legions were employed, and Mehmet Ali was the first to use conscription among the fellahs. The system employed was so much loathed and dreaded that the peasants mutilated themselves rather than become soldiers. They blinded themselves in one eye or cut off the fingers on their right hand, but even this did not save them, one-eyed battalions were formed, and the men with injured hands were taught to shoot from the left shoulder. It was not until 1883 that a fair system was arranged. In 1885 an equitable law was made and greatly improved upon in 1900. The Army in 1932 comprised 3 infantry brigades, 2 squadrons of cavalry, 4 artillery batteries, 1 company of garrison artillery, 1 motor machine-gun battery and 1 engineer company. Its total strength was then 12,000.

In 1938 E. had an air force of 18: squadrons. Service is nominally compulsory on all Egyptian subjects between 19 and 27, but certain classes are exempt, and exemption may be purchased for ££20, if paid before the ballot.

Finance.—In 1937-38 the revenue and expenditure balanced at ££36,120,000. In 1947-48 revenue and expenditure balanced at ££103,257,800. The total exports in 1937-38 amounted to ££39,760,000 and the total imports to ££38,038,000; in 1946 exports were ££63,680,500 and imports ££83,247,800. In 1943 the consolidated debt stood at ££86,669,840 or, together with Egyptian Tribute Loans, ££92,027,020. These debts were converted into a National Loan by a law of Sept. 7, 1943. The new loan amounts to ££86,001,550.

Railways.—The prin. lines radiate from Cairo to Alexandria (and on to Rosetta), Damietta, and Ismailia (continuing northwards to Port Said and southwards to Suez). From Cairo the line runs southwards for a distance of over 500 m. to Shellal, the first Cataract. At this point a steamer connexion runs to Wadi Halfa, connecting the Egyptian State with the Sudan Government Railways. Westwards from Alexandria and near the coast runs a line to the frontier at Sollum, and on to Tobruk, giving the possibility of later linking with Tripoli. The total length of the Egyptian State Railways (excluding the Auxiliary Railways of Upper E. and the Western Oases Railways) in 1915 was nearly 4200 m. The gauge is standard (4 ft. 8½ in.), with the exception of that to the W. oases, which is 2 ft. 3¼ in. gauge. There are two other State-owned lines in E., the Auxiliary Railways of Upper E., consisting of 282 m. of standard gauge, and the Western Oases Railways, a length of 110 m., connecting the oases of Kharga with the Nile Valley. In addition to the gov. lines, there are nearly 900 m. of light railways exploited by public companies. A swing bridge, constructed after 1939, across the Suez Canal, estab. connexion between Cairo and Beirut, over the northward extension of the Palestinian railway system from Haifa to Tripoli in Syria, and there is now a continuous line joining E. and Istanbul.

Exploration.—The exploration which has been carried on for so many years by Egyptologists, met with a wonderful find on Nov. 4, 1922, when an Englishman, Howard Carter (*q.v.*), discovered the tomb of Tut-ankh-Amen in Thebes. The tomb was opened by Carter and the earl of Carnarvon (*q.v.*) on Nov. 26. Despite the fact that the tomb had been rifled some time after the king's burial, the contents were found practically undamaged and in a wonderful state of preservation. The discovery must be ranked as the most important that has yet rewarded the efforts of explorers (see TUT-ANKH-AMEN). But though so far (1931) this find has dwarfed all others before or since, many others, valuable to the archaeologist and historian, have been made in the past few years. In 1925 great interest centred on Sakkarah, where the work begun in 1924 by the Dept.

of Antiquities in investigating the area surrounding the Step Pyramid, the oldest stone building in the world (3rd dynasty), reaped its reward in the bringing to light of a temple built to commemorate the thirty-year jubilee of King Zoser. There were found near the temple a colonnade 85 yards in length, which seems to have formed the main entrance to the pyramid enclosure.

This colonnade comprises forty-eight columns of white limestone, arranged in pairs, and all were originally 5 metres high and 1 metre in diameter. The shafts are not fluted, like those found shortly before, but are carved to imitate a bundle of reeds. The E. and W. end of the colonnade have curious imitation doors carved in the masonry of the walls, having the appearance of doors swung open. In a bay space between the columns were found the heads in diorite representing foreign prisoners, and in the style of the so-called Hyksos statues, and now regarded as belonging to the middle kingdom. The colonnade is the work of Imhotep, the first known architect, who was subsequently canonised and worshipped as the patron saint of wise men and scribes. On the wall near by was found the record of a tourist eleven centuries B.C., who stated, in a fair round hand, that he had taken a holiday to see the wonders of Sakkara, after having spent sev. years in campaigns, of which he was the sole survivor of his troop. In 1925 also was found at Dair el Bagara, near Thebes, among other things, Queen Hatshepsut's statues. Karnak excavations in 1926 disclosed a temple to Pharaoh Akhenaton, thus supplementing the work begun the previous year when two enormous statues of Pharaoh Akhenaton were discovered. The area being cleared in 1926, six more similar statues, having the same grotesque facial and bodily characteristics as the first two, were unearthed. The temple was found behind the statues, and though the existence of the temple had been recorded by historians it had not up to 1926 been found. The statues evidently formed the courtyard to the temple, and were in good condition. Other finds of 1926 included a bronze statuette of a singing girl unearthed in the remains of Fustat and an anct. plough found at Thebes.

The most notable discovery in 1927 was that of the secret tomb of Queen Hetepheres, mother of Pharaoh Khufu (Cheops) by the Boston-Harvard Expedition at Giza; but the mummy itself was not found, having evidently been destroyed by robbers. What was found was an alabaster canopic box on a wooden tray with a perforated pottery bowl covering the box. The box had four rectangular compartments, each containing a mass of organic matter, probably the Queen's viscera removed at the time of mummification, and the theory is that the officials, dreading the wrath of Pharaoh Khufu if the violation of the mummy were discovered, conceived the plan of reclosing the sarcophagus as it originally was, before acquainting Pharaoh of the robbery of the gold and other ornaments.

The Vienna Academy of Science also made finds of tombs near the Giza pyramids, including a group of statuary of Senab, wife and children. The Fayum oasis has also proved a fertile hunting field for the archaeologist. Dr. Johnston, the Oxford Univ. librarian, conducted excavations there just before the First World War and discovered numerous interesting articles including women's vanity bags and children's toys by no means dissimilar from those of to-day. Excavation work has been continued there almost without a break for many years and as recently as 1930 some interesting Rom. remains were found at Tebtunis. The study of Philistine tombs and Israelitish culture has been furthered by various discoveries in 1929 at Tel-el-Amarna, one of genuine human interest being that of a child's toy thousands of years old, representing a monkey in a chariot drawn by monkeys. This was found by the Egyptian Exploration Society, which body also found there a number of tools, ornaments, and weights. In 1932 a fourth pyramid was discovered at Giza.

HISTORY.—The origin of the Egyptians is still a matter of dispute. It is quite probable that they were Semitic, though they appear to belong to the Berber type of N.E. Africans; they certainly possessed many characteristics of the fair-skinned Libyans; they have no real negroid trace about them, though probably there is a strain from intermarrying; thus it is likely that they may have been a fair-skinned indigenous race, mixed also with people of Asiatic origin, and a certain amount of negro blood. The earliest types, as pictured by themselves on monuments, show men of fine build with no trace of the negroid type; the males are painted red-brown and the females a light yellowish tint. The earliest prehistoric remains are at Thebes, viz. so-called palæolithic flints, rudely chipped, but these may have been produced by natural forces. On the desert implements of quite clearly defined form have been discovered. The Neolithic remains are found in considerable quantities and in interesting forms and varieties, though their age is doubtful; the prov. of the Fayum is very rich in these relics. The Egyptians appear to have learnt the use of metals very early; copper and bronze instruments of a very early date have been found. Apparently iron was not familiar, or at least not freely worked or used in E., although countries such as Syria sent it to them as tribute yearly. In the Brit. Museum (Case A, first Egyptian room) is the body of a man whose grave was discovered on the W. bank of the Nile in Upper E.; he belonged to the later Neolithic age, a relic of remote antiquity. He was buried on his left side with the knees drawn up nearly to the chin; the hair and skin are fair, the fingers long and slender; by the side of the body were flint knives and black and red and buff pottery, pointing to the belief in the existence of a future life even in that prehistoric period. The first really historical king is Mena (Menes of the Gks.); he was king of the

anct. empire, a Thinite from the city of This; he founded the kingdom of white-walled Memphis. Mena is the first king of the First Dynasty, i.e. the family or line of kings governing successively. Manetho, the Egyptian priest-historian, who lived in the reign of the early Ptolemies, first divided the kings of E. into dynasties, naming and numbering them; unfortunately only fragments remain of his valuable history. Manetho's list of kings and dates is scarcely trustworthy. Very few people are agreed as to the actual dates, there being a slight discrepancy of 2000 years between the leading authorities in the date of the first Dynasty, some persons placing it as far back as 5869 B.C., others as late as 3315 B.C. The following table of Egyptian kings, with dates, is a rough attempt to place them correctly and give some idea of about the time they existed.

The Old Kingdom.—First Dynasty (from the city of This): Menes, or Menu, 4400 B.C.; Teta, or Atet, 4366; Ateth and Ata, of whom nothing is known; Hesept, or Semti, 4266; Semen-Ptah, or Semsu, 4200. *Second Dynasty* (from the city of This): Neter-bau, or Kha-Sekhemni, 4133; Ka-ka-u (?), 4100 (Ra-Neb may be the same); Hetep-Sekhemui (?); Ba-en-Neter (?), 4066. Names have been found of kings of this dynasty or whom at present very little has been discovered, such as Uatchnes, Senta, Neferikara, Neferkaseker, Hetchefer, Bebl, or Tchatchai. *Third Dynasty* (from Memphis): Neb-ka, 3900; Zeser, or Ter-sa, 3866. Other names appear as kings of this dynasty but details are wanting. Hen-Nekht, Tchaser-Teta, Setches, and Nefer-ka-Ra-Huni. The dates of these kings have not been settled yet. *Fourth Dynasty* (from Memphis): Sneferu, 3766; Khufu, or Cheops, 3733; Khaf-Ra, or Chephren, 3666; Men-ka-Ra, or Mykerinos, 3633. Other kings are identified with this dynasty, Tet-f-Ra, placed between Khufu and Khaf-Ra, Shespeskaf probably succeeded Men-ka-Ra. *Fifth Dynasty* (from Elephantino): Us-Kaf, or User-kaf, 3566; Sahu-Ra, 3533; User-en-Ra-An, 3433; Tat-ka-Ra, or Asa, 3366. Other kings of this dynasty are, Kahaa, Neter-ari-ka-Ra, Shop-ses-ka-Ra, Kha-nefer-Ra, Mem-ka-Ra-Heru, and Unas, 3333. *Sixth Dynasty* (from Memphis): Teta, 3300; Pepi I., or Ra-Meri, 3233; Queen Men-ka-Ra, or Nitocris, 3066. Other kings of this dynasty are: Userka-Ra, Mer-en-Ra, Nefer-ka-Ra, or Pepi II., and Mer-en-Ra Tchefan (?). *Seventh Dynasty* (from Memphis): very little is known of this dynasty at present; it appears to have possessed seventy kings in as many days. *Eighth Dynasty* (from Memphis): apparently had twenty-seven kings, of whom we have discovered nothing. *Ninth and Tenth Dynasties* appear to have had nineteen kings each, of whom we know nothing. *Eleventh Dynasty* (the Old Theban).

The Middle Kingdom.—Antefa, 2600 or 2700. Many names belong to this dynasty, but up to the present time very little has been discovered about them;

many of them end with the name of Menthu-hetep. Sankh-ka-Ra (c. 2500) appears to have arranged the first voyage to the land of Punt. *Twelfth Dynasty* (from Thebes): Amenemhat I., 2486; Usertsen I., 2433; Amenemhat II., 2400; Usertsen II., 2370 or 2366; Usertsen III., 2340 or 2333; Amenemhat III., 2300; Amenemhat IV., 2265; Queen Sebek-Neferut-Ra, 2255. *The thirteenth, fourteenth, fifteenth, sixteenth, and seventeenth Dynasties* are exceedingly difficult to make clear, as so very little is known. The thirteenth Dynasty apparently reigned at Thebes, and Sebekhotep I. was its first king.

The Hyksos, the shepherd kings, probably nomad Semites, invaded E. and estab. themselves, during the Fourteenth Dynasty to Xoia. The fifteenth is purely a Hyksos dynasty; some of their names were Salatis, Beon, Apachnas, Apophis, Yannas, and Asses. The Seventeenth Dynasty saw the end of the Hyksos.

The New Empire.—Eighteenth Dynasty (from Thebes): Aahmes I., or Amasis I., 1635; Amenhotep I. (?); Tehutimes I., or Thothmes (Tethmosis) I., 1590, ? 1550; Tehutimes II., or Thothmes II., 1565 (?); Queen Hatshepsu, 1552; Tehutimes III., or Thothmes III., 1530; Amenhotep II., 1500; Tehutimes IV., or Thothmes IV., 1470. Amenhotep III. (the Memnon of the Gks.), 1455, ? 1450; Amenhotep IV., or Khun-Aton, or Akhnaton, 1420 (?); Saa-Nekht (?), 1400; Tut-ankh-Amen (?), 1390; Ai (?), 1380; Hor-em-heb, 1368 (?). *Nineteenth Dynasty* (from Thebes): Ramesses I., 1365, ? 1370; Seti I., 1355; Ramesses II. (the Sesostris of the Gks.), 1345 (?); Menephtah, or Merenptah, 1285; Seti II., or Merenptah, 1250; *Twentieth Dynasty* (from Thebes): Set-Nekht, 1235; Arsu, or Ariser, probably a Syrian conqueror; Ramesses III., 1225. After this successive Ramesses continue to twelve, the thirteenth prince of the name was murdered or died, and Her-Hor, the priest, succeeded. *Twenty-first Dynasty*: E. was divided at this period. *Kings of Tanis*: Smendes, Pasebkanut I., Amen-en-Apt, Sa Amen, Pasebkanut II. *Kings of Thebes*: Her-Hor or Hor-Hen, Piankhi, Piankhet I., Piankhet II., Masaherth, Men-Kheper I., Piankhet III. *Twenty-second Dynasty* (from Bubastis): Shashank I., or Shishak, 945, ? 950; Uasarken, or Osorkon I. (?); Theckelet I. (?); Osorkon II. and others (?). *Twenty-third Dynasty* (from Tanis): Peta-Bast (?), 766; Osorkon III.; Piankhi, king of N. Sudan, was reigning at the same time. *Twenty-fourth Dynasty* (from Sais): Bakrennef (the Bocchoris of the Gks.) (?). Other kings are ascribed to this dynasty, of whom nothing is known. *Twenty-fifth Dynasty* (from Nubia): Shabaka, or So, 700 (?). Other kings are named, but their hist. is still obscure. *Twenty-sixth Dynasty* (from Sais): Psamthek I., or Psammetichus, 666 (?); Neku II., 610, ? 612; Psamthek II., 594; Uah-Ab-Ra, or Iophra, or Apries, 593; Aahmes II., or Amasis II., 570 (?); Psamthek III., 526 (?). *Twenty-seventh Dynasty* (from Persia): Cambyases,

527; Darius I., 521; Xerxes I., 486. There are other kings of this dynasty, some Persian, some Libyan, some native princes; see historical record below. *Twenty-eighth Dynasty* (from Sais): Amen-rut, a native prince, 405 (?), 399 (?). *Twenty-ninth Dynasty*: five kings of small importance. *Thirtieth Dynasty* (?): Nekht-Heru-Hebt, 378 (?). Some few others, unknown, belonging to this dynasty. *Thirty-first Dynasty*: Ochus, or Artaxerxes III., 340 (?), 338 (?); Alexander the Great, 332.

The Ptolemaic Period, 304. There are thirteen Ptolemies, followed by Cleopatra and her son, Ptolemy XIV.

The Rom. Period, 30 B.C.

The Moslem Conquest, A.D. 639.

This table of dynasties gives a small idea of the rulers of E., and below is a short record of the most important events of the best known periods, but it must be remembered that every year the search of the archaeologist is rewarded with fresh facts coming to light which may alter the time and even the name of the chief actors in many of these events. The first dynastic king of E. was Mena, called Menes by the Gks. Tradition says he founded Memphis; he also united the N. and S. kingdoms. The name of Aha has been identified with Menes. He resided at Abydos as well as at Memphis. His tomb was discovered at Abydos, a large brick-lined pit with props to support an inner lining of wood. Tradition asserts that he was slain by a hippopotamus. The great interest which centres on this king and his whole dynasty is due to the remarkable stage of civilisation the country had reached. The furniture of inlaid ivory and ebony, the carved alabaster vessels, and the copper-work, also the wonderful skill of the gold-workers, examples of which have been discovered, prove how far advanced the Egyptians were already at the early date of about 4400 B.C. Hieroglyphic writing was coming then into common use, and a state religion and priestly organisation were fully regulated and estab. During the third Dynasty, Tchoser (or Zoser) built the great step pyramid at Sakkarah. The great Sphinx of Giza may have been built during this dynasty, though some authorities attribute it to the fourth. It is interesting here to state that when the king became (as Menes) ruler of Upper and Lower E. the red crown of the delta was worn outside the white helmet of the kingdom of the valley; this curious head-dress of royalty has become familiar to all who see the various statues in museums. The *wreath* worn by kings was the model of the African cobra or asp whose name 'Ouro' signifies king. It was represented with the body erect and the hood expanded. The fourth dynasty kings were the great builders of pyramids (*q.v.*). The first King Sneferu finally estab. the peninsula of Sinai as part of the Egyptian dominion, with its rich copper and turquoise mines. Cheops or Khufu built the Great Pyramid. His reign seems to have been marked by oppression of his people. Tradition says the temples were closed

and private labour ceased, so that all persons could be employed to build the Great Pyramid. Khaf-Ra, the Chephren of the Gks., built the Second Great Pyramid; he also appears to have been an oppressor of his people. The Third Great Pyramid was built by Men-ka-Ra. Many legends attach themselves to this king; he appears to have been beloved by his people; the temples were re-opened and the people returned to labour at their proper occupations. During the Fifth Dynasty few great monuments were built. The Palermo Stele or Stone, engraved with various events and the names of some pre-dynastic kings, belongs to this

EGYPTIAN SCULPTURE: QUEEN
NEFERTITI

period, also the papyrus of accounts and the Proverbs of Ptah-hotep. Some traditions place in the Sixth Dynasty Queen Men-ka-Ra, the Nitocris of Herodotus, round whom have gathered many legends. Some of the pyramids at Sakkara were built during this dynasty, also the red granite Sphinx of Tanis. The city of white walls received its later name of Memphis at this time. Herkuf, a prince of Elephantine, who led many successful caravan expeditions, brought from the land of Punt by way of the Red Sea a dancing dwarf to please the boy king, Pepi II., whose letter of boyish delight to Herkuf is fully engraved on the facade of the latter's tomb. During the Eleventh Dynasty Sankh-ka-Ra despatched a successful expedition to the land of Punt, bringing back spices and scented gums, much prized by the Egyptians for the purpose of embalming. The Twelfth Dynasty

estab. the power of Thebes after a period of anarchy. The monuments of this period are numerous and of splendid design and workmanship. The great temple of Amen at Thebes was built, and the papyrus of Amenemhat I., containing the famous instructions to his son, belongs to this dynasty. These kings were great irrigators, and Amenemhat III. completed the work of Lake Moeris; he also built the labyrinth at Hawara. Art, sculpture, architecture, and trade flourished during his reign; many interesting buildings and statues belong to this period, also very beautiful jewelry. The following period of the thirteenth, fourteenth, fifteenth, sixteenth, and seventeenth Dynasties is a time of doubt and confusion. Three or four hundred years seem the probable time of the whole of these dynasties, and the Fifteenth Dynasty seems to mark the arrival of the Hyksos, or shepherd kings, who invaded E. and apparently conquered her without a blow. Manetho in his hist. describes them as the foreign Phœnician kings. Josephus calls them the children of Israel. It is almost certain these people were Asiatic, possibly a nomadic tribe from the Syrian desert, but this matter is still obscure, and the problem remains unsolved. The bitter hatred of the Egyptians for these invaders roused them at last to a more martial spirit, and the final and complete expulsion of the Hyksos opened one of the most glorious periods of Egyptian hist. Relics of the Hyksos are very scarce. They were termed Barbarians by the Egyptians, and Josephus quotes from Manetho, 'We had formerly a king whose name was Timaios. In his time it came to pass, I know not how, that God was displeased with us, and there came up from the East in a strange manner men of ignoble race, who had the confidence to invade our country and easily subdued it by their power without a battle.' Probably the horse and the war-chariot were introduced into E. by the Hyksos. The princes of Thebes who were vassals of the Hyksos at last revolted. One named Seqenen-Ra III., who was married to an Egyptian princess of pure blood, determined to throw off the yoke of the Barbarian. The Hyksos king ordered him to worship their god Sutekh; he refused, and the war of independence began. Seqenen-Ra appears to have been a determined man of great courage; when his mummy was discovered at Deir-el-Bahri, and subsequently unrolled at Cairo, the skull was hacked and split, the lower jaw-bone was broken and there were other large wounds; obviously he had died fighting for his country's freedom. His son, Ka-mes, continued the bitter struggle, and at last Aahmes, or Amasis, I. captured the stronghold of the Hyksos at Avaris and expelled the Barbarians. Aahmes became the founder of the Eighteenth Dynasty. This king rebuilt the temples and the cities ruined by the Hyksos, and at last estab. law and order. He was a great soldier, and fought successfully in Syria and in Nubia. Once more E. became a strong rich country. Amenhotep

I., his son and successor, founded the brotherhood of the Priests of Amen.

Thothmes I., or Tehutimes I., followed Amenhotep; this great warrior king subdued Cush, or Nubia, fixed the boundary of his kingdom at the fourth cataract, and carried his arms victoriously to the Euphrates. He built on to the Theban temple of Ammon or Amen at Karnak (q.v.), which gradually became the largest temple in the world. He was the first king to be buried in the valley of the tombs of the kings of Thebes. Thothmes II., who succeeded, married his half sister, Hatshepsut; after her husband's death she became sole queen of E. Thothmes III., her nephew, was nominally king also. Hatshepsut was a woman of forceful character, and her father's military genius appears to have descended to her, and in her capable hands many warlike expeditions were successfully carried out. She was a great builder, among her works being the famous temple of Deir-el-Bahri. Her design was to make a paradise for the god Amen, and a large expedition to Punt was organised to obtain the necessary incense trees and spices. A fleet was sent off and reached Punt in safety, returning laden with ivory, gold, ebony, myrrh, dog-headed apes, leopard-skins, and thirty-one incense trees. These trees were planted on the terraces of the temple for the pleasure of the god. This famous queen usually dressed as a man, but allowed herself to be described as a woman in her inscriptions. On her death Thothmes III. became sole king; one of his first acts was to deface the late queen's monuments and replace her name either by his own or his father's. He seems to have been filled with rage and hate at the very thought of her, regarding her as a usurper of his rights. Afraid of her during her life, his only revenge after her death was an act of vandalism utterly unworthy of the great warrior king he afterwards became. Thothmes III. built an enormous number of temples both at Memphis, Abydos, Denderah, Coptos, etc., his greatest work being the colonnade at Karnak; he also set up sev. magnificent obelisks. His conquests had made the country exceedingly rich. His campaigns in the revolted Syria, in Libya, and Ethiopia were splendidly successful; he secured the Phœnician ports, and Crete, Cyprus, and the Ægean Isles sent ann. tribute to him. He died at a very advanced age; his mummy was wrapped in a fine linen sheet inscribed with the 154th chapter from the Book of the Dead.

After the unimportant reigns of two kings followed Amenhotep III., the Memnon of the Gks., one of the richest kings E. ever saw. The country was now at the height of her splendour and prosperity. Thy, the wife of Amenhotep, was a very beautiful and remarkable woman. It is not yet perfectly certain whether she was a Syrian by birth, but she certainly seems to have been of foreign extraction. Her father, Yuas, may have been a Syrian, and her mother, Thuas, an Egyptian. Amenhotep's buildings were very extensive. Among them are the Apis chapels at Sakkarah, the temple to the Theban

Triad at Luxor, one of the finest monuments of Thebes. He also built a famous palace on the W. bank of the riv., under the Theban hills, with a large pleasure lake for his beloved queen, Thyi; it must have been a place of great beauty. The excavations there have brought to light a dim idea of this age of wealth and luxury; among other things of interest found in the palace were bath-rooms, eight in number, properly drained. The two great Colossi known to the Gks. as the Colossi of Memnon were carved for Amenhotep; they represent himself seated, and look out over the W. plain of Thebes; one was famous from a sound which was said to issue from it at dawn. Amenhotep was succeeded by his son Amenhotep IV. He was only a child at his father's death, and his mother, Thyi, took over the control of the state. Her own ideas of religion may have influenced her son; though she was too wise actually to break with the powerful priests of Amen, it is certain she worshipped Aton or the one God.

Amenhotep IV. (Akhnaton) stands out as a most significant individual in human hist. This boy, so delicate and probably an epileptic, was a monotheist, and taught this religion to his people. He was an idealist, and the new religion swept away the anct. superstitions and the great multitude of gods with their ceremonies and traditions; in their place he preached simplicity, honesty, and purity, a code of morality hardly exceeded by the later teaching of Christianity. His god was not a person, he was an essence, the source of life and eternal love. In the face of the anct. traditions of E. and in a land which was utterly priest-ridden, this boy-king set up his beautiful faith. He called it 'The heat-which-is-in-Aton,' and symbolised it by the sun, the giver of joy and energy. He changed his name from Amenhotep to Akhnaton, so that the word Amen might not be connected with it. He married only one wife and strove to teach his people the sanctity of marriage. He built the city of Tel-el-Amarna purely for the worship of Aton. Egyptian art now underwent a great change; Akhnaton wished to be represented really and not conventionally, and his monumental pictures are utterly different in style from the previous Egyptian art. On the death of his mother he broke finally with the powerful priesthood of Amen, and retired to Khatoon or Tel-el-Amarna. Here he developed his creed, and lived entirely in a world of ideals and dreams. One of the hymns he wrote to Aton is of exceeding beauty, and is strangely similar to Psalm civ. (see A. E. P. Weigall, *The Life and Times of Akhnaton*, 1910). The king having practically retired from his kingdom, the inevitable happened. Whilst he was preaching love and peace, red war knocked at the outposts of his empire; in vain his governors sent for help, one by one the hard won victories of his fathers were forgotten, and enemies and plunderers began to show themselves unafraid. Thus the empire of E., greatest in the world during his father's reign, crumbled to pieces, while he dreamed in Tel-el-Amarna. Syria

revolted and intrigued with the advancing Hittites. He had no son to succeed him, and he died at the early age of thirty-five. The kings who followed him were of slight importance until Hor-em-heb became the Pharaoh. Mention should, however, be made of Tut-ankh-Amen, son-in-law of Akhnaton, whom he had assisted in his religious reforms. His reign, c. B.C. 1358-c. 1350, appears to have lasted only from 5 to 9 years. His is among the best known names in Egyptian antiquity from the important discoveries in his tomb. Little is actually known of his life. He re-estab. Thebes as his cap. and, it is said, formally restored its old religion. He was buried in the valley of the kings at Thebes. Hor-em-heb was a practical soldier and a worshipper of Amen. Akhnaton was regarded as a criminal heretic by him, and wherever the name Aton occurred it was effaced. When Akhnaton's mummy was discovered it was found that his name had been erased from both coffin and wrappings; since it was nameless, the priests of Amen felt satisfied, because to the Egyptian the nameless soul was homeless and a wandering shadow without rest throughout eternity.

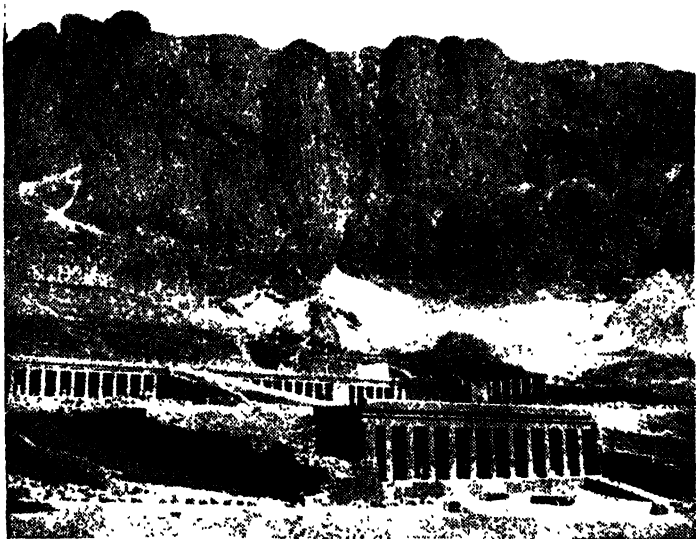

One of the most interesting discoveries of this reign are the tablets of Tel-el-Amarna; they were found in the city ruins; they are nearly all written in Semitic dialect and in the cuneiform character. They consist chiefly of letters from Amenhotep to various royal persons and from foreign kings to Thyi and Amenhotep, and are of the greatest value and interest for the hist. of Palestine and N. Syria at this period. Rameses I. was the founder of the Nineteenth Dynasty, he was probably a distant relation to Hor-em-heb; his two years were spent in severe fighting. His son, Seti I., succeeded him. Seti was a soldier; and his campaigns against Palestine, Syria, Libya, and the Sudan were successful, and he returned home laden with spoils. He continued the building of temples, and added seventy-nine columns to the hall of columns at Karnak. He reopened the copper mines of Sinai, and built many good roads. He commenced a beautiful temple at Abydos, but died before it was finished.

He was succeeded by Rameses II., the Sesostris of the Gks., who had been associated with his father on the throne for some years. He is frequently called 'the Great,' but he must rank below his father in the eyes of hist. He was a vigorous and able king, but possessed of the most amazing vanity and ambition. His pride, his cruelty, and his appalling extravagance sapped the strength of E. The various wars undertaken by Rameses were successful, and the commemoration of his victories was lavishly carved on every temple. The Kheta (Hittites), whose ever-increasing power was a menace to the empire, were not conquered by him, but a treaty was arranged by which each country was sworn not to molest the other's ter. Rameses built the rock-hewn temple of Abu-Simbel, the temple of Bet-el-Wall, and the Ramesseum at Thebes, with many others. All over the

land his name is found carved in many buildings that he did not build, for he placed his name on these that the people to come might believe he was the greatest king of E. His harem was enormous, and he was the father of nearly a hundred sons and fifty-nine daughters. He lived to a great age, and his long oppressive rule left E. impoverished and suffering from an incurable decline. The gathering hosts of the enemy waited at the gates. E. never again took her place as the strongest nation. Mer-en-Ptah, the thirteenth son, succeeded him; the eldest son

the country fell into a state of anarchy, and the kings following were of little importance.

The founder of the Twentieth Dynasty was **Rameses III.** His father Setenhot appears to have driven a Syrian invader from the throne and restored the monarchy. **Rameses** once more estab. a certain amount of order, and drove out his enemies. His greatest victory was over the confederation of people from Cyprus, Crete, Philistia, and the N. shores of the Mediterranean combined with the Libyans. They divided their forces and

OF THE KINGS AT THEBES

died before his father; this prince, called **Kha-em-uast**, was reported to be a magician and filled with learning. **Mer-en-Ptah** is supposed to be the Pharaoh of the Exodus. He was nearly sixty when he came to the throne. Among the records of his victories is a reference to the conquest of the Israelites in Palestine, proving that there were people of that name already living in Palestine. His reign was full of wars against the encroaching enemies. The Libyan war, in which he was victorious, once more saved E. from being overwhelmed. He appears to have been an excellent general, though an old man at the time of his victories. His mummy was discovered in the tomb of **Amenhotep II.**, and when unrolled showed the placid face of a stout old man with the high-bred aristocratic features of his fathers. After his death comes a period of misery and trouble;

attacked E. by land and sea. **Rameses**, however, outwitted them, and won the famous naval battle near Pelusium and overthrew the land league with much slaughter. This king was evidently a man of some ability; his life-work was to restore the prosperity of his country. He kept two large fleets for trading purposes, one in the Red Sea and one in the Mediterranean, and greatly increased the declining commerce of E. After his death several kings followed of small importance, all named **Rameses**. The last, **Rameses XII.**, was utterly priest-ridden, and the country had become poor and oppressed. On his death **Her-Hor**, the high priest of Amun, seized the throne and probably murdered the young prince, **Rameses**, a lad of great promise, who is heard of no more; so pathetically ends the long line of kings begun some two centuries before. After the accession of **Her-Hor**, E. became

divided, with two kings ruling at the same time, one in Upper and one in Lower E.; great confusion followed, and not until the founder of the Twenty-second Dynasty came to the throne was there any king of importance. He was Shashanq I., the Shishak of the Book of Kings; he invaded Palestine and sacked Jerusalem. He filled all the chief posts in the gov. with members of the royal family, so that presently E. became a land of petty kings. In the reign of Shashanq III., Plankhl, the king of N. Sudan, invaded E. and conquered her. The Twenty-fourth Dynasty from Sais contains the King Bakenrenef, the Bocchoris of the Gks.; he was supposed to be a great law-giver. Shabaka, the Ethiopian, who succeeded him, is said to have defeated Bakenrenef and burnt him alive, an appalling crime in the eyes of the Egyptians. At the end of this Ethiopian dynasty, Thebes was sacked by the Assyrians. Psamthek (or Psammetichus) I. from Sais is the first king of the Twenty-sixth Dynasty; he restored Thebes and estab. some order. Nekau, who succeeded him, led an army against Syria, and on the way slew Josiah, King of Judah, but was defeated by Nebuchadnezzar II. His son Psamthek II. found time during his short reign to repair the temples. His son, Haa-ab-Ra, the Pharaoh Hophra of the Bible and the Apries of the Gks., succeeded him on the throne. This king made an expedition to Syria purposing to assist Zedekiah, King of Judah, but failed to arrive in time, and Jerusalem fell into the hands of Nebuchadnezzar II. The remnant of the people who escaped fled to E. carrying Jeremiah, the prophet, with them. Haa-ab-Ra was dethroned by his own people, and Aahmes, or Anusis II., who was a general in the army, became king. Haa-ab-Ra was slain by an arrow while watching a fight from his galley, though some say he was strangled by order of Aahmes. The son of Aahmes was Psamthek III., who reigned only six months.

The Persian king, Cambyses, now invaded E. and conquered her. Tradition says that Psamthek was forced by Cambyses to drink bullock's blood in sight of the people so that he died, in any case he was almost certainly murdered, and E. became a Persian prov. This closes the hist. of the Pharaohs; the fate of the once glorious land of E. now lay in the hands of the half-insane and wholly cruel king of Persia, who heaped misery and insults on his victims. From the various legends and records concerning him, the man appears to us only as an inhuman brute. Having married two of his sisters, he took the younger to E. with him and slow her for grieving over the death of her brother, Smerdis, whom he had previously murdered. He desecrated the temples of E., and the Egyptians believed his increasing fits of madness were due to a curse because he wounded the sacred calf 'the Aps.' His successor, Darius I., appears to have been a less oppressive ruler, and more inclined to conciliate the native pop. He encouraged the Egyptian priesthood, restored their temples and built fresh ones.

The full titles of the Pharaohs were adopted by him and his successors, but the hatred smouldering in the heart of the Egyptians for E.'s conquerors could not appreciate these things. The country now was not strong enough to combine in a national revolt. In 486 B.C. they rose against Xerxes, who speedily crushed the rebellion. Later on Amyrtaeus of Sais revolted successfully against Darius II., and for perhaps sixty years E. was once more independent. Nectanebus II. was the last native king of E. Artaxerxes III., or Ochus, the Persian, subdued E. finally with great brutality. Her condition now became so miserable that Alexander the Great was welcomed as a deliverer.

After the victory of Issus, Alexander travelled to Memphis and from there marched to the oasis of Siwa to worship at the oracle of Jupiter Ammon. He also founded the port of Alexandria. In the div. of his conquests, E. fell to the share of one of his generals, Ptolemy, son of Lagos, who founded the Ptolemaic Dynasty. Under the rule of the Ptolemies, in spite of heavy taxation, E. once more prospered. Ptolemy I., or Soter I., commenced the famous library and museum at Alexandria. He wrote a hist. of Alexander's campaigns, and he introduced the worship of Serapis. Ptolemy II., Philadelphus, built the lighthouse at Alexandria known as Pharos, regarded as one of the seven wonders of the world. The splendour of his court was famous. Manetho the priest wrote his hist. of E. during this reign. Ptolemy III., Evergetes II., left more monuments than his fathers, among them the temple of Edfu, finished by Ptolemy IX. Ptolemy IV. was merely a debauchee, and the decline of the Ptolemaic kingdom began during his misrule. In the reign of Ptolemy V., who came to the throne at five years old, E. suffered from a series of incompetent regents. When the child grew to manhood his chief pleasure seemed to be athletic games and hunting. During his reign the suppression of native rebellions was remarkable for their cruelty and tyranny. While Ptolemy V. was quite a child, the chief priests met in council at Memphis and passed a decree ordering that special honours be paid to this king. This decree was duly carried out and inscribed on stone steles. The Rosetta stone, now in the Brit. Museum, which was dug up by M. Boussard in 1798, is one of these steles. Its name is derived from the place where it was found. It is of especial interest and value, because it was inscribed in hieroglyphic, demotic, and Gk., and consequently helped materially to decipher the hieroglyphics. Ptolemy VI., Philometer, reigned jointly with his brother Ptolemy VII., Euergetes II., nicknamed Physkon. The infant son of Philometer, Ptolemy VIII., was murdered, and Ptolemy IX., his uncle and murderer, seized the throne and married the mother of the little king. Ptolemy IX. was a man utterly vile in his habits and in himself. During his reign he finished the temple of Edfu and repaired many other temples both in E. and Nubia. Ptolemy X. was

murdered by the people, and an illegitimate son of Soter II. was chosen as Ptolemy XI.; he was called Auletes, the flute-player. Rome supported this man, and after he was driven out by popular hatred, restored him. On his death he left the kingdom to his eldest son, aged ten, Ptolemy Dionysus, who was married to his sister Cleopatra, when she was barely seventeen years old.

These two children ruled jointly under the care of the Roman Senate. The great Pompey was appointed their guardian. Pompey was murdered off Pelusium by order of the boy-king, who had succeeded in banishing his beautiful and troublesome sister. Cleopatra had withdrawn to Syria to make preparations to recover her rights by force; thence she went to Rome and met Julius Caesar. One legend asserts that at her command she was wrapt up in a bundle of rugs and skins and sent as a present to Caesar; her singular beauty and charm overcame his scruples and he resolved to place her on the throne of E. It is certain that he undertook the war for the purpose of reinstating her. In 48 B.C. he landed in E., having defeated Ptolemy, who perished in the naval battle off Alexandria. Cleopatra was replaced on the throne to rule with her younger brother, Ptolemy XIII.; the child died soon afterwards; tradition says he was poisoned by Cleopatra's order. She then lived openly as Caesar's mistress, but after his assassination she went no more to Rome, and her son, whom she asserted to be Caesar's child, called Caesarion, was associated with her on the throne as Ptolemy XIV. The Rom. triumvir, Mark Antony (q.v.), succeeded Caesar in her affections; the story of their love is well known; it was the ruin of both Antony and E. When Octavianus sailed to E. he murdered the little Ptolemy XIV., Mark Antony died by his own hand, and Cleopatra, knowing her kingdom lost, and refusing to become a Rom. captive, died, according to tradition, by applying an asp to her breast. Thus ended the reign of the Ptolemies, and E. now became a Rom. prov. The Ptolemies left many beautiful monuments behind them, among them those on the is. of Philæ. The last native king of E., Nectanebus, built a temple to Isis there, which Philadelphiaus reconstructed. The unfinished kiosk, known as 'Pharaoh's bed,' is one of the most beautiful ruins on the is.; the temple of Ptolemy (Euergetes I.) is also famous for its beauty. As a Rom. prov., 30 B.C., E. was under the rule of a prefect. The first was Cornelius Gallus; he appears to have made a treaty with the Queen of Nubia at Philæ. This queen, Amentaret or Candace, broke the treaty five years later, marched from her city of Meroë and invaded E. The Romans defeated her and marched to Napata, which they sacked, and Candace was forced to retire and submit. During the reign of Claudius the valuable Indian trade was secured for E. Most of the Rom. emperors from Tiberius onwards adopted Egyptian names and titles in E. Hadrian twice visited E., and

founded Antinoë. Greco-Rom. buildings of this period are numerous. Under Marcus Aurelius the suppression of a serious rebellion caused lasting damage to the prosperity of the country. One Rom. general called Avidius Cassius struggled to make himself Emperor of E., but he was slain by his own troops.

When Christianity first began in E. is not quite certain, but probably very early; many Egyptians adopted it as the hope of a future life coincided with their own views. It must always be remembered that the Egyptians thought more of the future life than the present, and that from the earliest times they were a deeply religious race; it was obvious therefore that having adopted Christianity they would do so thoroughly, and under Severus they suffered severe persecutions which merely added to their zeal, and they soon made Alexandria a centre of Christian learning. During the rule of Caracalla (A.D. 211) all the men who could possibly bear arms as soldiers were massacred in Alexandria, because of some real or fancied insult to Caracalla. Under the rule of Decius the Christians again suffered terrible persecutions. In A.D. 270 Zenobia, the famous Queen of Palmyra, invaded E., and Athenodorus, her son, governed E. jointly during the reign of Claudius. When Aurelian became emperor he perceived the dangerous policy of the Palmyrene queen, as her son was already having coins struck bearing the imperial title. Aurelian drove the Palmyrenes from E. His army was led by Probus, and E. was ruled by Rome again. Probus became governor of E., and under his rule repelled the tribes of Blemmyes who came from the E. Sudan and who were dominating the whole of the Thebaid. Under Diocletian the country was still troubled by them, and a formidable revolt broke out led by Achilleus, who called himself the Emperor Domitianus. Diocletian came to E. and captured Alexandria, and Achilleus was slain. The Blemmyes retired to the Sudan, and an arrangement was made to pay them a fixed annual sum on the understanding that they ceased from raiding Rom. ter. A temple was built at Elephantine where both sides swore to observe this covenant. 'Pompey's Pillar' was erected during Diocletian's rule to commemorate part of the corn tribute being paid to the Alexandrians. The Christians at this period were again persecuted with savage cruelty and they fled to the deserts in large numbers, building and hiding in obscure monasteries. In 378 Theodosius the Great proclaimed Christianity to be the religion of his empire. E. at once turned her attention to converting the temples of the anc. gods of her country into churches. The temple of Serapis at this time was the scene of a bloody conflict between the Christian mob and the remnants of the pagans; finally it was converted into a church for the use of the Christians. This was the real death-blow to Paganism; the Christians showed as little mercy as the pagans in asserting the supremacy

of their belief. During the reign of Justinian, while the army was occupied in quelling an invasion of the Blommies, Chosroes, the Persian, invaded E. and easily conquered her, holding her for ten years. Heraclius defeated the Persian and won back the country for a little while, but one stronger than he was rapidly gathering forces on her borders to take and possess her finally. E., weakened by her long internal struggles and utterly impoverished by the years of misrule, now fell an easy prey to Amr-Ibn-al-Asi, the general of the Khalifa Omar, and the once great E. became a prov. of the newly-founded Arab empire. See below, *Moslem Conquest*.

Religion and Antiquities.—The anct. religion of the early Egyptians is exceedingly difficult to disentangle or explain. The multitude of tribal gods and the enormous number of various legends and beliefs belonging to each separate god of one dist. makes it impossible, except at great length, to show how all were subject to and fulfilled their various functions under the one supreme head. The names of many gods and goddesses have been lost, but a total of about 2200 have been discovered. The Egyptian never had any real uniformity of religion, but always the chief god reigned supreme, the others merely fulfilling their allotted parts. We cannot, with absolute truth, describe their anct. religion as monotheistic, but the one supreme being was their real and *only* God, and the multitude of others were but attendants and symbols.

The most familiar gods from the anct. records are first Thoth, who was the heart of Nu, Nu being a god who floated in vast waters and Thoth the heart or idea of Nu who created the universe. The sun, Ra, sprang into being from the endless waste of waters and thereafter ruled the heavens. Osiris (whose name must not be spoken) and Isis, his beloved sister and wife, were the children of Ra, also Set, the wicked one, and Nephthys, his wife and sister. The legends of Osiris and the cult of that same god are as old as dynastic E. (probably older). Osiris was the good god-man who for love of this world, suffered, died, and rose again to rule in Heaven. He was to the Egyptian the proof of the resurrection, and their great hope of eternal life. The description of his kingdom, 'The fields of peace, the pleasant pools of peace,' prove how readily acceptable such a creed was to the hard-worked Egyptian who lived in abject poverty, depending entirely on the Nile for his hard-won crops. Isis, the most famous goddess of E., the wife and sister of Osiris, had many beautiful legends attached to her name. One of the stories of her love for Osiris and the finding of his body may be briefly told: Set, the wicked one, the god of evil, killed Osiris and divided his body into fourteen pieces; Isis wandered over the earth until all the parts of her husband's body were found. During her wanderings, Horus, her divine son, was born. The holy child, under the instructions of his devoted mother, performed certain ceremonies

at his father's burial, and assisted in raising him from the dead; from that time Osiris became the king of Amenti, the under-world, the land of hopes and dreams. The worship of the gentle mother Isis increased gradually, spreading at last to Rome and Greece. She became the goddess of the under-world of love, of magic, and of healing. As the goddess of magic, a legend of the new kingdom describes how she discovered the hidden, all-powerful name of Ra, which no one knew (names always bore a large part in Egyptian ceremonies). To the Egyptian she was always the great gentleness, the pure in heart, and the devoted wife and mother. Her worship withstood longer than any other the overwhelming tide of Christianity and there is much in common between the Isis-Osiris legend and the doctrine of the Incarnation. Thoth was usually represented as the scribe of the gods; he it was who weighed the hearts of the dead in the court of Osiris; by his side always waited a half-animal monster known as Am-mit, the eater of the dead, patiently waiting to devour the heart that would not balance against the feather. Among the other better-known gods and goddesses are Ptah of Memphis, who assisted in the creation, the Hephestus of the Gks.; Maat, the goddess of truth; Hathor, the lovable, represented with a headdress of the horns of a cow and the solar disc between them; the old god Bes of the Sudan; Hapi, the Nile god; Anubis, the jackal god, son of Set; Nut, the goddess of the sky; Bast, the goddess of Bubastis, to whom cats were sacred; and many others.

Later, many foreign gods crept in and were either worshipped separately or associated with the gods of E.; such were Iap, the Apis Bull, and Serapis, and the great god Ammon or Amen of Thebes, who became associated with Ra of Memphis as Amen-Ra. Amen-Ra became a very powerful god; his worship reached its zenith during the Eighteenth Dynasty. The priesthood of Thebes associated Ra-Harmachis of Memphis with him because they desired to absorb all the lesser gods. Amenhotep IV., or Akhnaton, who formed his own creed apart from all previous Egyptian teachings, was as a child dedicated to Ra of Memphis; thus at the beginning of his new religion his god Aton was associated with Ra. Aton has been identified with the Syrian-Asiatic Adonis (*cf.* Hebrew *adonai*, Lord!). The worship of Serapis was introduced by Ptolemy Soter I., Serapis being identified with Userhapi the Osiris-Apis. A Gk. statue of this god was placed in the Serapeum of Alexandria, the destruction of which by the Christians has already been referred to. The dead Apis, or sacred bull, was embalmed and buried at Memphis. Sacred amulets were popular with the Egyptians, and were supposed to possess magical properties. The best known are the *scarab* or beetle, symbol of the god Khepera, who was one of the creators; the *girdle* of Isis, symbol of protection; the *ankh*, symbol of life; the *shen*, or circle, which became the car-

touché of the kings, meaning protection from Ra; and many others. Sacred figures were used to bury with the dead, known as *Ushabti* figures; these were supposed to come to life in the other world and perform all the hard work for the person who was buried with them. The god Thoth, who was the scribe of the other world, was said to have invented writing. Hieroglyphics were used until the Rom. period, when demotic writing took their place.

The hieroglyphics were purely pictorial; they were used for monumental purposes, but for ordinary use on papyrus the hieratic writing soon came into use. The key to their decipherment, the Rossetta stone, has been referred to above. Writing materials consisted of papyrus, a reed-pen, and ink. The papyrus used was the stem of the plant which grew in the marshes by the Nile: the strips of the stem were arranged in a sheet perpendicularly and another sheet placed horizontally, the two sheets being then gummed together and dried. The Coptic writing consisted of the Ok. alphabet and sev. signs. Of the large amount of literature which has been saved, the largest part is religious. 'The Book of the coming forth by Day,' or 'The Book of the Dead,' is a series of formulas collected by the priests of Heliopolis about 3200 B.C. 'The Book of Breathings' contains a number of prayers. Others are 'The Book of the Lamentations of Isis and Nephthys,' and 'The Book of Traversing Eternity,' an account of a journey through the other world. There are many other curious and interesting books of litanies, hymns, and prayers, etc. Some of the hymns are very fine. Among the literature not religious may be mentioned the 'Precepts of Ptah-hotep,' 'The Instructions of Amen-em-hat I.,' 'The maxims of Ani,' and a 'Hymn to the praise of Learning.' There are many stories of marvellous adventure, and some interesting scientific works on astronomy and geometry. The Turin Papyrus is a chronological list of 300 kings, with the length of their reigns; the tablets of Abydos were lists made for Seti I. There are various medical works of great interest, but although learned physicians existed, magic was mixed up with medicine and probably believed in more than drugs. A good deal of poetry must have been written; many songs and verses have been saved, among them the love-songs from the Harris Papyrus. The manners and customs of anc. E. are exceedingly interesting. Women enjoyed great freedom; unlike the women of other Eastern countries they went unveiled, and met men friends on equal terms. The legal wife passed in and out of the house as she chose, and when she became a mother her influence greatly increased. The descent of a house was traced through the mother, not the father. Brothers were allowed to marry sisters, and uncles their nieces. Kings and nobles were allowed sev. wives and concubines, but only one was the legal mistress of the house, whom it was almost impossible to divorce; all the wives were free and respected and appear to have

lived happily together without jealousy. The poorer class women worked very hard, and being married frequently at fourteen and fifteen and often having large families they naturally aged very rapidly, but all enjoyed common rights and freedom and held a much better position than the other E. countries gave to their women. The children had many toys; sev. have lasted to our own day, such as dolls, balls, animals with movable limbs, ninopins, and many others.

A certain amount of education was given at various schools, and colleges for the students of magic and religion existed, learning being always held in high repute. The people ate their meals with their fingers and used the flat bread-cakes to wipe them on. Beer was the common drink of the country and made in sev. ways; date-wine was also largely drunk. Dancing men and women were popular and greatly amused the people, also tumblers and contortionists. The harp, the drum, and the sistrum were favourite musical instruments. The furniture of royal and noble houses was very rich and beautiful, inlaid ebony and ivory being much used. From the earliest time the Egyptian was an excellent potter. Vessels of a great variety of shape and size were always in use. The making of glass was an anc. art in which the workers excelled; porcelain was much used, and many beautiful coloured vases, figures, beads, etc., have been discovered; the colouring of their porcelain was often exceedingly vivid and lovely: the beautiful rich turquoise blue, with which most people are familiar, and brilliant greens and purples delighted them. Jewellers excelled in their art at a very early date; some extremely early specimens of exquisite design have been discovered, such as the gold bracelet of the wife of a king of the First Dynasty. Both sexes wore a quantity of jewellery and frequently carried fans and mirrors. Their currency appears to have been ring money of gold and copper, and later of iron, also bags of gold dust, representing a certain fixed value. A distinct class of the people were employed as embalmers of the dead, who had certain restrictions and privileges. For the methods of embalming, see MUMMY. The weaving of fine linen was always a flourishing trade; apparently each temple possessed its staff of linen weavers.

The clothes worn by the Egyptians were very simple for a long period; a loin cloth and a belt for the men and a short tight petticoat for the women, made of linen, wool being unclean. The children went naked, both rich and poor. Later the men wore a skirt reaching to the knees, with a curious triangular front which stood out as though starched. The women's skirts became longer and were held up by braces over the shoulders, leaving the upper part of the body bare. The people of the Eighteenth Dynasty wore more elaborate clothes; cloaks and tunics became fashionable with fringes and embroideries. Sandals were made for the feet and elaborate wigs for the

heads. The men all shaved their heads, the young boys retaining a long plaited lock on the side of the head until they came to manhood. The women plaited up their own hair with strings of beads, and wore decorated bangles.

Moslem Conquest.—In A.D. 639 Omar I., the second Caliph, sent an army of 4000 men, under the command of Amr, to take E. They marched through Syria to Pelusium, which fell easily, then on to the Fayum, and defeated the Romans at Heliopolis, A.D. 640. It is probable that Cyrus, the governor of E., may, for reasons of his own, have assisted in betraying the country to the Moslems. It is certain the Copts helped the enemy, and E. was conquered with very little difficulty. The pagan pop. embraced the faith of Islam,

obtaining the throne of E.: many of them were murdered, and the struggles of different persons to obtain power, together with heavy taxation, reduced the country to an utterly wretched condition. In 1164 the Franks invaded E. and joined a usurper called Shawar; they were defeated by Shirguh and his nephew, the famous Saladin (q.v.). Saladin took the title of Sultan, and during his rule E. recovered a little. His son Othman succeeded him, and another period of disputes and disasters convulsed the country. The Mameluke Dynasty began after the death of the Sultan Nagm-al-din, who had purchased vast numbers of slaves and turned them into soldiers; these were called the Bari Mamelukes. In 1515 war began with Selim I., the Ottoman Sultan,

W. McLeish

THE AVENUE OF SPHINXES AT THE ENTRANCE OF THE TEMPLE OF KARNAK

but the Copts remained Christians. The Arabic language rapidly spread and gradually superseded Egyptian. Now began a hist. of bloodshed, cruelty, tyranny and treachery that it would be difficult to exceed. For about the first 100 years the Christians were tolerated, and then a series of terrible persecutions commenced. Heavy taxation began and steadily increased. A series of ineffectual revolts occurred, but the unhappy people had suffered so long that they were utterly incapable of a properly organised struggle for freedom, and their futile efforts were instantly crushed with great cruelty. In 832 the Copts raised a more serious revolt, and Motasin, the feudal lord, failed to suppress them with an army of 4000 Turks. The Caliph Mamun came to E. to assist and the Copts were defeated. All the men who were caught were massacred horribly and the women and children sold as slaves. This finally subdued the Coptic nation. In A.D. 868 E. was given in fief to a Turkish general called Bayikbeg, the son of a slave, who had risen in the Caliph's service: from this time onwards various Arabs, Turks, and Syrians succeeded in

who defeated the Mamelukes and incorporated E. with the Ottoman empire: the country then became a Turkish prov.

Modern History.—From this time until the Fr. expedition in 1798, the gov. suffered constant changes; sev. rulers were murdered, with continual bloodshed, cruelty, and internal revolts. The Fr. expedition was presumably to suppress the Mamelukes and restore the authority of the Sublime Porte, but it was the beginning of that dream of Oriental conquest that always possessed Napoleon. Napoleon landed, and, after taking Alexandria, defeated the army of Murad Bey and Ibrahim Bey at the battle of the Pyramids. He then estab. a municipal council at Cairo, and the Fr. exercised dictatorial power. The Fr. fleet was destroyed by Nelson and the Eng. in the great battle of the Nile in 1798. Napoleon went off on an expedition to Syria, leaving Fr. governors at Cairo, Alexandria, and Upper E. The Sublime Porte sent a double expedition to recover E. by force. The Fr. general, Kléber, defeated the Turks, and a certain amount of order was restored. Kléber was assassinated, and

Gen. (Baron) de Menou succeeded in command. His declaration of a Fr. protectorate over E. convulsed the country again. In 1801 the Eng., commanded by Sir Ralph Abercromby, landed at Aboukir and invested Alexandria. Gen. de Menou attacked them, but he was defeated. Sir Ralph Abercromby died from his wounds received in the battle. The combined Brit. and Turkish armies under Gen. J. Hely Hutchinson and Yusuf Pasha marched to Cairo, and the Fr. general, Bellard, finding himself overwhelmed, agreed to evacuate Cairo and leave E. with his troops. General de Menou at Alexandria was compelled to accept the same conditions, and both left for France, thus terminating the Fr. occupation of E. Troubles arose almost at once. The Turks treacherously tried to exterminate the Mamelukes. Gen. Hely Hutchinson took measures at once against the Turks, who submitted and gave up their prisoners. Mohammed Khosrev was the first Turkish governor after the Fr. occupation. The Turks and Mamelukes continued to fight, and the Albanian soldiers rebelled against the Turks successfully, and Mahommed Khosrev fled. Tahir Pasha, the leader of the Albanians, seized the gov., but was assassinated twenty-three days afterwards. Mehmet Ali, an Albanian commander, allied himself to the Mamelukes; this was the beginning of further terrible struggles; one faction of the Albanians placed Ahmed Pasha Khorshid in the seat of gov. His rule was abominable and the half-starved and ruined people of Cairo waited in misery for a deliverer. Three thousand Kurdish troops were sent from Syria to Cairo to strengthen Khorshid, but they behaved with such brutal ferocity that Mehmet Ali returned, and was hailed by the people as their leader and saviour. A furious and bloody struggle took place between the forces of the two Pashas. Khorshid was recalled to Turkey, and Mehmet Ali made himself governor of E. The Beys (Mamelukes) disputed his authority; Mehmet Ali arranged and carried out successfully a treacherous and horrible massacre of the Mamelukes. In 1807 a Brit. force arrived under the command of Gen. Mackenzie Fraser. The troops entered Rosetta without opposition, but were trapped in the narrow streets, every roof and window rained fire on them from the hidden garrison, 185 Eng. were killed and 281 were wounded. A series of disasters followed. Mehmet Ali marched to Cairo, having allied himself to his enemies, the Beys, for the purpose of driving out the Eng. The Eng. were defeated and obliged to retire. Mehmet Ali then proceeded to massacre the remaining Beys, and finally remained the sole undisputed possessor of E. He recognised the suzerainty of the Sultan, and complied with the command of the Porte to send an army against the Wahabis (q.v.). He returned to Cairo on the day of the battle of Waterloo. Mehmet Ali now turned his attention to Egyptian domestic affairs; he created for himself a monopoly of the industries of the country, and by

nationalising the land became the proprietor of all the cultivated soil of E. He started and encouraged the cotton-growing industry in the delta, which was perhaps the best thing he ever did. He ordered the new canal between the Nile and Alexandria to be dug, which was done with forced labour and under such wretched conditions that 20,000 fellahin died before it was completed. The country was still heavily taxed; all the necessities of life were four times the price they formerly had been; the land became utterly impoverished; and the finances were in hopeless chaos. In 1838 a commercial treaty with Turkey was arranged which destroyed the monopolies, and matters grew a shade better. Mehmet Ali reorganised his army, and the fellahin and negroes replaced Turks and Albanians. The sultan appointed him governor of Crete, and in 1821 a fleet of 60 Egyptian vessels sailed to Suda Bay to assist the Sultan against the Gk. insurgents. The European powers intervened and Mehmet Ali withdrew to E. In 1833, the Sultan appointed Mehmet Pasha of Syria and the dist. of Adana, so that Mehmet now became the sole ruler of a large empire, while he was only responsible for a small tribute to the Sultan. In 1841 the powers again intervened; Mehmet was becoming too strong and too aggressive; he was compelled to submit to certain restrictions. He died in 1849 at the age of eighty. This remarkable man had achieved a great deal during his long and stormy career. His list bears the records of many treacherous deeds and violent scenes of bloodshed, but he was, in spite of all, a wonderful, strong, and interesting character. Among the really good things he accomplished for E. was the fostering of the cotton industry in the delta and the conquest of the Sudan.

His son Ibrahim being dead, Abbas I., Mehmet's grandson, ruled. During his reign the railway from Alexandria to Cairo was commenced at the suggestion of the Brit. Gov. Abbas was murdered by his own slaves after only six years' rule. He was succeeded by Said, the fourth son of Mehmet. During his rule Ferdinand de Lesseps obtained the concession (1856) for the construction of the Suez Canal (q.v.). The Eng. secured the right to start the Telegraph Company and establish the Bank of E. The national debt was commenced under Said; he died in 1863. Ismail, who succeeded him, did a great deal to reorganise the gov., and made many improvements, but his extravagance landed him in bankruptcy; he sold his shares in the Suez Canal to the Brit. Gov., thereby paving the way for the international control of the Khedive's affairs. He was compelled to submit to a constitutional ministry, of which he soon found means of getting rid. Ismail was immediately deposed by the Sultan, and his son, Tewfik, succeeded him as Khedive. In 1879 the Eng. and Fr. re-established the constitution; Maj. Sir Evelyn Baring (afterwards Lord Cromer) and M. de Blignières represented the two countries. A movement now began among the Arab

troops to remove the foreigners; it was led by a fellow officer, calling himself Ahmed Arabi. This man was promoted and made under-secretary for war, and then member of the cabinet. Arabi possessed a gift of rough eloquence, which appealed to the people; it is probably that he was sincere at heart but an unconscious tool in stronger and more unscrupulous hands. At the instigation of an Ariatic faction, a massacre took place in Alexandria, 1882, and, fearing a serious revolt, the Brit. and Fr. fleets arrived. The forts were bombarded, but the nationalist movement prepared to resist with great determination. The Brit. Gov. decided to employ military force. The Fr. declined to share the responsibility and England acted alone. Troops were landed under the command of Sir Garnet Wolseley, and the revolt was crushed at the battle of Tel-el-Kebir. The Khedive returned to Cairo, and a fresh ministry was formed. Arabi was sentenced to death, but his life was spared and he was banished. The task of restoring the country to order fell to Lord Dufferin, the high commissioner; he laid down lines for the reorganising of the administrative parts of the gov., and the practical carrying out of this general scheme was undertaken by Sir Evelyn Baring (Lord Cromer), who was appointed consul-general in 1884. The Sudan now claimed the immediate attention of the country. A religious rebellion had broken out led by a fanatic calling himself a Mahdi of Islam. Col. William Hicks Pasha had been sent with 10,000 men to suppress the revolt, but was utterly defeated at the battle of Obeid in 1883. The Khedive wished to make another attempt to regain his lost province, but Sir Evelyn Baring insisted that, there being neither men nor money, the Sudan must wait. The Mahdi was now master of the chief part of the Sudan, though Khartoum and some other places (*q.v.*) still held out. Gen. Vajentine Baker, with an army of 2500 mixed troops, was sent by the Khedive to relieve Sinkat and Tokar; they were defeated with great loss, and Suakin was in grave danger. A Brit. force of 4400 was sent and concentrated at Suakin. Sinkat fell, and Tokar surrendered to the Mahdi. Gen. Gordon and Col. J. D. Stewart, who had been sent by the Brit. gov. to Khartoum to discover the best method of evacuation, were now entirely cut off from help and besieged in Khartoum, and the problem was how to extricate them. There was a long delay, due to various causes. Gen. Gordon was only provisioned for five months; the siege began on March 18, 1884, and held out till Jan. 1885. Sir Charles Wilson, arriving on Jan. 28, found Khartoum in the hands of the enemy and Gen. Gordon murdered two days before. Khartoum had fallen, Gordon was murdered, the relief expedition had come too late. Lord Wolseley's Nile expedition, though failing in its ultimate purpose, experienced some severe fighting, and won the battles of Abu Klea and Metemnah, etc. The Brit. troops were withdrawn in June,

and the Mahdi died before the rearguard had left Dongola.

During this time Sir Evelyn Baring was fighting the internal difficulties of E., the question of finance being the hardest to overcome. The Convention of London (1885) enabled E. to raise a loan of £9,000,000; of this, when the indemnities and debts were paid, £1,000,000 remained over, and this was invested in irrigation and largely helped to save the country from bankruptcy. In 1892 the Khedive Tewfik died, and his son Abbas Hilmi succeeded. He was quite a young man and at first failed to comprehend the need of understanding his position as Khedive under the protection of Britain. He secretly encouraged an anti-Brit. agitation, but at last realising his own danger, he submitted without further trouble. During this time the Khalifa Abdullah-el-Taisha succeeded the Mahdi and ruled the Sudan. His intention was to conquer E., and though delayed at first by trouble with Abyssinia and various massacres of Egyptians, he arranged his campaign and placed Wad-en-Nefum, the Dervish Amir (who had defeated Hicks Pasha), in command of the army that was to conquer E. Another large portion of the army under Osman Digna, once a slave-dealer of Suakin, and now one of the greatest generals under the Khalifa, was engaged in fighting the Abyssinians. Osman Digna was defeated with great slaughter and fled to Kassala. In 1886 Col. Kitchener seized Osman Digna's stronghold and a large store of ammunition; Osman himself escaped. Kitchener became governor of Suakin in the same year and Sirdar of the Egyptian Army in 1890. It was not until 1898 that the power of the Khalifa was broken. The battle of Omdurman marked the destruction of the Khalifa's rule. His army was 40,000 strong. Kitchener marched to Omdurman, driving the enemy back as he went. Among the many deeds of gallantry that occurred must be mentioned the famous charge of the 21st Lancers. They were surprised by 2000 Dervishes but cut their way through with heavy loss. During the battle over 10,000 Dervishes were killed and as many wounded; 5000 were taken prisoner. The black flag of the Khalifa was captured and sent to Queen Victoria. The result of this victory was the extinction of Mahdism and the recovery of the Sudan for E. The Khalifa fled. On the Sirdar's return he encountered the Fr. expedition at Fashoda under Capt. Marchand. Matters were diplomatically arranged, though the crisis became very acute. Capt. Marchand returned to France. The Khalifa was killed in an encounter in 1899, and his son surrendered. Osman Digna was captured at Yebel Warriba in 1900.

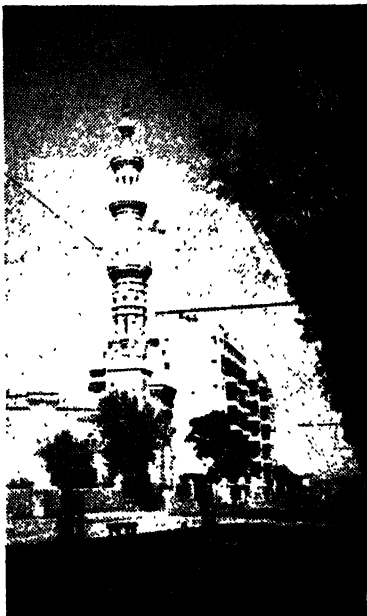

Meanwhile the country of E. continued to increase in prosperity. In 1907 Sir Evelyn Baring (now Lord Cromer) resigned, having completed his great work of creating from the ruins of hopeless misrule and ignorant tyranny a country that was steadily progressing and prospering. Sir Eldon Gorst succeeded him. The

Anglo-Fr. Agreement of 1904 put an end to the foreign complications attendant on the somewhat anomalous position of Great Britain; it recognised the protection and occupation of E. by Great Britain as a *fait accompli*. It was further of inestimable importance in freeing the country from the financial embarrassments imposed on her by the foreign bondholders through the *Caisse de la Dette*, and to this freedom the increasing prosperity of the country must be regarded as mainly due (the *Caisse* still exists, but its duties are now restricted to receiving the revenues necessary for the interest and for the payment of the coupons as they become due, while it also holds a reserve fund of £E1,800,000, the interest on which reduces the amount of the Treasury contribution). Trouble arose with Turkey over a boundary question on the E. frontier in 1906, but this was adjusted, and the Nationalist movement then became the chief cause of political anxiety. This culminated in the murder of Butros Pasha, the Coptic Prime Minister, in 1910, by one Wardani, who, after a long trial, was executed in the following year.

The resignation of Sir Eldon Gorst in 1911 owing to ill-health was followed by the appointment of Lord Kitchener as Brit. agent and *commandant-general*. Kitchener's administration was marked by great personal prestige, and the policy of his predecessor was to a certain extent reversed. The cry of 'Egypt for the Egyptians' was not quite so insistent, and any measure of independence which Egyptian ministers had previously enjoyed was quietly but firmly withdrawn. The Brit. officials were again ensconcing themselves in administrative posts, and strange as it may seem, these actions seemed to pass without demur on the part of the Egyptians. During the years of the Brit. occupation there had been little or no social intercourse between the Egyptians and the members of that vastly different race who were administering and virtually ruling their land for them. Indeed the social barriers had been well defined; but it was part of Kitchener's policy to alter this and to foster social intercourse between the Brit. and the Egyptians. The First World War interrupted Kitchener's activities in E. and on Aug. 6, 1914, he became secretary of state for war. Great Britain declared war on Turkey on Nov. 5. This was followed on Dec. 18 by Great Britain declaring E. to be a Brit. Protectorate. Next day the Khedive was deposed and his uncle, Hussein Kamil, was proclaimed Sultan of E. Sir Henry MacMahon, who had rendered political service in India, but was without experience of E., was made high commissioner. In 1916 Sir Henry MacMahon was succeeded in the high commissionership by Sir R. Wingate, governor of the Sudan and Sirdar. On Oct. 9, 1917, the Sultan Hussein Kamil (or Kamel, *q.v.*) died, and was succeeded by his brother Ahmed Fuad. After his accession (Oct. 30) an armistice between Turkey and the Allies was proclaimed, to be followed on Nov. 11 by the armistice between the

Allies and Germany. (For the campaign in Egypt, see EGYPT, FIRST WORLD WAR CAMPAIGN IN.)

It is not surprising that the wave of self-determination that had risen, as a direct consequence of the First World War, among the smaller races in Europe, was not without its effect on the political situation in E. The Nationalists were becoming extremely restive, and by skilful propaganda were adding daily to their numbers and enhancing the self-assertiveness of their adherents. They were led by Saad Zaglul Pasha, an able man of

E. Buchanan

A STREET IN CAIRO

humble origin and a former minister of education and minister of justice, who within a couple of days from the signing of the Armistice led a deputation to the high commissioner asking that permission might be granted to send an Egyptian delegation to London to discuss Egyptian affairs. The request received the backing of Sir R. Wingate, but was refused in somewhat curt terms by the Foreign Office. A carefully worded reply by Zaglul, in which the request was renewed, was also rejected against the advice of the high commissioner. This refusal determined Zaglul, and early in 1919 he announced the Nationalist programme at a public meeting. This programme demanded no less than complete independence for E. It is difficult to understand

the policy of the Brit. Gov. at this juncture. It had acted against the advice of its own high commissioner, Sir R. Wingate, who on account of the advice he had tendered was recalled. The next stroke was the banishment of Zaglul with three other prominent Nationalists to Malta, and this was the occasion of rioting and strikes. Property was destroyed, Eng. offices were wrecked and a state of general lawlessness prevailed. The Brit. troops were called out, and sev. rioters were shot. The rioting spread, and on March 18 at Deirut a train was attacked, and two Brit. officers, an official and five soldiers were murdered. For these murders about thirty people paid the extreme penalty on April 9. Gen. Allenby (*q.v.*), who had been appointed Special High Commissioner, succeeded in restoring order, and Zaglul and his fellow-exiles were allowed to return to E.

Acting on the recommendation of Gen. Allenby the Brit. gov. proclaimed the end of the Brit. Protectorate, and E. was recognised as an independent sovereign state (Feb. 28, 1922). This proclamation was subsequently ratified by the Brit. Parliament, which reserved the four following points for a later settlement: (1) Security of communications between various parts of the Empire; (2) defence of E. against foreign attack; (3) protection of European interests; (4) the Sudan. The Sultan Ahmed Fuad became King Fuad I. (*q.v.*). On April 19, 1923, the constitution of the kingdom of E. as an hereditary constitutional monarchy was proclaimed. The constitution settled the succession, declared the gov. to be representative and estab. equal legal, civil, and political rights for all Egyptians. Religious and personal liberty is guaranteed, and compulsory free elementary education for both sexes is provided in gov. schools. Islam is declared to be the state religion, and Arabic the official language. Parliament consists of two houses, the Senate and the Chamber of Deputies. The king nominates two-fifths of the members of the Senate, and the remainder are elected by universal suffrage, one senator to every 180,000 inhabs. The king also nominates the President of the Senate. The Chamber of Deputies is elected by universal male suffrage, one member to 60,000 electors. The term is for five years, and each member receives an allowance of £E600 per annum. The first election under the new constitution took place in Nov. 1923, and resulted in a large majority for the Nationalist party. Zaglul became Prime Minister, and the first demands put forward by his party were the complete independence of E., the withdrawal of Brit. troops and the return of the Sudan. On Nov. 19, 1924, Gen. Sir Lee Stack, governor-general of the Sudan, was assassinated by Egyptian Nationalists at Cairo. The Brit. Gov. insisted on the withdrawal of detachments of Egyptian troops from the Sudan. In Oct. 1925 Lord Lloyd was appointed high commissioner by the Baldwin gov. and held office till his recall by the Labour gov. in 1929.

In midsummer 1927 King Fuad visited England and conversations between his Prime Minister, Abd-el-Khalig Sarwat Pasha, and Sir Auston Chamberlain, the Brit. foreign secretary, took place in respect of a draft treaty between the two countries. The main points of the treaty offered by the Brit. gov. as a result of the negotiations were: E. to become a member of the League of Nations; Brit. troops to remain in E. for another ten years, when a fresh agreement would be made; Great Britain to be represented in E. by an ambas. who was to take precedence in the diplomatic corps; the organisation of the Egyptian army and the existing administration of the Sudan to remain unaltered. The treaty was rejected by the Nationalists, to the leadership of whom Mustafa en-Nahhas Pasha had succeeded on the death of Zaglul Pasha on Aug. 28, 1927. The ministry of Sarwat resigned on the rejection of the treaty terms and Mustafa en-Nahhas became Prime Minister. His term of office was brief, the ministry being dismissed on June 24, 1928. Muhammed Mahmud Pasha was appointed Prime Minister three days later, but, on July 19, Parliament was dissolved by royal decree and parl. gov. was suspended. In May 1929 an agreement between Great Britain and E. was concluded in respect of the rights of E. and the Sudan in the waters of the Nile and the regulation of irrigation works. In 1930 another attempt was made by the Brit. (Labour) Gov., with Arthur Henderson as foreign secretary, to settle the outstanding differences between the two countries, but the question of the final settlement of the Sudan proved a stumbling-block, and no treaty was concluded until 1936, the year in which King Fuad died and was succeeded by his son, Farouk I. In Aug. of that year was signed the Anglo-Egyptian Treaty stabilising Anglo-Egyptian relations for the succeeding twenty years, terminating the fifty years' occupation of E. by Brit. forces and making E. a sovereign State bound to Britain by a close alliance. The provisions of this treaty may be summarised as follows: (i) aid in war-time—in the event of either the United Kingdom or E. becoming involved in war, the non-combatant nation was pledged to give aid as an ally. Egyptian aid to the United Kingdom included the use of such Egyptian ports, aerodromes and means of communication as might be required by the Brit. forces. Three years later, when the Second World War broke out E. loyally fulfilled this obligation, as was shown by the disembarkation at Alexandria of the Australian and New Zealand Expeditionary force in the early part of 1940; (ii) The Suez Canal—Brit. troops to be stationed in the vicinity of the Canal, in a specific zone, to ensure, with Egyptian co-operation, the defence of the Canal. Not more than 10,000 Brit. troops or more than 400 R.A.F. pilots to be maintained in the Canal zone (actually an increase on the former numbers). The passage of aircraft over the Canal and within 20 km. of it was (except for Brit. and Egyptian machines) forbidden. At the expiry of 20 years the

question whether the Egyptian Army was strong enough to ensure the security of navigation of the Canal, thereby rendering the presence of Brit. forces no longer necessary, might be submitted to the Council of the League of Nations. (iii) Military and aerial facilities to be accorded to Britain including the maintenance of adequate landing-grounds and seaplane anchorages in Egyptian ters. and waters. (iv) The Sudan—The Brit. governor-general to continue to exercise his powers on the joint behalf of E. and the United Kingdom. Appointments of officials in the Sudan to remain vested in the governor-general. In addition to Sudanese troops, both Brit. and Egyptian troops to be stationed in the Sudan for its defence. Egyptian immigration into the Sudan to be unrestricted and no discrimination to be made between Brit. and Egyptian nationals in commercial or proprietary matters. (v.) Capitulations—abolition of this regime to be undertaken as soon as possible, the United Kingdom recognising that the responsibility for the lives and property of foreigners in E. devolves upon the Egyptian gov. To effect this change, a transitional regime for a reasonable period would be fixed, during which the mixed tribunals would remain and would, in addition to their existing judicial functions, exercise the jurisdiction vested in the consular courts. With the coming into force of the Montreux Convention in Oct. 1937, the regime of capitulations was definitely abolished. The treaty was ratified by the Egyptian Chamber by an overwhelming majority (202 votes to 11) and by the Senate by 109 votes to 7. In 1938 the Egyptian Council of Defence decided to create an Egyptian Navy. As a nucleus a fleet of 36 ships was to be built, comprising cruisers, minelayers, minesweepers, and submarines.

During the war Germany and Italy made every effort to persuade E. to betray Britain. A small but influential body of opinion in E. was greatly attracted by this political bait, but E. as a whole stood firm by her obligations. But an acute crisis arose in Feb. 1942, Hussein Sirry Pasha, the Premier, and a good friend of Britain, had no following in the country and was powerless to suppress a strong clique of intriguers who were stirring up anti-Brit. feeling. King Farouk then called in Mustapha el Nahas Pasha, leader of the Wafd and with the Wafd in office the situation changed overnight. In the succeeding elections the Wafd secured 250 seats in a chamber of 264. Nahas's first step was categorically to declare his determination to carry out the terms of the treaty. In the negotiation of which he himself had been the country's leader in letter and spirit. The country now drew inspiration from its new-found unity and responded with a will to its leader's example. This sentiment was vitally necessary a few months later. Until the end of June 1942 there had been no definite threat to E. proper, although in 1940 the forces of Marshal Graziani had reached Sidi Barrani. But at the begin-

ning of July 1942, Gen. Rommel's forces were actually marching on the Nile Delta, and for some days the military position was precarious. In such a situation an E. hostile to Britain would vastly have increased the danger from Rommel's Afrika Korps. E. was the base of the famous Eighth Army (q.v.) through which the Army's supplies and reinforcements had to come, where its headquarters were estab., which provided its ports and communications, through which came tanks from America, and which was, in fact, a *sine qua non* of its existence as a fighting force (for the issue of the campaigns in Egypt and Cyrenaica see under AFRICA, NORTH, SECOND WORLD WAR CAMPAIGNS IX). Rarely can any international undertaking have paid such solid dividends as the Anglo-Egyptian Treaty. Had there been no treaty, had not Anglo-Egyptian relations been so regularised, E. could not but have taken advantage of Britain's preoccupations to further her own interests. On the other hand, a treaty which demanded more of E. than it in fact did might well have defeated its own ends. Criticism of E. for not taking an active military part is misconceived. E. duly severed diplomatic relations with the Axis (q.v.), but she was not obliged under the treaty to make active war upon Britain's enemies: nor, indeed, was the Egyptian army in a condition to measure its strength against the Its., much less the Gers. Moreover, it was an open secret that some of the Egyptian army leaders with good connections in the Palace favoured the Axis, whose political principles appealed to them more than those of the W. democracies. Indeed, it was from the Palace that came the chief opposition to cordial co-operation with the Allies throughout the war. The crisis came, as we have seen above, in 1942 when the Brit. Eighth Army had just been driven back for the second time across the borders of Tripolitania, the Japanese seemed to be all-conquering in the Far E., and Russia at bay at Stalingrad. It was then that the Brit. Ambassador (Sir Miles Lampson, afterwards Lord Killcarn) demanded an audience of King Farouk and supported his demands by surrounding the Abdin Palace with Brit. troops. It was on the Ambassador's insistence that the King summoned to the premiership Nahas Pasha, leader of the largest political party and traditional upholders of national independence. The demand might therefore seem to have been inexplicable, but Nahas had signed the Treaty and it was calculated, and rightly, that of all E.'s politicians, he might be most relied upon to uphold its terms. Nahas continued in power for the ensuing two years, in face of increasing political and economic difficulties, until a scandal involving public charges of corruption, sensational even by Middle E. standards, gave the King an opportunity to dismiss him and his party. Nahas was replaced by the Saadist party leader, Ahmed Maher, who was murdered a few months later after declaring war on the Axis.

After the war, the Egyptian Gov. asked for a revision of the treaty on the plea that it had been made in the midst of an international crisis and that the war had exhausted the treaty's prin. objectives. It was also averred that the presence of foreign troops, even though stationed in distant areas, was wounding to national dignity and could only be interpreted by public opinion as a tangible sign of mutual mistrust. The Egyptian Note said that E. would shrink from no sacrifice in order to place her military potential in a state enabling her to repel aggression pending the arrival of the reinforcements of her allies and of the United Nations (q.v.). The Brit. Gov. was willing to revise the treaty arrangements 'in the light of their mutual experience and with due regard to the provisions of the United Nations Charter.' This exchange of Notes followed months of growing agitation by most sections of politically-conscious Egyptian opinion for the withdrawal of Brit. troops. On Sept. 23, 1945, the cabinet of Nokrashy Pasha took the extreme step of issuing a communique calling for evacuation of Brit. troops and for the incorporation of the Sudan with Egypt. Two months earlier even Nahas Pasha had presented similar demands to the Brit. ambas. on his own initiative. On Nov. 12, 1945, King Farouk, in his speech from the throne on the opening of Parliament, repeated the demand for 'an end to all restrictions on Egyptian independence.' In the first fortnight of Feb. 1946 students—Egypt's professional demonstrators—staged anti-Brit. demonstrations in Cairo and Alexandria. There were collisions with the police and in the result Nokrashy's gov. resigned. As his successor the king chose Ismail Sidky Pasha (q.v.) a doyen of Egyptian 'big business' and wealthy elder statesman. His return did not please the young Nationalists or the nascent Egyptian Labour movement. The climax came on Feb. 21 with riots in Cairo. Brit. service clubs and institutes were attacked and looted. Brit. troops opened fire on the mob and some twenty Egyptians were killed. The Brit. Gov., angered at the failure of the Egyptian authorities to protect Brit. property and personnel, demanded compensation and the punishment of the guilty. The Egyptian Gov. conceded the demands in principle and their new-found firmness had at least the effect of restoring order in the cap. Although the former front shown by Sidky Pasha kept the cap. reasonably quiet, in Alexandria there was a violent outbreak on March 4 in which, for the first time, Brit. lives were lost. In Jan. 1947 the Egyptian Gov. broke off negotiations, and later appealed to the Security Council of the United Nations to instruct Britain to withdraw troops from Egypt and the Sudan and the existing administrative regime in the Anglo-Egyptian Sudan. The Security Council, however, did not make any recommendation. Nevertheless the Brit. Gov. evacuated its troops from Alexandria and Cairo early in 1947.

E. was involved in the Arab-Jewish struggle over the partitioning of Palestine, which was recommended in Nov. 1947 by a committee appointed by the General Assembly of the United Nations. The Arab League refused to recognise partition and, following the termination of the Brit. mandate in Palestine, Egyptian troops invaded Palestine in the S., while the Transjordan Arab Legion and Syrian and Lebanese troops invaded the country in the N. and E. (May 1948). A truce supervised on June 11, by which date the Egyptian army had reached Isdud, 20 m. S. of Tel Aviv, and occupied positions running S.E. from Majdal through Faluja to Boersheba and linked up with the Arab Legion at Bethlehem. When hostilities were resumed the Arabs sustained sev. defeats and accepted a renewal of the cease-fire (July 19). Israeli troops then decided to take the offensive against Egypt and a large Egyptian force was surrounded at Faluja, 20 m. N.E. of Gaza. Egypt then became the sole target of Israeli pressure. Israeli troops entered Egyptian ter. in Dec. but were driven back and a truce was finally arranged for Jan. 7, 1919, a general armistice being signed at Rhodes on Feb. 24 (see further under PALESTINE) See also ANGLO-EGYPTIAN SUDAN; HIEROGLYPHIC; HIERATIC, and DEMOTIC WRITING; NILE.

Egypt Exploration Fund was founded in 1883 by Miss Amelia Edwards, who was greatly interested in Egyptian antiquities, and who was one of its first secretaries. Indeed, she gave up her other literary work to devote her time to writing about Egypt, her work being pub. under the title *Pharaohs, Fellahs, and Explorers*. The object of the society is to collect all the information possible which has reference to the hist. and nature of the sites excavated. The society pub. annual reports, which are beautifully illustrated. Some of the distinguished men who have worked for it are Professor Hinds Petrie, Professor Gardner, and Doctors Grenfell and Hunt.

Egypt, First World War Campaign in. Although Turkey was not in a state of war with Great Britain until Nov. 5, 1914, she had been under Ger. influence for some years before the First World War broke out, and an alliance actually existed between the two countries. The Central Powers had regarded Egypt as the 'throat of England,' and to Turkey had been allotted the task of throttling England, when such a task was considered strategically necessary. In Oct. 1914 Germany's fortunes were at a low ebb; she had lost the battle of the Marne, Russia had overrun E. Prussia, the Austrians had suffered heavily at Lemberg, and reinforcements to Brit. arms were moving freely from India and the dominions. The time had therefore arrived for Turkey to come into the arena of war and play her allotted rôle. The pre-war Brit. garrison was required in France, and in Sept. 1914 the 42nd (E. Lancs.) Territorial Div. was sent out to replace it. Troops from India, Australia and New Zealand also arrived, and by the end of 1914 about 70,000 troops were concentrated in E. Early in Nov. 1914 a Turkish force under Jemal Pasha advanced through the Sinai peninsula against the Suez Canal. Jemal's Chief of Staff was Col. Kress von Kressenstein, a Bavarian officer of great ability and energy. They advanced in three columns, and arrived at the canal on Jan. 25, 1915. Their strength was about 12,000-15,000 men. They raided Kuberi, 7 m. N. of Suez, on Jan. 27, and Kantara on Jan. 28. On the night of Feb. 2-3 a general attack was made between Serapeum and Tussum, but was repulsed by gun-fire. The Turks succeeded in throwing three pontoons across the canal, but all the Turks in them became casualties. At 9.30 a.m. on Feb. 3 the enemy brought up reinforcements and made another but equally unsuccessful attempt, and withdrew at 1.30 p.m., leaving sixty dead and 300 prisoners with the Brit. The next operations were against the Senussi (a Moslem nonconformist sect founded in

1835), which occupied the W. desert, with centres at Kufra and Siwa. The sect had many adherents in E. and was susceptible to Turkish propaganda. The Kaiser sent Sayed Ahmed, their leader, arms and munitions by submarines, which were landed on the coast of Tripoli. In Nov. 1915 they captured the crew of H.M.S. *Tara*, which had been torpedoed near Sollum, and committed other hostile acts against the Brit. This led Gen. Sir John Maxwell, the Brit. commander-in-chief in this theatre, to take offensive action against them. Actions were fought at Hazalin and at Agadir in Dec. 1915 and March 1916, respectively, in which the Senussi lost heavily. An armoured car detachment under the command of the duke of Westminster found forty survivors of the *Tara* in a distant camp and rescued them.

When the Gallipoli Peninsula was evacuated the Brit. troops went to E., and the whole of the garrison was reorganised under Gen. Sir Archibald Murray. The total force amounted to thirteen divs., six of which were sent to other theatres of war. A line to the East of the Suez Canal was occupied, where a much-advertised Turkish advance was awaited. They were under the command of Kress von Kressenstein, and numbered about 18,000 men. By the middle of July 1916 they were in touch with the Brit. outposts. On the night Aug. 3-4 they attacked Roman, but, being heavily counter-attacked, fell back in disorder, having suffered 9000 casualties, 4000 being prisoners. The Brit. followed up this success and drove the Turks out of E., the Sinai Peninsula and eventually out of Palestine.

Egyptian Bean, name sometimes given to the bean-like fruits of *Nelumbium speciosum*, the sacred Lotus, now found only in Asia and Australia. The seeds are eaten in some parts of India, and are believed to be the beans which Pythagoras forbade his disciples to consume.

Ehrenbreitstein, until 1919 'the Gibraltar of the Rhine,' tn. of Germany, on the Rhine opposite Coblenz. The fortress is famous, and is situated on an almost inaccessible rock, 400 ft. high. The sides are steep except on the S. where the approach is winding and strongly defended. It was conquered in 1631 by the Fr., in 1637 by the Imperialists, and again in 1799 by the Fr. The castle is ant. and the site was a Rom. fort. In the eleventh century, a noble named Erembert held it, from whom it derived its name. In the twelfth century archbishop Hillin of Trier had possession of it. When the Allied troops of occupation were stationed on the Rhine after the 1914-18 War Amer. soldiers occupied the fortress and the Amer. flag flew over it. Pop. 5500.

Ehrenburg, Ilya Grigorievitch, b. in 1891, is one of the best novelists and poets of the young generation of Russians. He spent a good many years of his youth abroad, but returned in time to live in Russia the four stormy years after the 1917 revolution. Outside his own country, he is best known in Germany, where

many of his books have been trans. There is an acrimonious tone about most of them which stamps him as a pamphleteer rather than romancer. His best novel is *Julio Jurenito*, which seeks to give a picture of most of Europe after the First World War. His most successful book of short stories gives the true facts connected with thirteen pipes in his collection and the lives of those who once owned them. One of his most beautiful poems is *The Sons of Our Sons*, in which he tells how future generations will think the war period was all blood and horror, whereas the truth was that flowers still bloomed, birds still sang, the sun still gilded the trees, and the sons of men still rejoiced in these lovely things. Lived mostly in Paris, but often returned to Russia to study political and social progress achieved under the Soviet system. His novel *The Second Day* (1934) made its appearance in the post-revolutionary period. Its 'hero' is the collective body of builders of Kuznetskstroy, the coal and metallurgical centre. During the Second World War he proved an effective propagandist with an unerring sense of vivid reporting. He has written ten novels and vols. of short stories including *The Loves of Jeanne Ney* (1924), *A Street in Moscow*, *The Fall of Paris* (Stalin prize novel), 1942; and *The War* (short stories), 1943.

Ehrlich, Paul (1853-1915), Ger. chemist, b. at Strehlen, Silesia. His first notable discovery was of 'tri-acid stain.' At the Koch Institute, Berlin, his standardisation of anti-toxins won for him the appointment in 1906 as head of the Institute for Experimental Therapeutics, Frankfurt-on-Main. His chief discovery was of Salvarsan as a remedy for various diseases, including syphilis, made in conjunction with the Jap. doctor S. Hata. He shared the Nobel Prize for medicine with Metchnikoff, in 1908. See M. Marquart, *Paul Ehrlich als Mensch und Arbeiter*, 1924.

Eibar, tn. of Spain in the prov. of Guipuzcoa, noted for its damascened 'E. work.' Pop. 11,840.

Eibenstock, tn. of Saxony, Germany, situated on the R. Mulde. It is a centre of the tambour embroidery. Pop. 10,000.

Eichendorff, Joseph Freiherr von (1788-1857), Ger. poet, b. at Lubowitz. He was a famous member of the Ger. Romantic school. His chief work of romance is *Aus dem Leben eines Taugenichts* (1826); and his chief dramas are: *Ezzelin von Romano* (1828), *Der letzte Held von Marienburg* (1830). He is best known, however, as a lyric poet; indeed, he is the greatest lyricist of the Ger. Romantics. His language is simple and musical; some of his poems have been set to music both by Schumann and Schubert. Two of his best lyrics are *Nachts* and *Waldegespräch*. See lives by J. Nadler, 1908; J. Hoyer, 1931; R. Wehrli, 1938.

Eichhorn, Hermann von (1848-1918), Ger. soldier, b. at Breslau. Won the Iron Cross in the Franco-Ger. War of 1871. In the First World War he served throughout on the Russian front. He came into

prominence as one of Hindenburg's chief lieutenants in the E. Prussian campaign, in which he took a notable part in the second battle of the Masurian Lakes (Feb. 1915). As commander of the Tenth Army he directed the operations against the Niemen, and was in command of the forces which captured the important stronghold of Kovno in Aug. 1915, whereby the Russians were compelled to abandon Brest-Litovsk and the whole of Poland. In 1918, he was made field-marshal and Ger. commandant in the Ukraine. Bombed in the streets of Kiev by social revolutionists, he died of his injuries.

Eichhorn, Johann Gottfried (1752-1827), Ger. historian, b. in Dörrenzimmern, Franconia. In 1788 he was made prof. at Göttingen, where he lectured both on oriental languages and on political economy. He is important as being the first to subject the books of the Bible to the ordinary methods of literary criticism. He was of the old school of rationalists, now superseded by the historico-critical.

Eichstätt, or Eichstätt, formerly Eistat, tn. of Bavaria, Germany, in Franconia. It is situated on the Altmühl, in a deep valley, 38 m. S. of Nuremberg. The cathedral was begun in the eleventh century. Other noteworthy buildings are the Schutzensel (protecting angel) church (1640), the church of the Capuchin monastery, with an imitation of the Holy Sepulchre at Jerusalem, etc. The tn. owes its origin to the grave of St. Walpurgis, and St. Willibald, an A.-S. missionary, to which pilgrimages were made from A.D. 870. Pop. 9000.

Eider, riv. of Germany, which rises to the S. of Keil. It crosses Schleswig-Holstein, forming a boundary between those two divs. Its direction is first N. and then generally W., but it has an exceedingly winding course, and after flowing 117 m. it enters the N. Sea at Tönning. The E. is navigable as far as Rendsburg, a distance of 70 m., and from this place the Kaiser-Wilhelm canal connects it with the Baltic Sea.

Eider-Duck, popular name of a species of *Somateria*, included in the sub-family Fuligulinae of the duck family Anatidae. They inhabit N. regions and are to be found on the coasts of the Atlantic and Pacific. The commonest species, *S. malimbica*, is occasionally found in Britain in the breeding season. The bill and feet are olive green, and the down is much valued in commerce for stuffing quilts and cushions. Other well-known species are *S. spectabilis*, the king E., which furnishes most of the down exported from Greenland; *S.* (or *Hemionetta*) *stellata*, known as Steller's E.; *S.* (or *Ardeonetta*) *fischeri*, the spectacled E. The common E. nests on rocky is. near the shore from the Farne Is. to Spitzbergen and is protected in Norway and Iceland.

Eidograph (Gk. *eidos*, form; *graphein*, write). This is a machine which is often used instead of a pantograph, and is employed for copying drawings, maps, and plans on the same scale, or for enlarging or reducing them in any proportion.

Eifel, volcanic plateau of the Rhineland, stretching from the frontier of Belgium to the Rhine and the Moselle. The heights reach from 1500 to a little more than 2000 ft., and the surface is generally undulating, with ridges and well-wooded valleys. The plateau is composed principally of Devonian rocks and limestone, with numerous fossils.

Eiffel, Alexandre Gustave (1832-1923), Fr. engineer, b. Dec. 15, at Dijon. Studied at the Ecole Centrale for three years. His first work was the construction of the iron bridge over the Garonne at Bordeaux, where he worked his 'caissons' with compressed air. The bridge over the Douro at Oporto, the viaduct of Garabit, as well as other metal bridges, are also his work; and it was he who designed the immense locks for the Panama Canal. His best-known work is the E. Tower, on the completion of which in 1889 he was made an officer of the Legion of Honour. In 1907 he pub. *Recherches expérimentales sur la résistance de l'air, exécutées à la Tour Eiffel*. Later, he made experiments in aeronautics, on which he pub. two books and also a report in 1919, and, in 1920, *L'Efface aérienne*.

E.N.A.

THE EIFFEL TOWER, FROM THE SEINE

Eiffel Tower, iron structure which stands in the Champ de Mars, Paris, on the S. bank of the Seine. It was designed for the Paris Exhibition of 1889 by Gustave Eiffel (q.v.) and was erected 1887-89.

It consists of three stories or platforms, the platform of the summit being 985 ft. above the ground. Almost 7500 tons of iron were used in its construction, and the cost of its erection was about \$250,000. The ascent to the top is made by powerful electric lifts. The tower is an important station of wireless telegraphy and broadcasting station and meteorological centre.

Eiger (Ogre), mt. of Switzerland, in the Bernese Oberland, situated about 4 m. from the Jungfrau. First ascent 1858, Mittelegg ridge, 1921. Its immense N. face, which towers above Grindelwald, was the last great unsolved climbing problem in the Alps, until it was scaled by an Austro-Ger. Party in 1938. Its height is 13,040 ft.

Eigg, or **Egg Island**, is. belonging to the Hebrides, W. Scotland, situated 5 m. S.W. of Skye. It has an area of 12 sq. m. The S. extremity, called the Scaur of Eigg, is a remarkable basaltic cliff, reaching 1346 ft. in height. In one of the caves 200 of the Macdonalds were suffocated by the Macleods. Pop. 197.

Eight Hours Labour Law, Act passed by Congress in 1912 limiting the hours of daily service of labourers and mechanics employed upon work done for the United States or for any Territory or for the District of Columbia to eight hours.

Eight, Piece of, popular name given to an old Span. silver coin. It was divided into eight silver reals, hence the term P. of E. Other names for it were plastre or dollar. (See DOLLAR and PIASTRE.) Its value was about 4s.

Eight Points, see ATLANTIC CHARTER.

Eighth Army, formed in Nov. 1941, of the Brit. forces in the W. Desert, thus carrying a stage further the reorganisation under which the Middle E. forces were divided into a W. Army (Egypt and the W. Desert) and an Eastern Army (Palestine and Syria): the creation of the E. A. separated the Brit. forces in the W. Desert from those in Egypt and was in fact a new incarnation of the Army of the Nile or Desert Army which, under the command of Gen. Maitland Wilson and the supreme direction of Gen. Wavell, won the first great victory over the Its. in the W. Desert. Under Sir Alan Cunningham the E. A. launched its own first offensive against the Axis forces on the Egyptian frontier on Nov. 18, 1941. The commander-in-chief, Gen. Auchinleck, anticipated his adversary's projected offensive by a few days and this gave the E. A. the initiative, which, however, he was dangerously near losing through the superior equipment of the Axis army. But if the Brit. victory was indecisive the battle ended in Jan. 1942, with Tobruk relieved, the Axis frontier garrison destroyed and Gen. Rommel's (q.v.) mobile Afrika Korps hurried back to the Gazala line. But Rommel's attack in the following May brought a reversal of fortune. His superior armour won a decisive victory over Lieut-Gen. N. M. Ritchie, who had taken command in the middle of the previous battle, and in the result Tobruk was lost and Rommel's Axis army advanced to Alamein and

threatened Egypt. But Gen. Auchinleck, assuming personal command of the weakened remnants of the E. A., brilliantly averted disaster. The way to Alexandria was barred still more securely at the end of Aug. when Rommel launched a great offensive against the Alamein line; for under its new commander Lieut.-Gen. B. L. Montgomery and commander-in-chief, Gen. Sir Harold Alexander, the E. A. hurled the Axis back in the now classic battle of El Alamein (officially styled Alemel Malfa). In the first week of Oct. the E. A. launched its most famous offensive, driving the Afrika Korps right across Libya, Cyrenaica, and Tripolitania. It broke the Mareth Line and entered Tunisia to co-operate with Lt.-Gen. Anderson's First Army and the Amer. forces already there, in shattering Axis resistance and completely destroying the last armies of the enemy in Africa.

For the Brit. Empire El Alamein was the turning-point of the Second World War. The battle proved not only the first great engagement lost by Germany, but the means to a succession of Allied victories across Africa and S. Europe. No Power had ever previously mustered so cosmopolitan an army as the E. A.; in it were men from almost every part of the Brit. Empire and they were welded together by superb training into a supremely efficient and confident military formation. Together with the Amers. and the Brit. First Army they were the first Allied troops to assault the fortress of Europe. Among the divs. of the E. A. that invaded Sicily there were only two from the old Desert Army, and Canadian regiments had now joined it. But the spirit and tradition which had brought the Eighth, after bitter disappointments, on its triumphant advance of 2000 m. under Lt.-Gen. (later Field-Marshal) Montgomery were the same, and the Crusaders' Cross still remained their proud badge. In Sept. 1943 the E. A. landed on the It. mainland and by Christmas they were N. of the Rome line. Its constitution had now become not merely imperial, but international. The original design of this campaign was that the E. A. should draw Ger. divs. down to the S. while the Amer. Fifth Army landed at Salerno. Later the task was to hold as many of Kesselring's Ger. divs. as possible in Italy in order that the Allied armies on the W. Front should have fewer to overcome. Combined movements of the E. A. and the Fifth brought about the fall of Rome two days before the Allied invasion of Normandy in June, 1944. The E. A. under the immediate command of Lieut.-Gen. Leese and Field-Marshal Alexander's supreme command, moved from the Adriatic to the Cassino front unsuspected, then drew most of the Ger. troops eastward and so enabled the Fifth to break through the Gothic Line. In the spring of 1945 the E. A. opened the offensive with a magnificent start in which, besides Brit., New Zealand and Indian troops, Polish, Jewish and It. units shared. The swift success of this advance brought the E. A. to Trieste and into Austria and

so to the close of its famous career. In the course of nearly four years its constitution repeatedly changed. The Australians who had served early in its hist. returned to their own land to meet the Jap. menace. Some of the Brit. and Indian troops also went E. From Italy divs., including the famous 'Desert Rats'—the Seventh Armoured corps with a desert rat for its emblem—were withdrawn to take part in the invasion of France in the Twenty-First Army Group. Later its Canadian corps was also sent to France. See: H.M. Stationery Office, *The Destruction of an Army*, 1942, and *The Battle of Egypt*, 1943; H. Rowan-Robinson, *Wavell in the Middle East*, 1942; A. B. Austin, *The Birth of an Army*, 1943; R. J. Crawford, *I was an Eighth Army Soldier*, 1944; Viscount Montgomery, *El Alamein to the River Sangro*, 1948. The E. A. headquarters was disbanded in July, 1945. See also under AFRICA, NORTH, SECOND WORLD WAR CAMPAIGNS IN; ITALIAN FRONT IN THE SECOND WORLD WAR; LIBYA, CAMPAIGNS IN; SICILY, BATTLE OF.

Elkon Basilike (Εἰκὼν Βασιλική) (*The Portraiture of His Sacred Majesty in his Solitudes and Sufferings*). This work was pub. immediately after the death of King of England, Charles I., and being written in the first person was ascribed to Charles himself. Indeed, his words about his treatment of Strafford confirm that belief. Dr. John Gauden said he started the work about 1617, and submitted it to Charles, but those in favour of Charles' authorship say that he wrote the first six chapters before 1645, i.e., before the battle of Naseby. The general verdict, however, is against Charles.

Eildon Hills are three high hills situated near Melrose, Roxburgh, Scotland. The central peak rises to an elevation of 1385 ft., and commands a most magnificent view of the surrounding country. The remains of a Rom. camp are to be seen on one of the hills, and sev. legends are told concerning them. The poet Thomas the Rhymer is associated with them, and Scott remarked that, standing on the Eildons, he could point out forty-three places famous in war and verse.

Eileithyaspolis, Gk. name of Nekhab, a city of anct. Egypt, which stood on the Nile about 40 m. from Luxor or Thebes. In anct. Egypt, E. or Nekhab, now represented by the ruins of El Kab, was the cap. of Upper Egypt. In the midst of every tn. was the temple of the local god, and the vulture-goddess of El Kab, called Nechbet (Nekbbi, Nekhebi), was the goddess E. of the Gks. The city contains the ruins of the following temples: that of Rameses II. dedicated to Ra, another built by Euergetes II. and dedicated to Nekhab (E.), and a third by Amenophis III. which is dedicated to the local deities. Some rock-tombs have also been excavated, some of which date back to the thirteenth century. The remains are now very scanty because all the stones worth taking were appropriated for the building of sugar factories under the Khedives Mehemet Ali and Ismail Pasha.

Eilenburg, tn. of Saxony, Germany, noted for manufs. of agric. implements, calico, and cloth; and also breweries and chemical works. E. possesses an anct. castle, known as Ilburg. Pop. 19,600.

Eilendorf, tn. of the Rhineland, Germany, situated about 3 m. from Aachen. Pop. 17,000.

Elilithya (Εἰλιθυα), called also Ilithya, was the impersonation of the pains of childbirth, and was therefore worshipped as the goddess who assisted women in labour. But seeing that all moon-goddesses had influence over birth, she is identified at times with Artemis, Hera, and Aphrodite. According to the Cretan legend, E. was born at Cnossus, and from there her worship spread over Delos and Attica. Another legend says she was born in Crete, but came to Delos to assist Leto. She is at times connected with the Fates, who also have control over childbirth.

Eimeo, or **Aimeo**, called by the Fr. **Moorea**, the most important of the Fr. Society Is. in the Pacific Ocean, is situated about 15 m. N. of Tahiti. Its area is about 50 sq. m.; its surface is hilly and the valleys are well cultivated. The London Missionary Society was estab. on this Is.

Einbeck, tn. of Hanover, Germany, 50 m. S. of Hanover. The picturesque old inner tn. is still partially enclosed by its former fortifications, and contains the fourteenth-century Alexander church, thirteenth-century Market church, fifteenth-century New town church, the sixteenth-century town hall and fine medieval houses. From the end of the fourteenth century its beer brought it prosperity. It is noted for carpets, engraving tools, and weaving machinery. Pop. 10,000.

Einölschtal, the Ger. name, more correctly spelt **Elvischtal**, of Val D'Anniviers, an Alpine glen in the Swiss canton of Valais. It is a summer resort, and its chief vil. is Sierre.

Einhard, **Einhard**, or **Eginhard** (c. 770-840), the biographer of Charlemagne, b. in E. Franconia. Owing to his extraordinary ability he came under the notice of Charlemagne at an early age. His artistic skill gained for him the name of 'Bezaleel,' and the basilica of Aachen, as well as other buildings, have been attributed to him. He became very friendly with the emperor, and when he died, Louis, his son and successor, appointed E. tutor to his own son Lothair. His best work is *Vita Caroli Magni*, which is a splendid biography of Charlemagne and is perhaps the finest historical biography of the Middle Ages. Of his other works, the most important are: *Epistole*, *De Adoranda Cruce*. His authorship of *Annales Francorum* is not certain. See M. Buchner, *Einhard's Künstler und Gelehrtenleben*, 1922.

Einsiedeln, tn. in canton Schwyz, Switzerland, the most famous pilgrim-resort in Switzerland, with a Benedictine Abbey, founded about 948 on the site of the cell of St. Meinrad, who was murdered in 881. It was dowered with land by two emperors, and became an independent principality of the Holy Rom. Empire.

The church (1719-35) is 446 ft. long, and is one of the most noble works of the baroque period. In the Gnaden-Kapelle is the 'Black Virgin,' a richly decked miracle-working image in wood. The Abbey Library comprises 100,000 vols., and 1300 MSS., some of the eighth to the twelfth centuries. The celebrated chemist Paracelsus was born here in 1493. Pop. 8,400.

Einstein, **Albert** (b. 1879), propounder of the theory of Relativity (q.v.), b. at Ulm in Wurttemberg; son of Hermann E., a Jew, described as owner of electro-technical works. The family removed to Munich during the childhood of Albert, who was slow in learning to speak, shy,

Topical Press

ALBERT EINSTEIN

and unsociable, with a taste for music. His early education was Jewish at home, Catholic at school. When older, he attended the Luitpold Gymnasium at Munich. In 1894 the family removed to Milan, and Albert began wandering tours in N. Italy. He wandered into Switzerland, and at Aargau studied mathematics and physics at the canton school. With a view to school-mastering, he began studying at Zurich Technical School at the age of seventeen, and remained there four years. He afterwards acted as tutor at Schaffhausen and Bern. In 1901 he was naturalised a Swiss citizen; and he was engaged as a technical expert in the Patent Office at Bern, 1902-5. In 1903 he married a S. Slavonic student from whom he was afterwards divorced. In 1905 he pub., in the *Annalen der Physik*, papers on the production and transformation of light, the Brownian movements, molecular dimensions, and the electrodynamics of moving bodies. The last-named brought him under the notice of Max Planck (q.v.). In 1909 he became prof. extraordinary at Zurich of Theoretical Physics; in 1911 prof. ordinary at

Prague. In the autumn of 1912 he returned to Zürich as professor at the Polytechnic. Early in 1914 he was appointed director of the Kaiser Wilhelm Physical Institute at Berlin, in which city he resided until 1933, when, owing to his Jewish origin, he was deprived of his appointment and took refuge in England. Later, he went to America and became a prof. at Princetown, N. Jersey. His second marriage was with a cousin of the same surname. By 1916 he had pub. *Die Grundlage der allgemeinen Relativitätstheorie*; followed by *Über die spezielle und die allgemeine Relativitätstheorie* (1921). E. gave a new direction to thought on the propagation of light and allied subjects by pointing out that time and space are not absolute, but merely relative to the observer. He gradually overcame the great mathematical difficulties, and his work has affected that of all subsequent mathematicians and astronomers. His theory was not verifiable experimentally until he applied it to gravitation, when he predicted that the deflection of a ray of light by the sun should be twice what the Newtonian theory would indicate. Observations made during the total eclipse of 1919 confirmed the E. theory. In Jan. 1921 he was lionised by philosophers and astronomers in U.S.A. and England. His doctrine, falling in with the reaction towards mysticism, has invaded philosophical as well as scientific fields of thought. Newton's dynamics still suffice to a high degree of accuracy for practical purposes, but for ultimate physical concepts it seems that Newton's theory is superseded by E.'s. He has written books on other subjects, among them *About Zionism* (1930), *Why War?* (with S. Freud) 1933, *My Philosophy*, 1934, *The Evolution of Physics* (with L. Infeld), 1938. See P. Frank, *Einstein, His Life and Times*, 1948.

Eire (Ireland), or Republic of Ireland. E. is the official name, since the passing of the Constitution Act of 1937, of what, prior to Dec. 29 of that year, constituted Saorstát Éireann or the Irish Free State. (The Act itself purports to embrace in the name "Eire" the whole of Ireland (*q.v.*), the intention of Mr. de Valera (*q.v.*), the chief sponsor of the new Irish Constitution, being to promote the unity of Ireland. The Brit. Gov., however, has made it clear that it does not recognise this larger connotation). In 1949 E. became a republic and left the Brit. Commonwealth of Nations.

Area and Population.—According to the census of 1916, the following are the areas and population of the provs., co. and co. bors. of Eire. The names of the caps. appear in parenthesis. (See next column.)

Constitution.—The constitution of E., which came into operation in 1937, declares that Ireland is a sovereign independent democratic State and affirms the right of the Irish nation to choose its own form of gov., to determine its relations with other nations, and to develop its life, political, economic and cultural, in accordance with its own genius and traditions. The constitution applies to the

PROVINCES, COUNTIES AND COUNTY BOROUGHS	AREA IN STATUTE ACRES	POPULATION

Total for Eire	17,024,485	2,953,452

whole of Ireland, but it provides that, pending the reintegration of the national ter. the laws enacted by the Parliament estab. by the constitution shall have the same area and extent of application as

those of the Irish Free State, which did not include the six Northern Counties or Province of Ulster known as Northern Ireland (*a.v.*). The President of Ireland (*Uachtarán na h-Eireann*) is elected by direct vote of the people for a period of seven years. On the advice of the Prime Minister (*Taoiseach*) the President summons and dissolves *Dail Eireann* (i.e. the Irish Commons). He signs and promulgates laws. On the nomination of the Dail, he appoints the *Taoiseach* and on the nomination of the latter and with the previous approval of the Dail he appoints the other members of the gov. In the exercise and performance of certain of his constitutional powers and functions, the President is advised by a Council of State. The Parliament—*Oireachtas*—consists of the President and two Houses: a House of Representatives or *Dail Eireann*, and a Senate—*Seanad Eireann*. The Dail consists of 147 members elected by adult suffrage on a basis of proportional representation. The Seanad consists of sixty members, of whom eleven are nominated by the Prime Minister, six elected by the univs., and forty-three from panels of candidates estab. on a vocational basis. The executive power of the state is exercised by the gov., which is responsible to the Dail and consists of not less than seven and not more than fifteen members. The constitution contains special provision for the recognition and protection of the fundamental rights of citizens, such as personal liberty, free expression of opinion and so forth. Freedom of conscience and the free practice and profession of religion are, subject to public order and morality, guaranteed to every citizen. No religion may be endowed or subjected to discriminatory disability. The special position of the Catholic Church as the guardian of the faith protected by the majority of the citizens is recognised by the State.

Local Government.—Ireland is divided into twenty-seven administrative cos. and four co. bors. governed by councils elected triennially. The co. councils administer co. affairs generally levy rates and borrow money; the co. bor. councils possess with certain exceptions the powers of co. councils. The administrative cos. include the urban co. dists. which are urban areas that have been constituted sanitary dists. Each such dist. is governed by an elected council that administers the Acts relating to public health, housing, maternity and child welfare, etc. An enlarged rural sanitary dist., called the co. health dist., was created by the Local Gov. Act, 1925. This dist. generally extends over the co. with the urban dists. excluded. The co. council performs its duties as a health authority directly, and appoints a co. medical officer of health. The co. council is also usually the public assistance authority and co. homes have been set up for the aged and infirm, and co. and dist. hospitals for the sick. Home assistance is the normal method of poor relief. Old age pensions are a charge on State funds but local authorities take part in the administration. Industrial and reformatory

schools are managed by religious communities, but maintained mainly out of capitation grants from both state and local funds. The local authorities have a system of gov. which combines an elected council with a manager. All functions formerly exercised by the councils other than those specifically reserved by law are exercised by the manager, a paid official who has control over all officers, and whose removal from office requires the sanction of the central authority. Elections to public bodies are held according to the principle of proportional representation. Women are eligible for election as members of all local gov. bodies on the same conditions as men.

Religion.—According to the census of 1936 the prin. religious professions were (including part of Ulster): Catholics, 2,773,920; Protestant Episcopalians, 143,030; Presbyterians, 28,067; Methodists, 9,649; other professions, 11,754. There are also approx. 2000 members of the Society of Friends.

The Judiciary.—Justice is administered by courts estab. by the Courts of Justice Act, 1924 (and amending Acts 1936, 1947). They include a Supreme Court, a High Court, a Court of Criminal Appeal, a Central Criminal Court, a Circuit Court and a District Court. The Supreme Court consists of the chief justice and four other judges, with appellate jurisdiction from all decisions of the High Court. The High Court, which consists of a president and five ordinary judges, has full original jurisdiction in, and power to determine, all matters and questions, whether of law or fact, civil or criminal. In all cases in which questions arise touching the validity of any law having regard to the provisions of the Constitution, the High Court alone exercises original jurisdiction. The Court of Criminal Appeal consists of the chief justice or some other judge of the Supreme Court and two ordinary judges of the High Court. Its decisions are final, unless either the court itself or the attorney-general certifies that the decision involves a point of law of exceptional public importance and that it is desirable that an appeal should be taken to the Supreme Court.

Education.—Elementary or primary education is free and given in the national schools. Secondary education is in private hands and is largely conducted by religious orders. There were in 1947 4957 primary schools (with an enrolment of 451,820, the percentage average daily attendance being 82). There were (1947) 395 recognised secondary schools, with 42,927 pupils between the ages of twelve and twenty years. Technical schools are estab. in all cities, the prin. tns., and some rural areas, the schools being controlled by the local authorities. Winter agric. classes for the sons of farmers are provided by statutory co. committees of agric. Univ. education is given at the univ. of Dublin (Trinity College) founded in 1591 and at the National Univ. of Ireland, founded in Dublin in 1909. The National Univ. has three constituent

colleges, viz. the Univ. Colleges of Cork, Galway, and Dublin (*see also* TRINITY COLLEGE, DUBLIN).

Defence.—The defence forces are organised on the basis of an estab. of 12,500 officers and men (permanent force) and 60,000 first and second line reserves. These figures include both the Air Corps and Naval Defence Service. The Naval Service comprises 3 corvettes and 5 motor torpedo boats. The personnel numbers 500.

Production and industry.—Agric. and the rearing of cattle (both fat and store) are the leading industries. The number of livestock in 1947 was: cattle 3,950,000; sheep, 2,094,000; pigs, 457,000; horses, 349,600; poultry, 17,304,000. The chief

£12,725,000 and raw materials and manuf. goods, £5,381,000. The statistics of distribution of trade show that a great part of E.'s trade is done with Great Britain. Imports from Great Britain were £13,037,000 and exports to Great Britain, £28,705,000. Imports from other countries were: U.S.A., £8,476,000; Argentina, £3,628,000; Brazil, £2,858,000; Canada, £2,851,000; India, £2,166,000; N. Ireland, £1,557,000; Dutch colonies, £1,261,000; Spain, £1,029,000; Belgium, £935,000; France, £873,000; Sweden, £759,000; exports to other countries: N. Ireland, £7,042,000; U.S.A., £575,000; Belgium, £478,000; France, £221,000.

Shipping.—Net tonnage of vessels entered and cleared in the foreign trade at

THE CLADDAGH, GALWAY

British Railways

crops are: potatoes (3,227,000 tons in 1946); turnips (2,264,000 tons); mangels (1,350,400 tons); oats (689,000); sugar beet (529,000 tons); wheat (463,000 tons); barley; rye; and hay (4,170,000 tons). The chief secondary industries are grain milling, bread, flour, biscuits, etc.; butter, cheese, margarine and condensed milk; bacon curing; brewing and malting; sugar, sugar confectionery and jam-making; tobacco; clothing (wholesale factories); woollen and worsted; furniture and upholstering; soap and candles; timber; distilleries; bricks, glass and cement; engineering and implements; linen, cotton, jute, and canvas; boots and shoes (wholesale factories); paper, printing; hosiery; fellmongering and leather; oils and paints.

Commerce.—The value of imports and exports for 1946 were: Imports, £72,043,372; Exports, £35,612,594. The chief imports were raw materials and manufactured goods, £53,167,000; other imports were live animals, £2,228,000 and food, drink and tobacco, £15,576,000; the chief exports were live animals, £19,867,000; food, drink and tobacco,

Irish ports in 1946 was: entered, 6318 vessels of 3,431,000 tons; cleared 6,324 of 3,438,000. The ports are Dublin, Cobh, Dun Laoghaire, Cork, Galway, Waterford, Rosslare, Limerick, and Dundalk.

Finance, currency, and banking.—Receipts were estimated in 1947-48 at £63,465,000 (customs £19,570,000; income and super tax, £13,640,000; excise, £11,695,000). Estimated expenditure totalled £66,884,000 (food subsidies, £9,796,000; education, science and art, £7,057,000; agric., land div., etc., £6,447,000; old age pensions, debt service, post office, army, about £4,000,000 each; police, £3,000,000). Total liabilities of Eire at the end of the financial year 1947 were £82,543,000; assets, £39,379,000. The unit of currency in Eire is the Irish pound, which has the same value as the pound sterling. The circulating medium consists of legal tender notes, consolidated bank notes, and token coinage. The Central Bank (estab. in 1943) has the sole right of issuing legal tender notes and token coinage is issued by the minister for finance through the

Bank. The Board of Directors of the Central Bank consists of a Governor appointed by the President of Ireland, and eight directors, all appointed by the Minister for Finance. Consolidated bank notes are a first charge on all the assets of the responsible banks, and are also secured by a reserve held by the Central Bank. They are convertible into legal tender notes which in turn are convertible into equivalent Brit. legal tender at the Bank of England. The Bank of Ireland, founded in 1783, has a cap. of £2,769,231; other banks, £3,430,000.

Communications.—There are nearly 2500 miles of railway of which 2158 are of standard (5 ft. 3 in.) gauge. There are 650 m. of inland navigation, including the Grand Canal 208 m., the Royal Canal, 96 m., and the Shannon Navigation, 139 m. The length of road, first track, actually situated in the State is 2181 m., of which 87 per cent is constructed to standard gauge. There are 13 m. of electric tramway. Some 15 m. W. of Limerick is an important land plane junction on the main trans-Atlantic air route. A thrice-daily service from Dublin is operated to the airport. Dublin airport, situated at Collinstown, 5½ m. N. of Dublin, serves the cross-Channel and European services operated by Aer Lingus (Irish Air Lines Ltd.). This company has exclusive rights on the cross-Channel services to Great Britain.

See S. Gwynn, *Ireland* (Modern World series), 1925, and *The Charm of Ireland*, 1934; Cicely Hamilton, *Modern Ireland*, 1936; T. Ireland, *Ireland, Past and Present*, 1942.

History of Ireland from the institution of the Irish Free State in 1922. (For the history of Ireland from the earliest times to 1922 see under IRELAND).—In 1921, after a year of guerilla warfare between England and Ireland, a truce was declared, followed by a treaty (Dec. 6, 1921) whereby Southern Ireland was given independence and Dominion status. The *Dail* (see DAIL EIREANN), the Parliament founded by the Irish Republicans in 1919, accepted the treaty in Jan. 1922. A provisional gov. was set up, with Michael Collins at its head, and the Irish Free State or Saorstát Eireann came into being. The elections in June were followed by civil disorders. The 'Irregulars' were eventually suppressed but Michael Collins was shot on Aug. 22, and Arthur Griffith (q.v.) first president, had died only ten days before. Griffith was succeeded as president by W. T. Cosgrave (q.v.), and T. M. Healy (q.v.) was nominated as governor-general. Republican resistance to the gov. officially ended in 1923, and, in the elections of that year, a gov. similar in temper to the previous one was returned. The constitution inaugurated by the first Dail provided that 'all powers of Government and all authority, legislative, executive and judicial, were derived from the people of Ireland,' and, secondly, that Irish (Gaelic) was to be the national language of the Irish Free State. The Dail decided that the *Oireachtas* or Irish Parliament should consist of the King and

two houses—the *Dail*, and the *Seanad* or Senate, but, with the passing of the Senate Abolition Bill, in 1935, the Senate disappeared, though, immediately afterwards, the gov. appointed a commission of inquiry into the whole question. This commission recommended the institution of some form of Second Chamber chosen by the Dail.

Proportional representation together with equal suffrage for all over twenty-one years, was introduced by the law of 1920. The Irish Free State became a member of the League of Nations in 1923. In 1928 governor-general Healy was succeeded by James McNeill. Through various parl. vicissitudes, and in spite of being without a majority after the elections of June 1927, Mr. Cosgrave remained in office till 1932, when he was succeeded as President of the executive council by Mr. Eamon de Valera (q.v.), leader of Fianna Fail. Mr. de Valera at once began an intensive Republican and anti-Brit. campaign by intimating that the Dail would proceed to pass a Bill to abolish the Oath of Allegiance to the Crown required to be taken by the deputies, and that his gov. proposed to withhold payment to the Brit. National Commissioners of the annual sum of £3,000,000 in respect of Irish land annuities and £2,000,000 in respect of pensions for the ex-Royal Irish Constabulary, Civil Pensions, Local Loan Fund Annuity, etc.—the amount of £5,000,000 being the total aggregate liability of the Irish Free State as finally agreed between the Cosgrave gov. and the Brit. Gov. some years previously. In reply to the Brit. Gov's objection that the Irish Free State constitution (Removal of Oath) Bill was a breach of the Treaty of 1921, the de Valera gov. argued that the requirement as to taking the oath as members of the *Oireachtas* was not mandatory and that in any event the Free State gov. was entitled under the Statute of Westminster (q.v.) to legislate on the Constitution as they might wish. In the result the bill was passed by the Dail but, being rejected by the Seanad, the matter was postponed.

The more acute issue throughout 1932 was that of the Land Annuities. These annuities had their origin in the various Land Purchase Acts under which the Irish tenants were enabled to purchase their holdings through loans made by the creation of land stock, and the sum of £3,000,000 was the annual payment made to the Brit. Gov. in respect of interest on the land stock and sinking fund. The de Valera Gov., however, defaulted in payment of the instalment due in the summer of 1932 and declined arbitration on the issue by a commonwealth tribunal. In order to collect the money the Brit. Gov. at once imposed tariff duties on Free State exports to the United Kingdom and the Free State retaliated with duties on United Kingdom imports. In the course of this 'economic war' the Free State Gov. initiated plans for a self-sufficient Ireland. In 1935 a Citizenship Act was passed laying down the status of an Irish Free State citizen or national. In the same year the Dail passed Bills to

abolish the Senate, and Univ. Representation. It also abolished the governor-generalship and replaced that official by a Seneschal (later replaced by a constitutionally orthodox president). When the 1937 Constitution Act was passed, E. was declared to be 'a sovereign independent democratic State.' The authority of the king of Great Britain was then only recognised 'as head of the Brit Commonwealth of Nations' for external purposes, such as the signing of Treaties and the appointment of representatives to foreign or dominion caps. Every effort is made by the gov. to promote the spread of Gaelic, but so far without much success. E., as stated above, comprises what is commonly called Southern Ireland, and though there is much agitation for the abolition of the border, the Brit. Gov. has taken its stand on the position that unity is essentially and exclusively a matter for accommodation between the two Irish Govs. and peoples. Agitation by the I.R.A. (so-called Irish Republican Army) has taken the form of bomb outrages in England and in Ireland—a campaign which was as strongly condemned in Ireland as it was in England.

On April 25, 1938, an Anglo-Irish Agreement was signed in London, under which the most outstanding differences (apart from partition) were disposed of. It was agreed—in accordance with the Treaty of 1922—to transfer the control of the coast-defence stations—one of the outstanding causes of friction being the Brit. occupation of certain ports like Berehaven, Lough Swilly, etc.—to Eire; to accept £10,000,000 from Eire in commutation of the land annuities; and to reduce or remove the special and retaliatory customs duties on Irish and Brit imports respectively.

Strenuous efforts have been made by the E. Gov. to promote the development of secondary industries in E.—notably beet sugar and industrial alcohol. But it cannot be said that secondary industries have flourished or are likely to flourish in E. to any very marked extent. With the Ger. invasion of Denmark in 1940, the demand in England for Irish dairy produce and bacon was increased; but it was evident that Irish agric. required bold measures of reorganisation before it could avail itself of such opportunities. On the outbreak of the Second World War in Sept. 1939, E. declared its neutrality, and was the sole member of the Brit. Commonwealth of Nations to remain neutral. This neutrality, in spite of many tragic examples of the fate of weak neutrals, E. was determined to preserve; and the possibility that Ireland might be exploited by Germany as a stopping-stone for invasion now became a major preoccupation in Britain's defensive plans. There were tripartite negotiations between the United Kingdom, Eire and Northern Ireland for seeking some formula which might reconcile Brit. security with Ireland's political necessities; but Mr. de Valera's insistence on the removal of Irish partition proved insurmountable and all the Brit. gov. gained was the

right to send aid if an invasion actually took place—Mr. de Valera repeating publicly, more than once, that invasion would be resisted from *whatever quarter it came*. Precautionary measures, however, included the posting of troops on the border of Ulster, and the mining both of the Irish Sea and the passage between the Orkneys and Iceland (1940). E. did not altogether escape bombing for bombs were dropped on Aug. 26, 1940, but it is probable that this was the inadvertent act of inexperienced Ger. pilots, who were off their course. The deprivation of the use by the Royal Navy of the Southern Irish ports no doubt augmented the toll of dead from Ger. U-boat attacks on merchant shipping, though this assumption is contested in Irish quarters. When Italy and Japan entered the war, there were, in Dublin, therefore, three embassies of nations hostile to Britain; but it is probable that Irish vigilance prevented any of them from being useful channels of enemy communication. With the landing of Amer. troops in Ulster, and the fortification of bases there, the chances of an enemy invasion of Ireland began to recede. Mr. de Valera's protest to America against the landing of Amer. troops on Irish soil was entirely unavailing; for neither Britain nor America would or could have dreamt of foregoing the decisive advantages of the Northern Irish bridgehead. To this and to the sure shield of the Navy, E. owed its immunity from attack in the war.

During Mr. de Valera's tenure of office E. became in all essentials an independent republic; for in the new constitution of 1937 no reference was made to the Crown. But the Constitution left in force the Eire Executive (External Relations) Act of 1936, which authorised the King to act on behalf of E. in certain matters within the field of external affairs as and when advised by the E. Executive Council to do so. This, in practice, meant that the King's authority was never invoked except in the matter of accrediting E.'s diplomatic representatives abroad. Pressed in the Dail to state whether E. was or was not a republic and whether or no it remained within the Brit. Commonwealth of Nations Mr. de Valera maintained the position that according to 'dictionary' definitions of an independent republic E. was a republic; but he evidently shrank from severing the last tenuous constitutional link or 'external association' with the Commonwealth—the rest of whose members acknowledged the common allegiance to the Crown—because of the partition issue. The existence of the border made it impossible to declare the whole of Ireland to be an independent republic *de jure*, even though the E. Constitution purported to embrace the whole is under the designation of 'Eire.' In Dec. 1937 the United Kingdom Gov. stated, after consultation with the govts. of the four dominions, that they, like those govts., were prepared to treat the new E. constitution as not effecting a fundamental alteration in the position of E. as a member of the Commonwealth.

But Mr. John A. Costello of the Fine Gael party, who became Prime Minister of a coalition gov. in Feb. 1948 after defeating Mr. de Valera's Fianna Fail Gov. at the polls, unexpectedly announced on Sept. 7 that his gov. proposed to repeal the Executive Authority (External Relations) Act and thus remove the last vestige of E.'s constitutional partnership in the Commonwealth. At the same time he declared that this was to be done in the most friendly spirit, and he repeated this assurance in the Dail (Nov. 24) and reinforced it by disclaiming any hostility to the King. Two days later the Dail gave the Republic of Ireland Bill a unanimous second reading and the Brit. Prime Minister, Mr. Attlee, accepted the spirit of goodwill in which the E. Gov. had acted and stated that after the Republic of Ireland Bill became law the United Kingdom Gov. would not treat E. as a foreign country or her citizens as foreigners.

The Republic of Ireland Act (disposing of the External Relations Act) came into operation on April 18 (1949). By this Act E. officially severed her last link with the Brit. Commonwealth of Nations. This resulted in legislative anomalies on the status of Irish citizens, but, conformably to the pledge given by Mr. Attlee, the Ireland Bill, introduced in the Commons soon afterwards, removes these anomalies by recognising the secession of E. from dominion status (*q.v.*) and confirming citizens of the new republic in all the rights which they held in the United Kingdom while E. was still a member of the Commonwealth. The Bill also proposed to give statutory authority to assurances to N. Ireland concerning her constitutional position and territorial integrity. The severance of the Crown link implied no real or material change in the position which had been accepted for the previous 12 years and even before Mr. Costello's gov.'s new move was taken, the highly individual status of E. was exercising the ingenuity of lawyers. Thus the new Brit. Nationality Act, which came into force in Jan. 1949, had to ensure that, while E. citizens should not be Brit. subjects, they should continue to be treated in the same way as Brit. subjects and not be called aliens. The attempt to smooth over possible difficulties was dictated by mutual interest; for Britain has a large Irish population in every walk of life and E. has a serious emigration problem that, since America and the dominions offer less easy openings than formerly, can only be solved in Britain; and in any case the introduction of passports and registration would impose an intolerable strain on both sides.

Alison Phillips (Lecky Prof. of Modern History, Dublin Univ.), *The Revolution in Ireland, 1906-1923*, 1926 (reproduction, mainly of hist. pub. in the 12th ed. of the *Ency. Brit.*, excluding the concluding chapters on the creation of the Irish Free State); D. Gwynn, *The Irish Free State, 1922-1927*, 1928 (survey of the work of reorganisation and reconstruction in the early years of the development of the Irish Free State, in the light of Dail debates, Irish newspapers, departmental reports and the evidence given before Commissions of Enquiry); Earl of Middleton, *Ireland—Dupe or Heroine*, 1932 (a defence of Brit. policy during the period when Arthur Balfour was mainly responsible for it); R. Pakenham, *Peace by Ordeal*, 1935 (on the negotiation of the Anglo-Irish Treaty of 1921); E. Curtis, *A History of Ireland*, 1936 (a hist. of the struggle for political unity and nationhood, cultural, social and economic factors being given their due weight with the major influences of politics and religion); Dorothy Macardie, *The Irish Republic*, 1937 (a documented chronicle of the Anglo-Irish Conflict and the partition of Ireland, with a detailed account of the period 1916-1923) (with a preface by E. de Valera); H. Harrison, *Ireland and the British Empire, Conflict or Collaboration?* 1937 (a study of Anglo-Irish differences from the international standpoint); D. O'Sullivan (Clerk of the Senate), *The Irish Free State and its Senate: a study in Contemporary Politics*, 1940 (a documented record combining the hist. of the Second Chamber and of the Irish Free State); N. Mansergh, *Ireland in the Age of Reform and Revolution*, 1940 (deals with the hist. of nineteenth-century Ireland from 1840-1921); and *Britain and Ireland*, 1942 (a pamphlet on the story of Ireland from the earliest times to the advent of Sinn Féin, followed by chapters on dominion status, the Irish Free State under the Fianna Fail party and the gov. of Ulster); M. McDunphy, *The President of Ireland: His Powers, Functions and Duties* (Dublin), 1945; Sir S. Leslie, *The Irish Tangle*, 1946 (deals with the partition problem and present-day Anglo-Irish relations generally, Ireland's neutrality in the world war, etc.).

For the physical features, etc., of Ireland, see under IRELAND.

Eisenach, tn. in Thuringia, Germany, is beautifully situated on the edge of the Thuringian forest. The mineral waters from Kreuzburg attract many invalids (8500 in 1927). There are sev. churches of the early thirteenth century, the tn. hall (1508, rebuilt 1638) and the castle of the former grand duke in which is now a picture gallery. In the Karls Platz in the centre of the tn. stands a statue of Martin Luther, who attended the Latin school in the tn. from 1498 to 1501. E. is noted for the manuf. of motor-cars, dyes,

agric. machines, chemicals, and electrical articles. There are many educational establs. and museums, one on the Wartburg, where Martin Luther, too, passed some years in this tn., and the chapel in which he preached is still in existence. The tn. dates back to about 1065, and was founded by the landgrave of Thuringia; later it passed into the hands of a Saxon family, and finally in 1711 it became the property of the duchy of Saxe-Weimar. It contains the Klemda, a castle built about 1260, a ducal palace, built in 1742, a tn. hall, and the late Gothic Georgenkirche. Pop. 52,800.

Eisenberg, tn. in Thuringia, Germany, with a pop. of 11,300 and the anct. castle of Christiansburg, which is used as the tn. hall.

Eisenerz, tn. in the Austrian prov. of Styria, in the Erzberg Mts., which is famous for its iron mines. Pop. 10,000.

Eisenhower, Dwight David (b. 1890) Amer. soldier, son of David J. Eisenhower of Swiss forbears who came to America before the Amer. Revolution, born at Abilene, Kansas, where he spent his boyhood. Graduated from West Point in

Press Portrait Bureau

DWIGHT DAVID EISENHOWER

1915. In the First World War he was chiefly engaged in training troops of the tanks corps at home and his promotion up to a point, was not rapid, his rank at the opening of the Second World War being still lieutenant-colonel; but by 1942 he was one of America's seventeen lieutenant-generals and thereafter was advanced more rapidly than any other Amer. officer, his outstanding qualities being quickly discovered by Gen. Marshall (q.v.). In Feb. 1942 he became chief of the plans div., War Department, General Staff. In Feb. 1943 he was appointed temporary general. In the following June he was appointed commanding general European Theatre of

Operations and from that post proceeded to N. Africa. After the expulsion of the Axis forces from Tunisia and Sicily he was appointed supreme commander of the Allied forces and worked on the plans for the launching of the 'Second Front': the success of the landings and ensuing battle of Normandy owed much to his organising abilities. For more than a quarter of a century E. had been an inspired student of mechanised warfare and in large-scale manœuvres in America he showed remarkable originality in his direction of this type of combat. In 1922 he was assigned to the Amer. Battle Monuments Commission and went to France to compile a guide-book of the Amer. battlefields there—a useful study in view of his destined appointment in 1944. Later at the Fort Leavenworth Command and General Staff School E. finished first. He was a moving force in the estab. of the Army Industrial College while he worked in Washington on plans for war mobilisation. In 1935 he went to the Philippines as assistant military adviser to the commonwealth under Gen. MacArthur and for the ensuing five years played a major role in devising the defences of the is. In the *Report by the Supreme Commander to the Combined Chiefs of Staff on the Operations in Europe of the Allied Expeditionary Force 6 June 1944, to 8 May 1945* (H.M.S.O. 1946) is told the story of the planning, courage, work and final results of the operations in Europe. Through the whole report is to be detected Gen. E.'s impression of complete allied unity, though, towards the Brit. Chiefs of Staff in London he often felt impatience, chiefly because they 'regularly queried their commanders in the field concerning tactical plans' (*Crusade in Europe*). He indicates that three episodes were the most decisive in ensuring victory—the Battles at the Normandy beaches, the Falaise pocket, and those W. of the Rhine in February and March 1945. 'Victory was won,' he states, 'before the Rhine was crossed.' The king conferred on E. the O.M. at Buckingham Palace on June 12, 1945. He retired from the U.S. Army in 1948 after thirty-three years' service, and in the same year became president of Columbia Univ., New York. See his *Crusade in Europe*, 1949; and K. S. Davis, *Soldier of Democracy*, 1945; H. C. Butcher, *My Three Years with Eisenhower*, 1946.

Eisenstadt, cap. of the Austrian prov. of Burgenland, noted for its magnificent seventeenth century castle, Schloss Esterhazy. Pop. 6000.

Eisenstein, Sergei (1898–1948), Russian film director b. at Riga. Set the task, after the Russian Revolution, of founding a school of cinema, he rivalled in a short time the Amer., Ger., and Fr. His best work which made him one of the world's greatest masters of film technique, was achieved with the silent films *Battleship Potemkin* (1925) and *October: Ten Days that shook the World* (1927). Later films were *Alexander Nevsky* (1938) and *Ivan the Terrible* (1943).

Eisleben, tn. of Saxony, Germany, 24 m. from Halle, the bp. of Martin Luther. The

house in which he was born has been a museum since 1917. Both that and the house in which he died are in the Altstadt or old tn. The churches include the Andreaskirche, with the pulpit in which Luther preached, the fifteenth-century church of Peter and Paul, with the chapel in which he was baptised, the Nicholas Church, 1426, and the Anna Church, 1514. The tn. hall is of the date 1519-30. Besides the mining of copper and silver, there is a trade in seeds. Pop. 24,000, mostly Protestants.

Eisner, Kurt (1868-1919), Ger. journalist and statesman of Jewish descent, b. at Berlin. Wrote voluminously on art, the drama and sociology. Won a high reputation at the Berlin Gymnasium in philosophy and Germanic studies, and early in life wrote an excellent treatise on Nietzsche. Wrote for the *Frankfurter Zeitung* in 1892 onwards, and for his socialist opinions was sentenced to a term of 9 months' imprisonment in 1897. Subsequently co-operated with Wilhelm Liebknecht in the editorship of *Vorwärts*. Organised a bloodless democratic revolution in Bavaria towards the close of the 1914-18 War, becoming Premier after the abdication of King Ludwig, but was murdered by Spartacist soldiers early in 1919. He prophesied the first World War in his Morocco treatise, *The Sultan of the World War*. See A. Got, *La Terreur en Bavière*, 1922.

Eisteddfod (plur. eisteddfodau), congress of Welsh bards, was instituted in order to encourage the composition and preservation of national poetry and music. Its origin dates back to very early times, and an E. was held at Caerwys, in Flintshire, about the beginning of the twelfth century. It was first sanctioned in England after the annexation of Wales, and there are records of eisteddfodau having been held in the reigns of Edward III., Henry VI., Henry VIII., and Elizabeth. The festival then seems to have been discontinued, but was again revived in 1789. It is held annually, in a different tn. each year. Its celebration generally occupies three or four days, and a president and conductor are appointed for each day. There are competitions in poetry, music, singing both choral and solo, as well as singing with the harp; there are also art competitions. The third day is the chair day, when the fortunate winner is proclaimed.

Ekowe, see ESHOWE.

Ekron, city of the Philistines on the borders of Judah and Dan, where Beelzebub was worshipped. It was the place from which the Ark of the Covenant, which had been captured by the Askalonites, was returned to Israel. At a later period it became part of the ter. ruled by the Maccabees. E. was one of the five allied cities (the others being Gaza, Ascalon, Ashdod, and Gath) of the 'Peleshim' or Philistines (1 Sam. v., vii., xvii.; 2 Kings, i. and Zeph., ii., and Zech. xvi.). Its modern name is Aqir. Its present inhabs. number about 1200, and in its neighbourhood is a Jewish agric. settlement founded by Baron Rothschild.

El Aazariyeh, see BETHANY.

Elabuga, tn. of the Sverdlovsk Ilegion of the R.S.F.S.R., situated on the Kama R. It has flour mills and exports corn. In 1858 the celebrated 'Ananiyskiy Mogilnik' (burial-place) was discovered 3 m. from this tn.

Elæagnus, see OLEASTER.

Elæocarpus, genus of Elæocarpaceæ. *E. serratus* bears an olive-like fruit used by the natives of India as an ingredient of their curries; *E. cyaneus* has white flowers and is one of the most ornamental of Australian plants.

Elæococca, genus of Euphorbiaceæ. The seeds yield valuable oil. *E. verrucosa* of Japan produces seeds supplying oil for burning, and *E. vernicia* of China furnishes oil used for painting.

Elæodendron, genus of Celastraceæ, occurs in all tropical countries, and is divided into 30 species. *E. glaucum* is a small tree about 14 ft. in height; it is a native of Ceylon and Coromandel and has been introduced into Britain as Ceylon tea. *E. Roxburghii* grows in the mts. of India, and *E. orientale* is found in Madagascar.

Elæolite, crystalline plutonic rock composed largely of nepheline and alkali felspar. It resembles granite in appearance, and is of a pale grey or pink colour; green is also found. It does not contain quartz, but is rich in many other minerals which contain alkalis.

Elagabalus, or **Heliogabalus**, emperor of Rome (A.D. 218-222), was b. at Emesa. A.D. 205, and was then called Varius Avitus Bassianus. When very young however, he became priest of E., the sun god, and so obtained this name. In A.D. 218 E. was proclaimed emperor as the successor of Caracalla, and was successful in overcoming Macrinus, who had murdered Caracalla and had occupied the throne for a short time. His reign, which lasted over three years, was characterised by the most unheard-of excesses, and he was eventually murdered by the prætorians.

El Alamein, Battle of, see under AFRICA, NORTH, SECOND WORLD WAR CAMPAIGNS IN.

Elam, anct. name for that part of the land which lies E. of the lower course of the R. Tigris. Susiana (from the name of Susa, its prin. city) was the name given in classical hist. to the S. portion of this land, the modern name of which is Khuzistan. This portion was called by the Gks. Elymais.

Elan, riv. of Wales. It flows through Cardiganshire and Radnorshire, joining the Wye S. of Rhayader. A dam has

been constructed on this riv. for the purpose of forming a reservoir which supplies the city of Birmingham with water.

Eland, popular name of a genus of large and almost exclusively African antelopes, characterised by the general absence of horns in the females and by those of the male being devoid of rings, angulated in front, and usually spirally twisted. Both sexes have a large dewlap, and the crowns of the upper molar teeth are low and broad. The common E., *Orias canna*, formerly ranged over the greater part of S., E., and Central Africa, but is now extinct in the S. of the continent. Its complete extirpation is probably only a matter of time, the animal being frequently slaughtered for its hide. The magnificent species known as the Derbian E., *O. derbianus*, replaces the common species on the W. coast in the dists. of Angola and Senegambia.

Elandslaagte, vill. of Natal, S. Africa, 16 m. from Ladysmith, scene of a Brit. victory over the Boers on Oct. 21, 1899, early in the S. African war.

Elanet, or **Elanus**, genus of Falconide closely allied to the kites, found in all the continents. *E. caerulus*, the black-winged kite, is common to Africa and Asia, and is occasionally seen in Europe. *E. scriptus* belongs to Australia; *E. dispar*, the black-shouldered hawk, occurs in America. All are birds of prey and some will eat even insects.

Elaps, see CORAL SNAKES.

El Arish, see ARISH.

E.L.A.S. (Gk. Ellinikos Laikos Apelevtherotikos Stratos) a Gk. national popular liberation army of the left in the Second World War, originally a section of E.A.M. (q.v.).

Elasmobranch. The Elasmobranchii are an order of fishes marked by the cartilaginous nature of the bones and by the absence of sutures in the cranium. Such are the shark, ray, sturgeon, skate, etc., and a number of more or less allied extinct forms. They appear in the Upper Silurian epoch, and as they are the oldest fishes with which we are acquainted, it is probable they may have been the stock from which all fishes were derived. A Jap. shark, *Chlamydoselachus*, is said to be the oldest living fish. All the existing members of the order are carnivorous, but whereas the tropical shark is highly predaceous, some of the largest species have very small teeth and feed on molluscs and other invertebrates. The Elasmobranchii are marine fishes, but many ascend tidal rivers.

Elasmosaurus, gigantic fossil reptile belonging to a family allied to the Plesiosauroidea. It is found in the Upper Cretaceous rocks in Kansas, and its computed length is 45 ft.

Elasticity. A substance is said to be elastic when, on being left free, it recovers wholly or partially from a deformation. A very general proof of compressibility and of E. of bulk is afforded by the fact that the great majority of bodies are capable of transmitting sound-waves, for the propagation of sound consists essentially in the handing on by resilience, from

layer to layer of the medium, of a state of compression or dilatation. All ordinary sounds are propagated in air; the rate of passage of sound has been measured in the waters of the lake of Geneva and elsewhere, and it is a matter of common observation that sound can be transmitted through solid bodies, such as a wall or a floor. The one kind of elastic deformation which can be experienced by a fluid, i.e. a gas or a liquid, is change of bulk. This change of bulk can only be brought about by a pressure acting equally in all directions. The E. in these cases is the ratio of the change of pressure to the change of vol. per unit volume. A change of vol. of a gas is accompanied by an evolution or an absorption of heat, which is usually shown by a rise or a fall of temp. It is sufficient to state here that there will be two values for the E. of a gas, according as the change takes place without loss or gain of heat or without change of temp. In the latter case, the E. is numerically equal to the pressure, if the gas obeys Boyle's law. The ratio of the E. when heat is neither gained nor lost to the E. at constant temp., is equal to the ratio of the specific heat of the gas at constant pressure to the specific heat at constant vol. The change of vol. which can be produced in a liquid by pressure is very small, being about 5 parts per 100,000 for one atmosphere change of pressure. The E., according to the above definition is, therefore, very high. When we pass to the consideration of solids, we are met with another kind of E., the E. of form. The processes of manufacturing many articles show clearly that it is possible to bring about changes of form from which the body does not recover on removal of the forces. The moulding of clay in pottery work, and the forging, stamping, and wire drawing of materials are familiar instances of such effects. On the other hand, the recovery of form and shape is used, very frequently, in such cases as hair-springs of watches, spring balances, carriage springs, buffers, and so on. These examples show clearly that there is an elastic limit within which bodies will recover their form and shape, and beyond which they will be permanently changed. Two terms, strain and stress, which are frequently used in E., may be defined as follows: Any alteration in form or bulk of a body is called a strain, and the combination of forces producing a strain is called a stress. The resistance which a solid offers to a pure change of form is measured by its rigidity, and if for this change the body is truly elastic, the rigidity is measured by the ratio of the deforming stress to the resulting strain. A pure twist applied to a rod or wire involves no change of vol. The resistance which such a rod offers to a change of form depends on its rigidity and form, and is independent of its compressibility. But in most cases, where a body is strained by a particular form of stress, the ratio of the stress to the strain involves both the rigidity and the compressibility. Thus, when a wire is stretched by applying a tension parallel to its length, it increases

in length but diminishes in thickness. If the ratio of the stretching force per unit area of cross section to the increase in length per unit length be called E , then $E = \frac{1}{9k} + \frac{1}{3n}$ (where k = bulk, modulus = ratio of a hydrostatic pressure to the change in vol. per unit vol. of the solid produced by that pressure, and n = the rigidity), and the ratio percentage lateral contraction = σ (or percentage elongation

Poisson's ratio) is equal to $\frac{3k-2n}{6k+2n}$. Thus the quantity E , which is called Young's modulus, is not an independent quantity. Young's modulus is of importance in engineering, for it determines not only the contraction which will be produced in a pillar by a given load, but also the resistance which a beam or a bar offers to bending (see STRENGTH OF MATERIALS). It has already been stated that there is a certain limit of strain called the elastic limit, beyond which a permanent strain or set will be produced in a body. The limits of perfect E are very low—if they exist at all—for glasses and other hard, brittle solids; but metallic substances, such as copper, iron, platinum, brass, and steel, are very nearly perfectly elastic as regards distortion, provided the distortion is not too great. The exact

EXTENSION

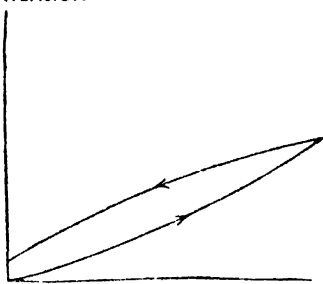

FIG. 1

value of these limits is somewhat indefinite, for a small stress acting for a long time will produce a permanent change of form, which could only be produced in a short time by a very much larger stress. But within the elastic limit, and with stresses applied for a short time, experiment shows that the stresses are proportional to the strains. This relation was stated in 1678 by Robert Hooke, in the form *Ut tensio sic vis*. Applying Hooke's law to the case of a stretched wire, it follows that the extension is proportional to the stretching force over a considerable range of values. Even within the elastic limit, Hooke's law is not accurately true, although the divergences are not great.

It will be seen from Fig. 1 that the extension produced in a wire by a given load depends on the way in which the given load is obtained, whether by increasing or decreasing a former load. It is also seen that the wire is slightly longer at the end of the experiment than it was at the beginning. Similarly, if a rod is subjected to torsion, the twist produced by a given couple will depend on the previous treatment of the rod. When a cyclic state has been estab., the relation between the couple and the twist is that shown in Fig. 2. It is seen that the twist lags behind the couple. Thus, as we pass from B to B₁, the couple vanishes at C, but the

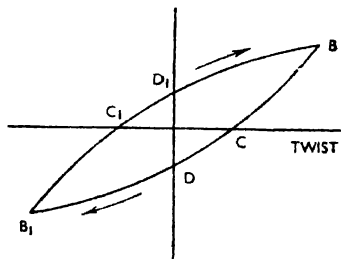

FIG. 2

twist does not vanish till we reach D. The lagging of the effect (in this case the twist) behind the cause (the couple) has been called hysteresis by Ewing. The area enclosed by the curve B'D'BDB₁ is proportional to the energy dissipated in each cycle.

When rubber and certain synthetic materials are subjected to stresses their behaviour differs from that of most other substances in that, even after considerable deformations have been produced, rubber and rubber-like materials revert to nearly their initial form when the stress is removed. The common feature of all such elastomers is that they are built up of molecules each of which has a long chain of atoms. These molecular chains have relatively few or weak links with neighbouring chains, and in the unstretched material most of the chains are coiled back irregularly upon themselves like the strands of a tangled skein of wool. When a stress is applied the chains are straightened out, and arrange themselves more nearly parallel to one another. Atoms are continuously in vibration, however, and the result of this is that, when the stretching force is removed, the chains tend to revert to their coiled up configuration, and the material spontaneously retracts to its original length. Many naturally occurring fibrous materials such as silk, collagen (the material from which leather is made), and wool, also have long chain molecules. They do not, under normal circumstances, exhibit long range elasticity of the same order as rubber because the links joining neighbouring

chains are more numerous and prevent the chains becoming randomly bent, but the stretchiness of wool is due to a straightening out of the atom chains, as is also that of muscle fibres. See A. E. H. Love, *A Treatise on the Mathematical Theory of Elasticity*, 1927; R. Houwink, *Elasticity, Plasticity, and Structure of Matter*, 1937; R. V. Southwell, *An Introduction to the Theory of Elasticity for Engineers and Physicists*, 1942.

Elastin and Elastic Fibre, see TISSUE.

Elatea (the modern Drachmani) was in ant. times the largest tn. in Phocis, Greece. It was not far from Cephissus, whilst one of the chief passes from Thessaly to Boeotia was near at hand. Once it was famous for a temple to Æsculapius, and ruins of one dedicated to Athena Cranea were unearthed here in 1883. In the course of his subjugation of Greece, Philip of Macedon captured the city in 338 B.C.

Elatér Beetle, see CLICK BEETLES.

Elatéridæ, name given to a family of Coleoptera commonly known as click-beetles, glow-worms, fireflies. (q.v.).

Elatérin, active principle of elaterium. It is a chemical substance, its formula being $C_{20}H_{30}O_8$. It is extracted, by means of boiling alcohol, from the juice of *Ecballium agreste* in the form of colourless hexagonal crystals which are insoluble in water. Elaterium is a vegetable extract obtained from *Ecballium elaterium*, a perennial tropical plant. It is very bitter, and a powerful purgative. It is also used as a remedy for dropsy and cardiac diseases.

Elatérite, an elastic bitumen. It is blackish-brown in colour, translucent, and is found in soft, sticky masses in Derbyshire, near Edinburgh, and in Fifeshire. It is sometimes called mineral caoutchouc, and is very much like India-rubber.

Elatinacæ, dicotyledonous order, contains about thirty shrubby or herbaceous species found in marshy places and under water in tropical and temperate parts of the globe. *E. hydropiper*, the water-pepper, grows under water in France and sometimes in Britain.

Elba (known as *Albania* to the Gks., and 'Illa' to the Roms.), an is. 18 m. long, in the Mediterranean Sea, lying some 6 m. from the mainland of Italy, and forming part of the prov. of Livorno, from which it is separated by the gulf of Piombino. Monte Capane, its highest peak, attains an altitude of 2925 ft., but the whole is. is mountainous. Mining is the chief industry, the mines near Rio Inferiore yielding excellent hematite and other iron ore. Marble, lead, sulphur, and alabaster are also exported. Olives, the vine, and wheat are grown, but agric. is backward. Porto Ferrajo is the cap. E. is best known as the realm which the deposed emperor Napoleon ruled from May 3, 1814, until Feb. 26, 1815. Pop. 29,500. In the Second World War E. was taken by French forces on June 19, 1944.

Elbasan, tn. of Albania, in the prefecture of the same name, on the r. b. of the R. Shkumbin, with numerous mosques, in a fertile plain. Olives and maize are

cultivated. Pop. about 13,700 of whom 85 per cent are Moslems. E. was captured by the Serbs during the Balkan wars but was returned to Albania. In the Second World War in the fighting against the Its. (who had seized Albania before the war) the Gks. advanced on E. in Dec. 1940. The tn. was bombarded by the R.A.F. in Jan. 1941, but the Ger. advance from the N. in Greece prevented further operations against E.

Elbe (the 'Albis' of the Latins and the 'Labe' of the Czechs), the riv. next in importance to the Rhine in Germany. The area of its drainage basin is estimated at 56,000 sq. m., whilst its total length is 525 m. Ocean vessels can sail up as far as Hamburg (84 m. from the mouth), and the riv. is navigable for a distance of 525 m., that is up to the confluence of the Moldau, at Melnik. It is distributed chiefly over Bohemia (190 m.), Saxony (77 m.), Prussia (350 m.), and Hamburg (108 m.). The E. rises, at an altitude of 4600 ft., on the S. slopes of the Kieseengebirge in Bohemia. At first it flows S., then N. and N.W. Above Brandeis it is joined by the Iser, whilst at Melnik the Moldau more than doubles its volume. At Leitmeritz the Eger reddens its waters, and soon, after piercing the basaltic Mittelgebirge and passing the beautiful Saxon 'Alps' of the Elbsandsteingebirge, it oversteps the Bohemian frontier, flows past Dresden and Meissen, and begins, in a N.W. direction, its long course over the N. Ger. plain. Leaving behind on its banks the tns. of Torgau, Wittenburg, Magdeburg, Hamburg, and Altona, and swollen with the waters of the Mulde and Saale from the left, and the Havel and Elde from the right, it finally reaches the N. Sea at Cuxhaven. The two streams, the Norder and Süder E., which separate above Hamburg, are reunited at Blankenese. At Kolín the width is 100 ft., at Dresden 960 ft., whilst near the estuary it varies from 4 m. to 9 m. Since 1871 rapid improvements, including harbours, docks, etc., and numerous canals, have been made in the E. navigation, although inundations continue at times to retard its progress. The E., Reek, Rudersdorfer-Gewässer, Rheinsberger, and Sacrow-Paretzer Canals have effectually joined up the E. and Oder systems, whilst the Elbe-Trave Canal (42 m.) of 1900 has opened up direct communication between Lübeck and the E. A great deal of timber is floated down the riv., and the goods traffic, which is greater than on any other Ger. riv. is carried on by steamers and barges, which are partly hauled by the towing chain fastened in the riv. bed between Hamburg and Aussig. Passenger boats are mostly confined to Saxony and Bohemia. The many international changes resulting from the First World War, and especially the recognition of Czechoslovakia as a separate nation, gave a new political importance to the Elbe, which, according to the treaty of Versailles, was now declared to be an international riv. from its union with the Vltava, under a committee on which Germany, Czechoslovakia, Britain, France,

Italy, and Belgium were represented. Commercially, however, the E. has lost much of its heavier traffic of recent years, owing to the amalgamations of Ger. railways. In the operations on the W. Front in 1945 Gen. Bradley, Amer. general commanding the Central Group of Armies, was directed by Gen. Eisenhower (q.v.) in April to seize any opportunity of capturing a bridgehead over the E. and to be prepared for operations farther E.; but it was anticipated that these would be unnecessary, as the speed of the Russian advance from the E. would probably lead to a junction with them over the E., if not W. of the riv. The Amer. Ninth Army reached the E. S. of Magdeburg, on April 11 and crossed the riv. the next day. A second bridgehead S. of Wittenberg, was achieved by the Fifth Armoured Div. of XIII. Corps, on April 13. On April 14 the Third Armoured Div. of VII. Corps reached Dessau, immediately S. of the confluence of the Mulde and Elbe rivs. On April 21 Brit. troops, who had won a bridgehead a few days previously, expanded their hold and crossed the riv. near Lauenburg, S.E. of Hamburg on April 29. On the 25th Amer. patrols of the 69th div., which had probed eastward from the Mulde, met elements of the Russian 58th Guards div. in the Torgau area on the riv. The junction of the E. and W. Fronts had been effected on the riv. and Germany was cut in two. Thus the object of the central thrust under Gen. Bradley, had been achieved. While the Amer. forces in the centre were halted on the E. and Mulde other forces turned to the completion of the operations in the N. and, accordingly, in the N. sector 21st Army Group was directed to seize other crossings over the E. in the British Second Army zone, secure Hamburg and advance at speed on the general area of Kiel-Lubeck. On May 2 Brit. forces crossed the E. again and turned down its r. b. toward Hamburg which surrendered to the 7th Armoured div. on May 3. *See further under EASTERN FRONT or RUSSO-GERMAN CAMPAIGN IN THE SECOND WORLD WAR, and WESTERN FRONT IN THE SECOND WORLD WAR.*

Elberfeld, or Wuppertal-Elberfeld, tn. in the Rhineland, Germany, adjoining Barmen, with which it is now really merged under the common name of Wuppertal, and before the Second World War an important industrial centre of the Ruhr dist. For 9 m. along either bank of the Wupper, on which E. stands, there stretched an endless line of factories, warehouses, etc. It is the noted chief centre in Germany of textile manufs. and haberdashery, and known for its production of carpets, tailors' articles, hats and caps, machines, enamel work, lead wares, tools, and paper-dyes, and fine chemicals, rubber goods, wall papers and stained glass. The municipal museum of fine and applied arts is in the old tn. hall, severely damaged in the Second World War. The new tn. hall has a tower 243 ft. high. The tn. is surrounded by grounds and promenades. E. was frequently bombed by the R.A.F. in the

Second World War. In the intensified attacks of 1944-45 the industrial centres were badly damaged, and in part destroyed. Finally, the tn. fell to the Amer. armies when they encircled the Ruhr region in 1945. *See also under RUHR.* Pop. (Wuppertal) 410,000.

Elberton, tn. of Elbert co., 100 m. E. by N. of Atlanta, Georgia, U.S.A. It produces cotton, grain, peaches, alfalfa, and manufs., cotton drills, cotton-seed oil and artificial silk. Pop. 6100.

Elbeuf, important woollen manuf. tn., 14 m. S. by W. of Rouen by rail, on the l. b. of the Seine, in the dept. Seine-Inférieure, France. In the process of crossing the Seine the allies encountered stiffening resistance as they advanced in the neighbourhood of E. (Aug. 1944), and it was at E. itself that the enemy made a desperate stand to guard the last ferries as the remainder of his beaten army streamed across the riv. But it was captured on Aug. 25. Pop. 15,900.

El Bika, *see* COELE-SYRIA.

Elbing, *see* ELBLAG.

Elblag (formerly **Elbing**), seaport of the navigable Elblag riv., 72 m. S.W. of Kaliningrad (formerly Königsberg) by rail. Once a port of E. Prussia it is now part of Poland. The Kratochvil Canal connects the E. with the Nogat arm of the Vistula, whilst the riv. joins Lake Drausen with the Frisches Haff, which is 5 m. to the N. Founded in the thirteenth century by settlers from Bremen and Lubeck, and a member of the Hanseatic League, the old inner tn. before the Second World War possessed numerous gable houses of the fifteenth to the eighteenth century, the Protestant Mary church begun in 1246, the Holy Ghost church of the thirteenth century, with the Holy Ghost hospital, the St. George's Chapel (fourteenth century), and remains of the old fortifications. In the newer quarters important industries, before the defeat of Germany in 1945, included shipbuilding, locomotive machines and turbines, automobiles, motor ploughs, tractors, etc., also aeroplane parts and other articles including chocolate and organs. Its pre-war pop. was 75,000. This once populous city fell to the Russian forces in 1945, and was reduced almost to a heap of ruins, and indeed it remained so as late as 1949. Pop. (1940) 85,900. *See further under EAST PRUSSIA.*

Elbogen (Czech **Loket**), picturesquely situated tn. in N.W. Bohemia, Czechoslovakia, near Carlsbad (Karlovy Vary). It has a large porcelain factory and a fine old castle, which was vainly besieged by the Russians in 1127. Pop. 4000.

El Bostan, *see* ALBISTAN.

Elbow, *see* ARM.

Elbruz, or Elbrooz, highest mt. in the Caucasus range, its W. peak attaining an elevation of 18,470 ft. The other summit, which was reached for the first time in 1868 by Freshfield, is 18,347 ft. above sea-level. It is an extinct volcano, whose glaciers cover 46 sq. m. The Baksan glacier extends down to a distance of 7350 ft. above the sea. *See R. L. G. Irving, Ten Great Mountains*, 1940.

Elburz Mountains, lofty range in the N. of Persia, trending from within 20 m. to 50 m. of the Caspian Sea, right across to N.E. Khorassan, thus covering a distance of some 650 m. The E. M. may conveniently be considered in three sections. The first reaches with a N. to S. direction for 120 m. from Lenkoran, being known as the Talish range. Sev. peaks attain an elevation of 10,000 ft. The second section stretches for 240 m. with a direction N.W. to S.E. from near Resht to a point beyond Mt. Demavend, the crowning summit of the whole chain (19,400 ft.) which rises E. of Teheran. There are great heights in the Talikan range, N.W. of Teheran, whilst between Talikan and Demavend are over seven ranges with an average elevation of some 12,800 ft. The Safid Rnd., by whose banks passes the great trade route between the Caspian and Inner Persia, and the Heriaz, cut their way through this section. The chief ranges of the third section (290 m. long) strike S.W. to N.E. and extend as far as N. Afghanistan, rising often over 10,000 ft. above sea-level. The N. slopes form the main watershed. Here are plentiful forests and natural vegetation, and in the valleys fertile lands, gardens, and orchards. Endless stretches of barren ridges and arid wastes disfigure the scenery S. of the watershed.

El Capitan, granite peak, 3300 ft. high, in the Yosemite valley, on the W. slope of the Sierra Nevada, in California, U.S.A.

El Centro, city of S. California, co. seat of Imperial co., in the midst of Imperial Valley, which irrigation has transformed from desert into fertile farmland. Some crop is harvested every month. Pop. 10,000.

Elche, tn. S.W. of Alicante, Spain, on the railway joining Alicante and Murcia. The surrounding grove of almost 100,000 date-palms provides all Spain with leaves for Palm Sunday and absorbs all the summer waters of the R. Vinalopo. It has a fine and lofty domed church, and the only mystery play in Spain is performed on Aug. 13 and 14 each year. Pop. 33,000.

Elchingen, or Oberelchingen, vil. 5 m. N.E. of Ulm., close to the Danube in Bavaria, Germany. Marshal Ney became duke of E. because in 1805 he here defeated the Austrians.

Elcho Challenge Shield, see under BISLEY.

Elder. The O. T. E. was only the successor of what had existed in all anc. countries, and in all primitive communities where age was always looked up to with respect and called upon to rule and judge. Moses chose seventy Es. to assist and share with him the burden of responsibility in the Wilderness, and from this evolved the Sanhedrin, the court that condemned Jesus Christ. N. T. E. or bishop, which in Gk. means the same, is an ordained office-bearer in the church. The session of a Presbyterian church is composed of Es., preaching and ruling. The preaching E. is the minister, who is ordained and inducted by the Presbytery and is the moderator of the congregational

session. The ruling Es. are elected for life by the congregation, and are ordained and inducted by the moderator of the session. In some Amer. branches of the Presbyterian Church the Es. are only elected for a certain number of years. The session has the spiritual gov. of the congregation in its hands, and only through it can members of the congregation appeal to a higher court of the church. When John Knox set up the Presbyterian gov. in Scotland he meant the ruling Es. to be salaried office-bearers and thought that they should be elected annually. However, the alienation of the church funds from ecclesiastical to secular holders prevented his idea from being carried into effect. An E. should, in the words of Paul (1 Tim. iii. 2), 'be blameless, the husband of one wife, vigilant, sober, of good behaviour, given to hospitality, apt to teach.' The courts of the Presbyterian Church are entirely made up of Es., preaching and ruling, e.g. the congregational session, one preaching E. and one ruling E. for about every twenty members. Presbytery and Synod, generally one preaching and one ruling E. from each congregation. General Assembly, a certain number of each from each Presbytery within its gov. Thus the Presbyterian Church claims apostolic authority for its church gov.

Elder, or *Sambucus*, genus of the natural order Caprifoliaceae. The species are widely distributed, deciduous shrubs. *S. nigra*, the common elder, or the bourtree of Scotland, is found in many parts of Europe. It grows quickly, to almost any kind of soil, to a height of about 20 ft. The wood of the stem is hard and when polished is used for making fishing-rods, toys, and combs. The flowers contain oil, and the berries are used for making wine. It was formerly highly valued for its medicinal properties and used as a cathartic. There are sev. horticultural varieties, the most beautiful being the *S. racemosa*, the scarlet berried E.

Elderberry Wine, made by fermenting elderberries, which usually ripen in the early autumn. It was an old household cure for coughs, and is now often used for the adulteration of port wine. The *Sambucus canadensis*, a species very common in Canada and the U.S.A., produces a prolific crop of berries, and a great quantity of wine is made therefrom.

Eldon, John Scott, first Earl of (1751-1838), Eng. lawyer, and statesman, b. at Newcastle, almost blighted his prospects by making a runaway marriage as soon as he had won his fellowship at Univ. College, Oxford. However, he was called to the Bar in 1776, and from that time success smiled on him. He entered Parliament, became solicitor-general in 1788, attorney-general in 1793, chief justice of the Court of Common Pleas (1799), and finally was lord chancellor for many years. His only politics were a lively hatred of the Rom. Catholics, and he was a poor speaker, a tedious but sound judge, and a victim to parsimony. But he was graced with a winning disposition, and he had a big share in estab. modern equity as a coherent

body of principles no longer measurable by 'the length of the Chancellor's foot.' See W. E. Surtees, *Sketch of the Lives of Lords Stowell and Eldon, 1846*; W. S. Holdsworth, *Some Makers of English Law, 1938*.

El Dorado: (1) means in Span. 'The Golden,' and was the name given to a fabulous city long believed to exist somewhere in the interior of S. America. The belief in the existence of the mythical city of gold was based on the tales of a Span. soldier, set adrift by his companions when exploring the Orinoco. Finding his way back some months later, he narrated how he had been taken by the Indians to a great inland lake with golden sands, on which was a vast city roofed with gold. Certainly as early as 1500 confused accounts were given to Span. sailors about a rich city abounding in gold and precious stones, situated on the borders of Lake Parima somewhere within Guiana or Guyana. Numerous Span. expeditions set out to find it and most of them came to grief on the Amazon. One of the seekers was Don Diego de Ordaz, governor of Quito, who was the first man to build a tn. (St. Thomas of Guiana at the confluence of the Caronian Orinoco in ter. now belonging to Venezuela). Among other futile expeditions, of which E. D. was the imaginary goal, were those of Orellana (1540), Philip von Hutten (1511-45), who told how once he had caught a glimpse of the gleaming city, and Ximenez de Quesada (1569). Also in quest of E. D. was Sir Walter Raleigh, who set out in 1595 from gaol on parole, having sold his wife's and his own property in order to raise \$10,500 for the expedition. In this ill-fated expedition he lost his son, his health and his fortune and then chivalrously returned to England and to the scaffold. Undeterred by his chief's failure, Captain Keymis, at Raleigh's expense, undertook a second voyage and purported to identify E. D. with some spot on Lake Parima. The purely legendary Manoa, with roofs and walls of precious stones, to which Martinez said he had been taken, long occupied a conspicuous place on the map, till Humboldt proved it to be a fiction. But though E. D. was swept from the atlas, it has secured a high niche in literature as the goal of happiness after which humanity never wearies of striving. See D. G. Brinton, *The Myths of the New World, 1896*. (2) City of Saline co., Illinois, U.S.A., a trade centre with a pop. of 4482. (3) City in the oilfields of S. E. Kansas, U.S.A., co. seat of Butler co. Pop. 10,000. Centre of a farming and oil-producing region. (4) City of S. Arkansas, co. seat of Union co., chief tn. in the pioneer oilfield of the state. Pop. 15,800.

Elea, see ELIS.
Eleanor of Castile (1244-90), queen of Edward I. of England and half-sister of Alfonso X. of Castile, surnamed the Wise, accompanied her husband to the Crusade in 1270, and is said to have saved his life by sucking the poison from a wound inflicted by a poisoned arrow; was buried at Westminster.

Eleanor of Guienne (c. 1122-1204), queen of France and afterwards of England, daughter of William X., duke of Aquitaine, whom she succeeded, 1137; in the same year she married Louis VII. of France; accompanied him to Palestine, 1147. The marriage was annulled in 1151. In 1152 she proposed to and married Henry of Anjou, who became Henry II. of England, 1154; aided their son Richard's rebellion, 1173, and was imprisoned till Henry's death, 1189. She acted as regent during her son Richard I.'s absences.

Eleanor of Provence (c. 1221-1291), queen of Henry III. of England, daughter of Raymond Berenger IV., count of Provence. She married Henry in 1236, and was the cause of much of Henry's favouring of foreigners. Took the veil in 1276 and died at Amesbury, Wilts. Her eldest son was Edward I.

Eleatic School, The, school of Gk. philosophy which flourished from 570-450 B.C., so-called because its leaders were natives of the Gk. colony, Elea, in Lower Italy. Parmenides may not have been its founder, but he at least, with Zeno, became identified to a peculiar and especial degree with its salient principles. After the death of its great exponents, the Eleatics gave themselves over to futile verbal debates, whilst their serious contributions to mental science formed the basis of Plato's metaphysics. Parmenides and his adherents dilated on the unity of being and all phenomena, and on the paradoxical conception that 'the All is One,' and argued that this truth is hidden from the masses because their senses mislead and confuse them. Thought alone can attain to this conception by soaring high above the domain of the false and sensuous seemings.

ELECAMPANE

Elecampane, or *Inula helenium*, a composite plant with aromatic and bitter leaves and root. Formerly much used as an antiseptic aromatic herb, the root being candied and used for chest troubles. An ingredient of absinthe.

Election (in divinity), *see* PREDESTINATION.

Election, Equitable Doctrine of, in law, the act or right of choosing between two inconsistent alternate rights or benefits. It arises chiefly in cases of wills, but sometimes also in the case of a deed or other instrument. A person who accepts a benefit under a deed or will is obliged to conform with all its provisions. Thus, if A bequeaths B's property *x* to C, and A's property, *y* to B, B must 'make his election' between accepting his own *x* or A's *y*. See *Ency. of Laws of England* v.; Watson, *Practical Compendium of Equity*.

Elections in Great Britain: PARLIAMENTARY.—*The election writ—Polling districts.*—The authorisation for the issue of the election writs by the Clerk to the Crown is the royal proclamation after a dissolution of parliament; but where only a by-E. is to take place by reason of the death of a member, or the vacating of his seat in any other way, the writ is drawn up by the Clerk of the Crown in Chancery on the authority of the Speaker's warrant. The writs for a general election are always prepared in the Crown Office, and ready for issue in the event of a sudden dissolution before the normal term of five years. They are sent to the returning officers of the constituencies, who, in co. areas are the sheriffs, and in urban areas the mayor or chairman of the borough council. The postmaster-general, after giving his receipt, sends them at once, as registered letters, to local postmasters, who remit them to the returning officers. A book is kept by the postmaster-general for entering all particulars, and this book is open for inspection. Formerly notice had to be given within specified statutory periods of the day fixed for nominating candidates, but nomination day is now the same in all constituencies, the eighth day after the date of the Royal Proclamation. On that day the returning officer in each constituency attends at the municipal buildings or court house, within certain fixed hours, generally from 10 a. m. till noon, to receive nomination papers. Under the Ballot Act, 1872, each candidate must be nominated by a separate nomination paper, and the returning officer must supply a form of nomination paper to any registered elector requiring the same during the allotted two hours. The candidate must be sufficiently described in the paper and otherwise accord with the necessary formalities, its sufficiency being a matter for the decision of the returning officer who may reject it for non-compliance. His decision is final where he allows, but not where he disallows, an objection; an appeal being taken on a petition. The first schedule to the above Act requires that each nomination paper be signed by a proposer and seconder, both registered electors, and contain also the names and addresses of eight other electors in support of the nomination. Public notice must be given of withdrawals. If within one hour after the time appointed for the poll the number of nominated candidates does not

exceed the vacancies, they are to be elected. The polling dists. are fixed by the local authorities, but the returning officer fixes the polling stations. The Corrupt and Illegal Practices Act, 1883, provides that a polling station shall be assigned by the returning officer to each dist. in such manner that, so far as is reasonably practicable, every elector shall have his polling place within a distance not exceeding three miles from his residence. The returning officer must also select presiding officers for the different stations and a suitable staff of clerks. The returning officer's expenses are paid by the Treasury.

In the case of a by-election, proper notices must be given within the statutory periods of the day fixed for nomination, and also of the polling date. The actual dates within the statutory periods are determined on by the returning officer. In the case of a co. or dist. bor. election, the day of election is fixed by the returning officer not later than the ninth day after the date on which he receives the writ, with a clear three days' interval between the day on which he gives notice and the polling day; in the case of a bor., not later than the fourth day, with a clear two days' interval. In co. or dist. bors. polling must take place not less than two nor more than six days after nomination; in bors. not more than three days after nomination.

Qualifications and Disqualifications for Membership.—Membership of the House of Commons is remarkably free and unrestricted. The somewhat anomalous position is that a pauper, landless, homeless and without a vote, may be elected, while only a man of position and property, at least to the extent of being a householder of six months' standing and a ratepayer either directly or indirectly, may vote. The property qualification which formerly made candidature the privilege of the well-to-do was abolished in 1858, though the law had notoriously been evaded years before that date by fictitious transfers of land. With the removal of the necessity for any property qualification and the abolition of any incapacity by reason of religious creed, there are now no general grounds of ineligibility beyond the exclusion of aliens who have not been naturalised. The candidate must be either a natural born Brit. person or a naturalised foreigner. Colonists and native Indians are eligible. A candidate must be at least 21 years of age, though the production of a birth certificate is not required. Such disqualifications as exist are all put upon some special incapacity, either inherent, as in the case of infancy or lunacy, or acquired, whether by reason of some moral or social defect, *e.g.*, criminality, corruption, insolvency; or by reason of the holding of some office deemed incompatible with E. as a member for parliament. Those disqualified by reason of office include judges of the Supreme Court of Judicature, co. court judges, recorders as regards their own bors., London stipendiary magistrates, sheriffs as regards their cos., the commissioner of

metropolitan police, bankruptcy officials, barristers appointed to try municipal election petitions, and governors of colonies; those disqualified for other special grounds include infants, lunatics and idiots, felons who have neither served their term of imprisonment nor have been pardoned, and persons convicted of treason; pensioners at the pleasure of the crown, except civil service, army, or diplomatic pensioners; holders of any gov. contract other than company directors; clergymen of the Church of England, of the Church of Scotland, and Rom. Catholic priests (members of dissenting churches are, however, qualified); civil servants on the permanent staff of a gov. dept. are ineligible (commissioned officers of the Army, Navy, and Air Force are qualified, but Army officers become M.P. only at the sacrifice of half their pay. Returning officers may not stand for the places where they are commanded by writ to hold an election. Eng. peers and peers of Great Britain and the United Kingdom, being hereditary members of the House of Lords, are disqualified (it is the succession to a peerage and not the receipt of the writ of summons which is held to disqualify); Scottish peers are also precluded, including those outside the sixteen representative peers of Scotland; the Irish peerage is not disqualified, for by the Act of Union an Irish peer, providing he is not one of the 28 representative peers elected by the Irish peerage to sit in the House of Lords, may be returned for any constituency. An adjudicated bankrupt is disqualified until the adjudication is annulled or until he gets his discharge. A person once convicted of personally committing bribery or personation is for ever disqualified for the constituency in respect of which he was guilty of such corrupt conduct, and he is debarred from sitting for any other constituency for seven years. A candidate who has innocently, through his agents, committed the offences of personation, bribery, treating, or undue influence, is debarred for seven years, unless exonerated by the E. judges.

The Parliamentary Franchise.—The preparation of the register of voters, first provided for by the Reform Act of 1832, is the duty of the 'registration officers,' and is discharged under the Representation of the People Act, 1918, at the public expense, half being defrayed out of the local rates and half by the Treasury. The 'registration officers' are, in bor. divs., the tn. clerk, and in co. divs., the clerk of the co. council. The rate book is the basis upon which the registration officer draws up the list of voters. The franchise no longer rests on a property or occupation qualification so far as men are concerned, the Act of 1918 having substituted what is practically adult suffrage and mere residential qualification, though the minimum age for a female voter was thirty against twenty-one for a male. The Representation of the People Act (Equal Franchise), 1928, assimilated the franchise for men and women (both for the parl. and local gov. elections). The

qualifications for registration as a parl. elector are that the person is twenty-one years of age and not subject to any legal incapacity; and has the requisite residential qualification, or the requisite business premises qualification, or is the husband or wife of a person having a business premises qualification. 'Residence' is the actual inhabitation of premises, i.e. the place where he has his home and sleeps. The residence must have been during the whole of the qualifying period, i.e. three months in the constituency or in another constituency in the same parl. bor. or parl. co.; if not, it is essential that the residence should have been successive from a parl. bor. or parl. co. contiguous to that bor. or co. The Administrative Co. of London is treated as a parl. bor. 'Business premises' means land or other premises of at least £10 yearly value; the premises must be occupied for the purpose of the business, profession or trade of the person to be registered. By the Act of 1928 a person may not vote at a general election for more than one constituency for which he or she is registered by virtue of a residential qualification, or for more than one constituency for which he or she is registered by virtue of other qualifications of any kind. This means, in effect, that the person may, if qualified, lawfully vote twice at a general election, but one must be in respect of a residential qualification, and each vote must be recorded in a different constituency.

A person of full age, and not subject to any legal incapacity, who has received a degree is entitled to registration as an elector for a univ. constituency; a woman who has passed the final examination and fulfilled the conditions required of women by a univ. which did not at the time the examination was passed admit women to degrees is also qualified.

The voters' lists, as first compiled from the rate books, are supplemented by a house to house inquiry to ascertain the names of householders whose rates are paid through the landlord and the persons qualified as wives or lodgers. Under the Act of 1928, each parl. bor. and parl. co. is an 'electoral registration area.' It is the duty of the registration officer to compile a register for all persons entitled to vote whether as par. or as local gov. electors in his area, and he must comply with any directions by the secretary of state as to the arrangements for carrying out the registration. Separate lists are prepared for absent voters, the ballot papers being sent to the voters, who mark them and remit them with a declaration of identity. Voting by proxy is permitted in the case of naval and military voters in distant areas, and merchant seamen, pilots and fishermen at sea. A copy of the electoral lists can always be inspected at the office of the registration officer, and generally at the chief post office and other convenient places in the area. Claims and objections may be made by notice as directed. Appeals from a decision of a registration officer lie to the Co. Court; a further appeal on any point of law lies

to the Court of Appeal, whose decision is final. Persons disqualified from voting closely approximate to those who are ineligible as members of parliament. They include: aliens (unless naturalised); idiots, lunatics, felons (but not misdemeanants), peers in the House of Lords, persons employed for reward at elections, and persons convicted of corrupt and illegal practices.

The poll.—All polls at a General Election are held on one day. The presiding officer of each polling station must be at his station before 8 a.m. on polling day. He must then remove from the room all but authorised persons. It is advisable always to have adequate police support to hand. Voters may enter to record their votes at 8 a.m. Polling terminates at 8 p.m. A voter must present himself at his right station, and to ensure this the register is consulted. The actual recording of his vote takes place in a booth screened from observation. Voting is effected by marking a cross in the space opposite the chosen name. Where a voter gives as his name that of a person who has already voted he gets a special ballot paper which he does not place in the ballot box but hands to the presiding officer, who does not count it, but enters it on the 'tendered votes list.' Ballot papers may be marked for blind voters, voters physically incapable of recording a vote, or unable to read, or Jews who object to voting in the prescribed manner. At the close of the poll the presiding officer must deliver the ballot boxes and the various election documents, including unused or spoilt ballot papers, made up in separate packets, to the returning officer. The returning officer then opens the boxes and counts the papers in the presence of the candidates or their agents, afterwards mixing all the papers together. The actual counting of the votes must be in the presence of the agents, the returning officer rejecting papers invalid for want of an official, or any mark, for uncertainty, or by reason of the voter having voted for more candidates than he is entitled to vote for. The returning officer cannot vote at the election but should there be a tie between the candidates he may, if a registered elector, give a casting vote; but his casting vote is operative only if exercised on the declaration of the poll. Every candidate must deposit the sum of £150 with the returning officer, the sum being forfeited if the number of votes polled by him or her does not exceed one-eighth of the total number polled, and returned in any other case. The counted and rejected papers, after the ballot paper account of the returning officer has been verified in the presence of the candidates or their agents, are then sealed in separate packets and sent to the Clerk of the Crown, together with all the other election documents. It is in case there should be a demand for a scrutiny and recount of the voting papers in any constituency, or a petition presented to declare the elections null and void under the Corrupt Practices Act, that all the documents are stored in the Crown office cellars for a year and a

day before they are destroyed. The writs are kept by the Clerk of the Crown until the dissolution of Parliament, when they are sent to the Public Record Office, where they are preserved.

Corrupt and Illegal Practices at Elections.—The offences coming under the category of corrupt practices are personation, bribery, treating, and undue influence. Personation consists in applying for a ballot paper in the name of another, or after having once voted. The punishment is imprisonment with or without hard labour up to two years. Bribery (see at greater length under BRIBERY) as an election offence has a very comprehensive connotation. The element of corruptness is consistent with honesty of motive; the essential element is the intention to influence the mind of the person voting. By the Corrupt Practices Prevention Act, 1854, bribery consists in any gift or promise of a gift, directly or indirectly, to a voter, whether in the shape of money or any other valuable consideration, or of a promise of employment. It is bribery to pay money to another to be used in bribery, or to repay money known to have been so used. It is not bribery to pay money on account of legal expenses *bona fide* incurred at an election. By the Representation of the People Act, 1867, it is bribery corruptly to pay a person's rates to enable him to be registered as a voter and to influence his mind at any future election. It is sometimes difficult, by the light of the numerous decisions on the point, to say what is and what is not bribery, e.g. paying a voter's travelling expenses to the polling station after he has promised his vote is, but general payments to curry favour, without aiming at a particular vote or votes, are not bribery. Gifts after an election may be bribery if before the election something was said or done to raise the voter's hopes. Treating, which is really a specialised form of bribery, consists in providing or paying for meat, drink, or other entertainment so as to influence an elector, the latter being also guilty of treating if he corruptly accepts. The punishment for both bribery and treating is imprisonment up to twelve months with or without hard labour, or a fine not exceeding £200. Undue influence by the Corrupt and Illegal Practices Act, 1883, consists in the use of force, fraud, or threats to impede a person in the free exercise of his vote. To dismiss one's employees on the eve of an election may well amount to undue influence; so, too, giving a tenant notice to quit. But in every case a corrupt motive must be proved.

Illegal Practices comprise a great number of heterogeneous acts made illegal by the Corrupt and Illegal Practices Act, 1883; the element of corrupt intention is by no means essential. All such practices are misdemeanours, punishable summarily by a fine up to £100. Acts deemed to be illegal practices comprise the following: Expenditure by a candidate or his agent on his election beyond a certain amount, which varies according to the number of the electorate, the scale providing for a

maximum of 7d. for each elector in a co. constituency and 5d. in a bor.; paying or contracting to pay for the conveyance of electors to and from the poll; payments to electors for the use of any house, land, or premises for the exhibition of bills or notices; payments on account of any committee-room in excess of the statutory limit which is one for every 2000 electors with an additional room for an incomplete part of 2000 electors. It is not an illegal practice to make a fair business payment to an elector who is also an advertising agent. No person, unless authorised by the election agent of a candidate, may incur any expense by holding meetings or issuing advertisements or circulars to promote the election of any candidate. Other illegal practices are payments for bands or music, flags, and cockades; corruptly inducing a person to withdraw his candidature, or falsely publishing the withdrawal of a candidate; using as a committee-room any elementary school, or any club (other than a political club of a permanent character) where intoxicants or refreshments are sold; employing canvassers for hire; procuring a vote of a person not entitled to vote; voting with knowledge that one is not entitled to vote; employing at an election more than the statutory number of persons for remuneration; publishing false statements of fact in regard to the personal character or conduct of a candidate without belief in their truth; and, by the Public Meeting Act, 1908, creating a disturbance at a meeting held for the purpose of supporting the candidature of a particular person. Under the most recent Representation of the People Bill (1931), considerable importance is attached to the use of motor-cars at elections, the general view being that, if a fair vote is to be obtained, it is not desirable that one party should have more cars at its disposal than another. The method proposed is that only those cars should be used for taking voters to the poll which are registered with the returning officer, and these, in accordance with the directions of the secretary of state, will be allotted by the returning officer to work in various dists. and carry voters irrespective of their party allegiance.

Election Petitions.—These are only triable before two judges chosen, in England from the Divisional Court, and in Scotland from the Court of Session. Any rejected candidate, or nominee for candidature, or elector, may present a petition. A candidate declared elected by the returning officer, but whose return is questioned by petition, takes the oath and his seat in the House of Commons and serves in the usual course until the report of the judges is delivered to the Speaker and by him communicated to the House. It is in the discretion of the judges at the close of the trial to give or withhold a certificate of indemnity against further legal proceedings, civil or criminal, and all witnesses who speak the truth are entitled to such a certificate. The judges then certify to the Speaker of the House of Commons the result of their findings,

which may be either that the E. was void, or that someone was duly returned.

LOCAL GOVERNMENT.—The qualifications for the local gov. franchise as provided by the Representation of the People Act, 1928, are the same for men and women and the various stages of the election of a co. councillor or bor. councillor are regulated by Schedule II. of the Local Government Act, 1933. A person is entitled to be registered as an elector who is twenty-one years of age and not subject to any legal incapacity; and throughout the qualifying period occupied as owner or tenant any land or premises in that area; or is the husband or wife of a person who is entitled to be registered in respect of premises in which both the person entitled and the husband or wife reside. There is, in addition, a 'service' qualification for the local gov. franchise: a person who inhabits any dwelling-house by virtue of any office, service or employment is deemed to occupy the dwelling-house as a tenant and is thereby entitled to be registered provided the dwelling-house is not also inhabited by the employer. These qualifications apply to all local gov. E.s., whether bor., co. council, dist. council or par. council.

Borough Elections.—Where a bor. is not divided into wards, there is one election of councillors for the whole bor.; where a bor. is divided into wards, there is a separate election of councillors for each ward. The ordinary day of E. of bor. councillors is May 1.

Qualifications of Borough Councillors and Aldermen.—To be eligible as a councillor or alderman a person (1) must be entitled to be enrolled as a burgess, or (2) being so entitled in all respects save as to residence, must reside beyond seven but within fifteen m. of the bor. and in any case either (a) possessed of real or personal property to the value of £1000, or, in the case of a bor. having more than four wards, £500; or (b) in the case of a four-ward bor. rated on an annual value of £30, and in the case of a smaller bor. £15. But a person qualified as an elector and resident in the bor. requires no property qualification. Women may be elected councillors or aldermen.

City of London.—The lord mayor, sheriffs, chamberlains, and minor public officials of the city are elected in Common Hall by the freemen and liverymen of the city. Aldermen, common councilmen, and ward officers are elected at ward-motes by £10 freeman occupiers, ordinary £10 occupiers, and all other persons registered as parl. or local gov. voters for the city, and persons who but for the fact of non-residence would be entitled to be registered as parl. voters in respect of occupation.

COUNTY COUNCIL.—For the persons qualified as co. councillors or aldermen of counties, see under COUNTY COUNCIL. The Local Government Act, 1888, which created co. councils, regulates E. in connection therewith. The manner of conducting a co. council E. is as nearly as

possible assimilated to that of municipal elections.

DISTRICT COUNCILS.—The election of urb. dist. councillors is regulated by the urb. dist. councils election rules and of rural dist. councillors by the rural dist. councils election rules issued by the secretary of state in 1949 under the Local Gov. Act, 1933, and the Representation of the People Act, 1948. An urb. dist. need not be divided into wards but rural dists. are divided into electoral areas. Dist. councillors hold office for three years, one third of the council retiring each year, unless the co. council have made an order directing the whole of the councillors to retire together every third year. The returning officer is the clerk of the council or such person as might be appointed by the chairman of the council, and he must give Notice of an Election not later than the 20th day for urb. dists. and the 22nd day for rural dists., before the day of election. Sundays and public holidays and the Saturday before and the Tuesday after Easter and Whitsun are excluded in the computation of time. The returning officer must provide nomination papers free of charge to any local gov. elector of the area applying for them. The nomination papers must be signed by two local gov. electors for the electoral area, as proposer and seconder, and by eight other electors. The candidate must assent in writing to his nomination and must appoint an election agent. Nomination papers must be received by the returning officer not later than noon on the 14th day for urb. dists. and the 16th day for rural dists. before the day of election. The day of election is such day during the week commencing with the Sunday before the 9th May or if Sunday is the 9th May then with that day (provided that if that week is the week before Whit Sunday the election shall be held in the week ending with the Thursday before Whit Sunday) as the co. council may not later than the preceding Feb. fix with the dist. council. Public notice of the poll must be given by the returning officer five clear days at least before the election. If there are no valid nominations or the valid nominations are less in number than the vacancies, those retiring councillors who were highest at the poll at the last ordinary election will be deemed elected in order to fill up the vacancies. Within thirty-five days after the end of the poll a Declaration of Expenses must be sent to the clerk of the council. When a casual vacancy arises a person is elected to hold office until the time when the councillor whose place he takes would ordinarily have gone out of office. Subject to certain modifications made by the Representation of the People Act, 1948, the statutes which deal with corrupt and illegal practices and election offences are applied to the elections of dist. and par. councillors. In Scotland elections are regulated by the Local Gov. (Scotland) Act, 1947, and the Representation of the People Act, 1948. The manner of conducting these elections, which are held in the burghal and landward areas, is closely assimilated with

that of the municipal and co. councils respectively. The election of par. councils is regulated by the Par. Councils Election Rules, 1949, and par. councillors are nominated and elected in the same way as dist. councillors; any person qualified as a local gov. elector in the area is qualified to vote at a par. council election. Par. councillors retire together every third year.

Elections, Presidential (U.S.A.). By the Federal Constitution each state is to appoint, in such manner as its legislature may direct, a number of electors equal to the whole number of senators and representatives to which the state is entitled in Congress. These electors then vote for the president and vice-president. Theoretically, the people at large have no direct voice in the election, and the electors, or electoral college, have an unfettered freedom of choice, which freedom was formerly in fact exercised. As a fact the party system has long ago ensured that the persons nominated at the great National Party Conventions for the offices of president and vice-president shall ultimately be voted for by the members of the electoral college. The electors themselves are polled for, by a direct vote of the citizens on a 'general ticket,' like the *Fr. scrutin de liste*, but the candidates for the office of elector are all nominated beforehand by Party Associations, with the result that as soon as the polling for electors is over, the choice of the new president and vice-president follows as a matter of course. By the Constitution Congress may determine the time of choosing the electors and the polling day, which must be the same throughout the states. The election is held every fourth year, and at the present day electors are chosen in the different states on the Tuesday following the first Monday in Nov. The electors thereafter meet in their state capitals to record their votes on the second Monday in Jan. next following their appointment. Their certificates of choice are sent to Washington and opened and counted in the presence of both Houses of Congress on the second Wednesday in Feb. (For qualifications of the President, see under CONSTITUTION.) No senator or representative or person holding an office of trust or profit under the U.S.A. is eligible as an elector. If there be no majority of votes for President, the House of Representatives chooses one from the three names highest on the list, each state having one vote; if no majority for vice-president, the Senate chooses one from the two names highest on the list. **Election of Senators.**—The Senate consists of two members from each state elected by popular vote for a term of six years. Candidates for the office of senator must be over thirty years of age, have been citizens of the U.S.A. for nine years, and be residents of the state for which they are elected. **Election of Representatives.**—The 435 members of the House of Representatives are elected every second year according to the electoral laws of the several states. They must be citizens over twenty-one years of age and have lived in the country

at least seven years. The forty-eight individual states, through their legislatures, have the power to prescribe the qualifications that entitle a citizen to vote. Thus the time of residence required in a state before being allowed to vote in that commonwealth varies from two years to three months. There are further qualifications as to length of residence in the co., the city and the ward. Before any citizen votes, he must register for this purpose on a day set aside for the business, and is subject to challenge by representatives of the various political parties if they do not think he is eligible.

Electorate, in a political community, denotes the whole body of persons entitled to the right of electing the chief magistrate or other representatives to the communal assembly. The idea of election in one form or another is as old as the institution of the earliest units of the state. In England and other Teutonic lands the families enlarged into clans, occupying each its original common ter., early developed into the territorial unit of the *mark* or *township*. The township, then, was the lowest territorial div. and political unit of a tribe, and possessed its own assembly and peculiar political organisation. This unit, which in other countries is the commune, in England becomes either the *municipal corporation* or *par.* It is doubtless true that the feudal system and the manorial system changed the primitive community of the mark or township, holding its common land by its own right, into a body of tenants, holding their land of a feudal baron; but their essential character as political units was never really lost, and it may be said that the whole electoral system of England (apart from the representation of the classes in the cos.), modified admittedly in the course of time, grew out of the principle of representation as evolved in the tns. of the Middle Ages. Their adaptability to this end was due partly to the fact that even before the Conquest they possessed a complete political organisation, partly to the wealth that accrued to them from the grant of the charters of incorporation. Before the Conquest and immediately after many of them passed into the absolute ownership of the overlord; but the necessities of the latter soon led to the corporators gaining a measure of independence through the commutation of the feudal exactions for a fixed rent (*firma burgi*). Other territorial divs. such as the shire and the hundred co-existed with the tn. or bor., but in most cases the latter, especially after acquiring charters, were for all judicial and administrative purposes independent of those divs. The folk-moot of the shire and the moot of the hundred were no doubt assemblies consisting of local representatives, but they met almost exclusively for the purposes of bringing criminals to justice or assessing the freeholders to the royal revenue, and from compulsion of natural circumstances could never have acquired the integral civic existence of the tns. These, on the other hand, soon developed a strong

organisation for administrative as well as merely judicial purposes, and, through the institution of merchant and craft guilds fostered by the crown, rapidly acquired considerable accession of wealth both from their exclusive privileges of buying and selling free from exorbitant tolls and from the revenue accruing from corporate property. The guilds all tended to become the governing body of the tn. and still further developed their privileges of self-gov. and self-assessment. The result was that they became close corporations, election to which was a thing to be coveted, and the representation of which in parliament an object no less desirable. Parallel with the development of the bor. franchise, the co. representation was evolved through the elective principle of the old co. court (q.v.). In pre-Norman times the freeholders assembled in the co. court or shire-moot for fiscal and judicial purposes, and to the moot also came burgesses, and the reeves from the tns. Later the tn. representatives seceded, having through the grant of charters gained a right to send out their own representatives to bargain with the exchequer officials. The co. freeholders continued to elect knights, who either assembled in the co. court or were summoned by the sheriff to some central point for the same purposes, or to be consulted about a grant. When this representation for purposes of assessment became a representation for deliberative purposes too, election to parliament in the modern sense was begun. At first it seems that tns. did not appreciate the honour of sending members to parliament, and the representation, such as it was, was chiefly the co. representation of the classes. Many Acts were passed in the beginning of the fifteenth century to regulate the franchise in the cos., and in 1430 an Act was passed to restrict the right of voting for knights to persons possessing freeholds in the shire to the value of forty shillings a year, and all copyholders and villeins were disfranchised. The forty-shilling freeholders remained the only co. voters till the Reform Bill of 1832. In the intervening centuries, however, the bors., grown wealthy, began to realise the value of the right of election. Control over the royal expenditure meant the power to secure the redress of grievances. There was, however, always this difference between the co. representatives and those of the bors.: the crown could increase or diminish the number of bors. represented—a power based on the doctrine that bor. privileges were gifts of the crown, and that their status was historically that of the royal demesne; the number of shire knights, on the other hand, could not be altered. From this fact and the subsequent association of the knights with the burgesses as representatives of the people instead of the classes, the representation of the third estate of the realm was saved from the extinction that the corresponding bodies encountered abroad. But the institution of the representation of the third estate of the realm was as yet a far cry from even the most modified

democratic ideal. The bors. rapidly became corrupt, the franchise passing into the hands of a close body of corporators who frequently sold the bor. seats to the king's ministers. By the beginning of the nineteenth century the bor. had practically ceased to represent public opinion at all. From the time of the Reform Bill in 1832, which abolished the 'rotten' boroughs, there has been a series of Acts extending or limiting the franchise in one direction or another, and, until recently, leaving the general system of the Eng. E. in a somewhat bewildering condition. In 1884 the franchise conferred in 1867 on householders and lodgers in bors. was extended to similar persons in the cos. A year later the E. in England underwent a fundamental alteration, the whole country being divided into numerous co. and bor. constituencies, each co. being subdivided into two or more constituencies, and each constituency returning one member, the idea being to create equal electoral dists. The principle of div. adopted by the Redistribution of Seats Act, 1885, was eminently in accordance with the democratic feeling that had grown in intensity from the time Rousseau first preached the doctrine of equality. All the bors. with a population of less than 15,000 were disfranchised or merged in their cos., with the result that the inhabitants of the disfranchised bors. became voters for some single member co. constituency; bors. with more than 15,000 but less than 50,000 inhabs. were to return one member each, while those of over 100,000 inhabs. were divided into separate constituencies, with additional seats in proportion to their pop. At present England and Wales (including Monmouth), with a pop. of 39,952,000 (census of 1931) (41,460,000 in 1941) and an E. of 28,348,555 (1939) or 28,956,996 (1945) returned (in 1945) 553 members (Wales and Monmouth returning 36 of these); Scotland, with a pop. of 4,842,980 (census of 1931), (5,007,000 in 1941), and an E. of 3,396,323 (1945), returns 74 members; and N. Ireland, with a pop. of 1,279,745 (census of 1937) or 1,288,000 (1941), and an E. of nearly 800,000 returns 13 members. It is noteworthy that in the days of rotten bors., when the total pop. was only 7,000,000—of which 5,000,000 could not read or write—there were 558 members of the House of Commons, which means that each member represented on the average no more than 500 voters as against about 74,000 to-day. The net result of the reforms of the nineteenth century was an accession of power to the executive and the E. at the expense of the House of Commons. Prior to the Reform Act of 1832 a defeat of the ministry did not necessarily involve its resignation. Both the ministry and the majority in the House were for the most part in the confidence of the king. But after 1832 a general election became for the first time nothing more nor less than a vote to return a House pledged to support some particular politician with the result that a change of ministry necessarily followed.

The distribution, prior to 1918, was far from perfect. The progressive shifting of the pop. and the huge absolute increase in the whole pop. since 1885 rendered the old distribution in numerous instances peculiarly inequitable and as far removed from the spirit underlying the idea of equal electoral areas as the principle of plural voting from the doctrine of equality of all men. The result of this general inequality of areas and voting power was an agitation of intermittent activity for various reforms, some having for their object the substitution of a purely personal for a proprietary qualification, others the representation of the political opinions of the minority. The various aspects of the question of representation of minorities, the case for which was first thoroughly advocated by John Stuart Mill, included (1) an attempt to secure additional power in the representation for the educated, thrifty, and well-to-do (fancy franchise); (2) an attempt to secure representation for every opinion which can find supporters equalling in numbers the result of the division of voters by seats; (3) an attempt to break the power of the majority through the instrumentality of such a machine as the so-called three-cornered constituency of the Act of 1867; and (4) an attempt of the advocates of proportional representation to offer a wider choice to the voter and to secure the return of independent members. (See also PROPORTIONAL REPRESENTATION.) On the introduction of adult suffrage by the Representation of the People Act, 1918, the E. increased from 8,357,000 to sixteen million, including six million women. The Representation of the People (Equal Franchise) Act increased it considerably (see ELECTIONS), the large increase over 1918 being accounted for by reducing the age limit for women from thirty to twenty-one years of age and by giving all women the vote on equal terms with men. Proportional representation is applied only to Univ. constituencies returning two or more members: eleven seats were thereby affected.

Redistribution of seats.—In 1945 four boundary commissions, with the Speaker of the House as chairman, were set up under the House of Commons (Redistribution of Seats) Act, 1941, to make proposals for a redistribution of seats so as to remove inequalities of representation caused by movements of the pop. since constituency boundaries were last redrawn in 1918. This complete redistribution was to take effect at the next general election (1950). In the preceding thirty years social and industrial changes had led to an immense shifting of pop. and even before the beginning of the 1939-45 war, when evacuation brought a further temporary distortion, the inequalities of representation had become most marked. The Ee. of constituencies represented by one member varied from under 20,000 to more than 200,000. The worst inequalities were removed by an interim redistribution in twenty abnormally large constituencies in England which preceded the election of 1945. These

constituencies, headed by Hendon with 208,000 electors, were split into forty-five, and, with twenty-five new members, the membership of the House was increased from 615 to 640. But pronounced inequalities remained, for, at the 1945 election, there were 115 constituencies with Es. of under 40,000 including eleven with fewer than 20,000. The Eng. boundary commissioners were at first handicapped by the rule in the Act of 1944 which limited the E. of a constituency to a figure which was to be not more than about a quarter above or below the electoral quota for the whole of Great Britain. It was found impossible to comply with this rule without cutting across local gov. boundaries and severing communities long closely united. The first recommendations for redistribution, made in 1947, raised a storm of protest. The scheme was seen to be impracticable, and an amending Act of 1948 relaxed the rule above noted that had caused the difficulties. While aiming at approximate equality in Es. the commissioners were now instructed to preserve the integrity of local gov. wherever they reasonably could. They were also instructed to relate redistribution to the E. as registered in Oct. 1946. With greater latitude they began a fresh review and their new provisional recommendations in all four countries, England, Wales, Scotland, and N. Ireland, were then pub. The commissioners also had regard to the statutory rule that, while the number of constituencies for Great Britain should be 'not substantially greater or less than 591,' there should be no reduction in the number of constituencies in Scotland or Wales and that the number in N. Ireland shall remain as at present. This means that Scotland must still have not fewer than 71, Wales not fewer than 35, while N. Ireland is to retain precisely 12 (this leaves out of account the 12 members of university constituencies). On the basis of the provisional recommendations the total strength of the next House of Commons will be reduced from 640 to 621. It is proposed to reduce the number of Eng. constituencies from 510 to 488 (excluding the city of London) and to increase Welsh constituencies to thirty-six. All these will return one member. Thus the numbers will be: England 489, Scotland, 71, Wales 36, N. Ireland 12, city of London 1, univs. 12: total, 621. The final recommendations which may be further modified by the home secretary, will be submitted to Parliament in a Bill, which will also contain a provision concerning the representation of the city of London. The City is a two-member constituency whose 1939 E. of 38,022 had fallen in 1948 to 12,503, of which 7,918 were business premises votes and it seemed improbable that the City's privilege of returning two members for so reduced an E. could be longer justified. There are at present (1948) ninety-two constituencies with Es. of less than 40,000 and 131 of more than 70,000, including many of more than 100,000. The proposed redistribution will abolish all those

of less than 40,000, while the bigger constituencies have been heavily pruned.

A feature of the proposed redistribution is the introduction of new constituency names. Brighton, one of the two member bors. to be severed into two constituencies, will now have a Pavilion div. Lambeth is to have a new Vauxhall div. Stratford on Avon is carved out of Warwick and Leamington as a new co. div. In some of the new constituencies the names of anc. bors. are revived, e.g. Arundel and Shoreham, W. Sussex; Beverley in E. Yorks; Poole in Dorset; and Beaconsfield in Bucks. The present two-member bor. of Southampton will become two new divs. of Itchen and Test. Rowley Regis is a new parl. bor. of Staffordshire. Yet other new constituency names are Blyth, Goole, Harrogate, and Newton Abbot. Some notable constituency names will disappear. Thus Lincolshire (20,013) will go. Westminster, despite its record of four centuries of parl. history, will be merged with Chelsea in the new parl. bor. of Chelsea and Westminster. Of the two divs. into which this new bor. will be divided the present Abbey div. (of Westminster) is to remain, but not St. George's. Other losses are the Drake div. of Plymouth, Bewdley (Worc.), Balham and Tooting, Spen Valley, the Ladywood and King's Norton divs. of Birmingham, Sudbury (with Dickensian memories of Eatanswill, Frome, Rye, and the Wrekin div. of Shropshire).

With all the readjustments proposed, England is to be divided into 266 bor. and 222 co. constituencies. This will give England 488 members for 28,700,000 electors. The 2,380,000 electors of the twenty-eight metropolitan bors. of London are at present represented by 60 members. These 60 seats will be reduced to 40. Improved social conditions and transport have enabled masses of people to reside in suburban areas. Poplar, Southwark, Stepney, Battersea, Bermondsey, Bethnal Green and Paddington, which now return 16 members, have all been reduced to single-member constituencies. Hackney and Stoke Newington have been amalgamated into a new parl. bor. of two divs.; similarly Holborn and St. Pancras, and Finsbury and Shoreditch will together return one member. Lewisham's two divs. are increased to three and Paddington, reduced from two to one div., is left with an E. of nearly 87,032, which will be the biggest in England. Other large single-member constituencies in London are Hammersmith (81,887), and Battersea (82,679), which have been similarly reduced from two to one div. Some big provincial cities, such as Leeds, Bristol, Hull, Leicester and Portsmouth will suffer no loss of representation. Birmingham's thirteen divs. will be reduced by one. Manchester (ten) and Liverpool (eleven) will be reduced to eight divs. each. Sheffield (seven) will be reduced to six, Nottingham (four) and Bradford (four), to three. Salford (three) and Wolverhampton (three), will each lose one seat. Newcastle (four) will retain

four seats, though at first it was proposed to take one away; but it will have its E. increased to over 76,000. Norwich (two) will have only one member to represent an E. of 86,406. Huddersfield is to have its E. increased to 97,242, with two members instead of one. With an expanded electorate of 213,399 Bradford's representation is to be reduced from four members to three. Lancashire, with 3,609,000 electors, at present returns sixty-seven members; this number will be reduced to sixty-one. The four two-member hors. of Blackburn, Bolton, Preston, and Oldham, have each been divided into two constituencies returning a single member, in common with all other two-member hors. Liverpool and Manchester both have many very small Es. at present, and a loss of five seats between them seems probable. The three Ridings of Yorks., which together return fifty-seven members, will have that number reduced to fifty-five, representing thirty-four hors. and twenty-one co. constituencies. With the loss of one of its seven seats Sheffield will have the same representation as Leeds. Doncaster, Pontefract, and Keighley, all at present co. divs., will become parl. hors. Except for the reduction of Plymouth's representation from three to two and the substitution of Newton Abbot for the S. Molton div. of Devon, there will be few changes in the W. Country. In the Home Cos., however, there will be a considerable rearrangement of cos.: thus Surrey's fourteen seats will be increased to nineteen; and Middlesex's twenty-four seats will be increased to twenty-eight, with the creation of a number of new parl. hors., e.g. Enfield, Uxbridge, Hayes and Harrington, and Ruislip and Northwood. In Wales, the famous constituency of Caernarvon Bors., represented for fifty-four years by David Lloyd George, will disappear, but to offset the loss a second co. div. bearing the historic name of Conway is allotted to Caernarvonshire. In Scotland, a rearrangement of the eight constituencies in Midlothian and Peebles will increase Edinburgh's five divs. to seven. The Montrose District of Burghs and the Dumbarton Dist. of Burghs will each disappear and there will be a new Ayrshire div. of Cunningham and Irvine. N. Ireland, with 864,700 electors, is to have twelve single-member constituencies. This involves the div. into two constituencies each of the present two-member parl. cos. of Antrim, Down and Fermanagh, and Tyrone. Belfast will continue to return four members and the cos. of Armagh and Londonderry one each.

The principle of equal electoral areas obtains in the United States, Canada, and S. Africa; other countries, like Switzerland, still adhere to the system of representation of com., or ter. divs. for administrative purposes, like the old Eng. shires, hundreds, and chartered tns. A system of double election prevails in the U.S.A. and in France. In the U.S.A. the E. elect the members of the Electoral College on the Tuesday after the first Monday in Nov. of every fourth year, when the presidential election takes place.

The Electoral College is thus composed of states' representatives, who, on the second Monday of the succeeding Jan., elect the president. There are 531 votes in the Electoral College, and therefore 266 secure a majority. As in U.S.A. so in England, an election really means that the E. chooses some one particular politician, for the Electoral College is no more than a species of conduit pipe, and in practice exercises no independent choice. *See also CABINET.*

Electors, The German Imperial (*Kurfürsten*), the great princes in whom was vested the right of choosing the emperor or king of the Romans. Under the Carolingians the crown was hereditary, then Germany became an elective monarchy, and finally by 1257 the number of electors was fixed at seven—three lay princes, the Count Palatine of the Rhine (imperial steward), the Duke of Saxony (marshal), the Margrave of Brandenburg (chamberlain), and three spiritual electors, the Archbishops of Mainz, Trèves, and Cologne (chancellors). As to the seventh elector there remained considerable doubt. Bavaria claimed the place, but in 1289–90 the King of Bohemia was chosen. During the Thirty Years' war, Bavaria was added to the electors (1623), the Peace of Westphalia (1648) finally establishing the electorate. In 1692 the ninth electorate of Brunswick-Lüneburg (recognised in 1710 as Hanover) was added. Changes took place during the Fr. ascendancy, and the electors' powers really came to an end (1806) on the dissolution of the Holy Rom. empire, though as late as 1866 the title 'elector of Hesse-Cassel' was used. *See O. Harnack, Das Kurfürstenkollegium, 1883; H. Fisher, The Medieval Empire, 1898; E. Henderson's trans. of the 'Golden Bull' issued by Charles IV., 1356, in Select Historical Documents of the Middle Ages, 1896; A. Meister, Deutsche Verfassungsgeschichte, 1922.*

Electra (Gk. Ἠλέκτρα, the bright or brilliant one) was the daughter of Agamemnon and Clytemnestra, and sister of Iphigenia and Orestes. She saved her brother from Egisthus and Clytemnestra, who after the murder of Agamemnon intended to kill him, and later assisted him in avenging Agamemnon's death. She married her brother's friend, Pylades, and became by him the mother of Medon and Strophius. Her tomb was shown in later times at Mycenae.

Electric Accounting Machines. Machines for book-keeping, calculations, statistics, and inventories. The punched card system of the Hollerith method permits business transactions of all kinds to be recorded, not in written books, but on specially designed manilla cards by means of perforations. The numerical significance of the holes is determined by their position in the cards. Cards can be designed for any purpose and information

is recorded by a hand-operated key punch capable of very high speeds. Accuracy of punching is checked by a second operator in a verifying key punch. The punched cards—which form, as it were, mobile figures—can be classified, sorted or selected in an electrical sorting machine. After sorting, the cards are passed through a tabulating machine which will either list each individual card or, alternatively, accumulate totals of the sorted groups of cards and print these totals in appropriate forms. Invoices, statements, ledgers and any kind of statistical return or inventory can be rapidly compiled by the Hollerith method which eliminates subsidiary book-entries and produces results direct from the original record, the punched card. In addition to the advantage inherent in high speed the greatest flexibility in operation is provided by an easily manipulated control panel.

Electric Bells and Alarms. Chief parts of an ordinary E. B. are the electromagnets A, and the armature C to which the knocker of the bell is attached. C is

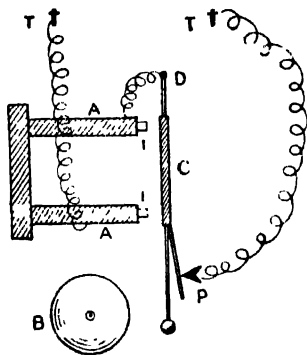

FIG. 1

connected by a thin spring to the point D. At P there is a platinum-pointed screw which makes contact with a spring attached to C. B represents the bell itself. The electro-magnet A is made in the shape of a U, and the wire is wound around the arms so that when the current passes the coils, which are connected in series, the magnet becomes one of the horseshoe variety. The two coils are joined together, the other end of the wire being connected to T and to D. The armature is fastened to D by means of the spring. The terminals T are connected to the external circuit. Now consider the action of the mechanism: initially the screw P is in contact with the spring attached to C; a complete circuit is thus formed and immediately the magnet becomes excited and attracts to it the armature C; this effects a break in the circuit at P, the current stops and the magnets

then cease to attract C, which flies back under the action of the spring attaching it to D and again making contact at P. In this way the circuit is alternately made and broken at P, thus giving to the armature C an oscillating motion which causes the striker to strike the bell B continuously. The above type is called an *electric trembling bell*. For signalling purposes the *single stroke bell* is more useful. This bell is very similar in construction to the trembling bell; but the screw P is omitted, the terminal T being connected directly to D. Thus when the current passes, the magnets are excited and the armature is attracted to them, thus causing the striker to strike the bell. So long as the current flows, the magnet continues to be excited, and thus C will not fly back until the current is broken in the outside circuit. It should be noted that the circuit is not broken inside the bell as in the trembler, but by means of a push button (say), which can be manipulated at the will of the operator, the bell being struck once for each contact made at the push. A simple circuit for ordinary household use is shown in Fig. 2. The

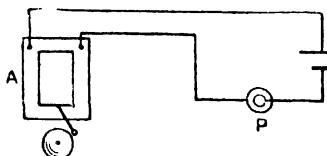

FIG. 2

terminals of the bell A are connected to the poles of the battery, the push P being inserted at any convenient point in the circuit from which the circuit can be completed, thus bringing the battery B into action and causing the current to flow through the bell. Various types of bells are now used, and one further type may be noted. This is the *continuous ringing bell*, which is used mainly in connection with fire or burglar alarms. This bell continues to ring when once started until it is checked by means of a small cord which hangs down the side. In construction it is similar to the trembling bell, but it has in addition a third terminal, a trigger, and another contact pillar. The trigger rests upon the armature, and when this armature is attracted by the magnets, the trigger is released and makes contact with the second pillar, thus completing the circuit and causing the bell to continue ringing. By means of the cord attached to the trigger it can be drawn back to its normal position and the ringing checked.

Indicators.—When a number of push-buttons are installed in the same house, it is necessary to know at which push contact was made in order to ring the bell. The indicator is a simple device suited for this purpose. It consists essentially of an electro-magnet M and an armature A pivoted at P, with a flag attached at its

lower end. When the current passes the magnet is excited and attracts the armature, causing the armature to rotate about P. When the current stops the armature falls back under the action of gravity and continues to swing like the pendulum of a clock for some time after the current has ceased to flow. One of these is put 'in series' with the bell for each position of a push button, and thus acts as a signal. These indicators are all

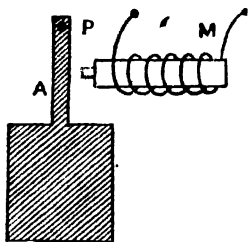

FIG. 3

collected together on one board called the 'Indicator Board.'

Burglar alarms.—These generally consist of devices attached to windows, doors, etc. They consist generally of a brass plate attached to the movable part, and a spring to the fixed part of the window. They are so placed that any movement of the window will bring these into contact one with the other, thus completing a circuit and setting the bell ringing.

Fire Alarms. See under FIRE BRIGADES AND FIRE-FIGHTING. For minor faults in household systems, see under HOUSEWIFERY.

Electric Cables. These are conductors through which electric currents are carried from place to place.

Manufacture of cables.—The interior of the cable consists of a bundle of copper wires. These are treated with tin to protect them from the action of sulphur. In the smaller cables these wires are then covered by a layer of tape, but in the larger cables this is generally omitted. The wires are then coated with vulcanised bitumen, and the whole is pressed into one solid mass of uniform thickness by the application of very high pressure. A covering of tape which has been treated with bitumen is then added over the vulcanised bitumen. The number of coatings of this tape varies in different cables. Underground cables are treated further by the addition of a coating of jute yarn, and then one of hemp braid. It may be pointed out that after the addition of each of the above coverings, the cable is pulled through a vessel containing hot compound. The insulation is made more perfect by increasing the thickness of the layer of vulcanised bitumen. When cables are employed for conducting alternating currents, both the return and outgoing conductors are placed concentrically

in the same cable and insulated from each other by a thick coating of vulcanised bitumen. By this method inductive effects of any apparatus, e.g. a telephone in the vicinity of the cable, are eliminated, and there is also a diminution in the power lost due to induced currents in the coatings of the cable.

Laying of cables.—When put inside a building, they must be protected and well insulated. Generally, perhaps the most efficient method is to enclose the wire in iron tubing. There are three important ways of laying underground cables. In the first system the cables are placed in rectangular iron troughs, the dimensions of which depend on the number of cables which they have to contain. The cables are kept as far away as possible from the iron, and are supported inside by wooden bridges, in which slots are cut to fix the cables a sufficient distance apart. The bridges are treated with bitumen before being placed in position. When the cables are laid, the whole trough is filled with bitumen and then covered with a layer of concrete. This is the solid system, but it has the disadvantage that only with difficulty can a cable be withdrawn in the event of a fault occurring. However, because of the good insulation, the occurrence of a fault is very rare in this system. Another system which overcomes this difficulty is by using blocks of bituminous concrete containing circular holes bored longitudinally. Only one cable is placed in each hole. Manholes or draw-boxes are provided at convenient places, and when the concrete blocks are being fitted along in a trench, the cables may be drawn through the hole. If a fault occurs the offending cable can easily be removed without digging up the trench. In a third system, a fibrous material is used as the insulator. This generally consists of layers of tape and fine yarn in the order named, and these are saturated with hot bitumen. Immediately, before the bitumen has had time to cool, a coating of lead is put on by the aid of hydraulic pressure. This has the great advantage of being practically impervious to either air or moisture. For submarine E. C., see under CABLE. See P. Dunsheath, *High Voltage Cables*, 1930; 'Proton,' *Cables and Wires*, 1945.

Electric Circuit. A circuit consists of any closed network of wiring along which a current will flow. The most important law applied to such a network is that due

to Ohm, which states that $C = \frac{E}{R}$ (where

C represents the current, E the electromotive force, and R the resistance, all these quantities being measured in practical units). The resistance of the wires is the question to consider under this heading. The resistance of a wire depends on the material of which it is made, upon its length and area of cross section, and upon the temperature. Expressed mathe-

matically $R = \rho \frac{l}{s}$, l = length, s = cross section, and ρ is a constant at any particular temp. its value depending on the

material. ρ is called the specific resistance of the material, and is measured by the resistance of a piece of the wire 1 cm. long and of 1 sq. cm. cross section. The specific resistance varies with the material of the conductor, the specific resistance of a good conductor being low, whereas that of a bad conducting material is very high. The effect of temp. is generally to increase the resistance with a rise of temp. The resistance of many materials decreases with rise of temp. Two important laws, due to Kirchhoff, are often applied to a network. The first states that no electricity can disappear in any part of the circuit. Thus, if a number of wires branch out from a main, the sum of the currents in the branches is equal to the current in the main wire. The second law states that in any network the fall of potential is always equal to the product of the current and the resistance of the wire between the two points considered.

Resistances in series and in parallel.—Resistances joined in series are shown in Fig. 1, where the two resistances are joined

FIG. 1

in the circuit, forming a continuous path. The symbols used having the same meaning as before, the effective resistance will be the sum of the two resistances, $R = R_1 + R_2$. Fig. 2 shows four resistances

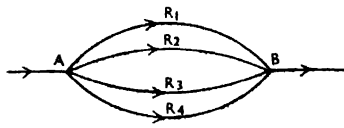

FIG. 2

joined in parallel. If E = fall of pressure between A and B, and C_1, C_2, C_3, C_4 be the currents in the wires R_1, R_2, R_3, R_4 , respectively, also if C be the total current, and R the effective resistance of the four wires, then $C = C_1 + C_2 + C_3 + C_4$. But $C = \frac{E}{R}$, also $C_1 = \frac{E}{R_1}$, $C_2 = \frac{E}{R_2}$, and so on.

Thus $R = \frac{E}{C} = \frac{E}{C_1 + C_2 + \dots}$, and hence $\frac{1}{R} = \frac{1}{R_1} + \frac{1}{R_2} + \frac{1}{R_3} + \frac{1}{R_4}$.

Battery resistance.—The battery forming part of the circuit offers a resistance to the production of the current. This is termed the internal resistance of the battery in contradistinction to the external resistance. The internal resistance is generally represented by r , and the external resistance by R , thus the total resistance is $r + R$. Hence $C = \frac{E}{r + R}$, and for large currents a battery of low resistance should be used in order to minimise the resistance.

Grouping of cells.—Cells may be grouped in series or in parallel as illustrated in Figs. 3 and 4. In the series grouping the

FIG. 3

opposite poles are joined together, whereas in the parallel grouping poles of the same sign are grouped together. Suppose the number of cells grouped together in

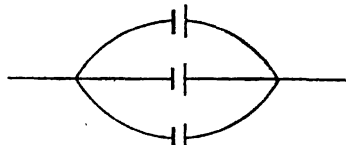

FIG. 4

either system be n . The total E.M.F. in the series grouping will be nE , the total battery resistance nr , and thus $C = \frac{nE}{nr + R}$.

$$C = \frac{nE}{nr + R} = \frac{E}{r + \frac{R}{n}}$$

In the parallel grouping the total battery resistance will be $\frac{r}{n}$, and the E.M.F. will be equivalent to that of only one cell. Thus $C = \frac{E}{\frac{r}{n} + R}$. Clearly

then, for maximum current, when the external resistance is high compared with the battery resistance, the series grouping is the more efficient, whereas when the external resistance is low in comparison, the parallel grouping is more suitable.

Counter E.M.F.—When a current is passed through an electrolyte (a liquid conductor), an E.M.F. is set up in the opposite direction and thus decreases the current flowing. The effective E.M.F. is the difference between the driving E.M.F. and this opposing E.M.F. Thus if e represents this opposing E.M.F., then $C = \frac{E - e}{R}$.

Alternating current circuit.—It has been noted under dynamos that in an alternating current, the current moves backwards and forwards, thus showing that the E.M.F. must be a varying quantity; this variation may be shown graphically as it approximates to a sine curve. This curve may easily be drawn as follows: Take the circle of Fig. 5 and divide its circumference into a number of equal parts, and then divide the line AA in Fig. 6 into the same number of equal parts. Let the radius OB of the circle rotate, and when it comes to a marked point, such as B', measure off the vertical height B'b, above the line AA and draw this line from the corresponding point B' in Fig. 6. When a complete revolution has been

made, we have all the points between the points AA; and by joining the ends of the lines drawn from these points we have what is termed a sine curve. The value of the lines, of which $B'b_1$ is typical, gives

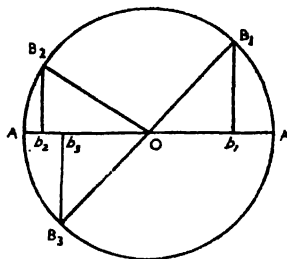

FIG. 5

the instantaneous value of the current. By comparison of these figures, it is clear that b_1B_1 is proportional to the sine of the angle through which OB_1 has rotated, and hence $C = C_0 \sin \theta$ (where θ is this angle,

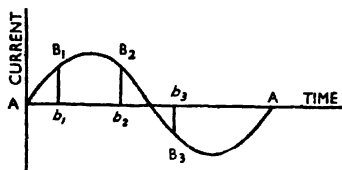

FIG. 6

and C_0 is a constant whose value represents the maximum instantaneous current. Similarly if E is the E.M.F. at any instant and E_0 is its maximum value, $E = E_0 \sin \theta$. We have neglected the question of self-induction so far. This occurs in most circuits. In this case the current does not rise and fall simultaneously with the E.M.F. but has a certain amount of lag depending upon the self-induction. As a result, the maximum of E.M.F. and that of current do not occur simultaneously and hence the direction of the E.M.F. reverses before that of the current, and thus for the moment the E.M.F. is acting against the current. This clearly will occur twice in a period, i.e. at each alternation. The lag is usually measured in degrees, its magnitude being called the 'angle of lag.' The power developed in the circuit is obtained by multiplying together the virtual voltage and amperes, and also the cosine of the angle of lag. The ratio of this to the product of the number of volts and amperes in a circuit free from induction is called the *power factor*. To explain this self-induction consider a coil of wire; when a current commences to flow in the circuit there is an

increase of lines of force through the coil, and this variation of the number of lines causes a current to flow through the coil in the opposite direction to the initial current, thus retarding its rise. On stopping the current there is again a variation in the number of lines of force through the coils, and this, causing electric induction, sets up a current in the same direction as the original current, thus retarding the fall of the current. The magnitude of the induced current will depend on the number of turns in the coil, its shape, and the strength of the current. Thus, the self-inductive effect or 'inductance,' which is measured in units called the *henry*, tends to retard the rise or fall of the current. Thus it is clear that when an alternating current flows, this self-inductive effect is brought into play at each alternation, and so the current will not only lag behind the E.M.F. applied, but its value will be lower than it would be in the absence of self-induction. It is therefore evident that two quantities offer obstruction to the passage of the current, viz., the resistance of the coils and the self-inductive effects, the total obstruction being called the *impedance* of the circuit. Under electro-magnetic induction, it has been pointed out that the current induced depends upon the rate at which the lines of force cut the coils, hence in the case of an alternating current it will depend on the rate of the alternation. Expressed mathematically, the impedance of the circuit = $\sqrt{R^2 + (2\pi n)^2 L^2}$ (where n gives the number of alternations per second, L the coefficient of self-inductance, and R the resistance). Hence $C = \frac{E}{\sqrt{R^2 + (2\pi n)^2 L^2}}$

(where C is the virtual current and E the virtual voltage).

Measurement of alternating currents.—Three types of instrument are widely used. In the moving iron type of ammeter two short rods of iron or other easily magnetised material are placed side by side in a coil through which the current flows. One rod is fixed; the other is supported from an axle to which the pointer is attached, and the movement of this rod is opposed by a helical spring. When a current flows through the coil the two bars become magnetised, and, irrespective of the direction of the current, they repel one another with a force whose magnitude is a measure of it. This type of instrument is convenient, but cannot be used if the frequency of the alternating current is high; a hot wire ammeter is then used. In this the whole, or a fixed fraction of the current passes through a fine wire and heats it; the temperature of the wire depending upon the value of the current. The expansion arising from the heating of the wire is used in one kind of hot wire ammeter as a measure of the current. In the other type the temperature is measured by a thermocouple attached to the wire (see ELECTRICITY.—Thermo-electricity); the current generated by the thermocouple, and used as a measure of the alternating current in the wire is a direct one and so

can be measured by a moving coil type of galvanometer or milliammeter (see GALVANOMETER).

Choking coils in a simple form consist of a coil of wire with iron cores to increase the self-induction. They are used in the alternating current circuit to reduce the current strength, or to reduce the fall of potential or pressure between any two points. Their great advantage is that, since they are designed to possess great self-induction, the current is choked and the energy is not wasted in the production of heat, but the major part is given back to the circuit. Occasionally it is necessary to vary the self-inductive effects. This may be conveniently done by using a core consisting of a bundle of straight iron wires, this core being capable of being withdrawn from the coil to a varying extent, and thus causing a variation in the self-inductive effect. The iron core is made of a bundle of iron wires to reduce eddy currents which would necessitate a waste of power due to the heat so developed.

The effect on the capacity of a condenser.—If a condenser is charged by an alternating current, it becomes charged in opposite directions as the current reverses; thus a current due to the charge on the condenser tends to flow in the opposite direction to that of the primary current. This current from the condenser is of the alternating variety. The E.M.F. of the primary current assumes a zero and a maximum value; when the value is zero, there is no E.M.F. acting against that of the condenser, and thus the current from it is a maximum. Similarly, when the primary E.M.F. is a maximum, this current will be a minimum. Here we consider practically no resistance in the external circuit and thus we see in this case the phase difference between the E.M.F. and current is 90° . This effect is of very great importance on the question of cable circuits. The cable acts like a condenser, and therefore this effect might assume great proportions. This is minimised by making the capacity of the cables as low as possible. See E. W. Golding, *Electrical Measurements and Measuring Instruments*, 1940; A. E. Clayton, *Alternating Currents*, 1934; A. T. Dover, *Theory and Practice of Alternating Currents*, 1944; J. R. Barr and D. J. Bolton, *Principles of Direct-Current Electrical Engineering*, 1943.

Electric Generator. A machine which converts mechanical energy into electrical energy. All machines that generate electricity are based on the fundamental principle that a current is produced in a conductor moving transversely to the

lines of force in a magnetic field. Basically an E. G. consists of two parts, the field magnets and the armature. The field magnets are arranged around a rotating armature, or rotate within a stationary armature.

Alternating Current Machines (Alternator).—A simple type is shown in Fig. 1. Conductor ABCD is rotated in a strong

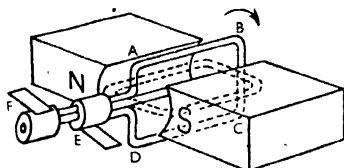

FIG. 1

magnetic field provided by the bar magnets N. and S. Considering conductor AB in the position shown it is cutting the minimum number of lines of force, therefore the E.M.F. induced is at a minimum. After revolving through 90° , AB is cutting the maximum number of lines, therefore the E.M.F. is at a maximum. During this period of rotation the current will be flowing from D to C and B to A. After another 180° of revolution the part CD of the conductor will be occupying the position now held by AB, therefore it will be seen that the direction of the current will be reversed: i.e. the flow will now be from A to B and C to D. The E.M.F. at the slip rings is composed of the E.M.F.s in AB and CD added together since they may be treated as separate conductors joined by wires BC and DA. (These latter connections do not affect the total E.M.F. since they merely slide through the lines of force and do not cut them.) From the foregoing explanation it will be seen that the E.M.F. rises from zero to a maximum in one direction, falls to zero and rises to a maximum in the opposite direction, then falls again to zero in one revolution, i.e. 1 cycle. The frequency being directly proportional to the speed of rotation. This alternating current (a.c.), is collected from the moving conductor by slip rings and brushes E and F. Modern alternators essentially consist of (1) the stationary armature or stator and (2) a rotating field magnet system called the rotor. It is now general practice to rotate the field magnets rather than the armature windings, because this simplifies construction and furthermore with the high voltages universally adopted with a.c. systems, stationary armature windings can be more satisfactorily insulated. Another important point is that the current generated is taken direct from the stator terminals without the necessity of sliding contacts, such as slip rings. The field magnets are energized by a low voltage direct-current generator, called the exciter, usually direct coupled to the alternator shaft. The current is supplied to the magnet coils through carbon

brushes bearing on insulated metal rings on the alternator shaft, and connected to the magnet coils. The armature core consists of thin, soft iron laminations securely fixed to the stator frame, and slots are provided into which the armature coils are fitted. The number of slots per pole is usually six, in order that the same design of lamination may be used for single, two- and three-phase alternators. Further reference will be made to this later. The rotating magnet system for low-voltage, low-speed alternators, usually comprises a series of field magnets, mounted on a cast-iron yoke, in this case the pole cores are of solid steel, but for medium and high voltage machines laminated poles are employed. The armature windings of a direct-current generator are uniformly distributed over the periphery of the core, but in the case of the alternator the windings are arranged around the stator core as a series of coils, equal in number to the field poles on the rotor. The spacing of the coils also bear a definite relationship to the pole-pitch of the field magnets, so that the E.M.F.s induced in each of the series of coils shall simultaneously attain their maximum values. In other words, the changes in the induced E.M.F. in each of the series of coils must be in step or phase.

Present-day alternators may be divided into three classes, viz.: (1) single-phase machines; (2) two-phase machines; (3) three-phase machines. By far the most important are the last two classes.

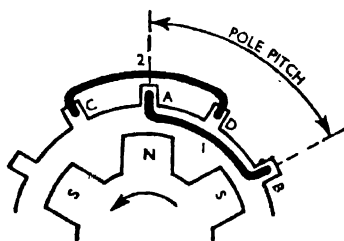

FIG. 2

Referring to Fig. 2, if we have a coil (1) wound in slots A and B, then the induced E.M.F.s in the conductors A and B will be equal and opposite in direction, and the total E.M.F. induced in the coil will be twice that of either conductor. At the instant when the poles N. and S. are immediately under the slots occupied by A and B, the induced E.M.F. will be a maximum, and as the field magnets continue to rotate, the induced E.M.F. in the coil will fall to zero. Further rotation will cause this induced E.M.F. to build up to a maximum of opposite polarity, and again fall to zero and then build up to a maximum when the slots A and B are again immediately over poles N. and S. respectively. This cycle of change in the induced E.M.F. is represented by the curve in Fig. 3. Now let us consider what

is happening simultaneously in coil 2, which is angularly displaced from coil 1 by half the pole pitch. The induced E.M.F. in coil 2 will pass through the same cyclic changes as that in coil 1, but

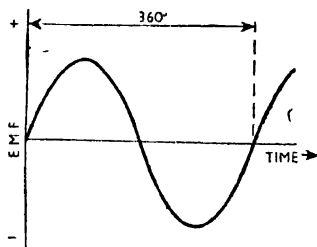

FIG. 3

at the instant when the E.M.F. in coil 1 is a maximum, the E.M.F. in coil 2 will be zero. Thus, the two E.M.F.s will have a phase displacement of a quarter of a period, or 90°, as shown in Fig. 4. If

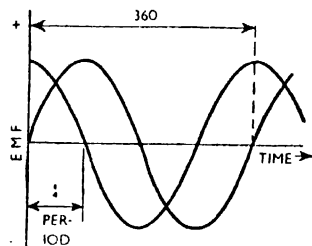

FIG. 4

then we have a series of coils such as 1 arranged around the stator and connected together to form a winding, the alternator will be a single-phase machine. By the addition of an independent series of coils 2

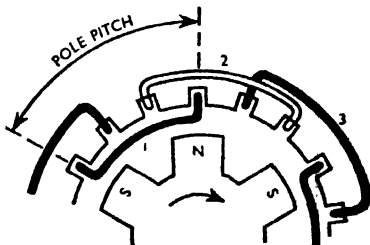

FIG. 5

displaced relative to the first set by half the pole pitch, the same alternator will be capable of generating two distinct alternating E.M.F.s, having a phase displacement of 90°. Such an arrangement

constitutes a two-phase alternator winding. The introduction of this second series of coils utilises space around the stator core which otherwise would be mixed. In a three-phase alternator there are three distinct windings arranged

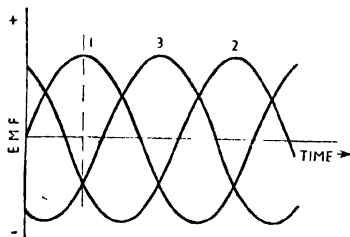

FIG. 6

around the stator core as shown in Fig. 5. The induced E.M.F.s therein have a phase displacement of 120° as indicated in Fig. 6. Large three-phase alternators

current in one direction only as shown in Fig. 7. The brushes span the segments when the E.M.F. in the conductors is at zero (6). Dynamos are constructed with a rotating armature, consisting of a soft iron core with axial slots containing the coiled conductors, the ends of which are connected to the commutator segments. The field magnet system is stationary and consists of a heavy cast iron yoke with pole pieces projecting inwards towards the armature, the field coils are wound on these poles. Dynamos are classified by their field winding connections, there being three types. (1) series wound dynamos; (2) shunt wound dynamos; (3) compound wound dynamos.

Series wound dynamos.—Field connections shown in Fig. 8. As the armature current rises with an increase in load the field current also rises, since both are connected in series. This causes a stronger magnetic field and consequently a rising characteristic of the voltage curve as shown in Fig. 8. If the field current is such as to saturate the iron any further increase in load will cause a drop in voltage. This is mainly due to an increase in the armature demagnetising effect

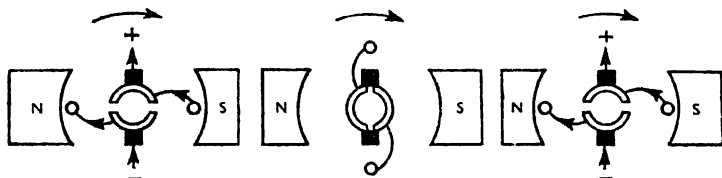

FIG. 7

have been constructed for direct generation at 33,000 volts for outputs up to 40,000kw.

Direct Current Machines (Dynamos).—This is basically similar to the simple

without a corresponding increase in field strength. In order to vary the field strength, i.e. the output voltage, it is usual to connect an adjustable resistance

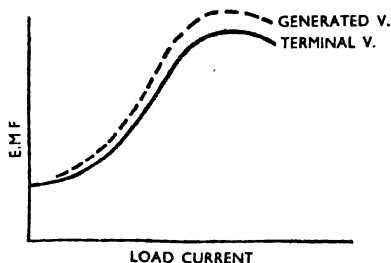

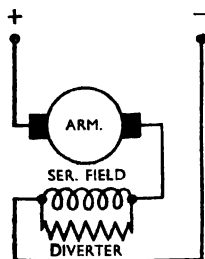

FIG. 8

alternator shown in Fig. 1 except that whereas the current reverses in direction in the alternator, in the dynamo the slip rings are modified and become a rotary switch or commutator, which picks up the

or diverter in parallel with the field winding. This type of machine finds but very little use as it is quite unsuited for dealing with variable loads. It is essentially a constant current machine and was

used in the past for supplying current for arc-lamps on the series system where the load was steady and the voltage not critical.

Shunt wound dynamos.—Field connections are shown in Fig. 9. The field winding in this case is connected directly across the brushes. A rheostat is usually

equipment requires a dynamo for battery-charging purposes.

Compound wound dynamos.—Field connections are shown in Fig. 10. The field windings in these machines are separate in so far as there are two distinct types, a heavy series winding connected in series with the armature and a lighter shunt

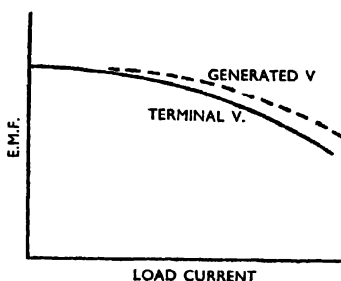

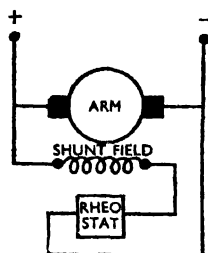

FIG. 9

inserted in the field circuit for controlling the field current and therefore the output voltage of the dynamo. The terminal voltage is a maximum on open circuit and diminishes as the load increases. This drop is due to armature voltage drop caused by an increase in armature current, the demagnetising effect on the field

winding connected across the brushes. The shunt winding maintains the voltage at no load and the series winding provides additional field strength to compensate for the voltage drop on load. It will be evident that by suitably proportioning the series winding in relation to the shunt winding, the voltage characteristic can

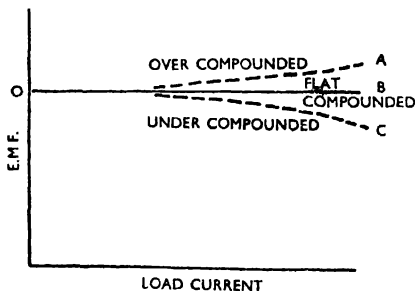

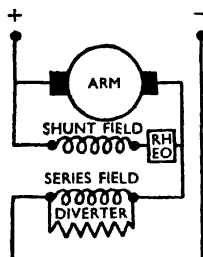

FIG. 10

strength of the increased armature current and the reduction in the field current consequent upon the lower terminal voltage caused by first two reasons. A characteristic curve for a shunt wound dynamo is shown in Fig. 9. These machines are suitable for steady load conditions and where the voltage variation is not of great importance. They are generally used for exciting the field windings of alternators and rotary converters. Also they are used for battery charging purposes. Perhaps there are more shunt wound dynamos in the world than any other type because every car and lorry that has electrical

to a great extent be controlled. Fig. 10 shows characteristic curves for a compound wound dynamo. When the series winding is arranged just to compensate for the voltage drop as a result of increasing load, the machine is said to be flat-compounded and a practically straight line OB is obtained. If the series winding is insufficient the voltage curves will 'droop' at the higher loads OC, and the machine will be under-compounded. On the other hand, should the series winding be greater than is required for flat compound, the machine is said to be over-compounded, and the voltage will rise as the load increases, as indicated by curve

OA. When a dynamo is required to supply power at some distance overcompounding is necessary to compensate for the increased line voltage drop at the higher loads. In this way the voltage at the load terminals can be maintained practically constant. See H. Cotton, *Design of Electrical Machinery*, 1934; M. G. Say and E. N. Pink, *The Performance and Design of Alternating Current Machines*, 1943; A. E. Clayton, *The Performance and Design of Direct Current Machines*, 1945; A. J. Coker, *AC Motors and Control Gear*, 1945.

Electric Heaters, see under ELECTRIC LIGHTING.

Electric Indicators, see ELECTRIC BELLS.

Electric Insulators. As defined in ELECTRICITY, an insulator is a body which does not allow electricity to pass through it. Metals, solutions of salts, water, and alcohol are not insulators. It is found that the best insulators are dry ebonite, glass, shellac, sulphur, silk, paraffin, sealing-wax, and many other fats, oils, and resins. All gases are insulators unless they are under the influence of Röntgen rays or great heat. It is found that a little moisture is detrimental to a substance's insulatory properties. Thus the glass of a Leyden jar is coated with shellac varnish, otherwise it would become covered with a conducting film of moisture. The stands and supports of all electrostatic and electromagnetic machines are insulators. Marble, glass, and porcelain are most commonly used for this purpose in large instruments. In small machines and laboratory appliances, ebonite is often used. The insulating supports on telegraph wires are made of porcelain. Submarine cable wires are insulated from each other by surrounding them with gutta-percha. This is then surrounded with tarred hemp, and then with hemp dipped in an insulatory composition. This keeps the cable insulated from the seawater, which is conducting. On a small scale silk and cotton are used for covering wires and bobbins of electrical apparatus. In electrical heating appliances, where great heat and strain are encountered, mica is the substance usually employed for insulating any material. For insulating purposes in very delicate instruments quartz or silk fibre is used. The latter is quickly affected by the damp, but the former is not. See *Electric Insulating Materials* by A. Monkhouse, 1926; and by H. Warren, 1931.

Electric Lamps. The first attempt to apply electric power to lighting purposes resulted from the discovery by Davy in 1810 that when the terminals of a powerful battery are connected to two pieces of carbon, the current continues to flow when the ends of the two carbons are not in contact. A brilliant light is emitted when this takes place, termed the electric arc. The gap between them is filled with an intense glow. Particles of carbon are projected from the positive terminal and float about freely in this space; these become intensely luminous. A chemical effect also takes place when the carbons are exposed to the air, resulting in the

carbons gradually being burnt away. The effect of the positive carbon throwing off these particles is shown in Fig. 1, where the point of the carbon assumes a hollow form like a crater. This crater is the source of most of the light emitted. Owing to the combined action of these effects, the distance between the points of the carbons increases, and ultimately the gap will be too great for the current to pass. Modern electric arc lamps attempt in various forms to overcome these difficulties automatically. The general method is to pass the current through an electro-magnet which is connected in series with the lamp; when the magnet is excited it attracts an armature, the motion of which is utilised to adjust the distance between the carbons. The brush lamp, illustrated in Fig. 2, exemplifies these principles. T₁ and T₂ are the terminals by which the lamp is connected into the main circuit.

FIG. 1

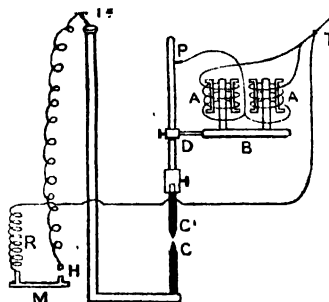

FIG. 2

The negative carbon C is fixed, while the carbon C' is movable, its movement being regulated in a manner to be described, so that as the carbons gradually waste away the arcing distance is adjusted. The current enters at the positive terminal T₁. It then travels through the solenoids A and A so as to give very powerful and opposite poles at the lower extremities. The currents then unite and travel through the connection P to the positive carbon C', thence to the negative carbon C which is connected to the negative terminal T₂. Now consider the action of the lamp, the carbons being initially in contact: the current passes through the solenoids A, causing the soft irons B to be drawn upwards, B is connected to the arm holding the positive carbon, and thus the movement is transmitted and the carbon is raised. This results in an increase of resistance in the main circuit, and thus more current travels through the coils A, and the magnetic force is increased. Thus the distance would continually increase until the current ceased. To obviate this,

another coil of thick wire, not shown in diagram, is wound around the coils A in opposite directions to the main coils on A, causing a diminution of the intensity of the magnetisation of the irons B, and so B falls a little. In this way the distance between the carbon points is kept at the proper arc distance. This is the main principle of the lamp, but in actual practice the mechanism is far more complex than that described above. When a number of arc lamps are used they are mostly connected up in series. A difficulty arises from the fact that if any one of the lamps fails to act, the whole group is cut off from the current. A device is introduced whereby the lamp on failing to act becomes short-circuited, the current taking up a new path through the lamp.

Incandescent lighting.—The principle underlying most phases of lighting is that of heating a body to a very high temp. It has been noted under ELECTRICITY that one of the effects of passing an electric

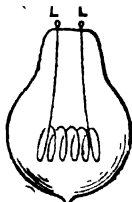

FIG. 3

current through a body is the production of heat. Further, the greater resistance which the body offers the greater the heat produced. Clearly it is necessary to use a substance which has a very high melting-point. Edison introduced the system of using a long carbon filament enclosed in a glass globe which is exhausted of air as completely as possible. This type of lamp is illustrated in Fig. 3. The filament is now generally made by forcing a solution of cellulose through a very fine pipe. When the filament is dried, it is reduced to a uniform thickness by forcing it through jewel dies; it is then transformed into solid form by the process of carbonising. Carbon is an exceptionally good absorbent of gases. As the temp. rises these gases expand and force their way out, thus causing small holes in the carbon. It is necessary to diminish this tendency in the case of filaments and thus the process of carbonisation takes place at a very high temp. It is then subjected to the process of 'flashing' to correct further this fault. The filament is first cut to the required size and then connected to the terminals of a dynamo. It is then surrounded by coal gas and is traversed by currents sufficient to raise it to white heat. The gas is decomposed to a certain extent and carbon particles are deposited in the filament. If the filament is not of uniform cross section the heat developed in

the different parts will vary, and so decomposition of the gas will be greater at the places of highest temp. A greater quantity of carbon will thus be deposited on the thinner parts of the wire. The process of flashing is continued until the whole filament assumes a uniform temp. It is then placed in a partial vacuum and a continuous current passed. In this way the filament is hardened, its resistance is decreased, and its absorbent properties practically destroyed. The efficiency with which an incandescent filament lamp can convert electrical energy into light depends upon the temp. at which the filament is run, and increases rapidly as this is raised. With increasing temp. the emitted light also becomes more like the white light from the sun, so for both these reasons the filament temp. should be the highest that is practicable. On the other hand it must not be so high that the filament melts or is vaporised rapidly. The latter condition is that which limits the temp. in practice because evaporation becomes serious at temps. far below the melting points of suitable materials, and evaporation not only reduces the working life of the lamp but also reduces its efficiency since the evaporated material is deposited as a semi-opaque film on the interior of the glass envelope. In most modern lamps tungsten is used instead of carbon as the filament material as it permits the use of higher temps. In the earliest tungsten lamps, as in carbon filament ones, the glass bulb was evacuated to prevent oxidation of the filament, but the modern practice is to fill them with an inert gas (argon, containing a small admixture of nitrogen). Evaporation is thereby reduced, and the evaporated material is also carried by convection currents in the gas to the top of the lamp, where its deposition does not interfere with light emission. Since tungsten is a metal, and hence a good conductor, the filament must be longer and thinner than a carbon one, and in the gas-filled lamp it is wound into a close coil which may then be further coiled on itself. This construction reduces to a minimum heat losses by gaseous convection, and so increases the efficiency further. The current to and from the filament is carried by wires sealed through the glass envelope, the wires being of an alloy chosen as suitable for this, and the seal is protected by the familiar bayonet cap. To reduce glare from the lamp the glass bulb is frequently frosted (i.e. roughened) on its interior surface.

Discharge lamps.—In lamps where electrical energy is used to heat a solid to incandescence the efficiency is never high, because the greater part of the energy radiated is emitted as invisible infra-red radiation. Higher efficiencies can be obtained if the light is produced by a current through a gas or vapour at a suitable low pressure, as in neon signs and the mercury or sodium lamps used for street lighting. For ordinary purposes the colour of the light so obtained is objectionable, but white light or light of a colour that is desired can be produced

by such discharge lamps if the internal walls of the discharge tube are coated with a thin layer of a suitable fluorescent material. When the current flows through a column of mercury vapour, for example, some light of particular colours is emitted, and also some invisible ultra-violet radiation. The latter is absorbed by the fluorescent material on the wall of the tube, but causes it to emit other radiation of the visible spectrum. By a suitable choice of fluorescent material a brilliant white light, or light of some desired shade can be obtained. Fluorescent lamps of this type are more expensive than filament lamps, are less compact, and require subsidiary apparatus to provide the higher voltages required for starting them up. They are, however, more efficient, have longer working lives, and are free from glare because the light is emitted from a relatively large surface. The intensity of the light emitted from a fluorescent lamp fluctuates with a frequency similar to that of the mains supply, and special arrangements for safety purposes are therefore required if they are used to illuminate a room containing running machinery. See L. B. W. Jolley, J. M. Waldram, and G. H. Wilson, *The Theory and Design of Illuminating Engineering Equipment*, 1930; H. Cotton, *Electric Discharge Lamps*, 1946.

Electric Lighting and Wiring of Houses. This consists of setting up a system of wires from the main circuit to all the electrical apparatus contained in the house,

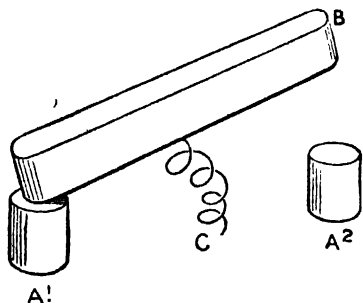

FIG. 1

e.g. lamps, heaters, etc. To make a circuit along which the current flows, there should be a continuous line of conductors, any break in which will stop the current. These breaks or gaps are a necessary feature of the system, in order that the supply may be controlled. These gaps consist of a mechanism called a *switch*. The rough description of this mechanism is that it consists of two brass blocks insulated from one another, each being the terminal of a wire. A brass lever is so adjusted to make or break contact with both blocks, thus making or breaking the circuit. To minimise sparking when contact is made or broken, the lever is made to work automatically so that its action is practically instantaneous. Fig. 1 gives

a rough illustration of a switch. A¹ and A² represent the brass blocks, B the lever fastened to A¹, and C a spring. B is pressed down from above to make contact with A²; when the pressure is released B immediately breaks contact by the action of the spring C.

Fuses.—One of the chief properties of a current flowing through a wire is the production of heat. When too great a current is allowed to flow, the heat developed may be enormous, and thus cause damage to the insulating material. The danger of over-heating is minimised by using thick wires. Another, and the mostly employed, contrivance is the *fuse*. This consists of a very thin wire fixed in a box which will not burn. Being so much thinner than the cable, the heat is developed at a faster rate, and the temperature is soon high enough to melt the wire; this causes a break in the circuit and thus any further damage is prevented. This wire is generally three or four in. long; the best material for its construction is fusible metal (an alloy of tin and lead), owing to its low melting point, and thus the molten metal itself is not so destructive. As a matter of practice all the

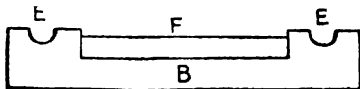

FIG. 2

fuses are located in the same place. The main cable is attached to a brass bar; the distributing cables are attached to brass blocks opposite, these being insulated from one another on an earthenware base. Thick brass arms effect the junction at this point. Fig. 2 represents such a bar. B is the brass arm and F the fuse. The ends E fit into the brass blocks. In this way the arm B can be taken out of the circuit and the fuse easily renewed before it is replaced. The system of wiring is practically independent of the voltage of the supply. The function of the system is to afford a complete circuit for the current from the source through the various apparatus back to the source. The wire used generally consists of a core of wire strands, insulated by a covering of rubber (pure and vulcanised) and then a layer of tape which has been soaked in bitumen. A most important feature of the system is to note the occurrence of *leaks and short circuits*. Of two paths a current will choose the one of least resistance, and if the outgoing wire and the return wire *both together* come into contact with earth, the earth being a good conductor, the current will take the earth circuit rather than the various apparatus. Thus the necessity of good insulation. If the leak is great an electric arc may be developed, and a great deal of damage caused. A short circuit is made when the outgoing and return wires make contact with one another. If the voltage is high, this is accompanied by an intense flash and a

great evolution of heat, and the current immediately ceases. These short circuits are of very frequent occurrence. The electricity meter is placed on one of the mains which come from the town main, and thus all the electricity utilised passes through it and is measured. Switches are placed near so that the house may be cut off the t.n. mains. One method which was frequently adopted was that of two mains leading from the switchboard and various branches being made off to the lamps. This necessitated a large number of joints, which, to a large extent, spoiled the insulation and also increased the number of fuses, since these must be placed wherever the size of the wire varies. To overcome this, the wire is now made the same thickness all through, and a few lamps are attached to each wire. In this way the number of joints and fuses is greatly decreased. The cables themselves are encased in a lead covering to exclude moisture. They are generally fixed on the walls.

Fittings include the various devices for connecting the lamps, etc., to the cables, and for their support. In ceiling fittings, the cables enter at a broad flanged base

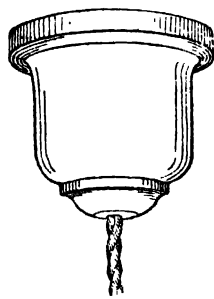

FIG. 3

and pass down to the connecting screws of the lamp. Several lamps are often connected at the end of these cables on the same fitting. The most generally used fitting is the pendant. A small porcelain box is screwed on a piece of wood on the ceiling. This contains two brass terminals insulated from one another by porcelain. The cables which lead in from the base are attached to these terminals. To these terminals a pair of flexible cables are attached, these are twisted together and passed through a hole in the bottom of the porcelain cap. This cap is fixed to the ceiling as shown in Fig. 3. The cords hang downwards, and to the ends the lamp is attached. Another fitting is the bracket which is attached to the wall; it consists of several short arms at the end of which a lamp is suspended. A very useful contrivance for portable instruments, such as reading lamps, etc., is the wall socket. The socket is similar to the above-described porcelain cap, but it has two holes which contain brass tubes

attached to the cables. The plug is also a porcelain cap containing two insulated brass terminals to which two brass pins are attached which fit the brass tubes in the socket. Flexible cords are attached to the terminals, and at the other end to a lamp. The current is supplied to the lamp by pushing the pins into their corresponding sockets.

Electric heaters.—The development of heat due to the passage of a current is utilised in these appliances. The wire is generally contained in enamel, against which the body to be heated is placed. They have the advantage that little heat is wasted, and are free from smoke and the various other inconveniences caused by the process of combustion which underlies the numerous other types of heating appliances.

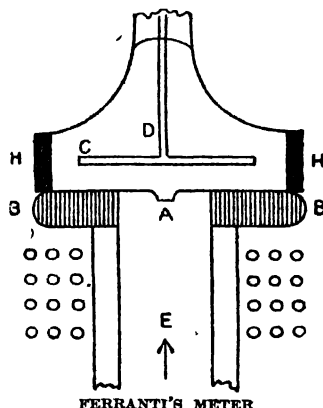

There are five different systems of wiring. They are: (a) Vulcanised India rubber (V.I.R.) in steel conduit; (b) V.I.R. in lead sheathing; (c) V.I.R. in wood casing; (d) V.I.R. on porcelain cleats; (e) rubber-sheathed cables. Of these five methods the first two are those most employed in house wiring; the third method is used chiefly in public buildings, offices and schools; V.I.R. on porcelain cleats is employed in factories and workshops where the wiring is of a temporary nature and has to be fastened on steel girders. Rubber-sheathed cables have a marked advantage over others in that they are not so greatly affected by moisture; thus they are used in public baths, laundries, boiler-houses and other places where there is always a large amount of moisture in the air. Steel conduit may be employed either to screw together or to be connected by spring collars. More skill is required to instal screwed conduit, since it involves the use of taps and dies and the lengths of conduit have to be cut accurately, and also it is hard to bend. One disadvantage of this method is that if there are many cables in the same conduit and one of them catches fire, either by earthing on to the conduit or by a short circuit, all the other cables are also destroyed. Lead-covered cable is the simplest to instal, in that it can be run along woodwork or brickwork on the surface and can be easily painted over to hide it; moreover it bends easily and can be made to conform readily with the contour of a wall or ceiling. This latter point is very important, as it makes the wiring of old houses possible since wires can be bent out of sight. Wood casing is resorted to only where wiring has to be carried out on the surface of walls, and where long lengths of it are to be visible, when wood casing made to resemble picture rails is employed and is painted or discoloured to match the walls. This type of wiring needs great skill, as each corner has to be accurately cut in order to avoid unsightly joints. Cable on porcelain cleats has the great advantage that it is easily and rapidly erected, and that when a break occurs in the wiring it is easily seen and repairs quickly effected. For minor faults in household systems see under HOUSEWIFERY.

Electric Meters are used to measure (1) the strength of an electric current at any time, or (2) the quantity of electricity supplied, or (3) the quantity of electrical energy supplied.

Ammeters and voltmeters.—The heating or magnetic effects of an electric current may be used to measure it. In *Siemens'* electro-dynamometer there are two coils, one fixed and one movable, at right angles to each other and in series. The movable coil carries a pointer which moves over a horizontal (limited) scale. When the current passes, the movable coil is displaced, but is brought back to the original position by twisting it by means of a torsion head. The angle of twist varies as (current)². Thus the current can be found. The expansion of a wire when heated by a current can be used to measure the quantity passing per second. In *Lord Kelvin's* current balance the attraction between coils through which a current is passing in opposite directions is measured against a mechanical force, and thus the current strength is measured. The *Weston ammeter* is essentially a suspended coil galvanometer (q.v.). The instrument is usually shunted. If the magnetic field is uniform, the deflecting couple varies as the current. *Lord Kelvin's* ampere gauge consists of a fixed coil and a piece of soft iron wire carrying a pointer which moves over a horizontal scale. When a current passes in the coil, the iron wire is sucked into it, and the motion of the pointer measures the current. The amount of silver or copper deposited from their solutions can be used to measure quantity of electricity. In this case the instrument is called a *voltmeter*. *Weston's* instrument may be used as a *voltmeter* by removing the shunt and adding a high resistance of low heat coefficient in series.

Wattmeters and supply meters.—The power supplied is equal to the product of the E.M.F. and the current. The energy supplied is equal to power multiplied by time. A wattmeter measures the power supplied, and is essentially a combination of an ammeter and a voltmeter. The best known form is *Weston's*. A fixed coil of low resistance (the current coil) corresponds to the ammeter. The field due to this coil varies as the current (C). A coil of high resistance (the pressure coil) swings in this field. The current in this coil is proportional to the potential difference (P.D.). Thus the deflection is proportional to $C \times P.D.$, i.e. to the power. If the current is alternating the deflection varies as the mean power. **Supply meters** are of two kinds: *quantity meters* and *energy meters*. If the P.D. in an electrical supply is practically constant, then the power varies as the current, and the energy as the quantity. Thus, any wattmeter used in such a system becomes a quantity meter for measuring energy. If in a meter it is so arranged that the energy supplied is read directly, this would be an energy meter. *Electrolytic meters* can be used to measure quantity of electricity. *Edison* used silver and copper voltameters. In the *Bastien* meter water is electrolyzed by the current. The rate of loss of water

measures the quantity of current passing. This rate of loss can be read directly. In the *Wright meter* mercurous nitrate is used as the electrolyte. Here the polarisation is small. Mercury forms the anode, and a platinum cone the cathode. Mercury dissolves at the anode and is formed at the cathode, from which it falls to the bottom of the vessel. The vessel is graduated so that the volume of mercury in the bottom can be read. The mercury automatically siphons off when it reaches a certain height, so that the quantity formed in a given time can be measured, and thus the quantity of electricity passing can be estimated. *Motor meters* are another form of meter. The diagram

shows a sketch of *Ferranti's meter*. BB is an electro-magnet with a steel core E. This forms a uniform field inside an iron ring HH. This space is filled with mercury, in contact with the electro-magnet only at a point A. A light fan C is suspended in the mercury. The current passes along E, to the mercury through A, and then radially to the ring HH. This causes the mercury to rotate, taking the fan with it. The driving force varies as the (current)². The fluid resistance on the fan varies as the (speed)³. Thus, the speed of the fan varies as the current, and the number of revolutions varies as the quantity of electricity. In *Chamberlain* and *Hookham* meters a copper disc is placed in the mercury. The current causes it to rotate. A 'brake disc' is attached to rotate at the same spindle. This rotates in a non-uniform field. Eddy currents are set up, giving a retarding couple varying as the speed. Thus speed varies as the current.

Alternating current meters.—The *Siemens'* electro-dynamometer and the wattmeters described can be used for alternating currents as well as direct currents, with a little modification. Alternating supply meters fall into two classes: (1)

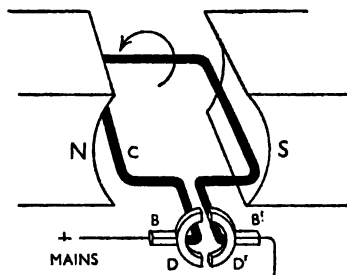

Motor meters, (3) clock meters. Of the second class the *Aron meter* is the best known. It consists of two clocks electrically driven. A coil is suspended below each clock. The current in these coils is in such a direction that the speed of one clock is retarded and that of the other increased, due to the magnetic action on the pendulums. The difference is measured by means of a differential gear. This difference varies directly as the energy supplied to the system, and is read off by the rate of translation of the differential gear. This method can be used for one, two, or three phase currents. *Motor meters* consist of small motors. The field coils carry the whole current, the armature only a shunt current; a resisting torque varying as the speed of the armature is supplied by a 'brake disc.' The number of revolutions of the armature then measures the energy supplied. Blatby and others used two coils for alternating currents, one of thick wire carrying the whole current, and another of fine wire carrying a current varying as the pressure applied, so designed that the current lags 90° behind the pressure. A rotating field produced, giving eddy currents in a suspended disc, which then rotates. Speed of rotation varies (after a magnetic brake is applied) as the power. Thus the number of revolutions varies as the energy supplied. For measuring small alternating currents, especially when the frequency is high (as in radio practice), a thermocouple is used to measure the current in conjunction with a resistance. The resistance is put in the main circuit whose current is to be measured; one junction of the thermocouple is fixed to this resistance, and the leads of it connected to a milliammeter (an ammeter calibrated in thousandths of an ampere); the other junction is connected to a point at constant temp. The heating effect of the resistance sets up a current in the thermocouple circuit which varies with the current passed through the resistance.

There are many types of meters; they are divided into two main kinds, (a) switchboard meters, and (b) portable meters. The switchboard meters are themselves divided into two types: the 'flat' instrument, which is comparable to a flat clock-face; and the 'edgewise' instrument, in which the readings are shown on the edge of a rotating drum. Recording instruments are those which in place of the usual pointer have a finger with a small ink pen attached, and this pen is trailed over a continuous chart of paper, which is passed under it by means of clock mechanism. The instrument is made more robust than the usual type, since the pointer has to overcome the friction of the pen on the paper and prevent sticking. See E. W. Golding, *Electrical Measurements and Measuring Instruments*, 1940.

Electric Motors. In a DYNAMO or ELECTRIC GENERATOR (q.v.) mechanical energy is supplied to the machine and electrical energy is supplied by it. In an electric motor the reverse process occurs; the electrical energy of a current, causes a rotor to rotate and turn a shaft, providing

a source of mechanical energy for driving other machines.

Direct Current Motors.—The principle of a direct current (d.c.) motor is illustrated in the diagram. Current from the mains flows to the carbon block B (called a brush), passes thence to the split ring commutator at D, round the flat coil C, and back to the mains via the other part D' of the commutator and the brush B'. The commutator and coil are mounted on an axle and can rotate in the direction shown by the arrow, and the coil lies between the fixed poles N, S. of a magnet. When current passes round the coil the latter becomes, in effect, a flat sheet magnet with its faces acting as magnetic poles, and it therefore turns through 90° so that its poles are opposite those of the

ELECTRIC MOTOR

fixed magnet. In this position there is no resultant torque tending to cause further rotation, but we may suppose that its own momentum carries the coil past this position. It will be seen that the rotation of the commutator simultaneously carries the gaps in it past the brushes, so that current now enters and leaves the coil through D' and D respectively. The reversal of current through the coil causes a reversal of its magnetic polarity, so it turns through a further 180° to bring its newly formed poles opposite to those of the fixed magnet. This causes the current in the coil to be reversed once more, bringing about a further rotation of 180° , and so on. Such a simple machine as that described would be weak and jerky in its action. To make it more powerful and steady running it is necessary to modify it by using an electromagnet as the fixed magnet, by using a laminated iron core within the coil, by using a more complicated armature winding in place of the single coil, and by attaching this winding at various points to a commutator that is split into a large number of segments instead of the two shown. The number of fixed pole pieces may also be increased, and subsidiary poles may be placed between them for reasons similar to those explained under ELECTRIC GENERATOR. It will be seen that such a machine is similar to one type of dynamo, and just as the rotation of a dynamo armature

produces an E.M.F. in it, so the rotation of the armature of a motor sets up an E.M.F. This E.M.F. opposes, but does not prevent, the flow of current. Its value is zero when the armature is stationary and the machine is being started up, so for all but the smallest machines it is necessary (to prevent the flow of excessive current at this stage) to use a starting switch incorporating a resistance. As the speed of the motor increases, and its induced armature E.M.F. builds up, the starting resistance in the armature circuit is reduced to zero. D.C. motors may be classified as series or shunt-wound according as the coils producing the magnetic field of the stationary magnets are connected in series or in parallel with the armature. The series-wound type gives a powerful starting torque. Its steady running speed falls rapidly if the load on the machine is increased, or rises rapidly if the load is decreased. Such a machine should not be started without an applied load. The shunt-wound machine, on the other hand, should be started up without an applied load, and the load should be added after the motor has gained speed. Its running speed also decreases with greater loads, but less rapidly than that of the series motor, and is readily controlled by regulation of the current to the field coils; on account of its effect upon the induced E.M.F. in the armature an increase of the field strength causes the motor to run more slowly. For electric traction it is often arranged that the motors should act as series-wound machines during starting up, and be converted to shunt-wound machines for steady running.

Alternating Current Motors.—Alternating current (a.c.) motors can be divided into three groups, depending upon the type of rotor employed in their construction, viz. (a) synchronous motors; (b) asynchronous or induction motors; (c) commutator motors. Synchronous motors are merely alternators used as motors, and their constructions are identical. The number of poles on an alternator is determined by the speed at which it is to be driven, and similarly the speed of a synchronous motor determines the number of poles it shall have. Like alternators, synchronous motors require direct current excitation for their rotor poles, and this is performed in the same way as is done on alternators, i.e. by a direct-current generator mounted on the same shaft as the rotor. One serious drawback to the use of synchronous motors is that they are not self-starting, but have to be rotated at their normal speed before they can be started. The induction motor is by far the most common type of a.c. motor, because its construction is very simple. It is reliable, and can be made to start against a very heavy load. The rotor of an induction motor consists of a number of insulated conductors, arranged to form a drum, with the ends fixed together into a ring. The alternating polyphase current supplied to the stator winding sets up rotating fields of a uniform strength. These fields induce currents in the copper

bars of the rotor, and repulsion is set up between like poles, and the rotor will rotate in the same direction as the inducing field and try to keep pace with it, but it will never quite succeed. Commutator motors are mostly applied to domestic uses, as they are best used as single-phase motors, polyphase motors being too complicated in structure to be practical. The single phase motor is the same as the d.c. motor except that the poles of the former must be laminated and only series wound motors can be used.

Electric Ray, see TORPEDO.

Electric Power Generation. The modern power station has grown to dimensions undreamt of many years ago. The development of the steam turbine and the improvement in the methods of steam generation have made large alternators of the capacity of over 100,000 K.V.A. possible. The cycle of operations at the generating station is as follows: the coal is fed from hoppers down chutes on to an endless chain grate, which passes slowly into the combustion chamber of the boiler; the coal fires and heats the water in the tubes above it converting the water into steam; the heat rises, and to dry the steam and raise it to very high temps. it is fed back again through super-heaters. The steam is then passed into a separator to remove any impurities which may be in the steam and also any water which may inadvertently be carried along with the super-heated steam or which may be in the pipe when the plant is started up from cold. The steam then passes on its way to the turbine through a stop valve and a governor valve; it then enters the turbine and impinges on the blades of the wheels, and thus a torque or turning momentum is applied to the turbine shaft and rotates it. The turbine has directly coupled to it the alternator and the exciter for the alternator. The steam, after leaving the turbine at the low pressure end, passes into the condenser. Here the steam is cooled, condensed back into water, and is then passed on to the hotwell. From this hotwell the water is pumped back to the boiler tubes, and again passes through the cycle of operations. The alternator has all its controlling equipment on a panel on the main switchboard of the station, and all the leads are taken from the alternators to busbars behind the panel. From the panel the power is fed to switchboards, which in their turn feed the distribution system, by cable ducts, out into the streets. If the current distributed is of high voltage, the switchgear for each section of the distribution scheme is installed in a separate cubicle. The main cables from the alternators are run to a switch-house and each unit coupled separately to a common omnibus bar through a circuit-breaker. Each alternator unit, whilst in service and generating electrical energy, is protected by certain relays for earth and intermediate faults. Should any fault develop between the alternator and the omnibus bars the

relays operate and clear the circuit-breaker, thus protecting the machine. In a modern and up-to-date power station the circuit-breakers are entirely submerged in a very light oil in a cylindrical steel tank so that should one open on a fault, the oil will very quickly damp out the arc caused by the circuit-breaker opening. All circuit-breakers are usually operated some distance from the power station by a control engineer who closes a small switch which, in turn, operates a solenoid connected to the main oil circuit-breaker. This is called 'remote control operation.' Numerous pilot cables are run between the control switchboard and the switch-house to operate the main circuit-breakers. The alternator voltages are kept constant by automatic voltage regulators. These instruments, in spite of varying currents, enable the voltages to be maintained at constant pressure. See T. H. Carr, *Electrical Power Stations*, 1944. See also HYDRO-ELECTRICAL POWER.

Electric Power Transmission. E. P. T. lines are those which are used for transmitting relatively large amounts of power from one point to another as compared with distribution circuits which convey small amounts of electricity to numerous points. Power is generally transmitted at high voltages to reduce its loss in the lines. At the generating end, the voltage is stepped up by suitable transformers to the line voltage. It is then transmitted. At the load end there are transformers and converters which reduce the voltage down to one suitable for distribution. Most of the E. P. T. lines of the world are used in connection with hydro-electric schemes, where the power generated at the river-falls is transmitted to the large towns; the manufacturing area being surrounded by hydro-electric plants which supply the power. The converse of this system is where the large power station is situated in the manufacturing area where the costs of generation are least and lines radiate from it to supply the surrounding country. In Great Britain the various main generating stations are now connected together in the 'Electric Grid' (see ELECTRIC SUPPLY). But little E. P. is transmitted by long underground cables because of the cost; and, in the case of very high voltages, cables have yet to be made to overcome the insulation problem. Hence most transmission lines are overhead, and consist of two main kinds, steel-tower lines and wood-pole lines. The steel-tower lines are used where very high voltages are employed, and therefore are required to give greater ground clearance; lattice steel towers are also used because larger size conductors can be carried on them, and heavier current can be transmitted. Wood-pole lines are used for short lines in which the voltage is not as great as in steel-tower work. They are not designed for carrying large currents and will not stand the strain of larger conductors. In steel-tower lines the towers can be much further apart than the poles in wood-pole lines. Thus it will be seen that

the greater strength of the one with its heavier cost of erection counter-balances the inferior strength of the other with its relative cheapness of erection. Failure of supply on overhead lines can be brought about by many causes; lightning striking the lines is very dangerous, but this has been eliminated by the use of choke coils at the line ends; birds settling on the lines and short-circuiting the conductors or earthing them is a common cause of failure; trees falling on the line; very high winds; and snow and ice in winter are all troubles which the overhead-line engineer has to consider when erecting such lines. Telegraph wires, roads, railways and canals all have to be guarded when they are crossed by lines, and the proper clearances must be given by the engineer.

Electric Supply. During recent years the question of universal and adequate provision of electric current has become very important: the wheels of industry turn largely by means of electricity, whether it be supplied by private installations or from central power stations. Electricity may be provided in direct current (d.c.) or alternating current (a.c.) but the latter has become generally used owing to the much greater facility with which it can be distributed.

Generators.—Electrical energy, whether it be direct or alternating current, is generated by revolving or passing a conductor through a magnetic field. In a dynamo or d.c. generator the field is always stationary and the energy is collected from brushgear, whereas an alternating current generator or, as it is usually called, an alternator, has the field revolving (rotor) and the energy, in this case, is induced into the stationary winding or (stator). When a conductor is passed through a magnetic field the potential can be measured by fixing the two ends of the conductor to slip rings on the revolving shaft. It will then be found that the current varies in pressure from maximum to zero according to the speed of the conductor. This is called a.c. To convert this to d.c. the conductor is tapped and connections made to copper segments, also on the revolving shaft, termed a commutator. The conductor in this instance is wound in the form of a coil and tapped at an equal number of turns to each segment. This rectifies the bottom part of the alternating wave form, thereby causing current to flow in one direction only, hence d.c. In large a.c. generators the great advantage with the revolving field is that low voltages and small currents need only be used to excite very large machines and that the stator, being stationary, can be more easily insulated to stand up to 22,000 volts. The excitation current is carried to the revolving rotor through slip rings on the main shaft. This current is supplied by a self excited d.c. generator also fitted on the main shaft of the turbine. But, as has been said, the practice of generating d.c. is rapidly dying out as the transmission of a.c. is more flexible and adaptable and more easily applied to works

and factories in general. For fuller details, see ELECTRIC GENERATOR.

Direct Current.—Private installations for the supply of lighting, and power in isolated premises are generally adequately provided for by a single d.c. machine (dynamo). This is driven by a gas, oil, or petrol engine as the motive power. The dynamo is employed to charge a storage battery during the day, the battery itself then being used for the various purposes required. It is, however, found to be more economical to use more than one dynamo, several small ones being less wasteful than one large one. One method, the one most generally used, will suffice to show the way in which they are connected up. The dynamos are connected

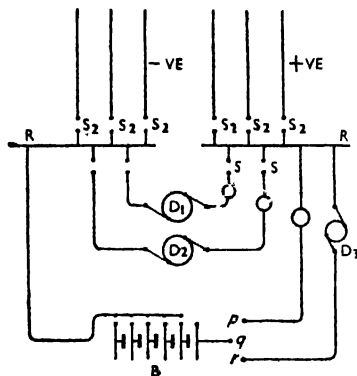

FIG. 1

together in parallel on to two bars called omnibus bars. Fig. 1 shows roughly this method. It represents the bars to which the two dynamos are connected in parallel. In the circuit are the switches S , by which any dynamo can be put into or taken out of the system. To these bars are also connected the outside distribution cables, also containing the switches S . The regulating battery B is charged by the booster D_3 by joining qr , and may be discharged by joining pq , its action being that of a regulator, as previously explained. As the cells composing the battery are slowly discharged, their E.M.F. gradually decreases, and it is necessary to correct this by placing more cells of the battery into action by means of switches.

The above method is practicable only for small power stations, whose area of distribution is limited and where the current used is not large, and so has practically the same value in all parts of the circuit. This, however, is impracticable in very large areas. In this case the distribution takes place through underground cables, and questions of economy demand that the cost of these should be a minimum. Electric power is the quantity in which the amount of electricity

utilised is measured by the product of the voltage and current. Now, the higher the voltage employed the smaller may be the cross section of the cable, and thus, by using high pressure and a low current, the amount of copper utilised may be smaller. There is a limit to the extent of this pressure, as the lamps manufactured cannot use a pressure higher than about 250 volts. As the current passes along the wires there is a loss of pressure due to the resistance, and when power is utilised from the cables to light lamps, etc., at varying distances from the supply, it is clear that the voltage along the wires must decrease as we go further away. In order to keep all the lamps at the same brightness the voltage should be the same at all parts of the circuit. This ideal condition is impossible, but it may be approximated to by making

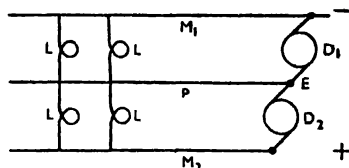

FIG. 2

the cables very thick to minimise resistance. It has been pointed out that the only way to save expense on the cables is to make the pressure as high as possible. This difficulty of electric lamps limiting the extent of this pressure led to the introduction of the *three wire system*, which doubles the pressure on the mains, while the pressure on the lamps remains unchanged. In Fig. 2 let M_1 and M_2 represent the mains in the diagram, let P be the middle wire, and let the mains be joined: M_1 to the negative terminal of the dynamo D_1 , and M_2 to the positive terminal of the dynamo D_2 , and the positive terminal of D_1 be joined to the negative terminal of D_2 . Let the lamps L be joined two by two in series 'cross the mains. Now, when there is the same number of lamps between M_1 and P and P and M_2 , there is a constant potential along P , and thus no current tends to flow along it; but on removing a lamp from between M_1 and P (say), this equilibrium is disturbed; this results in increasing the resistance between M_1 and P , and thus there is a greater fall of pressure than between P and M_2 , which lowers the potential at the point on P where the lamp has been taken out. The potential at the point E is clearly constant, and thus a current flows along P ; thus it may be deduced that the current that P carries is only due to the increase of the number of lamps over that on the other side of it. This by proper adjustment may be made very small, and thus the wire P may be made much smaller

than the mains M_1 and M_2 . This explains in brief the action of the system. Now, suppose each dynamo capable of maintaining a potential difference at its terminals of 100 volts: clearly when they are joined in series, as in the diagram, the potential difference between the mains M_1 and M_2 will be 200 volts, and also the pressure on the lamps will be only 100 volts, thus showing that, while the pressure in the mains is doubled, the pressure on the lamps is unaltered.

The immense advantages which accrued from the use of the three-wire system have largely displaced the system for private installations explained earlier. The dynamos are connected to omnibus bars as in the previous case, as also is the external circuit. The middle wire is connected (see Fig. 3) to the middle bar M , the excess of current being supplied to it by the two balancing dynamos D' , one placed on each side. As the prime motive power, various engines have been utilized, of which the turbine is the most economical. (See ELECTRIC POWER GENERATION.)

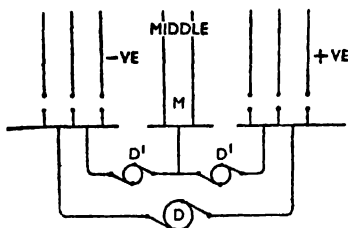

FIG. 3

The previous discussion has mainly dealt with the problem of lighting. The principles underlying the supply for traction purposes are very similar. Here there is the advantage that the time of running is known, and further variations of pressure are not so important as with lighting. Compound dynamos are used so as to give an increased pressure with an increased load. This is an important factor, since the variation occasionally is very sudden. The supplies for lighting and traction are always separate, owing to the great variations of the traction supply. They are connected up to separate switchboards which have no connection with each other. Economic considerations determine the site of the supply station, which in large towns, usually lies outside the boundaries. To supply an ordinary voltage of about 500 volts, the feeders would be very long, as well as the mains. It is therefore necessary still further to increase the pressure. This will be higher than can be utilised by lamps, consequently 'sub-stations' are introduced which receive the high pressure current from the central station and reduce its pressure.

Alternating Current.—The prime movers in these stations are similar to those of the d.c. stations. The alternators are, as

with d.c. machines, connected up in parallel. These are represented in Fig. 4 by A , connected to the omnibus bars B . The current clearly depends upon the number of alternators working, and thus,

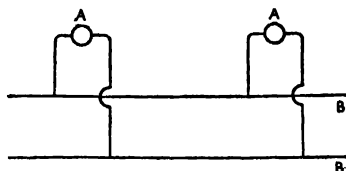

FIG. 4

owing to the varying demand on the current, arrangements are made whereby any number of alternators may be put into or taken out of the system. The difficulty arises when an alternator is synchronised into the circuit. It is necessary to switch the machine into the circuit at the exact moment when it is in step with the other machines, so that when the switch is closed no undue voltage rise takes place. When synchronised, the machine is then ready to pick up load to ease the other plant already working. So long as the speed of the turbine remains constant, the frequency of the current generated is constant. The standard frequency for all electricity supply stations throughout this country is 50 cycles per sec. This means that the current and voltage oscillate or alternate at this high speed. It is this frequency which is responsible for maintaining a constant speed on all a.c. motors and apparatus even to maintaining Greenwich time on electric clocks, which are simple synchronous motors running in step with the main power

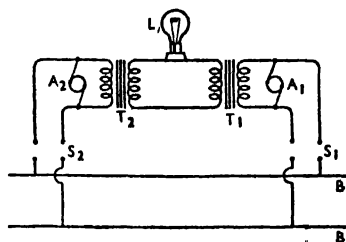

FIG. 5

station alternators. The instrument used to synchronise or parallel the alternators together is called a 'synchroscope.' A simple diagram illustrating the principle of this instrument is shown in Fig. 5. The alternators A_1 and A_2 can be connected to the omnibus bars B by the switches S_1 and S_2 respectively. Further, each alternator is connected to the secondary coils

of the transformers T_1 and T_2 , the primary coils of the transformers being connected in series with the lamp L ; then the current induced in these primaries may travel in the same direction, when the lamp will glow brightly, or in the opposite direction, when the light will be more feeble. Assume the alternator A_1 to be connected to the omnibus bars. At the instant of the maximum brightness the two alternators are obviously in the same phase, and thus at this instant the alternator A_2 may be placed in the circuit. Even if there is a slight difference of phase the action of the current in the circuit tends to eliminate this difference. All the alternators work at a very high pressure, averaging about 11,000 volts; hence the necessity for great care in manipulating the current.

Distribution.—In most large tns. the system of distribution is as follows: The mains from the generating station are high-voltage a.c., three phase; these

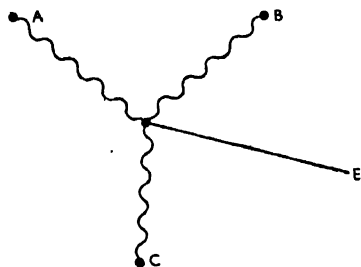

FIG. 6

mains are run to sub-stations situated at the best distributing points in the tn. In the sub-station is a transformer or transformers with their high-tension switch-gear, and on the low-tension side there are other fuses and switch-gear. The supply to houses is single-phase a.c. with one side earthed to neutral point on the transformer. This system is taken into the houses, and is then split up into two circuits, one for cooking and heating, and the other for lighting. The most modern practice is to transmit throughout the country on the 'electric grid' system (see below) at 132,000 volts and distribute at numerous sub-stations. This extra high voltage is then stepped down, through static transformers, to declared voltages for lighting and power. For lighting it is approximately 230 volts single phase. For power it is usually 415 volts three phase but for very large motors 11,000 volts have been used on the windings with advantage. The object of using the three phases for power is to avoid the overloading of single phase circuits. This is similar to the explanation given earlier upon the three-wire system except that four wires are usually used in a.c. circuits. In Fig. 6, A, B, and C represent the three phases, E the fourth wire

which is always at earth potential. Then from either phase to E or earth the potential is usually about 230 volts whereas between phases say A to B, or A to C, or B to C, they are all at 415 volts for power circuits. In country districts, where the amount of electricity used is small and the houses are relatively far apart, the laying of underground mains is too expensive to be practicable; thus the vills., farms, and rural industries are supplied by overhead transmission, and the distribution is carried in the same way as in tns., except that the houses are served from transmission lines carried on wood poles running down the roads from which each house taps its own power. In U.S.A. and Europe the system of supply by overhead lines is fast becoming universal, since by this method electricity can be transmitted from hydro-electric power (q.v.) stations situated in mts. to cities and tns. at a minimum of cost. See also ELECTRIC POWER TRANSMISSION.

'Electric Grid.' This is a national system of running a large number of power stations all over the country under one central control-authority. To maintain a power station under constant full load over 24 hours working is the highest form of efficiency and is the aim of every electricity undertaking. The country is therefore split up into zones or areas and all power stations in that area are pooled under one control. All stations are then worked on the main network called 'The Grid' and can assist in taking the load when and where required. As the load falls at the end of the day so 'control' instructs the less efficient stations to come off the 'Grid' and shut down. This leaves the large and superstations all over the country to carry the greater part of the load at full capacity. This makes for efficiency and permits the running costs to be kept as low as possible, thereby helping to cheapen the cost of electrical units generated to the advantage of the country in general and to the consumer in particular. See bibliography for ELECTRIC GENERATOR; and Political and Economic Planning, *Report on the Supply of Electricity in Great Britain*, 1936; A. T. Starr, *Generation, Transmission, and Utilization of Electrical Power*, 1941; H. Cotton, *The Transmission and Distribution of Electrical Energy*, 1945; E. W. Golding, *The Electrification of Agriculture and Rural Districts*, 1945.

Electric Traction. see under ELECTRICITY. There are three different systems of electric traction in use. They are: (i.) Direct-current (d.c.) systems; (ii.) single-phase systems; (iii.) three-phase systems. In the d.c. systems the voltages used vary from 600 to as much as 3000 volts. In the low-voltage system each motor is designed to take the full voltage of the trolley rail to earth. In most other systems the motors are designed to take half the voltage, motors being arranged in series of pairs. In the single-phase systems the third rail is not used, owing to the high voltages employed; the voltages of the overhead wires range from 3000 to 10,000 volts and

over, and low frequencies of the order of 15 to 33½ cycles per sec. are used. The motors are not run directly from the supply voltage, and it has therefore to be stepped down to 200 to 600 volts, which is the terminal voltage of the motors.

Application to Tramways and Railways.—The three-phase traction system requires the use of two overhead wires for each track, the track itself forming the necessary third conductor for the distribution, and the frequency varies from 16½ to 45 cycles per sec. The voltage ranges from 750 to 15,000 volts; transformers are carried on the trains to step down the voltage to 400 to 600 volts at the motor terminals. There are both advantages and disadvantages in each system, each of which must be considered. The cost of maintenance of a 600 volt d.c. system is low, and the motors used cost less, weigh less, and occupy less space than those of a high voltage d.c. system; on the other hand, a low voltage d.c. system requires the use of frequent sub-stations to convert the power available to the line voltage; also these converters are rotary, while in the case of alternating current (a.c.) systems the sub-stations are static in that they contain only transformers and the necessary switchgear. Rotary converter sub-stations also cost more to instal and maintain than transformer sub-stations. With a.c. systems transformers are required on the locomotives, thereby adding greatly to the cost and weight of the train equipment. Low voltage d.c. systems are used chiefly on interurban traffic, whilst the high voltage d.c. and a.c. systems are used on long distance trains. In Italy and Switzerland, owing to the lack of coal and the abundance of water power, the electric locomotive is all-powerful. In N. Italy there are sev. three-phase systems of which the most notable is the Genoa-Milan railway, which employs 3000 volt three-phase current, all of which is obtained from hydro-electric power stations.

Trolleybuses require two overhead lines, one for the supply and one for the return current, and consequently two trolleys. The wires are usually 4/0 S.W.G. hard-drawn copper. Ministry of Transport regulations stipulate that the supply line shall be completely insulated, the return line earthed at the station but otherwise insulated. Other paragraphs of the Regulations specify the maximum permissible leakage current (0.01 A. per m.), sectionalising of lines (0.5 m. max.) and routine insulation testing. The supply is protected by circuit-breakers and over-current relay. The vehicle has usually one motor only, though some designs use two, mounted forward or in the middle of the chassis. Forward mounting gives easy access to the motor for inspection, better cooling and less dust, but requires a longer cardan shaft for the rear-wheel drive. The motor power varies between 50 and 80 h.p. according to seating capacity (35–66) and wheel base (4 or 6 wheels). The motor is d.c. series-wound or, if regenerative braking is used, compound-wound. Some types use a series

motor with double armature for series-parallel working. The voltage preferred in Great Britain is 500 V. In the case of regenerative braking, when the motor acts as generator during coasting, a resistance is automatically put into the lighting circuit to protect the lamps against excessive voltage. The controller is foot-operated and may be of contactor or drum type, and the power pedal is interlocked with the reversing switch. A hand brake is always fitted and where regenerative braking is not used, rheostatic or vacuum brakes are supplied. The trolleybus must be turned at the terminals, and where no loop circuit through adjoining streets can be provided, a turning circle must be made in the road. Some buses are provided with an accumulator battery for manoeuvring independently of the overhead for short stretches. A trolleybus was first used experimentally in the U.S.A. in 1892 and during 1900–1912 various lines were operated both on the Continent and in England (Kelghley, Bradford, Leeds). But the modern large-scale development in design and application dates from 1926, when the first six-wheel double-deck buses with pneumatic tyres, built by Guy Motors Ltd., were put into operation in Wolverhampton. This system has remained the model of passenger transport service and was soon followed by replacements of tramcars by trolleybuses and installation of new routes, in Great Britain, on the Continent, and overseas, earning for England the name of 'the Home of the Trolleybus.' Of all heavy vehicles, the trolleybus is the least noisy. Unlike the tramcar, it loads and unloads its passengers at the kerb and is not confined to a track, but can give way to other traffic. Unlike the petrol bus, it emits no fumes, its maintenance costs are low, since the smooth acceleration of the electric motor causes less wear than the jerky gear-changing, and the fire risk is low. Moreover, it constitutes a valuable load balancer on the electric power station. (See Brit. Standard Specification 173.)

See also RAILWAYS; TRAMWAYS. See A. T. Dover, *Electric Traction: a Treatise on the Application of Electric Power to Tramways and Railways*, 1929.

Electric Units, see AMPERE, BOARD OF TRADE UNIT, COULOMB, DYNE, ERG, FARAD, JOULE, MHO, VOLT, WATT.

Electric Waves. When a current in a circuit is a low-frequency alternating current, it radiates waves of energy from it when the current is at a maximum; and these waves return when the current is zero. But when the frequency is high, part of the energy is sent out into space, and never returns. This energy is said to be radiated; and in radio circuits, where the frequency ranges from 15,000 to 20,000,000, this loss forms the main loss of the circuit. The radiated wave is an electro-magnetic wave, and travels with the velocity of light (186,000 m. per second). These waves are propagated in all directions over the earth's surface, and the length of the wave is found by dividing the speed of the wave in metres per sec.

(300,000,000 m. sec.) by the frequency in cycles per sec., the result being the wavelength in metres. As the wave travels outwards from the transmitter the wave tends to increase its height. If the earth is a good conductor, the wave remains upright; if, however, it is a bad conductor, the wave tilts forward in the direction of motion, and the crest of the wave overhangs the base, and if the air is ionised and thus acts as a brake on the wave, the wave tips backwards. Radio waves can be reflected and refracted in the same way as light. A mass of metal will deflect a wave out of its path; a mt. which is highly metalliferous will absorb the wave, and a receiving station in the lee of it will receive no signals. Waves, however, will pass through water, and submarines at the bottom of the ocean can receive messages; also they will pass through land, and radio receivers taken down deep mines have been worked efficiently.

Electric Welding, *see under* METAL-BURGY.

Electric Wiring, *see* ELECTRIC LIGHTING AND WIRING OF HOUSES.

Electricity, Atmospheric, the occurrence of thunderstorms shows that the atmosphere is in a state of electrification, similar to that obtained in any laboratory experiment. This was shown by Franklin by the use of an ordinary kite. Later investigation has shown that the state is variable, it being positively electrified during fine weather and generally negatively electrified during wet weather. The most convenient electrical unit to employ in these investigations is that of potential (*see* ELECTRICITY). The principal methods that have been employed are the determination of the potential of the earth's surface at a specified place and time, or to measure the difference of potential between a point in the air and the nearest point on the earth's surface. This is measured by placing a burning match at the end of a long insulated conducting rod placed vertically. While there is a difference of potential between the air and the rod, the products of combustion carry off the induced electricity until this difference of potential is destroyed. A quadrant electro-meter is attached to the bottom of the conductor, the readings on which will give the difference of potential between the air near the flame and the earth. Another instrument, the principles underlying which are similar to the above, which can also be used for the above determination, is the Kelvin water dropper. The result of these experiments shows that the difference of potential increases with the height. As a result of these experiments, Sir W. Thomson found that the difference of potential for a point 9 ft. from the ground varies between 200 and 400 volts. Various theories have been advanced in explanation of this phenomenon, all of which are very unsatisfactory. Explanation has been sought in assuming that particles of water when leaving the surface of water in lakes, etc., due to evaporation, assume a charge opposite to that of the water which they

leave. Condensation of vapour has also been held responsible. Further theory has explained the phenomenon as a result of friction between dry air and moist air, or air passing over the earth's surface. The more frequent occurrence of thunder storms in calm than in windy weather is sufficient refutation of this theory. Thus we see that no adequate explanation of the phenomenon has yet been obtained.

The most usual form of lightning is a discharge from a cloud. This occurs when the cloud is at positive potential, and the lightning consists of clearly defined branches directed away from the cloud towards the earth. Sometimes the positive charge is on the ground, and the lightning flashes from the ground to the cloud. There are also cases when the lightning discharge is from one cloud to another. In these cases the charge eventually is discharged to earth from the cloud which received it. One of the phenomena connected with storms is balls of fire which apparently accompany very brilliant flashes of lightning. These take up many varied shapes and sizes, varying from the size of a pea to a foot in diameter; they usually glow, and sometimes disappear quietly, and sometimes they explode with great force. These balls are always connected with lightning, and no satisfactory explanation of their substance and formation has yet been stated.

Owing to the very rapid growth of radio communication, the question of atmospheric electrical disturbances and their elimination is very important. Space is always agitated by electric disturbances, due to ionisation by the wind or the sun's rays, or by thunder storms, with their electric discharges. In tropical regions these 'atmospherics' or 'statics,' as they are called, become very prevalent, owing, no doubt, to the great heat of the sun. The disturbance itself is an impulse of electricity of exceedingly short duration, and in a radio receiver gives rise to an unpleasant crackling and hissing sound. In the case of receiving signals such as trans-Atlantic signals, which have to pass over large expanses of ocean, these static disturbances are very prevalent, sometimes making reception impossible; were it not for these statics, trans-oceanic communication could be carried out on ordinary wave-lengths and on a power of one kilowatt. The interference can be eliminated to a certain extent by the proper use of coil antennae and balanced earth antennae systems. Lightning used to be a very serious problem to the overhead transmission engineer, but this interference has been overcome by the use of choke coils in series with the line, and also by surge absorbers which are large condensers and, as their name implies, absorb the resultant surge in a line when it is struck by lightning.

Electricity and Magnetism. In the following article the science has been subdivided into its usual branches, and dealt with in the following order: (1) electrostatics; (2) magnetism; (3) current electricity; (4) electro-magnetic induction;

(5) electro-magnetic waves and Maxwell's theory of light; (6) electrolysis. A short account of its historical development is given at the commencement of each branch. This seems the most consistent and convenient method, since the development of any one branch has proceeded independently of that of the others.

(1) **ELECTROSTATICS.**—This part of the science deals with electricity in equilibrium. A Gk. philosopher, Thales, who lived about 600 B.C., discovered that amber, when rubbed, acquired the property of attracting light substances, such as pieces of pith or cork. Towards the end of the sixteenth century, Wm. Gilbert found that this property was also possessed by many other substances, such as sulphur and glass. All such phenomena are studied under the science of electricity, the name being derived from the Gk. word for amber. Gilbert's work was followed up by Robert Boyle, who added to the list of electrics. In 1729 Stephen Gray discovered the properties of insulators and conductors. If an electrified piece of sulphur is laid on another piece of sulphur it retains its electricity for some time. The same thing occurs if it is suspended by a piece of dry silk thread. If, however, it is rubbed gently with a damp cloth, or with the hand, or touched all over with a piece of metal foil, it loses its charge. The sulphur and dry silk thread are called insulators, whilst the hand, the damp cloth, and the metal foil are conductors. If a metal rod is held in the hand and rubbed with a dry cloth, no electrification apparently takes place, but if the metal rod has an ebonite handle by which it is held, the rod becomes electrified on rubbing. In the first case electricity is produced on the metal, but it is immediately conducted away by the hand. In the second case the ebonite handle, which is an insulator, prevents the electricity escaping. Whilst Gray was pursuing his researches in England, scientists on the Continent were busy making and perfecting electrical friction machines and condensers, and about this time the Leyden jar made its appearance. It was during this period also that Charles Dufay discovered that there were two kinds of electrification. This can be estab. as follows: A wire stirrup is suspended by means of a dry silk thread. In the stirrup a rod of glass or ebonite can be suspended after it has been electrified. Electrify one end of an ebonite rod by rubbing it with a piece of dry flannel, and suspend it in the stirrup so that it hangs in a horizontal position. Now electrify another rod of ebonite by rubbing it with flannel and bring it near the electrified end of the suspended rod. The latter is repelled. Now electrify a piece of glass by rubbing it with dry silk, and bring it near the suspended ebonite. The latter is attracted. This shows that there are two different kinds of electrification produced on the ebonite and glass. Dufay called the electricity produced on the ebonite 'resinous' or negative (—), and that produced on the glass 'vitreous' or positive (+). If the flannel and silk are

very dry, it is found that, after rubbing the former attracts the suspended ebonite rod whilst the latter repels it. This shows that when a piece of ebonite is rubbed with flannel the ebonite becomes negatively electrified whilst the flannel becomes positively electrified. In the case of glass and silk, the glass becomes positively electrified and the silk negatively electrified. These experiments led to the proposition of the two-fluid theory. All unelectrified bodies were supposed to contain vast equal quantities of vitreous and resinous fluids. When a body was electrified, it was supposed to gain an additional quantity of one fluid, and lose an equal quantity of the other, so that the total amount of fluid does not alter. In later years Benjamin Franklin (1706–90) maintained the existence of one fluid only, which unelectrified bodies possess in a certain normal amount. A positively charged body has more, a negatively charged body less, than this normal amount. Franklin also did much work with the Leyden jar, and succeeded in showing that the seat of the charge is the dielectric (see CONDENSERS). On this foundation Michael Faraday (1791–1867) and James Clerk-Maxwell (1831–79) have built up the whole theory of electrical science. John Canton (1718–72) was the first to discover the phenomenon of electric induction. Charles A. de Coulomb (1736–1806) and Henry Cavendish (1731–1810) investigated independently the law of electric attraction and repulsion, and Faraday, at the beginning of the nineteenth century, showed that electricity was a measurable quantity.

Electric induction.—Suppose C is an insulated conductor and is positively charged (Fig. 1). Suppose AB is an insulated, unelectrified conducting cylinder

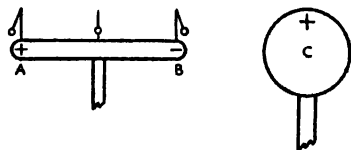

FIG. 1

on which three pith balls are suspended, as shown in the diagram. When C is far from AB the pith balls all hang vertically. When C is brought near to one end of AB (say the end B), the end B becomes charged with electricity of the opposite sign to that of C, whilst the end A is charged with electricity of the same sign as C. There is no charge on the middle parts of AB. This is shown by the fact that whilst the pith balls on the ends are deflected from their stands and away from AB, the middle ball is undeflected. If AB is touched with the finger or otherwise connected to earth, whilst still under C's influence, it loses its charge at the end A. If C is now removed, the body AB becomes uniformly charged with

electricity of the opposite kind to that of C. AB is then said to be electrified by induction or influence. It is obvious that these phenomena can be explained from the fact that like charges repel, and unlike charges attract each other. The un-electrified cylinder is considered to have an equal quantity of positive and negative electricity. It will be seen that a more vigorous explanation is possible from considerations of electric potential. Electric induction gives us the best means of obtaining a continuous series of charges and all friction machines are based on this principle.

The *electrophorus* is the simplest of influence machines. This consists of a disc of resin, or some other material easily excited, A (Fig. 2), and a polished metal plate, B, with an insulating handle, CD. The metal plate should be a little less in size than the resin disc. The latter is

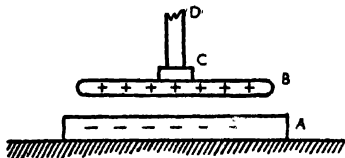

FIG. 2

electrified by striking it with dry flannel or fur. The metal plate is then placed upon it. The plate will not touch the disc except at a few points. Thus between most of the surface of the plate and that of the disc there will be a thin film of air. Thus B will be electrified by induction, that is, positive electricity will appear on the face of B near to A, and negative electricity on the face farther away. If the metal plate is now touched with the finger, the negative charge will be conducted away. Thus on removing the plate it will be found to have a positive charge. B can be charged by this method many times without appreciably altering the charge on A. A is often fitted into a shallow metal vessel, called the sole, which increases the utility of the arrangement.

Variation of electric force with distance.—It was shown by Franz *Äpinus* (1724–1802) that the electric force between two charged bodies diminishes as the distance increases. Coulomb, who made experiments with a torsion balance of his own invention, was the first to publish proof that the force varied inversely as the square of the distance between the electrified bodies. Coulomb experimented first on the couple required to produce a twist in a wire, and found that for a given twist the couple varied as the fourth power of the diameter of the wire. Coulomb's balance consists of a small gilded pith ball, A (Fig. 3), placed at one extremity of an arm, ABC, of shellac. This arm is suspended by a very fine silver wire, so that it hangs in a horizontal position.

At the top of the silver wire is a graduated screw, so that the wire can be subjected to a known twist. A second ball, E, is suspended by an insulating rod, so that it just touches A. The whole apparatus is placed within a cylindrical glass case. The ball A is then charged, and E brought

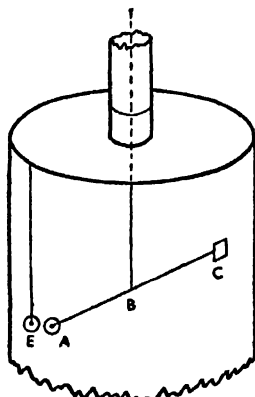

FIG. 3

up to it. When they touch, the charge is shared between them and they repel each other. E is fixed, so the rod ABO is twisted through an angle. The wire is now given a known twist. The rod ABC takes up another position, making a different angle with its original position. Knowing these two angles, the distance between the balls can be ascertained and the force between them is known from the twist given to the wire thus: Suppose that α is the angle ABO (Fig. 4) first turns through. Then suppose a twist, γ , is given to the wire, and let the angle of ABC with its original position be now β .

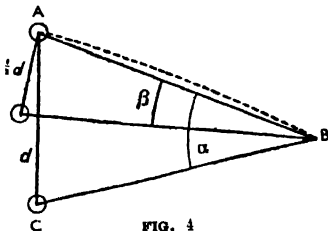

FIG. 4

The total twist in the wire is now $(\beta + \gamma)$. The original twist was α . Suppose now γ be made such that the distance, d , between the balls is halved, it will be found that $(\beta + \gamma)$ is four times α ; if the distance d is reduced to $\frac{1}{2}d$, $(\beta + \gamma)$ will be nine times α , and so on. Since the

force between the balls varies as the twist in the wire, it must vary inversely as the square of the distance between them. Coulomb was thus able to prove that this law was approximately if not absolutely true. Cavendish employed another method of proving the law of inverse square. It can be shown mathematically that if the law of inverse squares does hold, then there is no force inside a uniformly charged sphere. If the power is anything except the inverse square then there is force within the sphere. Now, whenever an electric force acts on a conductor, we have electric separation of induction, and parts of the conductor become electrified differently from other parts. If then we find that within a charged conductor no separation of electricity occurs, it shows that no electric force exists. Cavendish took a conducting globe and supported it on an insulating stand. He then enclosed the globe in two hemispherical conducting shells, which fitted exactly together to form a spherical shell without anywhere touching the globe. He then made connection between the globe and the shell by means of a wire pushed through a hole in the shell, and charged the shell, afterwards removing the wires by means of a silk thread in such a way that the shell was not discharged. He then removed the hemispherical shells and tested the inner globe for a charge. For this test, he used two pith balls which were suspended side by side. He found that the globe was uncharged, and so proved that there was no force inside a charged sphere, and also that the charge of a conductor resides on the surface. Thus he deduced that the law of inverse squares held.

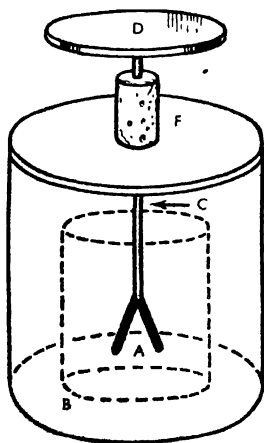

FIG. 5

Gold leaf electroscope.—Cavendish, in his experiment, used a pair of pith balls as his electroscope. This is not very

sensitive. A very sensitive instrument has been devised by Bennet. It consists of two gold or aluminium leaves, A (Fig. 5), suspended from a brass rod, C. This rod terminates in a disc, D, after having passed through an insulating plug, F. Thus A, C, and D form one conductor, which is well insulated. The leaves, A, are surrounded by a cylinder of wire gauze, B. In some instruments this is replaced by strips of foil placed on the glass vessel surrounding the leaves. When the leaves are electrified, they repel each other to an angle which roughly indicates the intensity of their electrification.

Electricity as a measurable quantity.—Most of the preceding experiments have been qualitative. But we can speak of giving a conductor a definite amount of electricity just as we can speak of pouring a definite amount of water into a vessel. The following ice-pail experiments, due to Faraday, justify the use of the term 'quantity of electricity.' Faraday placed

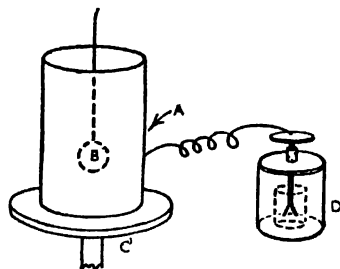

FIG. 6

a pewter ice-pail, A (Fig. 6), on an insulating stand, C, and connected the outside to a gold-leaf electroscope, D. A charged metal ball, B, was then lowered into the pail by means of a silk thread. As it approached, the leaves of the electroscope gradually diverged. The divergence attained a maximum when B was well inside the pail. On moving B about inside the pail, it was found that the divergence of the leaves did not alter. Another uncharged ball was lowered into the pail and allowed to share the charge on B. Still the deflection was unaltered. Finally, the balls were allowed to touch the inside of the pail. The deflection of the leaves did not change. On drawing the balls out again they were found to be uncharged. It is thus concluded that the divergence of the leaves depends on something which remains constant however the ball is moved about inside A. This something we shall call a quantity of electricity, and this quantity remains constant, not depending on the position, nature or size of the charged body. Having accepted the idea of quantity of electricity, we can show that the induced charge in the inside of the vessel is equal and opposite to the inducing charge, because when the ball

touched the inside of the vessel the quantity on the outside did not change. Again, the charge on the inside of the vessel must be equal and opposite to that on the outside, since, if the ball were taken out before touching the inside, the pail would be uncharged.

Unit of quantity.—The electrostatic unit of quantity of electricity is defined as that quantity which, when placed on a small particle at unit distance from a similarly charged particle, repels it with force, the particles supposed to be separated by air. It can be proved by means of the torsion balance that the force between two charges e_1, e_2 , is proportional to their product. Thus if f be the force and r the distance between the charges e_1, e_2 , $f = \frac{e_1 e_2}{K r^2}$ (where K is the specific inductive capacity which has unit value for air). See CONDENSERS.

Electric intensity.—The electric intensity at a point in an electric field is the mechanical force which would be exerted on a small particle charged with unit positive quantity of electricity and placed at the point. The electric intensity must not be confused with the mechanical force between two charged bodies.

Electric potential.—This can be defined as that which measures the condition of the body on which its power of communicating electricity to, or receiving electricity from, other bodies depends.

FIG. 7

From this definition it is at once seen that electric potential is analogous to temp., and to pressure in hydrodynamics. The difference of potential between two points can be defined as the work done against the electric forces in bringing one positive unit of electricity from one point to another, the state of the field supposed to be unaltered by the transference. The potential of any point in space can be defined as the work which must be done in bringing up to the point from an infinite distance a particle charged with unit positive quantity of electricity. Consider the potential at a point P, at a distance r from a charge e at O (Fig. 7). Suppose the charge is positive, and concentrated at a point—O. Join OP and produce to a great distance. Let Q, R, S be points on OP, distant r_1, r_2 , etc., from O. The force at P is $\frac{e}{r^2}$, at Q it is $\frac{e}{r_1^2}$, at R

it is $\frac{e}{r_2^2}$, and so on. Suppose Q, R, S are close together, so that r_1^2 is almost the same as r_2^2 , and both can be put as equal to $r_1 r_2$, and so on. Let v_1, v_2 , etc., be potentials at Q, R, S, etc. Then $v_1 - v_2 = \frac{e(r_2 - r_1)}{r_1 r_2}$, because the work done from R to Q on unit positive charge is equal to the difference of potential and

also to the product of the force and distance. Also $v_2 - v_1 = \frac{e(r_1 - r_2)}{r_1 r_2} \therefore v_1 - v_2$

$= \frac{e}{r_1} - \frac{e}{r_2}$, $v_2 - v_1 = \frac{e}{r_2} - \frac{e}{r_1}$, and so on, adding all such terms together to a point distant r_n from O, we get $v_1 - v_n = \frac{e}{r_1} - \frac{e}{r_n}$. Let Q coincide with P, and let r_n be infinite. Then v_n will be zero and $\frac{e}{r_n}$ will be zero. Therefore the potential

at P is $V = \frac{e}{r}$. Application of the principle of potential gives a concise explanation of many electrostatic phenomena. Take for example electric induction. It was seen that in bringing up a conductor, AB, of cylindrical shape to a positively charged body, C (Fig. 1), the end of the cylinder nearest the charged body became negatively electrified and the other end positively electrified. Now the charged body, C, sets up an electric field, the potential in which diminishes as the distance from A increases. When AB is brought into this field, the end B near C is at a higher potential than A. Thus since AB is a conductor, electricity will flow from the end B to A until the potential is uniform. Thus B becomes negatively electrified and A becomes positively electrified.

It has been shown that the charge resides on the surface of a conductor. The surface density of the charge at any point is that amount of electricity which would cover unit area surrounding that point if the electrification over this area were uniform, and equal to that at the point.

Capacity of a conductor.—It is found that the charge of an isolated conductor is proportional to the potential, i.e. that there is a constant ratio between them. This ratio is termed the electric capacity of the conductor, or it is the quantity of electricity required to raise the potential of the conductor by unity.

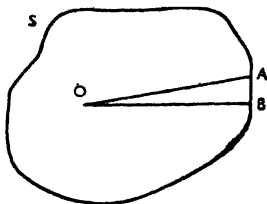

FIG. 8

Gauss' theorem.—Suppose we have an imaginary surface, S, surrounding a charge e , at O (Fig. 8). Consider a small element of area, a , at AB (say). Let N be the electric intensity normal to AB. Then the sum of all the products $N a$ (or $\sum N a$, as it is written) is equal to $\frac{e}{\epsilon}$. If AB is small, the intensity N over it can be

taken as uniform and acts along BO, and is equal to $\frac{e}{OB^2}$. With centre O and radius OB draw a sphere cutting OA in R. The intensity normal to AB is then $\frac{e}{OB^2} \times \cos RBA$. The product of the area and this intensity is (area $AB \times \frac{e}{OB^2} \times \cos RBA$). This is equal to (area $BR \times \frac{e}{OB^2}$), since area BR is equal to (area $AB \times \cos RBA$). With centre O describe any sphere cutting OA in P and OB in Q (Fig. 9). Then area PQ : area $RB = OQ^2 : OB^2$. Therefore area $BR \times \frac{e}{OB^2} =$ area $PQ \times \frac{e}{OP^2}$. This holds for all such elements, AB. Thus ΣaN is the

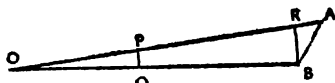

FIG. 9

same for the sphere as for the imaginary area S. But for the sphere N is constant and equal to $\frac{e}{OA^2}$ and Σa is equal to $4\pi OA^2$. Therefore for any surface S surrounding O the product ΣaN is equal to $4\pi e$. The proof can be extended to any number of charges. It can similarly be proved that ΣaN for surfaces not surrounding the charge is zero.

Intensity at a point, P, outside a charged sphere.—Through P draw a sphere radius OP (Fig. 10). The intensity normal to this sphere is everywhere the same and

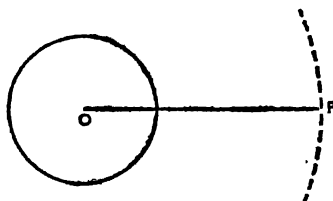

FIG. 10

equal to that at P (f say). Thus ΣaN is equal to $f \times 4\pi OP^2$, and this is equal to $4\pi e \therefore f = \frac{e}{OP^2}$. If σ is the surface density on the sphere, the charge e is $4\pi(OP)^2 \times \sigma$. The intensity at a point very near the sphere is then $\frac{e}{OP^2} = 4\pi\sigma$. This is Coulomb's law. Thus the sphere acts at external points as if its charge were concentrated at the centre. Therefore

the potential, at a point indefinitely near the sphere, and therefore that of the sphere itself, is $\frac{e}{r}$ (r is the radius).

Capacity of a sphere.—The capacity is the ratio $\frac{e}{V}$. Now $V = \frac{e}{r}$. Thus the capacity is r .

Energy of a system.—Suppose a sphere is initially uncharged and a charge, E , is brought up to it in very small amounts, e . Suppose at any time the potential of the sphere were V . The work done in bringing up a charge e would be eV . The potential would be raised to V_1 (say). The work in the next instalment would be eV_1 . Represented graphically we get a diagram as shown (Fig. 11). The total work done is the sum of all the vertical

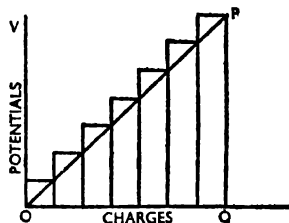

FIG. 11

strips. If e is made very small, the sum of these strips approximates to the area OPQ , i.e. it is $\frac{1}{2}EV$ (where E is the total charge and V the final potential). The energy of a sphere is therefore $\frac{1}{2}EV$.

Lines and tubes of force.—A line drawn such that its direction at any point is in the direction of the intensity at that point is called a line of force. If a tubular region of space be imagined as bounded

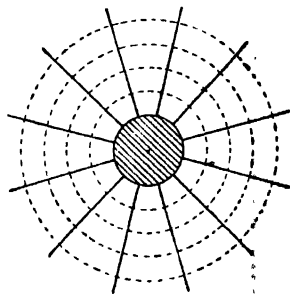

FIG. 12

by lines of force it may be called a tube of force or a Faraday tube. The importance of these tubes of force and the dielectric through which they pass will be

considered under electro-magnetic waves and Maxwell's theory. The lines of force from a positively charged sphere are shown (Fig. 12). The dotted lines are lines of equipotential. An equipotential line is one which passes through all points of the same potential.

Electrometers.—The attracted disk electrometer (Fig. 13) consists of a metal disk, S, which is supported by three fine springs, so that its surface lies slightly about that

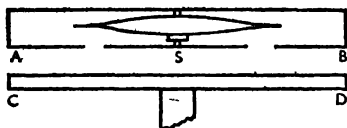

FIG. 13

of a guard ring, AB. The function of this ring is to keep the surface density on S constant, and thus avoid errors usually connected with edges of conductors. Another metal disk, CD, is placed on an insulating stand and parallel to S. It can be moved nearer to S by means of a micrometer screw. In using the instrument the guard ring and disk are connected to earth, and are thus at zero potential. The disk CD is connected to the conductor whose potential is required. The disk OD is moved until the disk S is in the plane of AB. The distance, d , between S and CD can be read off on the micrometer screw. The force, f , required to bring S into the plane of AB is determined, when OD is absent, by placing known weights on S. It can be proved that if V is the potential of CD, $V = \sqrt{\frac{8\pi d^2 f}{S}}$. Thus V can be determined.

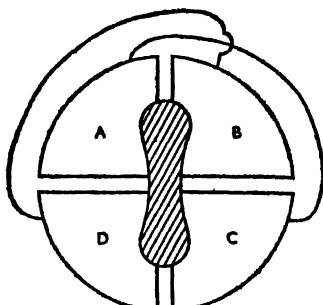

FIG. 14

Quadrant electrometer.—This electrometer was devised by Lord Kelvin and is extremely sensitive. In the simple form a light aluminium disk (called the needle) is supported in a horizontal position by a wire (Fig. 14). Any force tending to displace the needle is opposed by the torsion

in this wire. A shallow metal box divided into four quadrants, A, B, C, D, surrounds the needle. Each of the quadrants is supported on an insulating pillar. Opposite quadrants are connected together. When the needle is in equilibrium and the quadrants uncharged, it lies over the junction line between two quadrants. The needle is charged to a high potential. It still lies over the junction line as before. Any deflection of the needle is noted by the reflection of light from a small mirror attached to it, which reflects the light on to a scale. The position of the spot of light is observed when the needle is in equilibrium. If one pair of quadrants is put to earth and the other connected to the body whose potential is required, the deflection of the spot of light is proportional to the potential. If the opposite pairs of quadrants are connected to two sources of potential, V_1 and V_2 , and if V_1 is that of the needle, which must be great compared to V_1 and V_2 , the deflection of the needle is approximately proportional to $V_2(V_1 - V_2)$. Thus if the deflection is noted for a known difference of potential, a difference of potential producing any other deflection can be ascertained.

(2) **MAGNETISM.**—It was known to the ancients that certain black stones, iron ores, which were found at Magnesia in Asia Minor, possessed the power of attracting to themselves small pieces of iron. Such stones were called magnets. Several centuries later it was found that if a magnet were suspended freely by a thread, it always tended to set in one definite position. One end pointed N, the other S. Thus the magnet became known as the lodestone or 'leading-stone.' Practical use was made of this magnetic property in the formation of the compass needle. It was found that the needle does not point directly N. and S., but in a magnetic meridian, making an angle, called the declination (q.v.), with the geographical meridian. Burrows discovered that this angle changed during a voyage, and Halley in 1863 proved that the changes in declination at sea were not due to the effect of neighbouring land, but to the magnetic properties of the earth as a whole. In 1544 Hartmann discovered that a needle pivoted to move freely in a vertical plane dips down towards the N. when magnetised by a lodestone. Gilbert collected all magnetic phenomena then known into his book, *De Magnete* (1600), and also brought forward the conception of the earth as a huge magnet. Coulomb, with a modified torsion balance, investigated the mutual action of magnets, but it was left to Gauss to prove definitely that the law of inverse squares held for magnetic forces. In 1948 Prof. P. M. S. Blackett directed experiments in coal-mines to discover whether the magnetism of the earth increases or decreases at lower levels. The primary results showed a decrease in Great Britain and S. Africa.

Magnetic phenomena.—A small piece of watch-spring or steel can be magnetised in the laboratory in three ways: (1) Method of single touch; (2) method of double touch (3) electrical method.

Fig. 15a illustrates the method (1). The watch-spring is laid on the table, and one pole of a bar magnet drawn along the whole length of the spring. The process

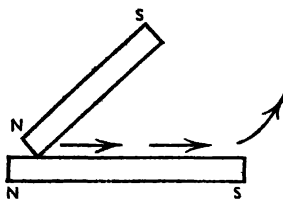

FIG. 15a

is repeated, always starting at the same end. The end at which the process starts has the same polarity as the pole used for magnetisation. Fig. 15b represents method (2). Opposite poles of two equally strong bar magnets are placed close together in contact with the middle of the

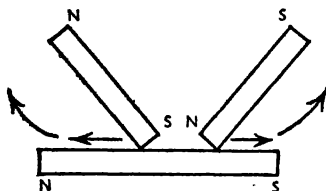

FIG. 15b

spring, and then drawn apart towards opposite ends of the spring. This is repeated several times. The electrical method is of great practical importance. If a wire is wound around a piece of soft iron and a current is passed through the wire, the soft iron becomes highly magnetised. In practice, the soft iron is in the shape of a large horse shoe. To produce a permanent bar magnet a piece of steel is placed across the ends of this large horse shoe and the current is passed through the wire for several short periods. The bar magnet is taken away at right angles to the surface where contact is made. A horse-shoe magnet is made in much the same way. The degree of magnetisation acquired by a piece of steel depends upon the strength of the magnet used in the process. But in every case there is a limit to the magnetisation produced. The steel is then said to be *saturated*. The magnetisation of a piece of steel may be destroyed by strongly heating, or by violent usage. A bar magnet when suspended tends to point N. and S. The end pointing N. is called the north seeking, or simply the north pole, and the other end is called the south seeking or south pole. The line joining

the poles is called the *magnetic axis*. It can easily be shown by two suspended magnets that like poles repel and unlike poles attract each other. Thus we have an analogy to electrostatics. A unit pole is defined as that pole which, placed at unit distance in air from a similar pole, repels it with unit force. The pole is positive or negative according as to whether it is north or south seeking. Unlike electrostatic effects, strong magnetic effects are observed only with iron and a few other materials, and also the force between two poles is practically independent of the medium between them, unless it be iron. Just as electric charges produce electric charges on conductors in their neighbourhood, so a magnetic pole produces magnetic poles on pieces of iron in its neighbourhood. Thus iron filings cling to a pole of a magnet because poles are induced on each filing, and opposite poles of neighbouring filings cling together, often producing long chains. A magnetic pole, or a whole magnet, is the centre of a field of force, the intensity at any point of which is defined as the force that would be exerted on unit positive pole placed at that point. This force is directive, and a line drawn such that the tangent to it at any point is in the direction of the magnetic force is called a line of magnetic force. The form of these can easily be

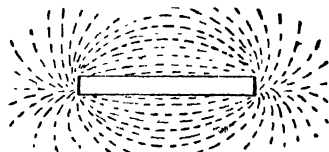

FIG. 16a

seen for a combination of magnets, by placing the combination under a sheet of glass and sprinkling filings on the glass. On tapping the glass the filings arrange themselves along the lines of force. Figs. 16a and 16b show the shape of these lines for a single bar magnet and two magnets respectively.

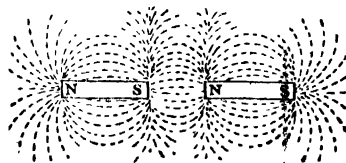

FIG. 16b

Variation of magnetic force with distance.—Gauss showed that the force due to a magnetic pole varied as the inverse square of the distance. Suppose a magnetic needle, AB, is placed at O, at which

point there is an intensity, F (Fig. 17), in an east and west direction. Let NS be the magnetic meridian at O , and H the horizontal component of the earth's field

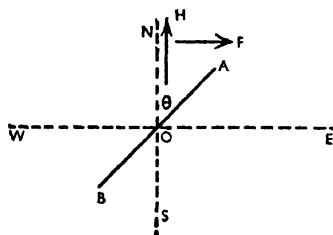

FIG. 17

at O . Let θ be the angle which AB makes with NS . If m is the strength of each pole, the horizontal force on it due to the earth is Hm , and if $2l$ be the distance between the poles, the couple due to the earth is $2mlH \sin \theta$. Similarly, the couple due to F is $2Fml \cos \theta$. Thus we get that $H \tan \theta = F$. $2ml$ is called the *moment*, M , of the magnet. Assume, for the time being, the law of inverse square. Let AB (Fig. 18) be a small magnet, of length $2l$ and pole strength m . Consider the

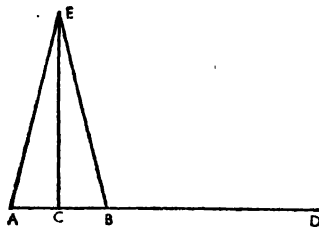

FIG. 18

intensity F , at a point D in AB produced at a distance r from C , the centre of AB .

$$F_1 = \frac{m}{(r-l)^2} - \frac{m}{(r+l)^2} = m \left[\frac{1}{(r-l)^2} - \frac{1}{(r+l)^2} \right]$$

Neglecting terms involving l^2 this becomes

$$F_1 = \frac{2M}{r^3} \quad (\text{where } M = 2ml, \text{ the magnetic moment of } AB).$$

Now consider the intensity at E a point on the normal to AB at C . The forces due to the poles act along AE and EB respectively. The resultant acts through E parallel to AB . The value of the intensity is

$$F_2 = \frac{2m}{(AE)^2} \cdot \frac{AO}{AE} = \frac{2m}{r^2 + l^2} \cdot \frac{1}{(r^2 + l^2)^{1/2}} = \frac{M}{r^3}$$

neglecting terms in $\frac{l^2}{r^3}$.

If we had assumed that the intensity varied inversely as the n th power of the distance, we should have had $F_1 = \frac{nM}{r^{n+1}}$ and

$F_2 = \frac{M}{r^{n+1}}$, i.e. $F_1 = nF_2$. On testing the intensities at D and E with a magnetised needle, it is found that $F_1 = 2F_2$, and therefore the law of inverse squares holds. This proof is due to Gauss.

Interaction of magnets.—It has just been shown that the intensity at a point, F (Fig. 19), due to a small magnet, AD , is $\frac{2M}{r^2}$ where $r = GF$. Suppose M' is the moment of a small magnet, CD , whose centre is at F . If CD is deflected through

FIG. 19

an angle θ , the couple acting on it is obviously $C = \frac{2MM'}{r^3} \sin \theta$ (from the above

deflection of a needle in Fig. 17). The force which AB exerts on the pole m' at C is $\frac{2Mm'}{(r-l')^2}$. The force on the pole $(-m')$ at D is $-\frac{2Mm'}{(r+l')^2}$. Thus the total force of translation is

$$F = 2Mm' \left(\frac{1}{(r-l')^2} - \frac{1}{(r+l')^2} \right).$$

Neglecting squares and higher powers of l , this reduces to $F = \frac{6MM'}{r^3}$. Thus the couples vary inversely as the cube of r , whilst the forces of translation vary as the fourth power of r . By similar processes other positions of AB and CD may be investigated.

Magnetic potential.—The difference in magnetic potential between two points is defined as the quantity of work required to carry unit positive pole from one point to the other. The potential at a point is the work required to bring a unit pole up from infinity to that point. It can be shown just as in the case of an electric charge that the potential due to a pole m

$$\text{is } \frac{m}{r}.$$

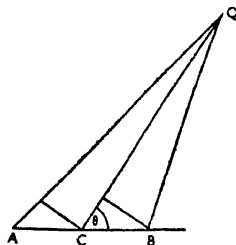

FIG. 20

Potential due to a magnet.—Let AB be the magnet with centre C (Fig. 20); Q

be the point distant r from C and $\angle QCB = \theta$. Thus the potential at Q due to m at A is $\frac{m}{AQ}$, that due to $-m$ at B is $-\frac{m}{BQ}$. Thus the potential, V , due to the whole magnet is

$$V = m \left(\frac{1}{AQ} - \frac{1}{BQ} \right) = m \left(\frac{1}{r + l \cos \theta} - \frac{1}{r - l \cos \theta} \right) = \frac{2ml \cos \theta}{r^2} = M \cos \theta.$$

Magnetic induction.—Magnetic substances like iron become magnetised under the influence of magnetic force. If a north pole were placed near a bar of iron, a south pole would be induced on the end of the bar nearer the pole. Attraction would take place, and the bar of iron would move into a stronger part of the field. If the bar were of bismuth, a north pole would be induced on the end nearer the pole and the bar would tend to move into the weaker parts of the field. Iron is said to be a *paramagnetic* substance and bismuth a *diamagnetic* substance. The magnetisation induced on the bar is measured by the resulting magnetic moment. The *intensity of magnetisation* is the magnetic moment per unit volume. Soft iron becomes more strongly magnetised than steel, i.e. it is more *susceptible* to

their axes in divers directions. When a magnetic force is applied, more and more of the molecules set so that their axes point in the same direction. Contiguous poles of the magnets neutralise each other except at the ends. Thus we have magnetic poles at the ends, and obviously the slight elongation which is observed when a bar is magnetised should be expected. Ewing has modified and improved Weber's theory to a large extent. Magnetic saturation is obtained when all the molecules point in the same direction.

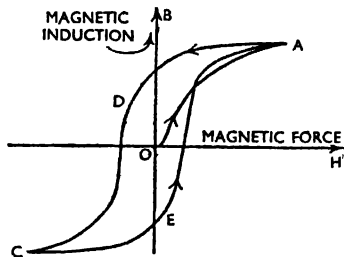

FIG. 22

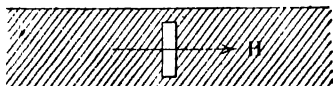

FIG. 21

magnetisation than steel. **Susceptibility** is measured by the ratio of the intensity of magnetisation to the magnetic field. This magnetic field is that field actually within the bar. If a narrow crevasse (Fig. 21) were cut in the iron perpendicularly to the magnetising field H , the force on a unit positive pole placed in this crevasse is defined as the magnetic induction, B . It can be proved that $B = H + 4\pi I$, where I is the intensity of magnetisation. Therefore $B = H(1 + 4\pi K)$ (where K is the susceptibility). The ratio of the magnetic induction in the iron to the magnetic field is called the *magnetic permeability*, μ .

$$\therefore \mu = 1 + 4\pi K.$$

If a bar of iron is placed in a magnetic field, which is gradually increased in intensity from zero, it is found that the relation between B and H , when plotted, gives a curve such as OA (Fig. 22). When the magnetic force is reduced, the relation between B and H does not give the curve AO , but another curve such as ADC . In fact, the iron may be taken through a cycle such as $ADCEA$. The name of *hysteresis* has been given to this phenomenon. The iron seems to retain its induction.

Theories of magnetisation.—Weber suggested that an iron bar consists of a vast number of magnetised molecules. When it is unmagnetised, these molecules have

Terrestrial magnetism.—The declination can be found by suspending a magnet and thus finding the direction of the magnetic meridian. If the direction of the geographical meridian is known at the place of experiment, the declination is easily determined. The dip is found by means of an instrument called the dip circle. This in essence is a magnetised needle suspended so as to revolve freely about a horizontal axis. The angle of dip, i.e. the angle the needle makes with the horizontal, is read off on a circular scale. For the corrections to be applied in the use of the dip circle and declinometer, the reader should refer to larger works.

To find H .—We know that a bar magnet produces a field of intensity $2M$ at a point end on to it, and at a distance r . Thus a compass needle will be deflected through an angle θ , where $2M = H \tan \theta$, if placed at the point.

Thus we have one relation between H and M . If now the bar magnet is suspended so as to be in a horizontal position and it is allowed to oscillate, its period can be

proved to be $2\pi \sqrt{\frac{k}{MH}}$ (where k is the moment of inertia of the magnet). Thus we have a second relation between M and H , if the period is accurately determined. Thus we can find M and H . The dip and the declination and H are now known. It is then easy to determine the vertical component of the earth's field and the total intensity I (say). For $I = \frac{H}{\cos i}$ (where i is the dip) and $V = I \sin i = H \tan i$.

(3) **CURRENT ELECTRICITY.**—About 1786 Galvani noticed that the leg of a frog contracted under the influence of a discharge from an electrical machine. He thought that it was due to some property of the animal. In 1800 Volta showed that this was not so, and also invented a pile known by his name. It consists of a series of little disks of zinc, copper, and paper moistened with brine, placed one on top of the other, starting with zinc and finishing with copper. This is really a primitive primary battery. Faraday was the first to show that the current got from such a pile is the same as an electrostatic current, save that the former is a huge quantity of electricity driven under a small difference of potential, whilst the latter is generally a small quantity of electricity driven under a very large difference of potential.

Electric cells.—See CELL, VOLTAIC.
Magnetic effects of a current.—In 1820 Ørsted discovered that a compass needle was deflected when brought near to a wire through which a current is passing. This

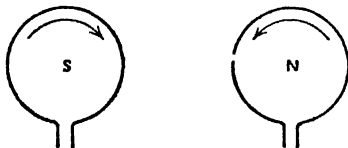

FIG. 23

showed that the current gave rise to a magnetic field surrounding the wire. The following rule of Ampère gives the direction of deflection of the compass needle. Imagine yourself swimming in the wire in the direction of the current and with your face towards the compass needle. Then the north pole of the needle will be deflected towards your left hand. Ampère and Weber experimented on coils, and showed that they acted like magnets of the same shape and size as the coils, and of suitable strength. Thus, a long helical coil, called a solenoid, when suspended so as to swing freely, sets, when a current is passed through it, like a magnet of the same length and shape. As the length of the solenoid is shortened, the length of the equivalent bar magnet is shortened also. Thus, when we have one single turn of wire, the equivalent magnet is a disk magnetised perpendicularly to its plane. Such a disk is called a **magnetic shell**. If this single coil is held so that its face is perpendicular to the line of sight, and if the current appears to pass round the coil in the clockwise direction, then that face will have south-seeking polarity (Fig. 23). The opposite face will have north-seeking polarity. This relation between a magnetic shell and a coil carrying a current holds for a coil of any shape and size, the equivalent shell being of the same size and form as the coil and having its edge coincident with the wire carrying the current. It

has been seen that the effect of a bar magnet at external points depends on its moment. The strength of a shell is defined as the magnetic moment per unit area. The electro-magnetic unit of current can be defined as that current which is equivalent to a magnetic shell of unit strength. If two circular coils carrying currents are placed parallel to each other it is obvious that they will attract each other if the currents flow in the same direction, and repel if they flow in opposite directions. It has been shown that the potential of a magnet of moment, M , is $M \cos \theta$ (where θ is the angle which the

magnetic axis makes with the line joining the point and the centre of the magnet). Let S be the strength of a shell, i.e. magnetic moment, per unit area, i.e. V , the potential at a point, is equal to $S \alpha \cos \theta$ (where α is the area). But

$\cos \theta$ is the solid angle subtended at the point by the shell. Thus $V = S\Omega$ (where Ω is the solid angle). We defined the unit current as equivalent to a shell of unit strength. Thus the magnetic potential due to a coil carrying a current, c , at a point is $V = c\Omega$. Consider a point, P , very near the plane of the coil on the side which has north-seeking polarity, and Q , a point on the opposite side of the plane. The solid angle subtended at P by the coil, or its equivalent shell, is 2π , and that at Q is -2π . Therefore the difference of potential between P and Q is $4\pi c$. Thus the work done in taking a unit pole from P to Q by a path around the edge of the shell is $4\pi c$. If there were a shell actually in place of the coil, we should have to finish the circuit by passing from P to Q through a hole in the shell, and the work already done would be reversed, making the total work zero. In the actual case, there is air between P and Q , and thus there is no discontinuity of force. Therefore, since P and Q are very close together, the work from Q to P is negligible. Thus the work done in taking unit positive magnetic pole around a circuit once is $4\pi c$.

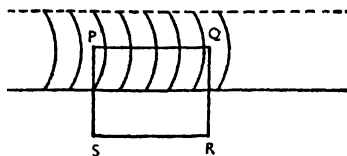

FIG. 24

Force inside a solenoid.—Let a unit positive magnetic pole be taken along PQ (Fig. 24) parallel to and inside the solenoid. Then let it be brought out perpendicularly to PQ between the coils along QR , then along RS parallel to QP , and finally along SP , through the coils, back to P . The work done for each turn

of wire is $4\pi c$; thus, if there are n turns in unit length, the work done is $4\pi ncl$ (where $l = PQ$). The lines of force due to a solenoid are similar to those of a magnet, except that instead of ending at the poles they pass inside the coil. Thus the lines are crowded inside the coil, whereas if the coil is long, the number in the region of RS is small; thus the work done from R to S can be neglected. There is no work done along QR and SP because these lines are normal to the lines of force. Therefore, if H is the intensity inside the solenoid HI is the work done along PQ and is equal to $4\pi ncl$. Thus $H = 4\pi nc$.

Force due to straight current.—Suppose the current is flowing along an infinite straight wire of which AB (Fig. 25) is a portion. Imagine a circle drawn around AB, and a unit positive pole taken around this circle. The lines of force surrounding AB are circles, since the magnetic field of the equivalent shell is perpendicular to the surface. The plane of these circles is perpendicular to AB. The work done in

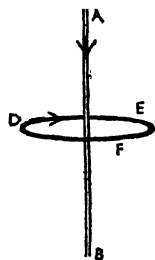

FIG. 25

traversing the circle DEF with the unit pole is $4\pi c$. The intensity H is constant around the path since DEF is a line of force. Thus the work done is also $2\pi rHI$. Therefore

$H = \frac{2c}{r}$ (where r is the radius of the circle). The electro-magnetic unit of current has been defined as that current flowing in a coil which has an equivalent magnetic shell of unit strength. It may also be defined, in a more practical form, as that

current which, flowing in unit length of wire bent into an arc of unit radius, exerts unit mechanical force on a unit positive magnetic pole placed at the centre of the arc. Thus the force at the centre of a circular coil of radius, r , is $\frac{2\pi c}{r}$, and is perpendicular to the plane of the coil. It can be shown that the force at a point P on the normal to the coil, through the centre O, is $2\pi c \frac{r^2}{(r^2 + x^2)^{3/2}}$ (where $x = OP$).

Galvanometers.—The magnetic force produced by currents may be used to measure the intensity of the current. This was at one time done by means of a tangent galvanometer, which consists of a circular coil of wire placed with its plane in the magnetic meridian. If the magnetic field is not wholly that due to the earth, the plane of the coil must contain the resultant magnetic force. At the centre of the coil there is a short magnet which can turn freely about a vertical axis. When no current is in the coil, the magnet will have its axis in the plane of the coil. A current in the coil produces a field at its centre at right angles to the plane of the coil. Let this field be Gc

(where c is the current). G is called the *galvanometer constant*. Thus, if H is the magnetic intensity at the centre of the field when no current is in the coil, the resultant has components Gc perpendicular to the coil and H parallel to it. We have already proved that in such a case the magnet will be deflected through an

angle θ , where $\tan \theta = \frac{Gc}{H}$. Thus we see

that the current is proportional to $\tan \theta$. Hence the name tangent galvanometer. One type of tangent galvanometer has a long thin pointer attached to the magnet and perpendicular to it. This pointer moves over a horizontal circular scale, and thus θ can be read off at once by reading off the deflection of the pointer. This simple type of galvanometer is now obsolete. It is obvious, however, that if H is decreased, the galvanometer is more sensitive. Thus a sensitive galvanometer (devised by Lord Kelvin) carries a control magnet above the coil which can be adjusted to make the field of force at the centre of the coil a minimum when no current is passing in the coil. Also the magnet consists of a few strips of magnetised watch spring fixed on the back of a small mirror which is suspended by a fibre of silk so as to hang with its plane vertical. The angle θ is measured by noting the deflection of the image of a spot of a light reflected from the mirror on to a graduated scale. The sensitiveness of a tangent galvanometer may also be increased by using it in an *astatic* manner. Two small magnets are hung, as shown in Fig. 26, from the same silk fibre so that their axes are in opposite directions. Each magnet is the centre of a coil. These coils are in the same plane, and arranged in series such that the currents in them are in opposite directions. It is obvious that the restoring couple on this system due to H is very small, because the effect on one magnet neutralises that on the other, whilst that due to the force arising from the current is very great.

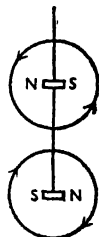

FIG. 26

Sine galvanometer.—This is similar in arrangement to the common tangent galvanometer first described. The coil is first placed in the magnetic meridian. The magnet will also point in this direction. A current is now passed through the coil and the magnet deflected. The plane of the coil is now rotated until it contains the direction of the magnetic axis in its deflected position. If ϕ is the angle of deflection of the magnet, it is easy to show that the current $c = \frac{H}{G} \sin \phi$. Hence

the name sine galvanometer. This instrument is now also obsolete.

D'Arsenval galvanometer.—In this galvanometer the coil carrying the current moves whilst the magnet is fixed. The coil consists of a number of turns of fine wire. It is suspended by very fine metal wires which also serve to convey the

current to the coil. The coil moves between the poles of a horse-shoe magnet, and the field is intensified by a fixed cylinder of soft iron inside the coil. When a current passes through the coil it tends to place itself so as to include as many tubes of induction as possible, i.e. it tends to place itself at right angles to the lines of magnetic induction. The motion of the coil is resisted by the torsion of the wire. Equilibrium is attained when the couple due to torsion just balances that due to the coil's tendency to turn. It can be proved that in such a state the current C is equal to $\frac{k\theta}{BAn}$ (where θ is the deflection, k is a constant, B is the magnetic induction, A the area of the coil and n is the number of turns of the coil). A mirror is attached to the coil, so that θ can be determined with accuracy by the method already mentioned for the sensitive tangent galvanometer or a light pointer is attached to the coil.

Ballistic galvanometer.—A tangent galvanometer may be used to measure the total quantity of electricity passing if the time taken for it to pass is very short. If θ is the throw of the magnet, i.e. the first deflection produced after the electricity has passed, it can be proved mathematically that Q , the quantity of electricity passed through the coil, is equal to $\sin \frac{1}{2} \pi \frac{TH}{nG}$ (where T is the period of swing of the magnet, H the intensity at the centre when no current is in the coil, and G the galvanometer constant). It should be noticed that for the simple tangent galvanometer it has been proved that the force at the centre of the coil when unit current passes in it is $\frac{2\pi n}{r}$. This is, therefore, equal to G .

Soft iron instruments.—Soft iron electro-magnetic instruments may be used in cases where a high degree of accuracy is not needed. Many types are in general use, but the general principle on which they are all based is that a piece of soft iron when placed in a magnetic field which is not uniform tends to move from weak to strong portions of the field. In most instruments the piece of iron is flat and is egg-shaped, and is made so that it can be just inside a coil of wire; when a current is passed through the coil, the iron is sucked further into the coil, and when the current is less, the iron tends to fall to its normal state. The moving portion has the pointer of the instrument fixed to it, and it is controlled by small weights; the instrument has to be carefully fixed so that it is exactly upright, otherwise it will not register truly. A more accurate type of soft iron instrument is described under ELECTRIC CIRCUIT—Measurement of alternating currents.

Electromotive force and resistance.—When an electric current flows along a wire we conceive that electricity is passing, and thus the ends of the wire must be maintained at a permanent difference of potential. This difference of potential is called electromotive force (E.M.F.). The

electromotive force between two points is thus defined as the work which must be done in conveying unit quantity of electricity from one point to the other, against the electric force. We have already defined the electro-magnetic unit of current. The electro-magnet quantity is that quantity of electricity conveyed past a point by an electro-magnetic unit of current in unit time. The electro-magnetic unit of electromotive force is thus defined as the difference of potential which must exist between two points when unit work is done in conveying unit electro-magnetic quantity in unit time. The practical unit of E.M.F. is the volt, which is 10^8 times the electro-magnetic unit. The practical unit of current is the ampere, which is one-tenth of the electro-magnetic unit. In 1827 Dr. Ohm found that the current strength in a wire is proportioned to the applied E.M.F. Ohm verified this by showing that along a homogeneous linear conductor the rate of fall of potential is constant. If C is the current and E the electromotive force, then by Ohm's law $e = kE$ (where k is a constant, and known as the conductivity of the conductor). In other terms $c = \frac{E}{R}$ (where R is a constant, called the resistance of the conductor, which only depends on the nature, dimensions, and temp. of the conductor). It became possible at once to measure two resistances by applying the same electromotive force and comparing the currents produced. The unit of resistance must evidently be defined as the resistance in which unit E.M.F. produces unit current. If electro-magnetic units of E.M.F. and current are employed, the electro-magnetic unit of resistance follows. If practical units are employed, viz. the volt and ampere, then the practical unit of resistance, called the ohm, follows. The ohm is 10^9 times the electro-magnetic unit.

Resistances in series.—Suppose AB, CD (Fig. 27) are a number of conductors joined together in series, the potential of

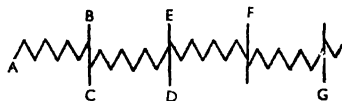

FIG. 27

the end B will be the same as that of C, that of D the same as that of E, and so on. Let E_1, E_2 , etc., be the potential differences between the ends of the different conductors, r_1, r_2 their resistances. The current, c , must be the same for all, since electricity does not accumulate. Therefore $c = \frac{E_1}{r_1} = \frac{E_2}{r_2} = \dots$. If R is the effective resistance of the combination, then $c = \frac{E}{R}$ where $E = E_1 + E_2 + \dots$. Thus $cR = (r_1 + r_2 + r_3 + \dots)c$, $R = r_1 + r_2 + r_3 + \dots$.

Resistances in parallel or multiple arc.—Suppose the beginnings of all the conductors were joined together and all their ends (Fig. 28). They are then said to be in multiple arc. The current, c , flowing

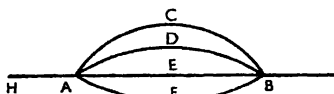

FIG. 28

along HA and in at A, must equal $c_1 + c_2 + \dots$, the sum of the currents in the conductors ACB, ADB, etc. Now $c_1 = \frac{E}{r_1}$, $c_2 = \frac{E}{r_2}$, and so on, since the potential difference between the ends is the same for all the branches, $\therefore c = E \left(\frac{1}{r_1} + \frac{1}{r_2} + \dots \right) = \frac{E}{R}$, if R is the effective resistance of the whole combination. Thus $\frac{1}{R} = \frac{1}{r_1} + \frac{1}{r_2} + \dots$

Kirchoff's laws enable us to apply our results to any complex network of conductors. They are: (1) *The algebraic sum of the currents which meet at any point is zero.* (2) *In any closed circuit the algebraic sum of the products of the current and resistance in each of the conductors in the circuit is equal to the E.M.F. in the circuit.*

Wheatstone's bridge.—Wheatstone made use of a combination, which goes by his name, to determine the ratio of resistances. Suppose the circuit of a voltaic cell

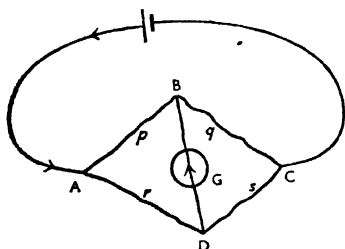

FIG. 29

branches off at A (Fig. 29) into two arms, ABC and ADC, as shown, which rejoin at C. Let the current flow from A to C. Consider a point, B, in the arm of C. Its potential, V_B , must be intermediate between the potential V_A at A and V_C at C. The potential in the arm ADC gradually falls from V_A to V_C as we pass from A to C. Thus there must be some point, D, where the potential is the same as that at B. If now B and D were joined to the terminals of a galvanometer, no current would flow in it. When this is the case, let c_1 be the

current in ABC, and c_2 that in ADC. Let p, q, r, s be the resistances of the parts AB, BC, CD, DA respectively. By Ohm's law, $V_A - V_B = pc_1$, $V_B - V_C = qc_1$, $V_A - V_D = rc_2$, and $V_D - V_C = sc_2$.
 $\therefore V_A - V_B = p$ and $V_A - V_D = r$
 $V_B - V_C = q$ and $V_D - V_C = s$
 but $V_B = V_D$, since there is no current through the galvanometer. Thus $\frac{p}{q} = \frac{r}{s}$.

Thus if the ratio $\frac{p}{q}$ and the resistance, r , is known, we can find s . There are two laboratory instruments based on these principles, the metre bridge and the post-office box. In the metre-bridge a long, thin, uniform wire, AB, is stretched alongside a scale (Fig. 30). The ends are soldered to thick copper bars, AH and BD, of negligible resistance. GE is another thick copper bar. A known resistance, R , is placed in the gap HG, and the unknown resistance, S , in gap ED. A galvanometer is connected to the

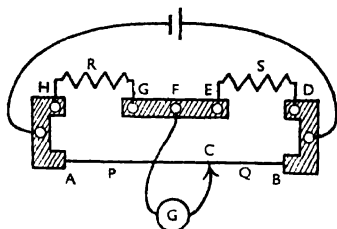

FIG. 30

copper bar, EG (at F), on the one hand, and to a movable jockey, C, on the other. The bars AH and BD are connected to the terminals of a battery. The movable jockey, C, is moved along the wire until no deflection of the galvanometer is noticed. We have then the relation that $R = \text{resistance of AC}$. If the wire is uniform the ratio of the resistances of AC and BC is equal to the ratio of their lengths, which can be read off. A modification of this bridge has been devised by Carey Foster for accurate work. In the post-office box the resistances p, q , and r are all arranged in a box. The arrangement is shown in Fig. 31. A number of brass blocks are connected together, inside the box, by carefully adjusted resistance coils of various values. By inserting a plug between adjacent brass blocks, the resistance that was connecting those blocks is thus cut out. In the actual arrangement the resistances of the arms AC and CB are such that p may be made 10 or 100 times as great as q and vice versa. The resistance in the arm AD may be made anything from 1 ohm to 10,000 ohms. The unknown resistance is inserted between B and D, the galvanometer between D and C, and the battery between A and B. Both the galvanometer connection and the battery connection can be

made or broken by means of the keys K_1 and K_2 , respectively. When no current flows in the galvanometer, when K_1 and K_2 are pressed down in the order named, the relation $\frac{p}{q} = \frac{r}{s}$ holds. Thus S can be

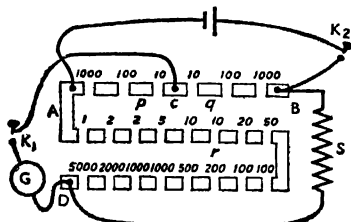

FIG. 31

found with considerable accuracy. The resistance of a galvanometer can be found by inserting it in the arm BD instead of S . No galvanometer is then used in the arm DC, and the resistance r is adjusted until the galvanometer deflection remains unchanged when K_1 is opened and closed. The usual relation holds, where the unknown resistance, S , is that of the galvanometer. With moving coil instruments, however, it is better to clamp the coil of the galvanometer under test, place it in the arm BD and measure its resistance in the usual way with the aid of a second galvanometer in the arm DC. The resistance of a cell also can be found by placing it instead of S in BD and removing the battery in the arm BA.

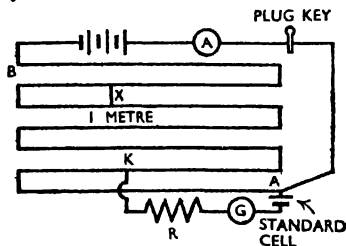

FIG. 32

The Potentiometer is one of the best methods of comparing or measuring potential differences or electromotive forces. It possesses three main advantages over any other method, namely: (a) it is a 'zero' method, i.e. one in which no deflection has to be observed; (b) in measuring the E.M.F. of batteries no current is taken from them; hence the true E.M.F. may be found; and (c) as no current passes through the galvo and battery it gives the accurate measurement of current and resistance facilitating the verification of the accuracy of ammeters and voltmeters. In its simplest form the potentiometer (see Fig. 32) consists of seven wires

of manganin or platino-iridium, each 1 metre in length, the wires being joined in series by thick copper strips. The potentiometer wire is connected in series to indicate any fluctuations in the current during the test. A standard cell (1.434 volts) is connected to the end A; the negative terminal being joined through a galvo (G) a resistance (R) to the sliding contact (K) which is placed 143.4 cm. from A: the difference of potential produced by the battery between A and K tends to send a current through the circuit A G R K while the E.M.F. of the standard cell tends to drive current in the opposite direction, and by adjusting the current in the potentiometer the P.D. between A and K can be made to equal the E.M.F. of the standard cell, and under these conditions no current will flow in the standard cell circuit and no deflection of the galvo will be produced; such a condition is effected by adjusting the jockey X. When this condition of balance is obtained, the resistance (R) is removed to obtain greater selectivity, and X further adjusted to obtain no movement of the galvo. It is clear that the P.D. between A and K is then 1.434 volts, which corresponds to 0.01 volt per cm. length of AK.

Specific resistance.—Imagine a cube of the substance whose edge is 1 cm. The resistance between opposite faces of this cube is called the specific resistance of the substance. It is obvious from the relation between resistances in parallel that the resistance of a wire varies inversely as its cross section.

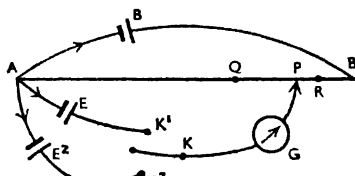

FIG. 33

Comparison of electromotive forces.—Electromotive forces may be compared electrostatically by means of a quadrant electrometer. A more useful method is the potentiometer method, based on the application of Ohm's law. A long thin wire, AB, of high resistance is stretched by the side of a scale (Fig. 33). A constant current is passed through the wire by means of a battery, B. The potential falls gradually and evenly along AB if the wire is uniform. Thus if the cell to be tested, whose E.M.F. must be less than that of B, is connected as shown, a point such as P will be found, which will give with A a difference of potential equal to the E.M.F. of the cell. There will then be no current in the galvanometer when the key K_1 is pressed. Suppose Q was the point found for the cell E_1 , at which no current flowed in the galvanometer. Suppose R is the point found for a standard

cell of known E.M.F. (E'), then the ratio of the E.M.F. of the unknown cell is to that of the standard as $AQ : AR$. Thus we can find the unknown E.M.F. By means of a three-way key, $K'KK'$, the standard cell can be quickly changed for the unknown. The older type of standard cell used in these experiments was the *Clark cell*. It consists essentially of mercury in contact with a paste of mercury sulphate, on which rests a solution of zinc sulphate, kept saturated by the presence of crystals of the salt. In this solution dips an amalgamated rod of pure zinc. A platinum wire dipping into the mercury forms the positive pole of the cell. Nowadays a Weston standard cell is more often used. This is generally similar to the Clark cell, but the zinc sulphate is replaced by cadmium sulphate and the zinc rod by an amalgam of cadmium. A *storage cell*, or accumulator, is usually used for the purpose of obtaining a current. This is described under **ELECTROLYSIS**.

Heating effects of electric currents.—The conversion of energy from an electrical form into that of heat takes place when current flows through a conductor, the incandescent lamp being a particular example, in which case approximately 95 per cent of the power is dissipated into heat and only 5 per cent converted to light energy. The power, in watts, absorbed by a circuit is the product of the current in amps, and the voltage in volts. This may be expressed by the expression $W = EI$. The energy, in joules, absorbed by this circuit in t secs. $= EI = I^2Rt$, since 1 joule = 1 watt second. If no mechanical work is done, all this energy is transformed into heat, and in so doing a certain amount of energy is expended. There is a relation between energy expended and heat produced, and the relation is such that if 4.2×10^7 ergs., i.e. 4.2 joules, of work are done, a quantity of heat is developed sufficient to raise 1 gm. of water 1 centigrade degree. This is known as the calorie or metric unit. The Brit. thermal unit is the Brit. heat unit, and is the quantity of heat required to raise 1 lb. of water through 1° Fahrenheit, and is equivalent to 778 ft.-lb. of work. Now I^2Rt is measured in joules, hence the quantity of heat (H) developed in t secs. in a circuit of which the resistance is R ohms and the current I amps. is given by: $H = \frac{I^2Rt}{4.2} = 0.24 I^2Rt$ calories. This

is known as Joule's law, and the heating effect as Joule's effect. The law may be expressed in words as follows. The heat generated in a simple circuit is proportional to the product of the square of the current, the resistance, and the time in sec. during which the current continues to flow.

Thermo-electricity.—Seebeck found in 1821 that if a circuit consisting of two dissimilar metals be taken and the junctions kept at different temps., a permanent current will flow in the circuit. The two metals are said to form a thermocouple, and the Seebeck effect is now widely used for the measurement of temp. In 1834 Peltier found that when a current was

passed across a junction of two dissimilar metals reversible heating effects occur. Heat is evolved when the current passes one way across the junction and absorbed when it passes in the opposite way. This is called the Peltier effect. From mathematical reasoning we should expect that if a circuit were made of two dissimilar metals and one junction were kept at a constant temp., the E.M.F. in the circuit should increase as the temp. of the other junction increased. It is found, however, that as the temp. of the second junction is gradually raised, the E.M.F. increases to a certain limit, then decreases again, and is finally reversed. Lord Kelvin found that when a current flows along a wire of which the temp. varies from point to point, heat is liberated at a given point in the wire when the current is flowing in one direction, and absorbed when the current is in the opposite direction. This reversible heating effect is known as the Thomson effect, and can be applied to explain the discrepancy alluded to above. For a fuller account of the Peltier and Thomson effects and their mathematical treatment, the reader should consult standard works on electricity.

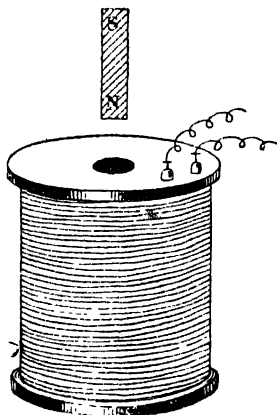

FIG. 34

(4) **ELECTRO-MAGNETIC INDUCTION.**—Faraday was the first to discover the phenomenon of electro-magnetic induction. The following are practically the same experiments that Faraday performed. Take a cylindrical coil consisting of many turns of fine wire wound on a hollow reel (Fig. 34). Connect the ends of the coil to a delicate galvanometer. Bring the N. pole of a magnet rapidly towards one end of the spiral. The needle of the galvanometer will be deflected in one direction. Now suddenly withdraw the magnet again. The needle is deflected in the opposite direction. It can be seen that the deflection is not permanent, but only takes

place just as lines of force are being introduced into, or taken away from, the coil. It can be shown that the current induced is also proportional to the rate at which the magnet is introduced. Now, instead of the magnet, use a coil wound on a thin cylinder through which a steady primary current is flowing. It will be seen that when this primary coil is introduced deflection of the galvanometer needle takes place, and when it is withdrawn a deflection in the opposite direction occurs. It can also be noted that a current is induced in the coil, which is called the secondary coil, in the same direction as the primary current whenever the number of tubes of magnetic induction threading the secondary circuit is *diminished*, and in the contrary direction if the number is increased. Thus attraction will occur between the coils when the tubes are diminishing, that is, when the primary coil is being removed, and repulsion when it is being brought nearer the secondary coil. Thus the induced current is such that it tends to stop the motion producing it. This is Lenz's law. Faraday, from the result of his experiments, explained the action of Arago's disk. This consists of a compass needle placed above a horizontal copper disk which is rotating in its own plane. It is found that the needle moves with the disk. Faraday stated that by the motion of the disk relative to the needle, eddy currents were induced in the disk, and these were such that they tended to stop the relative motion of the needle and disk. Thus the needle is dragged around with the disk. It is found that currents are produced in the secondary coil when the current in the primary coil is suddenly stopped or commenced. Faraday showed experimentally with his apparatus that the induced current in the secondary coil is proportional to the *rate of change* of the number of tubes of force threading the coil. It has been proved mathematically and demonstrated experimentally that the induced E.M.F. is the rate of decrease of the tubes of magnetic induction threading the secondary coil.

Coefficients of induction.—The number of tubes of magnetic induction which thread a circuit when unit current is flowing round it is called the coefficient of self-induction of the circuit. It is obvious that when the current is stopped, these tubes suddenly diminish. A current is then induced in the primary coil itself such that it tends to prolong the primary current. When the current is started the induced current in the primary coil tends to prevent the current starting. The number of tubes of magnetic induction threading a circuit when unit current passes through another is said to be the coefficient of *mutual* induction of the two coils. We know that the field inside a solenoid when unit current is passing is $4\pi n$, where n is the number of turns per unit length. The area of a single turn is πr^2 , and thus that of n turns is $\pi r^2 n$ (it is the length of the solenoid). Thus the self-induction of the solenoid is $4\pi n^2 r^2 l$. This discovery of electro-magnetic induction has led to vast progress in electric

machines. Practically all modern electrical machinery depends on the induction of currents.

The *Ruhmkorff induction coil* enables us to obtain an intermittent current at high voltage from a low voltage direct current. The primary coil, P (Fig. 35), consists of a few turns of *thick* copper wire. The secondary coil, S, is wound over the primary, and consists of a vast number of turns of very fine wire. Both the coils are wound on a bundle of soft iron rods, A.B. The primary current, which is supplied by a cell or number of cells, C.D, is

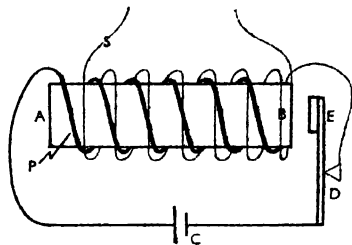

FIG. 35

broken at frequent intervals of time. One method of doing this is as follows: One terminal of the primary coil is connected to a fixed platinum stud, D, the other terminal to a spring which carries a piece of soft iron, E. When the spring is unbent it touches the stud D and a current passes in the primary. The core of soft iron becomes magnetised and attracts the soft iron disk, E, thus breaking contact at D. The current is stopped, and the core immediately becomes unmagnetised, the spring flies back and contact is again made. The process is then repeated. When the contact in the primary is broken, a current flows in one direction in the secondary coil, when it is made the current flows in the opposite direction in the secondary. Thus an alternating current of high voltage is set up in the secondary. In practice a condenser (not shown in the diagram) is connected between C and D, and in parallel with the spark gap at D. One function of this condenser is to suppress sparking at the gap, and it causes the decay of current in the primary coil to be much more rapid than its growth, with the result that the intermittent current in the secondary is practically a unidirectional one.

(5) **ELECTRO-MAGNETIC WAVES AND MAXWELL'S THEORY.**—Faraday was the first to consider the dielectric as the seat of all electrical processes. Suppose we have an alternating current in one circuit inducing an alternating current in a secondary circuit at some distance away. To originate a current in a conductor means expenditure of energy. We believe in the conservation of energy, so that if energy disappears at one place and reappears at another, it must have passed

through the intervening space, and existed there somehow in the meantime. A wave motion of some kind is suggested, and a vehicle is necessary to convey those waves. It is known that the propagation of light is a wave motion, and the vehicle necessary for this propagation is the ether. Maxwell, in his theory, declared that it was not philosophical to fill all space with a new medium for every new wave motion that appears. Thus if it could be shown that some property of the medium necessary to convey electro-magnetic waves is identical with some property of the medium necessary for conveying light waves, we should have strong reason for believing that the medium was identical for both phenomena, and that light is an electro-magnetic phenomenon. Thus, says Maxwell, if we can prove that the velocity of electro-magnetic waves is the same as that of light, we should have strong reason for stating that light was an electro-magnetic phenomenon.

Mode of propagation of electro-magnetic disturbance.—Let A and B (Fig. 36) be the two vertical armatures of a plate condenser. Faraday conceived the idea of

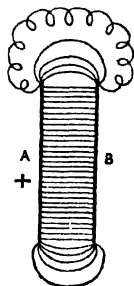

FIG. 36

tubes of force which passed from the positive armature, A, to their negative armature, B. These tubes are horizontal except near the ends, when they are curved as shown. Each tube has a positive charge at one end and a negative charge at the other. Faraday showed that if these tubes were supposed to be in a state of tension and also to exert a lateral force one on the other, then all phenomena of the electric field could be explained. Suppose that A and B were suddenly connected near the top by a wire, the plates would be discharged. There would be a flow of positive electricity up one plate and of negative electricity up the other. As the process goes on the tubes move parallel to themselves towards the wire with a definite velocity. They contract into the wire and disappear. The motion of these tubes gives rise to magnetic force and induction in the medium between the plates. From mathematical analysis Maxwell showed

that the velocity, v , of the tubes of force is equal to $\frac{A}{\sqrt{K\mu}}$ (where A is the ratio o

an electro-magnetic unit of current to the electrostatic unit, K is the specific inductive capacity of the medium, and μ its magnetic permeability). Maxwell stated that this velocity is that of an electro-magnetic disturbance in this medium, and obtained the same expression by other modes of analysis. Thus in air for which K and μ are each unity, the velocity of an electro-magnetic wave should be A. It has been proved by experiment that A is very closely equal to the velocity of light. Thus Maxwell's theory of light is considerably strengthened. Again, the ratio of the refractive indices of two substances (see LIGHT) is the ratio of the velocity of light in the two media. From Maxwell's

theory this ratio should be $\frac{\sqrt{K_2}}{\sqrt{K_1}}$, i.e.

inversely as the square roots of the specific inductive capacity. Experiment has shown that for electro-magnetic waves of frequencies comparable to those

of light the ratio $\frac{\sqrt{K_2}}{\sqrt{K_1}}$ does approximate

to the ratio of the refractive indices. Besides this, Maxwell's theory is the only theory that explains all observed phenomena in light.

Electric waves.—About thirteen years after Maxwell pub. his theory, Hertz made known the fact that he had produced and detected electro-magnetic waves, and also that their velocity was approximately that

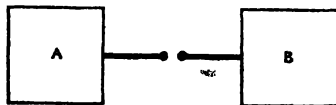

FIG. 37

of light. It can be shown that the discharge of an electrified system of capacity, C, through a circuit of self-induction, L, is oscillatory and of period $2\pi\sqrt{LC}$. The oscillations, however, rapidly die away. It is known that a vibrating tuning fork held near an open pipe will throw the air column into vibration, and elicit a note from the pipe if the length is adjusted so that its period is the same as that of the fork. In a similar way an oscillating discharge in a circuit will produce an electric oscillation in another circuit which possesses the same periodic time. It was on this principle Hertz worked. Fig. 37 shows the simple vibrator used by him. It consists of two brass plates, A and B, to each of which is attached a stiff wire carrying a brass knob. These are gilt and placed about two or three millimetres apart, so that when A and B are oppositely electrified a spark passes. Electric oscillation is set up, the spark passing back and forth from A to B. The time of each oscillation in Hertz's experiment was about

of the charge, induced currents appear in neighbouring conductors, and if the periodic time of oscillation in one of these should happen to be the same as that of the vibrator, the oscillations induced in it will become multiplied, and may attain

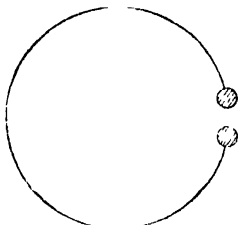

FIG. 38

considerable intensity. The resonator made by Hertz (Fig. 38) consisted simply of a circle of wire, the ends terminating in brass knobs, whose distance apart could be adjusted. The length of the wire was such that its period was the same as that of the vibrator. When the vibrator is in action the induced current swings backwards and forwards in the circle from one knob to the other, and finally attains such a strength that sparking actually occurs between the knobs. For testing the laws of reflection and refraction of waves

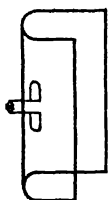

FIG. 39b

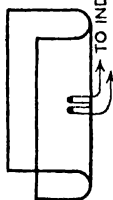

FIG. 39a

Hertz used more delicate apparatus. He concentrated the radiation by use of zinc reflectors bent to the shape of parabolic mirrors. By connecting the knobs of the vibrator to an induction coil continuous sparking takes place. There is then no need for the plates A and B. Figs. 39a and 39b show the vibrator and resonator respectively. With this apparatus he proved that electro-magnetic waves are reflected from the walls of a room. He also had a huge prism made of pitch, and found that the waves were refracted by it. He determined the index of refraction and

found it to be 1.69. The index of refraction of pitch for light waves is between 1.5 and 1.6. The discrepancy is due to the fact that the wave length for electro-magnetic waves is very great compared to that of light, and an agreement can hardly be expected. Hertz placed the receiver in front of a huge sheet of zinc, from which waves from the vibrator were being reflected. By investigating the field in front of the zinc with his resonator he showed that stationary waves were being produced. He was able to find the wave length of the disturbance for a known period of the vibrator. Thus he found the velocity of the electro-magnetic waves and found that it was approximately that of light. He also demonstrated the polarisation of these waves; in fact they behave in all ways like light waves. All these experiments of Hertz go to support Maxwell's theory in a striking way. Practical application of Hertz's results has been made by Marconi and others in wireless telegraphy (q.v.).

(6) ELECTROLYSIS.—In 1800, just after the announcement of the discovery of Volta's pile, Nicholson and Carlisle found

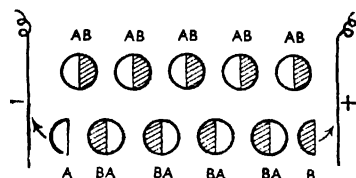

FIG. 40

that if two brass wires leading from the terminals of the pile were immersed near each other in water, hydrogen gas was evolved from one wire whilst the other was oxidised. If platinum wires were used oxygen gas was evolved from the second wire. Also they noticed that the volume of hydrogen was twice that of oxygen. Thus they said that the phenomenon was one of decomposition of water. Soon after this, the chlorides of magnesia and soda were decomposed by the passage of an electric current, and also silver and copper were precipitated from their solutions, an observation which led to the process of electroplating, *see under METALLURGY*. In 1807 Davy obtained potassium and sodium from moist potash and soda by passing a strong current through them, thus laying the foundation of the practical method of obtaining these metals (*see ELECTRO-CHEMISTRY*). The fact that the products of decomposition appear only at the poles was made the basis of a theory of electrolysis by Grotthuis in 1806. Suppose we have a solution of a compound which contains the elements AB (Fig. 40). A molecule of the substance near the positive pole is decomposed into its two atoms A and B. The B atom is set free. The A atom attacks the next molecule, annexing the

B atom to form a new molecule and liberating the A atom which attacks the next molecule, and so on. The last molecule on the chain is attacked and gives up its B atom to the attacking A atom. The A atom thus set free has not another molecule to attack and thus is set free at the negative pole. Thus it is obvious on this theory that the quantities of the elements evolved at the poles are in the same ratio as they occur in the compound. Grotthaus' theory is now known to be incorrect, and modern work is based upon ideas put forward in 1887 by Arrhenius (see ELECTRO-CHEMISTRY, and the article ELECTROLYSIS). Faraday called the poles electrodes, and named the electrode by which the current entered the liquid the anode, and that by which it left the liquid the cathode. He called the liquid through which the current passed the electrolyte. Faraday set to work to determine the relation between the amount of chemical decomposition and the strength of the current. He first showed that when several cells of acidulated water were placed in series and a current passed through, the amount of chemical action was the same in each, even if the electrodes in the various cells were of different metals and of different sizes. He also passed the current through one cell, and then through two in parallel. The amount of chemical decomposition in the first cell is equal to the sum of that in the other two. Faraday so framed his first law, which states that 'the amount of decomposition is proportional to the quantity of electricity which passes.' Thus an apparatus for the decomposition of water can be used to measure quantity of electricity. Such an apparatus is called a *voltameter*. Faraday then examined the amounts of different metals deposited from their solution by the same current and formed his second law, that 'the quantities of substances which separate at electrodes are proportional to the whole amount of electricity which passes and to the chemical equivalent weights of the substances.' The amount in grammes of a substance which is deposited by a current of one ampere flowing for one second is called the electro-chemical equivalent of the substance. The ratio of the electro-chemical equivalents of two substances is the same as that of their chemical equivalents. It has been proved experimentally that Ohm's law is obeyed by electrolytes. The electrolytic cell is placed in the fourth arm of a Wheatstone's bridge arrangement. Owing to polarisation a direct current cannot be used. But if an alternating current is used the effects of polarisation are overcome, because the gas deposited on an electrode by the passage of electricity in one direction is immediately removed by its passage in the opposite direction. An ordinary galvanometer cannot be used to detect an alternating current. A telephone is used instead. The alternating current produces in the telephone a buzzing sound which is a minimum when the current is a minimum. The alternating current is obtained from a small induction coil. It is

found that for very dilute solutions the conductivity (reciprocal of the resistance) is proportional to the concentration.

Theory of voltaic cell.—The source of energy of a voltaic cell is the chemical action. For example, in a Daniell cell there is a solution of zinc in sulphuric acid and liberation of copper from copper sulphate. Energy is evolved in the first action and absorbed in the second. The difference goes to provide energy for maintaining the current and doing external work. The work done by a cell giving a current c is Ect where E is the E.M.F. and t the time. If we know the electro-chemical equivalents of zinc and copper we can determine the amount of zinc dissolved and the amount of copper deposited in time, t , by a current, C . A knowledge of chemistry gives us the data for the amount of energy evolved by the solution of this amount of zinc and deposition of this amount of copper. Thus it is possible to calculate E . The calculated values agree closely with observed

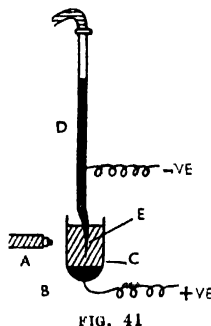

FIG. 41

values of E . The exact seat of the potential difference was debated by physicists for years. Volta located it at the junction of dissimilar metals, Faraday at the junction of the metal and electrolyte. It has been shown by experiment that there is a potential difference between the metal and electrolyte. One instrument used is the capillary electrometer (Fig. 41). It consists of a glass tube, D , drawn out to a fine capillary tube at E . This tube, D , is partially filled with mercury and dips into the electrolyte in a vessel, C . In the bottom of the vessel is placed some mercury, B , which is connected to one terminal of a cell. The mercury in D is connected to the other terminal of the cell. Thus an E.M.F. is applied in the surface between the mercury and the electrolyte. This E.M.F. is adjustable. The surface tension of the area of contact of the mercury and solution at E is affected by its electrical state. There is a certain E.M.F. due to the contact of these liquids. As the applied E.M.F. is gradually increased, having the mercury in D at a

lower potential than the electrolyte, the surface tension of this layer increases, and the mercury in D must be raised to keep the level of mercury in E the same. This is viewed through a microscope, A. As the applied E.M.F. is increased the level in D must be raised till it reaches a maximum, and then it has to be lowered again. The value of the applied E.M.F. at the turning point of the level of mercury in D is equal and opposite to the contact E.M.F. between mercury and the electrolyte. The result of experiments with this electrometer favours the view that the E.M.F. of a cell is the sum of the contact differences of potential between its electrodes and the acid. Polarisation can be explained on this contact potential theory. If the electrodes are platinum and the electrolyte sulphuric acid, hydrogen forms a film on the cathode, and oxygen a film on the anode. The difference of potential of the film of hydrogen and the acid is greater than that between the acid and oxygen. Thus a current tends to flow in the opposite direction to the direct current.

Accumulators.—Suppose an E.M.F. greater than the ordinary E.M.F. of a Daniell cell is applied to it in the opposite direction to its natural E.M.F., a current would flow in the reverse direction, and the chemical actions would be reversed. Such a cell is said to be reversible. Any reversible cell can be used as an accumulator. The usual method is to take two grids of lead as electrodes in sulphuric acid, and to pass a current between them. Hydrogen is evolved at one grid, and a layer of insoluble oxide formed at the other. If left to itself now, a reverse current will flow, and lead sulphate will be formed at both the anode and cathode, until the solutions surrounding them are of equal strength. On recharging, the lead sulphate at the cathode is reduced to spongy lead, whilst lead oxide is formed at the anode. The cell is allowed to discharge again. This process is repeated until a large quantity of spongy lead is obtained. The accumulator is then ready for use. It is charged by connecting to a powerful source of potential difference. It will then give a current for some time without appreciable loss of E.M.F. See (elementary). W. C. Badcock and E. J. Holmyard, *Electricity and Magnetism for Beginners*, 1931; R. J. Mitton, *Electricity and Magnetism*, 1937; (advanced), M. Faraday, *Experimental Researches in Electricity*, 1839–55; J. Clerk Maxwell, *Electricity and Magnetism*, 1873; J. J. Mott and others, *Magnetism*, 1938; L. F. Bates, *Modern Magnetism*, 1939; C. L. Boltz, *Electricity*, 1948. See also CELL, VOLTAIC; GALVANOMETERS; ELECTRO-CHEMISTRY.

Electro-chemistry deals with chemical changes brought about by the expenditure of electrical energy, and with the production of electricity from the energy transformed during a chemical change. In this short article it will be impossible to deal with the theoretical questions of E.C. in more than brief outline. The methods of preparation of substances by means of electrolysis of solutions at moderate fusion temp. will be considered and also some of the recent applications of electrical methods to chemical analysis and synthesis. For the refining of metals, electro-plating, electro-deposition, and high-temp. furnaces, see METALLURGY. (For the production of electricity see CELL, VOLTAIC; ACCUMULATOR, etc.) There are three main methods by which electrical energy can be made to effect chemical changes.

(1) *By electrolysis of electrolytes.*—Solutions of salts, acids, and bases (e.g. alkalis) conduct electricity, at the same time undergoing decomposition, into the metal and the acid radical, hydroxyl, or halogen; the metal being produced at the cathode and the acid radical at the anode. Water is the solvent generally employed, but for organic substances, alcohol or benzene, etc., may be used. When hydrochloric acid is electrolysed, we have hydrogen liberated at the cathode and chlorine at the anode. Here the primary products of the action are liberated, i.e. H and Cl. Sometimes, however, these products react in the solution. This is the case with potassium hydroxide (KOH). The primary products are potassium and hydroxyl, but unless special methods of prevention are attempted, the products obtained are hydrogen and oxygen, the liberated potassium reacting on the solution at the cathode to give hydrogen according to the equation $2K + 2H_2O = 2KOH + H_2$, while the hydroxyl decomposes to water and oxygen and hydrogen are called secondary products of electrolysis. Grotthaus (1805) evolved the theory that the current first decomposes the molecules of the electrolyte before electrolysis occurred, and this theory was universally accepted until 1887, when the results of Van't Hoff's work on osmotic pressure of solutions was pub. Van't Hoff showed that for dilute solutions the dissolved material was subject to laws similar to those governing the volume and pressure of gases, and as a result of this the theory of Grotthaus lost ground. Arrhenius (1887) advanced the theory of the dissociation of the electrolyte in solution into ions; i.e. atoms or groups of atoms carrying charges of positive and negative electricity. The dissociation is not brought about by the electric current, but the ions exist in the solution irrespective of whether a current flows or not. This theory, together with the discovery of the migration of the ions towards the electrodes, forms the basis of the modern explanations of electrolysis (see SOLUTIONS). The laws of Faraday state that the amount of decomposition is proportional to the quantity of electricity passed through the

solution. Losses by secondary reactions may reduce this theoretical yield and hence the current efficiency of a cell is expressed in terms of the proportion of the actual yield to the theoretical. Again, when an electrolyte is being decomposed by an electric current, a counter E.M.F. is set up in the decomposition cell, and hence the effective E.M.F. is the difference between the total and the counter E.M.F. In order, therefore, to produce an electrolytic deposit the decomposing current must have a higher E.M.F. than that which is set up in the decomposition cell. Thus $E - e = CR$, where e is the counter E.M.F. and R is the total resistance. Also

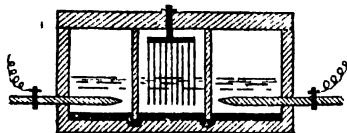

$R = \frac{d}{a} \times \text{specific resistance of the electrolyte}$, where d and a are the distance apart and the area of the electrodes, respectively. For economical working the resistance R must be made as low as possible, therefore the electrodes are set as closely as working conditions permit and are of large area. The specific resistance must also be kept low and this is found to diminish with rise of temp. in the solution, and with increase of the strength of the solution (within certain limits).

Electrodes and cells.—The negative electrode at which the metal is liberated may be of iron, lead, or copper, while the positive electrode may be carbon, platinum, or platinum-iridium alloy with 15 per cent iridium. Cells are made of various materials dependent on the nature of the solution. Wooden cells coated with pitch are used with acid liquors, or lead tanks in the case of H_2SO_4 , while stoneware is used for alkaline solutions. Some few processes and technical cells will now be described.

Sodium by Castner's process.—The method consists in the electrolysis of fused sodium hydroxide, contained in an iron pot. The products of the electrolysis are oxygen, hydrogen, and sodium. The sodium floats on the surface of the molten caustic and is removed from time to time with a perforated ladle which allows the caustic to drain through. The escape of oxygen and hydrogen in this process represents so much waste electrical energy, and attempts have been made to obtain the metal from the fused chloride. Borchers's apparatus is then used, which consists of a U-tube made in two parts, a narrow limb of iron and a broad limb of fireclay. The narrow limb itself is anode, and the sodium produced there flows down a side pipe to a receiver. The chlorine evolved at the anode is led by a pipe to a receiver and used for the manuf. of bleach. The practical difficulties to overcome when using the fused chloride are serious, owing to the higher temp. required and also to the corrosive action of the liberated chlorine.

Brine cells.—The first products of the electrolysis of brine are chlorine at the anode, and alkali hydroxide at the cathode. If these products are required, they must not be allowed to mix; while if hypochlorite, chlorate, or perchlorate are required, the chlorine and hydroxide must be allowed to react with one another.

Castner's process.—A rectangular tank is used, which is divided into three compartments by two non-porous partitions dipping into narrow gutters of mercury which covers the bottom of the tank. The two outside tanks contain brine, in which are gas carbon anodes, while the centre one contains water and an iron grid, which acts as the cathode. The alkali metal is electrolysed into the mercury in the anode compartments, and is electrolysed out in the cathode compartment. In the cathode compartment the mercury amalgam acts as the anode and hydroxide is formed. The whole cell is slowly rocked, causing the mercury to flow from one compartment to another, and so the liberated alkali metal is brought into contact with

ELECTRO-CHEMISTRY: CASTNER'S PROCESS

the water. The chlorine is led off by tubes at the top of the anode compartments to bleach chambers. With a 30 per cent solution at $40^\circ C.$, and a current density of one ampere per sq. cm., the current yield of hydroxide is 90 per cent.

Hargreaves-Bird cell.—This consists of a cast-iron box, divided into three compartments by two asbestos diaphragms made in copper gauze, which forms the cathode. The anode compartment through which brine circulates is the space between the diaphragms, and the anode is a row of gas carbons. No liquid is in the cathode compartment except that which percolates through the diaphragm. Carbon dioxide and steam are blown through the two outer compartments and convert the hydroxide formed on the diaphragm to sodium carbonate.

Hypochlorite cells.—Of these the Kellver cell is one of the simplest. It consists of a glazed stoneware vessel divided into compartments by glass plates which fit into grooves on the side of the cell, and around which is wound platinum-iridium wire. These form the cathode on one side of the plate and the anode on the other. The solution enters through holes in the bottom of the cell and the liberated chlorine and hydroxide react to give hypochlorite which flows out at the top of the cell in a cooling vessel. The solution is treated in the same manner several times until the strength is great enough.

Chlorate cells.—These do not differ materially from hypochlorite cells. Earlier cells, however, used a diaphragm to prevent reduction of the hypochlorite from which the chlorate is produced. Reduction can be avoided now by the use of potassium chromate without the use of a diaphragm. The solution flows continuously through the cell, the flow being

regulated so that the temp. is about 50° C. The percentage of chlorate in the solution is about 3 per cent, and it is crystallised out in cooling vats. Similar cells are used for perchlorates; no description of a special cell has been pub.

Oxygen and hydrogen.—Simple electrolysis of acidulated or alkaline water yields oxygen and hydrogen. Cells are used with iron electrodes placed close together. An E.M.F. of 2½ volts is generally used, and the gases are drawn off under hoods or bells and compressed into cylinders. Many other chemical substances are now prepared by electrolytic methods, e.g. per-sulphates, sodium, peroxide, and organic compounds.

(2) *By electrical discharges through gases*—The fixation of nitrogen by means of electricity has claimed much attention during recent years. When an electric spark is passed through air, nitric oxide is the main product. The reaction is a reversible one, but due to the researches of Nernst and Haber the conditions for the reaction $N_2 + O_2 \rightleftharpoons 2NO$ are well known. It was found that the best yield of nitric oxide is obtained by using a cool high tension arc and reduced pressure, so that little decomposition of the gas takes place. Electrical plants have been estab. in Germany, where air is treated at the rate of about 75,000 litres per min., the yield of nitric acid obtained being 57 grams per kilowatt hr. The production of ozone from oxygen is illustrated in the Siemens-Halske ozoniser. In this, air is subjected to the action of a silent electrical discharge (actually pressures of over 4000 volts are employed) after being dried with calcium chloride. The ozonised air is then used for the sterilisation of water by forcing it against a stream of water to be treated, as it drops down a tower.

(3) *By the production of high temperatures* (Electrothermal). Various electric furnaces have been designed towards this end (see METALLURGY). Carborundum, calcium carbide, graphite (from anthracite), carbon disulphide, and steel (from pig iron) are made by reactions effected by the heat produced in electro-thermal reactions. Other applications of electricity include the settling of dust in gases, and the drying of peat, by using the principle of electro-osmosis (see OSMOSIS).

Electro-chemical analysis.—Four different methods of quantitative analysis are in use, viz.: (1) Potential measurements for determining the concentrations of ions too dilute for gravimetric calculation; (2) conductivity measurements for determining concentrations; (3) titration with a galvanometer in place of an ordinary indicator, and (4) ordinary electro-analysis in which the metal is deposited on a platinum electrode and weighed. The electrolytic method is widely employed, and consists in depositing by electrolysis the substance to be determined on one of the electrodes in a form that can be easily weighed. Metals are deposited in the pure state on the cathode or amalgamated with a mercury cathode. Lead and manganese are deposited as peroxide on the

anode. Using a silver anode, chlorine, bromine, and iodine may be obtained and weighed as chloride, bromide, or iodide of silver. See H. J. S. Sand, *Electro-chemistry and Electro-chemical Analysis*, 1939-41.

Electro-chronograph, see CHRONOGRAPH.

Electrocution, method of inflicting the death penalty by means of a high voltage current passed through the body. First used in U.S.A. in 1888, it is supposed to be less revolting than any other form of cap. punishment (*q.v.*).

Electro-deposition, see METALLURGY.

Electrolysis. Substances behave differently towards the electric current. Some, such as the metals, are conductors of it, while others, like sulphur, are non-conductors. Conductors are divided into two classes. To the first class belong the metals. The passage of an electric current through such conductors is accompanied by a rise in temp., but no other change is evident. Conductors of the second class are chiefly aqueous solutions of acids, bases, and salts, or substances in a state of fusion. When the current traverses these liquids, simultaneously with the conduction of the current, they undergo chemical change, their components being chemically separated. This phenomenon of decomposition by the electric current is termed 'electrolysis,' and the liquid conductors which show it are called 'electrolytes.' The conduction of the current in an electrolytic solution is accompanied by a mechanical movement of the parts of the dissolved substance. These parts are called 'ions,' those moving in the direction of the positive current being the 'cations,' and those in the opposite direction the 'anions.' The solid conductors by which the current passes into the solution are termed 'electrodes.' The electrode toward which the cation moves is named the 'cathode,' that toward which the anion moves the 'anode.' Thus, suppose some copper sulphate is dissolved in water and placed between copper electrodes in a copper voltameter. The mere act of solution causes the appearance of ions of copper, i.e. atoms which are charged with positive electricity, and sulphate ions carrying negative charge. These ions are moving about freely. If a current of electricity is now passed through the solution, the copper ions move towards the cathode, and on arrival there the charge is neutralised by the negative charge at the cathode. They thus become electrically neutral, and are identical with ordinary copper. The metal therefore deposits on the cathode. Similarly the sulphate ions move to the anode, and there neutralisation of charge goes on. Now the sulphate radicle is incapable of separate existence, so the copper of the anode is immediately attacked, giving rise to copper sulphate, which passes into solution. If the same experiment is done, using platinum electrodes, copper is deposited at the cathode as before, but the liberated sulphate radicle immediately attacks the water present to form sulphuric acid and oxygen.

Water is peculiar in that it contains a very small percentage of ions, and is therefore a bad conductor. Faraday, from the investigation of the phenomena, deduced the following laws of E.: (1) The amount of chemical decomposition effected by the passage of the current is proportional to the amount of electricity which flows through the conductor. (2) The amounts of the different elements separated by the same quantity of electricity bear the same relation to each other as the equivalents or combining weights of the elements. If A = amount of material liberated, then $E = C \times t \times e$, where C = current t = time in sec., and e = weights of element liberated by one ampere in one sec., i.e. the electro-chemical equivalent of the element which is proportional to its combining weight. See W. Whetham, *Solution and Electrolysis*, 1895, and H. C. Jones, *Elements of Physical Chemistry*, 1910.

Electron. The elementary corpuscle or 'atom' of negative electricity. All matter is built up of Es, neutrons and protons (see ATOM AND ATOMIC THEORY—Structure and Energy). Plucker (1859) showed that when an electric discharge took place in evacuated tubes, rays were given off from the cathode. Sir J. J. Thomson (1896) proved these cathode rays to be composed of fast-moving particles carrying negative charge. By the application of a magnetic field, they could be deflected, but could be brought back again under the action of an electric field at right angles. The ratio of the mass of an E. to the charge carried by it (m/e) was calculated from these experiments. The value of e was found by Townsend and C. T. R. Wilson by experiments on the condensation of water on charged nuclei when sudden expansion was allowed to take place and more accurately by Millikan, who balanced the weights of small charged droplets of oil or mercury against the forces exerted upon them by an electric field of known strength.

Es. are also given off from metal surfaces when illuminated by ultra-violet light; from incandescent metals at high temps.; from certain oxides at red heat, such as lime; during the bombardment of material objects by X-rays; and from radioactive materials in the form of β -particles. The velocity of an E. varies according to its method of production, but the ratio m/e remains appreciably constant.

Atoms are composed of a central nucleus of protons and Es., surrounded by Es. moving in orbits, some circular, some

elliptical, according to a definite plan. Mass of E 9×10^{-31} gms. Charge of E 1.591×10^{-19} coulombs. See R. A. Millikan, *Electrons, Protons, Photons, Neutrons and Cosmic Rays*, 1935; D. H. Føllet, *Introduction to Electronics*, 1948.

Electron Microscope. When a large wave on the surface of the sea meets one of the piles of a pier it can be observed to divide as it passes the pile, and then to recombine and pass on with its form practically unchanged. On the other hand, ripples or waves of short wave-length are reflected or are broken up into a pattern when they meet such objects, so that whereas it would be impossible to deduce anything about the shapes or positions of the piles by observations of large waves that had passed between them the ripples carry with them implicit information about the obstructions. This behaviour is typical of other waves besides those on the surface of water, and waves that meet an object do not provide useful information about it unless their wave-lengths are comparable with, or smaller than the dimensions of the object. Ordinary light consists of waves whose wave-length is about one twenty-millionth of an inch, and there is thus a natural limit to the size of the smallest objects that can be examined with an ordinary microscope, no matter how well designed and constructed it may be. By using ultra-violet radiation (i.e. radiation of shorter wave-length than that of light of the visible spectrum) somewhat smaller objects can be observed, but the improvement is not great.

During the third decade of the present century it was found that electrons (and other material particles) possess many of the attributes of a wave motion, although in many respects they behave also as particles. The waves associated with them are peculiar in that their lengths depend upon the masses of the particles and upon their speeds, the wave-length decreasing as the speed increases. It is, moreover, a simple matter in the laboratory to accelerate electrons to such speeds that their waves are much shorter than those of light. If, therefore, it is possible to cause electrons to follow curved paths, in the same way as a beam of light is bent or refracted in passing from one medium to another, it should be possible to use electron waves in a microscope in the way light is used in an ordinary microscope, and at the same time avoid the limitations which the wave-length of light imposes. Electrons, however, are charged particles, so a beam of moving electrons can be refracted by an electrostatic or magnetic field, and if the field is of suitable shape and intensity it serves as an electron lens in the same way as a glass lens does with light waves. At the present time magnetic lenses are preferred to electrostatic for most purposes, but either can be used. The usual type of electron microscope works as follows. A beam of electrons is produced in a cathode ray tube and accelerated to a high speed by the use of a high voltage. The beam passes through a lens which concentrates it upon the

specimen whose thickness must be sufficiently small to permit most of the electrons to pass through without excessive scattering. The beam of electrons emerging from the specimen passes through a lens that acts as the objective lens of the microscope and produces a highly magnified image, and thence through a projection lens whose function is to form a further image on a photographic plate. After development this shows the structure of the object. Since collisions with air molecules would interfere with the paths of the electrons the E. M. must be evacuated. This is a disadvantage since it makes the apparatus more elaborate and makes it difficult to use specimens that are liable to damage during drying (e.g. biological material). The complexity and expensiveness of the apparatus are further disadvantages, but the E. M. is nevertheless a very useful instrument since it provides the means for examining objects far smaller than the smallest of those that can be seen in the best optical microscopes.

Electrophoresis. If solid particles, liquid drops, or gas bubbles are present in a liquid, and are so small that they settle out slowly or not at all, then, when electrodes are introduced into the liquid, a movement of the particles occurs, and they travel towards one or other of the electrodes. The direction and speed of motion depend upon the existence of electric charges at the surfaces of the particles, and hence upon the nature of the particles. The phenomenon is called E., and is used for the separation of particles or large molecules from others that are generally similar. A related phenomenon is that of electroosmosis. If electrodes are placed at each end of a tube containing liquid, and the tube has a porous plug of solid material somewhere within it, charging the electrodes causes liquid to flow through the plug towards one or other of the electrodes. On reversing the polarity of the electrodes the flow is reversed. Similarly, if the liquid is forced through the plug by mechanical pressure a difference of electrical potential is set up between electrodes placed in contact with the ends of the plug. This potential difference is called the streaming potential.

Electro-therapy. Static E. as developed by the Wimshurst machine, galvanic E. usually obtained from about forty Leclanché or bichromate cells yielding about sixty volts, and faradic E. as produced by a simple form of induction coil, are all used in the interests of medicine. Electricity may be used to produce physiological effects, as when it is applied to the skin, and when one electrode is applied to the spine and the other to a muscle. In the

first case the sensory surfaces are affected, a pricking and burning sensation being produced and the skin made red, showing increased vascularity. The second action is on the motor apparatus and causes the muscles to contract as the current is made and broken. During the First World War, and subsequently, sinusoidal currents were employed, rapid ones to stimulate relaxed muscles and slow sinusoidal current to restore paralysed muscles. Again, when a broad plate electrode is applied to any part of the body, and the other electrode, consisting of a platinum or steel needle, is inserted into a tumour (say), and a current measured in milli-amperes ($\frac{1}{1000}$ of an ampere, this being the unit used in E.) passed, an electrolytic effect will be obtained and the tissue will be decomposed. If the platinum electrode be positive the surrounding tissue will condense and contract round it; if it be negative then the tissue will break up into a loose frothy material. Some nervous and muscular diseases can be diagnosed with the aid of galvanic and faradic currents. Certain diseases of the spinal cord and the cerebro-spinal nerves alter the normal action of the muscles under the electric current. These abnormal effects are referred to as 'reactions of degeneration.' For the treatment of disease the three forms of current are used; the static for nervous disorders, e.g. neuralgia; the galvanic for acute neuralgia, atrophy of the muscles, diabetes, joints enlarged and stiffened by rheumatism, tonsillitis, etc., and the faradic for nervous exhaustion accompanied by insomnia, functional disorders of the generative organs, acute rheumatism, neurasthenia, and other diseases. By passing a suitable current between electrodes applied to appropriate parts of the body, a heating effect is produced, which may act as a sedative to pain, or may stimulate repair of broken-down tissues. Such diathermic treatment is used also for fibrosis of the limbs, empyema, and tuberculous bones.

Electrically produced rays, ultra-violet and X-rays are used separately and in conjunction. (See **CANCER, X-RAYS, ULTRA-VIOLET RAYS**.) The body itself produces electric currents, and those of the heart are utilised in the diagnosis of cardiac diseases. In conclusion it might be said that belts, rings, and all other contrivances which are advertised as having an electric or magnetic action, only cure in proportion to the faith of the wearer. They have no electrical effect, and if they had, the irregularity of their action and the lack of control of direction of the current would render them very uncertain. The so-called magnetic belts are worse than useless, since it is not known that even the most powerful magnets have any influence on the bodily functions. Electro-magnets are occasionally used to extract from tissues small pieces of steel, e.g. broken needle points. See H. H. U. Cross, *Electricity in Therapeutics*, 1936.

Electrotropism, a very poorly investigated subject dealing with the sensitiveness of plant organs to the action of electric

currents. If a plant be grown so that its roots dip into a liquid through which a current is passing, then some of the roots will incline to the anode and some to the cathode, thus showing the acquirement of polarity.

Electrotyping, see under METALLURGY; PRINTING.

Electrum has two meanings in antiquity: (1) A mixture of gold and silver; (2) amber. In the former sense it occurs in *Antigone*, where mention is made of Indian gold and the 'E. of Sardis,' as objects of the highest value. This is the native E., but it was also made artificially, and, according to Pliny, E. contained gold and silver in the proportion 4 : 1. It was used for plate and also for money, and coins are still in existence of this metal struck by the kings of Bosphorus, by Syracuse, and by other Gk. states.

Electuary (from a Gk. word signifying 'licking.' The term was also used by Lat. authors to designate a thick, honey-like substance). The word is used in medicine in Fr., but in Eng. is restricted to 'lentive E.,' a popular name for a compound confection of senna, an official preparation of the Brit. Pharmacopœia.

Elegit, see EXECUTION.

Elegy, general term in Gk. for any poem written in the elegiac metre, a combination of the dactylic hexameter and pentameter in a couplet. The word 'elegos' means a plaintive melody accompanied by the flute, and how it happened that the word was applied to elegiac poetry, the earliest representatives of which by no means confined it to mournful subjects, is doubtful. It may be that the term was only chosen in reference to the musical setting, the E. having originally been accompanied by the flute. The earliest representatives of the E., Callinus of Ephesus (c. 700 B.C.), and Tyrteus of Ephesus in Attica (c. 600), gave it a warlike and political direction, and so did Solon (640-559) in his earlier poems, and the E. of Theognis of Megara (c. 540), though erotic, are essentially political. The first typical representative of the erotic E. was Mimnermus of Colophon, a contemporary of Solon; and the E. of mourning or sorrow was brought to perfection by Simonides of Ceos (d. 469 B.C.). After this the emotional element predominated. Antimachus of Colophon (c. 400) gave the E. a learned tinge, and was thus the prototype of the elegiac poets of Alexandria, of whom Callimachus of Cyrene was the best. The subject of the Alexandrian E. is either the passion of love, or the learned narrative of fable and history, from which personal emotion is absent. This type was imitated at Rome towards the end of the republic, and the E. of Catullus are among the earliest attempts, later elegiac writers being Cornelius Gallus, Propertius, Tibullus, and Ovid, who, in his *Fasts*, showed how a learned subject could be treated in this metre. From this time onward the elegiac metre was constantly employed and was used for every possible subject, e.g. Rutilius Namantianus used it to describe his journey from Rome to France (418

A.D.). After the Renaissance the word E. was introduced into England, but was used to describe a funeral song or lament, the poem of Gascoigne's *The Complaint of Philomene* (1576) being among the first to receive the title. Later, however, the word was further restricted to its present meaning, e.g. a poem of regret pronounced at the obsequies of a particular person, and in this modern sense Spenser's *Daphnaida* is strictly an E., whereas Gray's celebrated poem, *An Elegy in a Country Churchyard*, belongs to a class apart, being not addressed to the memory of a particular person. Of the famous E. in English may be mentioned Milton's *Lycidas*, Shelley's *Adonais*, Matthew Arnold's *Thyrsis*, and Swinburne's *Ave atque Vale*. Tennyson's *In Memoriam* is generally excluded on the score of length, and Wordsworth's *Lucy* is a dirge.

Element is any substance which, as far as our knowledge extends, is composed entirely of atoms of identical or almost identical chemical properties (though not necessarily identical in structure—see ISOTOPES). In other words an E. is a substance which up to the present has not been split up into portions possessing different chemical properties. Es. used to be classified as metals and non-metals, and arsenic, boron, bromine, carbon, chlorine, fluorine, hydrogen, iodine, nitrogen, oxygen, phosphorus, selenium, silicon, sulphur, and tellurium; but this list was increased by the discovery of argon, helium, krypton, etc., and in any case, because of the merging of non-metals into metals by stages which make this classification difficult and arbitrary, the periodic system of Mendeleev, as modified in the light of modern knowledge of atomic structure, has been generally adopted (see CHEMISTRY). Most of the Es., except those of the argon group which are only found free, are usually found as compounds, although carbon, copper, gold, hydrogen, nitrogen, oxygen, silver, and sulphur are found in considerable quantities in their free state. The term E. could formerly be applied in only a tentative manner to any form of matter, because with the advance of science it was always possible that some substance once regarded as an E. might be found to consist of simpler forms, e.g. didymium was found to consist of neodymium and praseodymium. Chemical analysis is, however, now so precise that we feel confident in stating that there are altogether ninety-two elements, of which two only remain to be discovered. Following is a list of the Es. with their symbols and approximate atomic weights (q.v.):

Element.	Sym- bol.	Approx. At. Wt.	At. No.
Actinium .	. Ac	229	89
Aluminium .	. Al	27	13
Antimony .	. Sb	122	51
(stibium)			
Argon .	. A	40	18
Arsenic .	. As	75	33
Barium .	. Ba	137.5	56
Beryllium .	. Be	9	4
(glucium)			

Element.	Sym- bol.	Approx. At. Wt.	At. No.
Bismuth	Bi	209	83
Boron	B	11	5
Bromine	Br	80	35
Cadmium	Cd	112.5	48
Cæsium	Cs	133	55
Calcium	Ca	40	20
Carbon	C	12	6
Cerium	Ce	140	58
Chlorine	Cl	35.5	17
Chromium	Cr	52	24
Cobalt	Co	59	27
Copper (cuprum)	Cu	63.5	29
Dysprosium	Dy	162.5	66
Erbium	Er	167.5	68

Fluorine	F	19	9
Gadolinium	Gd	157	64
Gallium	Ga	69.5	31
Germanium	Ge	72.5	32
Gold (aurum)	Au	197	79
Hafnium	Ha	178.5	72
Hellum	He	4	2
Holmium	Ho	163.5	67
Hydrogen	H	1	1
Illinium	Il	146	61
Indium	In	115	49
Iodine	I	127	53
Iridium	Ir	193	77
Iron (ferrum)	Fe	56	26
Krypton	Kr	83	36
Lanthanum	La	139	57
Lead (plumbum)	Pb	207	82
Lithium	Li	7	3
Lutecium	Lu	175	71
Magnesium	Mg	24.3	12
Manganese	Mn	55	25
Masurium	Ma	98	43
Mercury	Hg	200.6	80
(hydrargyrum)			
Molybdenum	Mo	96	42
Neodymium	Nd	144.5	60
Neon	Ne	20	10
Nickel	Ni	58.7	28
Niobium	Nb	93	41
(columbium)			
Nitrogen	N	14	7
Osmium	Os	191	76
Oxygen	O	16	8
Palladium	Pd	106.5	46
Phosphorus	P	31	15
Platinum	Pt	195	78
Polonium	Po	210	84
Potassium	K	39	19
(Kalium)			
Praseodymium	Pr	141	59
Protoactinium	Pa	234	91
Radium	Ra	226	88
Radon (niton)	Rn	222	86
Rhenium	Re	187	75
Rhodium	Rh	103	45
Rubidium	Rb	85.5	37
Ruthenium	Ru	101.5	44
Samarium	Sm	150.5	62
Scandium	Sc	45	21
Selenium	Se	79	34
Silicon	Si	28	14
Silver (argentum)	Ag	108	47
Sodium (natrium)	Na	23	11
Strontium	Sr	87.5	38
Sulphur	S	32	16
Tantalum	Ta	181.5	73
Tellurium	Te	127.5	52
Terbium	Tb	159	65
Thallium	Tl	204.5	81

Element.	Sym- bol.	Approx. At. Wt.	At. No.
Thorium	Th	232	90
Thulium	Tm	169.5	69
Tin (stannum)	Sn	118.5	50
Titanium	Ti	48	22
Tungsten	W	184	74
(wolframium)			
Uranium	U	238	92
Vanadium	V	51	23
Xenon	Xe	130	54
Ytterbium	Yb	173.5	70
(neo-ytterbium)			
Yttrium	Y	89	39
Zinc	Zn	65.5	30
Zirconium	Zr	91	40

It should be noted that with the rapid advance of atomic science the possibility of making new Es. artificially has arisen. Thus plutonium, used in the Nagasaki and Bikini bombs, was made by bombarding atoms of uranium with neutrons (q.v.). Several other 'artificial' Es. are known (e.g. americium and curium) and their chemistry promises to be of great interest and importance.

Elemental Spirits, or Angels of the Elements, were imaginary beings who were supposed to preside over the four elements, the spirits of fire being called Salamanders, those of water, Undines, those of air, Sylphs, and those of earth, Gnomes. They were supposed to dwell in their respective elements, and the belief in their existence was a very popular one in the Middle Ages. Paracelsus wrote a treatise on them.

Elementary Education, see under EDUCATION.

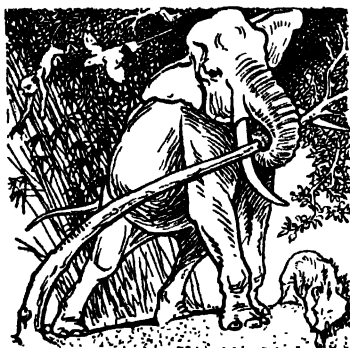

Elemi, oleo-resin obtained from the pitch-tree, a native of Manila. When pure it is pale yellow in colour and resembles honey in consistency. It has an aromatic odour and is soluble in alcohol and ether.

Elenchus (Gk. ελεγχος, commonly translated by the Lat. *argumentum*, *inquisitio*, *confutatio*, and *demonstratio*) a term frequently used in the Aristotelian system of logic to denote argument, replication, refutation, or the subject or nature of dispute, or demonstration. Aristotle himself defines E. as 'a syllogism of contradiction.' In the last two books of the *Organon*, he classifies and discusses the different kinds of sophistical elenchus, or modes of argument, used by sophists, e.g. the sophism designated *ignoratio elenchus*, or sinister deviation from the point under discussion, consists according to Aristotle, in proving something irrelevant.

Eleocharis, genus of cosmopolitan plants in the order Cyperaceæ. *E. valisneria* grows in marshy places, forming sometimes a large proportion of the peat in bogs; *E. tuberosa*, a native of E. Asia, has edible tubers.

Elephant (Lat. *elephantus*; Gk. ἐλέφαντος, ivory), a representative of the Proboscidea, a sub-order of ungulate mammals. There are two existing species of Elephants, the *Elephas maximus*, also called *Elephas indicus* or Indian E., and the *Elephas africanus* or African E. A number of extinct forms serve to connect

the E., to a limited extent, with other ungulates, but as the absolutely intermediate type has not been discovered, the origin of the *Elephantidae* is conjectural. The young Indian Es. are hairy, thus showing affinity with the mammoth. The most remarkable characteristic of the order, and the one from which they derive their title, is the long, flexible, prehensile proboscis, into which the nose is produced. This trunk, as it is called, is delicately sensitive. It has the nostrils at the extremity, and is used for the purpose of conveying food and water to the mouth. Es. have no canine teeth in either jaw,

ELEPHANT

and their tusks are developed only in the upper jaw; young Es. have a very minute pair of milk-tusks which are shed at an early age; the permanent tusks continue growing throughout life, and so remain open at their bases, which are enclosed in sheaths of the premaxillary bones, extending upwards in the skull as far as the nasal cavity. The tusks of young Es. are tipped with enamel, but this soon wears off and they then consist of ivory alone. The build of the E. is huge and bulky, the head being disproportionately large, the ears large and flapping, the neck very short and thick, and the limbs long and stout. The feet are short and broad, and have five toes each, of which the middle one is the largest. Es. are strictly herbivorous, subsisting chiefly upon roots, twigs, leaves, and young shoots. There is no authentication of the widespread belief that Es. may live for over 100 years. The oldest recorded age is sixty years. The *Elephas Indicus* is distinguished by its comparatively flat forehead and small ears, as well as by its smooth and nearly naked skin. The average height of the adult male does not exceed 9 ft., and that of the female 8 ft., but this is often considerably exceeded, and there is an enormous skeleton in the museum at Calcutta of an E. that lived about 1850-60, which measures 11 ft. 3 in. from the shoulders. The height of the Indian E. is almost pre-

cisely twice the circumference of its forefoot. Herds of Es. consist of from thirty to fifty individuals, all of which belong to a single family, a female being invariably the leader. They are fond of bathing and rolling in wet mud, and when heated they squirt water over their backs by means of the trunk. The *Elephas Africanus* differs chiefly from the Indian species in the enormous size of its ears, which, when in repose, completely cover the animal's shoulders. Its colour is a somewhat darker grey, and its disposition fiercer than that of the Asiatic tribe; also it is more rapid in its movements and has remarkable powers of getting over precipitous ground. Owing to persecution for the sake of its tusks, the African E. has grown much rarer, and is now only found S. of the Sahara, whereas formerly it was spread over the whole of the wooded districts. The white E. is a pure albino, and is sometimes found in Burma and Siam.

Elephanta Island (called by the natives Charapuri), small is. in Bombay harbour, about 5 m. from Bombay, India. It received its name from the Portuguese on account of a colossal statue of an elephant which once stood on the is., but is now in Bombay. It is celebrated for its cave temples, one of which contains a huge three-faced bust about 18 ft. high, representing Siva in his three-fold character of Creator, Preserver, and Destroyer. See J. Fergusson and J. Burgess, *The Cave Temples of India*, 1880; V. A. Smith, *A History of Fine Art in India and Ceylon*, 1911.

Elephantiasis, condition in which the legs become thickened and straight up and down like an elephant's. The disease also affects other parts, as E. of the scrotum. It is due to a blocking of the lymphatic glands and channels, combined with irritation of the skin, generally by an external contamination or inflammation. In the tropics, the blocking of the lymph channels is commonly due to a threadlike worm, known as *Filaria*, and its eggs. In cold climates the condition is rarely seen, but when it is, the blocking is due to various causes. The treatment consists in removing the irritation of the skin from any condition which may be present, by means of applications suitable for each individual case. The flow of lymph through the channels is aided by massage and elevation of the part.

Elephantine (the *Yeziret-ey-Taher*, or flowery isle, of the Arabs), beautiful is. in the Nile opposite Aswân. It was the prin. place of worship of Khnum or Khnoum, a ram-headed god, who enjoyed great repute as a creator, and was famous for its pottery, a peculiar pink ware with a brownish-pink face.

Elephant-seal, or Sea-Elephant, termed technically *Macrorhinus leoninus*, a carnivorous mammal, and is the largest of all the Pinnipedia.

Elephant's Foot, or *Tectudinaria elephantipes*, plant of the natural order Dioscoreaceae. It has a peculiar root-stock, with a rough and indented bark, shaped like an elephant's foot. It contains a great quantity of starch and was

used freely by the Hottentots for food; hence it is often called Hottentot's bread.

Elephant-shrew, name given to several insectivorous quadrupeds in the family Macroscelidae. They somewhat resemble the kangaroo-mice in appearance, and use their long hind-legs in similar fashion when they leap over the plains of Africa. The snout is so long that it looks like a proboscis, whence the name. *Macroscelides typicus* is a common specimen, and is called also the jumping-shrew or proboscis-rat.

Elephant's Tusk Shell, see DENTALIUM. **Elerts**, tn. of Orel Region of the R.S.F. S.R., 122 m. from Orel. It has a splendid position, and is important for its trade in corn and cattle and as a railway centre with foundries. E. was captured by the Gers. on Dec. 9, 1941, but was retaken by the Russians in the summer offensive of 1943. Pop. 45,000.

Eleteria, festival and mysteries, celebrated, originally only in Eleusis, in honour of Demeter and Persephone. They were regarded by the ancients as the most venerable and the holiest of all the mysteries celebrated in Greece, and were said to have been instituted by Demeter herself when wandering about in search of her daughter. At first the right of initiation was restricted to inhabitants of Attica, but later all Gks. were admitted and even the Romans, but all barbarians were excluded, as well as all who were guilty of murder. Those who wished to take part in the greater E. were first admitted to the lesser E., which were held every year in the month of Anthesterion, at Agræ on the Ilissus. They were then allowed as *mystæ* to take some part in the great E. the next autumn, but were not initiated into the greater mysteries until the next year. These were celebrated every year in the month of Boedromion during nine days, and on the second of these the *mystæ* were purified. The third was spent in fasting and sacrifice, and on the fourth the *Katathus kathodos*, a procession with a basket containing pomegranates and poppy seeds, took place. On the fifth day the *mystæ* went with torches to the temple of Demeter, where they remained all night, and on the sixth, the most solemn of all, a statue of Iacchus, son of Demeter, adorned with a garland of myrtle and bearing a torch in his hand, was carried along the sacred road amidst shouts and songs. During the night the *mystæ* were initiated into the last mysteries (*epopteia*), and confirmed their oath of secrecy, previously taken at the lesser E. On the seventh day the initiated (*epoptæ*) returned to Athens. The eighth day was an additional day for the convenience of those who arrived late, and the ninth day (*plemochœ*) was occupied by a libation, poured in the direction of E. and W. with mystical formula. The object of the E. was to excite and strengthen in the minds of the initiated by means of the story of Persephone, the faith in the continuance of life, and a system of rewards and punishments after death.

Eleusis, tn. and demus of Attica, 12 m. distant from Athens. It possessed a magnificent temple of Demeter, and it gave its name to the festival of the Eleusinia (*q.v.*). The tn. had been from time immemorial a seat of the worship of Demeter, but after its conquest, which took place, according to the story, under King Erechtheus, the Eleusinia became a festival common to both cities, though the superintendence of the festival remained with the descendants of Eumolpus, the king of E. Much damage was done to ancient monuments, especially Roman, remains, on the site during the Second World War.

Eleuthera, is. of the Bahamas, Brit. W. Indies, separated from Abaco by the Providence Channel. The soil is fertile, and pineapples, oranges, and lemons are cultivated. Chief tn., Governor's Harbour. The is. was colonized by a band of religious refugees from Bermuda, who sailed for the Bahamas in 1647 and settled on E., under the auspices of the Company of Eleutherian Adventurers—a body of Protestant Merchants and Members of Parliament. The Articles and Orders the Company drew up in London speaks of equality for all men, fair treatment for the natives, and the formation of a gov. and the calling of the 'small State-to-be' a 'Republic' with a Gk. name denoting its freedom. Although an Act of Parliament of 1649 confirmed the Eleutherian leader, Capt. Sayle, and his associates as proprietors, Charles II., twenty years later, ignored the Act, granting all the Bahamas to the duke of Albermarle and other lords, proprietors of Carolina. Area, 235 sq. m. Pop. 6400.

Eleutheropolis, see BETH JIBRIN.

Elevation, in astronomy, is the height above the horizon of an object on the celestial sphere, measured by the arc of a vertical circle passing through it and the horizon.

Elevators, see CONVEYORS AND ELEVATORS.

Elevators, Grain, see CONVEYORS AND ELEVATORS: HYDRAULIC MACHINERY; LIFTS.

Elf (O. E. *ælf*, *ylf*), a supernatural, diminutive being of early Teutonic lore. Efs. were believed to be tricky sprites, much given to interference in human affairs. They stole children and placed changelings in their stead, they visited people in their sleep and gave them nightmares, and sometimes inflicted them with diseases, and with their elf-bolts they struck down human beings and cattle alike. They also elf-locked women's hair, i.e. they tangled it into a matted mass, which it was considered unlucky to undo. Efs. were dwarfish and generally black in appearance. See also FAIRIES. See T. Keightley, *Fairy Mythology*, 1828; S. Nilsson, *Primitive Inhabitants of Scandinavia*, 1863; W. Sikes, *British Goblins*, 1880; J. Rhys, *Celtic Folklore*, 1901; O. H. Dunne-Jones, *Book of Fairies*, 1933.

El Fasher, cap. of Darfur, Anglo-Egyptian Sudan, and centre of the caravan routes across N.E. Africa. Pop. about 15,000.

El Ferrol, see FERROL.

Elgar, Sir Edward William, Bart. (1857-1934), Brit. composer. Practically self-taught, both as conductor, executant, and composer, E. spent his early years at teaching and similar drudgery. His music is deeply imbued with the mysticism, not only of Christianity (he was a Rom. Catholic), but also of paganism, as is realised, for instance, in *King Olaf*. E. devoted most of his attention to choral writing, and, besides *Olaf*, produced *The Kingdom*, *Caractacus*, and others, the best being his setting of Newman's *Dream of Gerontius* (1900). This is one of the finest works in Brit. choral music, yet was at

and again in his scores. His orchestration, especially for strings, is superb, and his harmony original and strongly chromatic. His two military marches, *Pomp and Circumstance* and the *Coronation Ode*, were inspired by the coronation of King Edward VII.; the tune *Land of Hope and Glory*, which occurs in both, has long been so popular in Great Britain as to be ranked next to *God Save the King* as a national song. His highly individual art, as exemplified in the tone poem *Falstaff*, 1913, was well sustained in his *Spirit of England* and *For the Fallen*, both composed in 1916 during the dark days of the First World War. Even if his chamber music, produced after that war, does not reveal him at his best, he is the most widely known of all Eng. composers. In 1924 he conducted the massed choirs and bands at the Royal opening of the Brit. Empire exhibition at Wembley when his Imperial March and *Land of Hope and Glory* were rendered before the King and a vast audience. He was appointed Master of the King's Music in 1924, and, in the year of his death, was president of the Hallé Concerts Society. He received the O.M. in 1911, and a baronetcy in 1931. See R. J. Buckley, *Sir Edward Elgar*, 1912; J. F. Porte, *Sir Edward Elgar*, 1921; W. H. Reed, *Elgar* (Master Musicians), 1939; E. Blom, *Everyman's Dictionary of Music*, 1916.

El Ghor, the Arabic name for the great depression extending from the sea of Galilee to the Dead Sea, Palestine. Length 65 m., breadth 6 to 12 m.

Elgin, co. of Scotland, see MORAY.

Elgin, cap. of Morayshire, royal and parl. bor. of Scotland, on the R. Lossie. There are ruins of the fine cathedral, 'Lantern of the North,' founded 1224 (burnt 1390, rebuilt later), in the form of a cross, also of the chapter-house and Grey Friars' monastery. The ruined palace of the bishops of Moray is 2 m. N., on Loch Spynie, and 6 m. S.W. is the Cistercian Pluscardine Priory (1230), restored by Lord Bute. There are brewing and woollen industries, saw-mills and sandstone quarries. Pop. 8,800.

Elgin, city of Kane and Cook counties, Illinois, U.S.A., on Fox R., 35 m. from Chicago. It manufactures watches, butter, pipe organs, silverware and condensed milk, and is the seat of two academies, Elgin and St. Mary's, and of the N. Illinois Hospital for the Insane, with 1800 patients, and has a library with 60,000 vols. Pop. 38,000.

Elgin, Earls of. The first earl, whose family was by descent connected with King Robert I. of Scotland, was given his earldom by Charles I. in 1633. He was succeeded in 1663 by Robert Bruce, who was created earl of Allesbury in 1664, and became lord chamberlain in 1687. Thomas Bruce, the third earl (c. 1655-1741), was a courtier of James II., and, for refusing to take the oath of allegiance to William and Mary, was under suspicion. He was imprisoned as a Jacobite conspirator (1690-98), but was allowed to flee to Brussels in 1696. The ninth earl of Kin-cardine (1732-71) succeeded as fifth earl

Herbert Lambert

SIR EDWARD ELGAR

first received with indifference, but since its eulogism by Richard Strauss it has become widely popular. In *The Apostles*, (1903) and *The Music Makers* (1912), E. carried his ideas to a point of originality beyond anything else he previously composed. His orchestral works include the beautiful overture, *In the South*, the fine *Enigma* variations (1899), and the offspring of this latter work, the two symphonies (1908 and 1911), both worthy to rank with the classic symphonies, the *Introduction and Allegro* for strings (1905), the great violin concerto, popularised by Kreisler, and the cello concerto (1919) which Casals ranks among the few masterpieces in this medium. E.'s songs, chamber-music, and smaller works are often poetic, but add nothing to a reputation founded on *Gerontius*, and the *Ab* Symphony. On the whole, the character of his music is deeply psychological and yet broad, *nobilmente*, as he directs again

of E. in 1747. Thomas Bruce, the seventh earl of E. (1760-1841), sold to the nation, in 1816, the collection of sculptures known as the 'Elgin Marbles' (*q.v.*). He was a soldier and diplomatist, and was Brit. envoy to the Porte (1799-1803), where he gathered together his collection.

His son, James Bruce, the eighth earl (1811-63), was also a diplomatist. He displayed great ability as governor of Jamaica (1842-46) and of Canada (1847-54). In 1857 he was sent as an envoy to the Far E., where he concluded the treaty of Tientsin with China (1858), and, on the Chinese refusing to ratify it, he captured Peking (1860). He was appointed viceroy of India in 1862. Victor Alexander Bruce, the ninth earl, was born near Montreal in 1849. He became treasurer of the Household and first commissioner of public works during Gladstone's administration (1886), and viceroy of India (1894-99). He was chairman of the commission of the Scottish Church case (1904), and was appointed by Campbell-Bannerman secretary for the colonies (1905-8). See *Letters and Journals* of the eighth earl, 1872; and his life by Bourinot, 1903, and G. Wrong, 1905.

Elgin Marbles, famous collection of anct. Gk. sculptures, brought to England (c. 1812) through 'the agency of the seventh earl of Elgin, after whom they are named, and acquired for the Brit. Museum in 1816 for £35,000. They are portions from the frieze of the Parthenon (designed by Phidias) and other buildings on the Athenian Acropolis. Elgin's act was denounced as 'vandalism,' but if left these treasures would probably have been destroyed by the Turks who were using the Parthenon for target practice. The vessel in which Lord Elgin shipped 250 ft. of the frieze (originally 524 ft. in length) was shipwrecked and Elgin had to pay 274,000 for their recovery.

Elgon, or **Ligonyi**, Mount, extinct volcano, 14,140 ft. high, of Uganda, Brit. E. Africa, 60 m. N.E. of Lake Victoria.

Eli (Heb., elevation), Israelite priest who was also one of the Judges. He was the son of Aaron and of the family of Ithamar. His name chiefly enters the Biblical narrative in connection with the story of Samuel.

Eliakim, see JEREMIAH.

Eliaas, Mount St., see ST. ELIAS, MOUNT.

Elle, small watering-place of S.E. Fife-shire, Scotland, in the frith of Forth. It has golf-links. Pop. (with Earlsferry), 1000.

Elgius, see ELIOT.

Elijah (N.T., Elias), greatest and most picturesque of the prophets of Israel, lived during the reigns of Ahab and Ahaziah. His life was chiefly spent in opposing the worship of Baal, which the former king was encouraging. The story of his life and acts is fully told in 1 Kings xvii.-xix. and xxi., 2 Kings i. and ii., 2 Chron. xxi., 12-15. Like Enoch he was translated to heaven instead of dying a natural death, and for long there remained a tradition among the Jews that he would again come to Israel before the advent of

the Messiah. This expectation, expressed in Mal. iv. 5, Jesus declares to have been fulfilled in the preaching of John the Baptist. In the N.T., Elias is also mentioned as appearing with Moses on the Mount of Transfiguration. The festival of E. is celebrated by the Gk. and Rom. Churches on July 20. In Greece he is regarded as the patron saint of mts., and among Rom. Catholics legend once described him as founder of the Carmelite order. The Russians have many legends about the Jewish prophet, chiefly derived from the anct. tales of Perun, their thunder-god. See W. Milligan, *Elijah, his Life and Times*, 1887; T. K. Cheyne, *The Hallowing of Criticism: Nine Sermons on Elijah*, 1888; A. Blunt, *The Prophets of Israel*, 1929; H. L. Taylor, *Elija and Elisha*, 1931.

Elimination, in algebra, is a process of solving systems of equations which consists in getting rid of a quantity or letter which is common to the equations, by forming another that does not contain that letter. For example, given

(1) $x^2 + y^2 = 1$ Eliminate y , i.e. deduce
(2) $x + y = 1$

an equation involving x only.

Equation (2) is equivalent to

$$y = 1 - x$$

∴ Equation (1) is equivalent to

$$x^2 + (1 - x)^2 = 1$$

$$\text{i.e., } 2x^2 - 2x = 0$$

$$\text{i.e., } x^2 - x = 0$$

which is an equation in x only, ∴ y has been eliminated.

Eliot, Charles William (1834-1926), Amer. univ. president and educationalist, b. in Boston, Massachusetts. He was the son of a former mayor of Boston, who had also been treasurer of Harvard Univ. As a matter of course, the son went to Harvard, from which he graduated in 1853. After a period of study abroad, he returned to his country to become prof. of chemistry in the Massachusetts Institute of Technology from 1865 to 1869. Later, he was elected President of Harvard Univ. in 1869, and held this great position for forty years, after which he was president emeritus until his death. In the country at large he was a motive force in improving primary and secondary schools. In religion he became known as one of the greatest spokesmen for the Unitarian faith. He was an active supporter of President Woodrow Wilson, who offered him the embassy to England, which, however, he declined. His mind marched with Wilson's on the great subjects of disarmament and the League of Nations. Among his works are *Four American Leaders* (1906), *The Road Toward Peace* (1915), and *A Late Harvest* (1924).

Eliot, George, was the pseudonym taken by Marian Evans (1819-80), the youngest child of Robert Evans, land-agent to the Newdigate family, by his second wife. She was born on Nov. 22, and the best authority for her early life is the easily-discernible autobiographical portions of her novels. Therein many of the characteristics of her father are reproduced in Adam Bede and Caleb Garth, her brother

Isaac figures as Tom Tulliver, and herself is introduced as Maggie Tulliver. Marian Evans was brought up to the strict observances of religion, and possibly influenced by an aunt who was a Methodist preacher, she inclined to evangelicalism. In these days she was most austere, theatres were to her something almost unholy, and her favourite reading was Thomas à Kempis and Bunyan, Young and Whiston, *Rasselas*, and *The Lives of the Poets*. When Marian was twenty-two, her father moved from Arbury Park to Coventry, and she went with him. Here began the second phase of her life. She made the acquaintance of Charles Bray (1811-84), the author of *The Philosophy of Necessity* and other works, and of Mrs.

GEORGE ELIOT

N.P.G.

The portrait by Sir Frederick Burton, 1865

Bray, whose brother, Charles Hennell (1809-50), had written *An Inquiry concerning the Origin of Christianity* (1838). In such company, for Bray, as well as his brother-in-law, was a freethinker, Marian Evans began to doubt, and at last to allow her doubts entirely to conquer her. In 1844 when Miss Brabant (afterwards Mrs. Charles Hennell) had to resign the task of trans. Strauss's *Leben Jesu*, she it was who brought it to a successful conclusion. This was pub. in 1846, but Miss Evans's name did not appear. Robert Evans, who had been greatly distressed by the change in his daughter's religious convictions, died in the spring of 1849, and then, after a short Continental tour with the Brays, she for a while made her home with these devoted friends. In 1851 she was offered the assistant-editorship of the *Westminster Review*, and she filled this laborious post for some years,

from time to time contributing to its pages articles and elaborate reviews. This work, which necessitated her living in London, occupied most of her day, but she contrived to find time to translate Fauerbach's *Essence of Christianity*, which was pub. in 1854, the only book to appear over her own name. The third phase of the life of Marian Evans—the 'George Eliot' period—dates from 1853, the beginning of her acquaintance with George Henry Lewes (1817-78), the author of the *Life of Goethe* and the *Biographical History of Philosophy*. In the following year they decided to live together, though they could not get married, because Lewes had a wife living, from whom, however, he was separated. It was not with light hearts that they took this step, but having taken it, they regarded the union as being as binding and as legitimate as if it had had the sanction of the law and the church, and it endured until the death of Lewes twenty-four years later. Miss Evans continued to contribute to the *Westminster Review*, and she wrote many reviews for the *Leader*, of which paper Lewes was editor. Lewes was a great believer in the genius of Miss Evans, and in 1856 he persuaded her to see if her gifts lay in the direction of fiction. She made an attempt, and Lewes, without divulging the name of the writer, sent it to Blackwood, who at once accepted it for his magazine. This was *Amos Barton*, and it was followed by *Mr. Gilfil's Love Story* and *Jane's Repentance*. These stories were collected in 1858 as *Scenes of Clerical Life*, and were received with enthusiasm in literary circles. Dickens was especially appreciative, and he alone among the critics discerned the sex of the author. Encouraged by the success of these short stories, Miss Evans began a full-dress novel, *Adam Bede*, which was finished thirteen months later, and pub. on Feb. 1, 1859. The qualities that marked *Scenes of Clerical Life* were present in *Adam Bede*, which evoked a further chorus of praise and placed George E. in the front rank of contemporary novelists. *Adam Bede* was followed by *The Mill on the Floss* (1860), which is generally regarded as her masterpiece. The earlier part, which is largely a transcript from life of the youth of herself and her brother, is one of the most beautiful things in Eng. fiction; but taken as a whole the novel gives undue prominence to the childish scenes, a fault the author, in reply to a criticism of Bulwer Lytton, regretfully acknowledged. *Silas Marner* appeared in 1861; and then George E., accompanied by Lewes, went to Florence to get material for a projected hist. novel of the time of Savonarola. While Thackeray was editor of the *Cornhill Magazine*, Smith, Elder & Co. offered her the hitherto unprecedented sum of £10,000 for the serial and book rights of the new novel, *Romola*, and eventually she accepted £700, for its appearance in the *Cornhill*. The first instalment was printed in the magazine in July 1862, the last in Aug. of the following year, the story being written from month to month, the last words not being written until June

1863. The author said that she 'began it a young woman, she finished it an old woman,' and certainly the amount of reading that she did in connection with it was enormous. George E. had said of *Esmond* that there was too much hist. and too little story. Of *Romola* it may be said that not only was the hist. of the period 'got up' for the purpose of writing the novel but that the information she had acquired most disastrously overweighted the book. *Felix Holt* appeared in 1866, *The Spanish Gypsy*, a Poem, two years later, and in 1871-72 was pub. *Middlemarch*. In spite of the over-elaboration of plot and language, *Middlemarch* will for ever be valuable as a picture of contemporary prov. life, and for the many characters that adorn its vast canvas, although it is disfigured by the exaggeration with which Casaubon is portrayed. This book at the time raised the reputation of George E. to the greatest height. The novel *Daniel Deronda* (1876), and *Theophrastus Such* (1878), though successful, did nothing to enhance her fame. Lewes died in the winter of 1878, and George E. lost in him husband, friend, and literary adviser, though it may be doubted whether in this last capacity his influence was entirely for good. She bitterly lamented his loss, and shut herself up from all society for some months. In April 1880, she, to the general surprise, being then in her sixty-first year, married John Walter Cross, whom she had known for many years. She died on Dec. 22 in that year. George E. is one of the great names in the annals of Victorian fiction. Her pictures of lower middle-class life in the Midlands are unsurpassed, and when, as in her earlier novels, she is not unduly didactic, her merits as a painter of character are great. *Adam Bede*, *The Mill on the Floss*, and *Middlemarch* show her at her best, and so good are each of these that critics are undecided as to which is her masterpiece. See lives by J. W. Cross (her husband), 1885; O. Browning, 1888; Sir L. Stephen, 1902; E. S. Haldane, 1927; J. L. May, 1930; Blanche C. Williams, 1936; S. Dewes, 1939; G. Bullett, 1947.

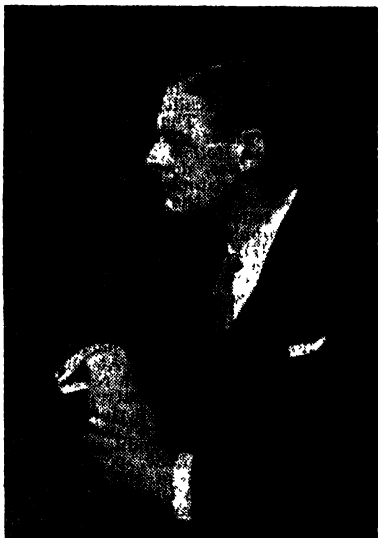

Eliot, Sir John (c. 1590-1632), Eng. statesman, an eloquent debater, and leader of the popular party. He led the Opposition in the Parliament of 1626, denounced Buckingham, and was imprisoned for a time. In the third Parliament (1628-29), he helped to draw up the Petition of Right, thus again offending Charles I., who dissolved Parliament and imprisoned E. and others. His *Monarchie of Man* (written in the Tower) was not pub. till 1879-82 with other works of his. See life by J. Foster, 1864.

Eliot, John (1604-90), Eng. missionary to the Indians of Massachusetts, known as 'the apostle of the Indians.' He attempted to organise the nomadic tribes into a great Christian community, and was minister of Roxbury church, near Boston, U.S.A. E. trans. the Bible into the Indian languages (1661-63), wrote an Indian catechism (1653), and grammar (1666); *The Christian Commonwealth*

(1659); and *Harmony of the Gospels* (1678). See W. L. Walker, *Ten New England Leaders*, 1901.

Eliot, Sir Thomas, see ELYOT.

Eliot, Thomas Stearns, Eng. poet and critic of Amer. origin, b. at St. Louis, Missouri, on Sept. 26, 1888, the son of Henry Ware E. (1841-1919), whose father, a Unitarian minister, had come to live in St. Louis in 1834. Before that the family had been estab. in Boston since emigrating from England in the seventeenth century. E. graduated at Harvard in 1909, spent a year at the Sorbonne, and returned to Harvard to study literature and philosophy. In 1913 he was given an academic

Press Portrait, Bureau
T. S. ELIOT

appointment there and the following year gained a travelling fellowship, which took him to Germany. He also read philosophy at Merton College, Oxford. He married in 1915 and made his home in England. He was for a short time a schoolmaster, then worked in a bank, and in 1917 became assistant editor of the periodical *The Egoist*. This was followed by his editorship of *The Criterion*, later *The New Criterion*, which for more than ten years was one of the foremost literary periodicals in London. Since 1925 he has been a director of the publishing firm of Faber and Gwyer, later Faber and Faber. E. had begun writing poetry at an early age, being influenced strongly by the French Symbolist poets, particularly Jules Laforgue (q.v.). His first poem to be printed was *The Love Song of J. Alfred Prufrock*, which appeared in the magazine

Poetry in 1915. This and other early pieces were pub. in *Prufrock and Other Observations* (1917), followed by *Poems* (1919), and *Ara Vos Prec* (1919). A collected vol. appeared in 1920. These poems show exact and humorous observation. They are also a criticism of contemporary urban life dramatically portrayed through a number of satiric characters. The climax of this phase of apparent disillusionment was reached with the pub. of *The Waste Land* in 1922. This widely celebrated poem, which won the Dial Award of 2000 dollars, applied to modern life the anct. fertility myths studied in Miss Jesse Weston's book, *From Ritual to Romance*, to which E. acknowledged his indebtedness. The modern world is one in which faith is lost and which is therefore incapable of rebirth. Great erudition, fused in poetic inspiration, is employed in the juxtaposition of vivid images by which are thrown into relief the characteristics of the reality which the poet seeks to express. The mood in which satire was stronger than sympathy continued in *The Hollow Men* (1925) and *Sweeney Agonistes*, described as 'Fragments of an Aristophanic Melodrama', which appeared in the *Criterion* in 1926. Thereafter followed three short poems pub. in pamphlet form, *The Journey of the Magi* (1927), *A Song for Simeon* (1928), and *Animula* (1929). E. increasingly devoted himself to the study of good and evil, and the way of escape from the 'waste land' through humility and faith. This found magnificent expression in *Ash Wednesday* (1930), a poem of profound religious intensity. At this time poetic drama was enjoying a revival with the work of the Group Theatre, by which *Sweeney Agonistes* was performed. E., however, gained a closer association with the stage during the production of his pageant play, *The Rock*, performed at Sadlers Wells in aid of the Forty-Five Churches Fund in the Diocese of London. The choruses, which are fine declamatory poetry, were later printed in the *Collected Poems 1909-1935* (1936). From this E. proceeded to his first full-length play, *Murder in the Cathedral*, an historical tragedy on the murder of Thomas-a-Becket. It was first performed in 1935 in Canterbury and London, and was a marked success. Apart from revivals on the English stage it has since had notable productions in France (1945) and Germany (1946). E.'s next play *Family Reunion* was produced in 1939. Its theme is inherited sin and redemption through renunciation. Its theme and the power of the verse are perhaps more than the characterisation and setting can convincingly carry. E.'s early poems, which marked a new direction away from nineteenth-century romanticism, affected the whole course of poetry since their appearance. They were as celebrated for their influence as their achievement. The reputation which challenged critical opinion in the 'twenties has been consolidated and enhanced by the work of the succeeding decade. *The Four Quartets*, which were first pub. collectively with

that title in 1944, have been described as 'the record of four pilgrimages whose purpose is the rediscovery of and reconciliation with the past.' Each of the four poems has for its title the name of the locality with which the poet's meditations are associated: *Burnt Norton*—included in *Collected Poems* in 1936—the name of a deserted house and garden in Gloucestershire; *East Coker* (1940), a Somerset vil. where E.'s forefathers once lived; *Dry Salvages* (1941), a cape of the Amer. coast; *Little Gidding* (1942), a vil. in Huntingdonshire where Nicholas Ferrar (q.v.) once set up a religious community. In criticism E., himself a critic of dogmatic clarity, is at the head of one trend of thought distinguished by the name classical, being concerned with estab. objective standards. His critical writings, which within their range have amounted to a complete revaluation of poetry, are contained in *The Sacred Wood* (1920), *Homage to John Dryden* (1924), *For Lancelot Andrewes* (1928), *Dante* (1929), *Tradition and Experiment in Present Day Poetry* (1929), *Elizabethan Essays* (1934), *Essays Ancient and Modern* (1936), *What is a Classic* (1945), and *Notes towards the Definition of Culture* (1948). In 1932 E. returned to the U.S.A. to take up the appointment of Charles Eliot Norton Professorship of Poetry at Harvard, 1932-33. A course of lectures delivered at the University of Virginia in 1933 was pub. the following year with the title *After Strange Gods, A Primer of Modern Heresy*. His Henriette Hertz lecture on Milton was pub. in 1947. As a churchman his *Idea of a Christian Society* (1939) is a notable plea for a Christian community founded on a national Church. His sociological writings also include *Notes towards a Definition of Culture* (1948). E. became a naturalised Brit. subject in 1927; awarded the O.M., 1948. Degrees include Hon. Litt. D. at Cambridge, Harvard, Yale, Princeton, Bristol, and Leeds, and LL.D. at Edinburgh. In recognition of his 'remarkable pioneering work in modern poetry' he was awarded the Nobel Prize for literature, 1948. See H. R. Williamson, *The Poetry of T. S. Eliot*, 1932; F. O. Matthiessen, *The Achievement of T. S. Eliot*, 1935; E. M. Stephenson, *T. S. Eliot and the Lay Reader*, 1944; R. Preston, *Four Quartets Rehearsed*, 1946; B. Rajan (ed.), *T. S. Eliot, A Study of his Writings by Several Hands*, 1947; and T. S. Eliot: *A Symposium*, 1948.

Elliott, George Augustus, see HEATHFIELD, BARON.

Elios, or Elea, in anct. Greece an important region of W. Peloponnesus, containing the Olympian valley and watered by the Alpheus and Peneus. It lay between Achaia and Messenia, stretching from Aracus and the R. Larissus (N.) to the R. Neda (S.), and bounded on the W. and E. by the Ionian Sea and Arcadian Mts. It was later incorporated in the Rom. prov. of Achaia. The modern Paleopolis occupies the site of the tn. of E. Since 1899 a prefecture of Greece, with Pyrgos as the cap. Pop. 148,500.

Elisabethville, tn., cap. of the Katanga Prov., Belgian Congo, Africa. Founded in 1910. Is 946 m. from Bulawayo, and 1619 m. from Beira. It has a theatre, park, hospital, public library, an agric. exhibition, and two daily newspapers. Many notable buildings have been erected, including a Rom. Catholic Cathedral; 8 m. away is The Star of the Congo Mine. The smelters of the Union Minière du Haut-Katanga, railway sidings and native compounds, etc., are in the suburb of Lumbumbashi. Malaria has been considerably reduced here and in other townships of the Belgian Congo and the sanitary services of E., especially, are highly organised. Pop. (white) 2700.

Elisha (N.T., *Eliseus*), son of Shaphat and successor of Elijah, was a great prophet of Israel. He lived during the reigns of Jehoram, Jehu, Jehoahaz, and Jehoash, exercising his ministry over a total period of nearly sixty years. As compared with his predecessor, whose faithful attendant he was, E. shows a mild and beneficent temperament instead of Elijah's fire and austerity. This comparison is fully brought out by a study of their miracles. His story is chiefly told in 2 Kings ii.-ix. E.'s festival is celebrated in the Gk. Church on June 14.

Elista, or **Yelista**, *see* STEPNOI.

Elixir, from the Arabic *al-iksir* and ultimately from the Gk. *ἐλεῖος* (a drying powder), is primarily an alchemical term for a supposed agent capable of transforming base metals into gold or silver and of prolonging human life indefinitely. It is therefore approximately equivalent to the philosopher's stone. There were two main Elixirs, viz. the Great Red E. and the White E. The latter turned mercury, etc., into silver, while the former turned silver or any other metal into gold. (See ALCHEMY.) The term E. is also applied to a drug of syrupy consistency intended to be slowly swallowed to lubricate the throat in cases of cough and irritation. Another meaning of E. is a medicated flavoured syrup.

Elizabethgrad, *see* KIROVO.

Elizabeth: (1) Cap. of Union co., New Jersey, U.S.A., 5 m. from Newark, on the Elizabeth R., Newark Bay, and Staten Is. Sound (Elizabethport), forming a residential suburb of New York. There are factories of chemicals, electrical machinery, the Singer Sewing Machine Co., ship-building yards, iron-foundries and railway machine-shops. Settled in 1664 as 'Elizabethtown,' the place has many historical buildings. Pop. 109,900. (2) Cap. of Pasquotank co., North Carolina, U.S.A., on the Pasquotank R., 40 m. from Norfolk, Virginia. It has a fine, deep harbour, cotton-mills, and shipyard. The first General Assembly of Virginia met here in 1665. Pop. 11,500.

Elizabeth (1533-1603), queen of England, daughter of Henry VIII. and Anne Boleyn, b. in Greenwich Palace on Sept. 7. After her father's marriage with Jane Seymour, E. and her half-sister Mary were declared illegitimate. Her early childhood was spent under a cloud, as was the greater part of her life until her acces-

sion. She was splendidly educated, her tutors had been steeped in the New Learning, and the future queen had the full benefit of this. The influence of the Reformation had by this time been fully felt in England, and the princess was brought under this influence also. During the reign of her half-brother Edward VI. she fell under the influence of Lord Seymour, lord high admiral of England, for whom she seems to have entertained some affection. He was, however, held to be only exercising his influence for the purpose of attaining his ambition, and was subsequently executed. During Mary's reign, although she had supported

N.P.G.

QUEEN ELIZABETH

Painting: artist unknown

the claims of her half-sister in preference to those put forward by Northumberland in favour of Lady Jane Grey, she fell under suspicion. She was accused of complicity in the rising of Sir Thomas Wyatt and was imprisoned in the Tower and later at Woodstock. In 1558 she succeeded to the throne of England without any open opposition. Diplomatic compromise may be taken as the keystone of her reign. She had been educated as a Catholic, but had imbibed Protestant doctrines, the result being that her religious convictions were somewhat shadowy. She, however, was responsible for the estab. of the Church of England on a basis which she hoped would be acceptable to all, Catholic and Protestant alike, the Thirty-nine Articles and the Book of Common Prayer as we have them at the present time being products of her reign. She, however, became a Protestant, not from religious convictions, but because it

was necessary for the salvation of England and the increase of Eng. power that she should be recognised as the Protestant champion of Europe. It is necessary to view the acts of Queen Elizabeth from two standpoints. First, as a queen and therefore the head of the Eng. nation, and secondly as a woman. In her former capacity, 'the days of good Queen Bess' amply describe the hist. of the time. By sheer diplomacy she and her ministers steered the ship of state through difficult times. She kept England nominally at peace until it was absolutely essential to strike, and when she struck, she struck with the whole force of a united England behind her. She played off her opponents skilfully one against the other, and in this way saved England from disaster. She kept the peace with Spain and yet at the same time encouraged the attacks made by the privateers of the W. upon the Span. power in America. When the Armada came it cannot be said that England was prepared, save that every Englishman was prepared to face united the efforts of Spain, and the speech of the queen at Tilbury, made when England was face to face with the greatest of her dangers, mirrored the opinion of England excellently. As a queen E. can only be described as popular, brave, courageous, and diplomatic, and perhaps her true greatness lies essentially in the fact that in her and through her England found her own aims and ideals most amply and excellently expressed. She owed her great power and popularity also to the fact that she was able to read the mind of the nation. She had great energy, industry, and physical strength, all essential Tudor qualities. From her mother she inherited great physical attractions, but also a coarseness and boldness which detracted not a little from her physical charms. Her qualities as woman and queen are illustrated by the way in which she made the gift of her hand the centre of the diplomacy of her earlier years. At home her two greatest romances were with the earl of Leicester and later with the earl of Essex. Her great passion was, however, for the former. She was inordinately vain, and was also cruel and capricious. Able to make up her mind and to act upon it with a suddenness that confounded her enemies, she also at times seems to have experienced the greatest difficulty in arriving at a decision, as witness her treatment of her cousin, Mary Queen of Scots. Both as a woman and queen she was only too obviously insincere, and the masculinity of her characteristics detracted greatly from what feminine charms she had. The 'Virgin Queen' passed away at Richmond on March 24. Her reign had seen a great revival in England on practically every side, socially, politically, and in the realm of learning. The Eng. Renaissance came in her reign. Shakespeare, Spenser, Marlowe, Jonson, were all writers during her time, and her reign may be called the golden age of Eng. literature. The revival was experienced not only in letters, but the exploits of the 'pirates of the West' reflect glory not

only upon the reign of E., but also on the hist. of England for ever. The queen herself was despotic, as had been all the Tudors, but her despotism was based upon the only foundation on which it could be successful, the trust of her subjects. See Agnes Strickland, 'Queen Elizabeth' in *Lives of the Queens of England, 1840-48*; J. A. Froude, *History of the Reign of Queen Elizabeth, 1856-70*; F. Munby, *The Girlhood of Queen Elizabeth, 1909*; M. Creighton, *The Age of Elizabeth, 1925*; Edith Sitwell, *Fanshawe for Elizabeth, 1946*.

Elizabeth (1596-1662), Queen of Bohemia, wife of Frederick V., Elector Palatine, and daughter of James I. of Great Britain and Anne of Denmark, b. at Falkland Castle, Fifeshire. From 1603 till her marriage in 1613 she was brought up in England. In 1610 Frederick was chosen to fill the throne of Bohemia, and from that time onwards Elizabeth's life was dogged by misfortune. The king was routed by the Catholic League and the royal family endured sore poverty in Holland. She had thirteen children, among whom were Charles Louis, restored to the electorate in 1648, and Sophia, who afterwards became the mother of George I. of England. See R. S. Rait (ed.), *Five Stuart Princesses, 1902*.

Elizabeth, Angela Marguerite (b. 1900) queen of George VI. of England; youngest daughter of Sir Claude George Bowes-Lyon, fourteenth earl of Strathmore and Kinghorne, by his countess, Nina Cecilia, daughter of Rev. Charles Cavendish-Bentinck, a son of the third duke of Portland. Born Aug. 4, 1900. She married April 26, 1923, Prince Albert Frederick Arthur George, duke of York: of which union there is issue—Princess Elizabeth Alexandra Mary, Duchess of Edinburgh, born April 21, 1926; Princess Margaret Rose, born Aug. 21, 1930. She became queen when Prince Albert succeeded to the throne as George VI. on Dec. 11, 1936; and went with the king on a tour of Canada and the U.S.A. in June, 1939, the visit being an unqualified success. She broadcast to women of the Empire, April 11, 1943. Queen Elizabeth is the first and only woman bencher of the Middle Temple Inn of Court—in which capacity she opened the temporary library, Nov. 21, 1946. In 1947 she accompanied the king on a tour of S. Africa.

Elizabeth (Pauline Elizabeth Ottilie Louise) (1843-1916), known under the pseudonym of Carmen Sylva in the literary world, b. at Neuwied, Germany, daughter of Prince Hermann of Wied and Princess Maria of Nassau. Married Prince Charles of Rumania in 1869, having previously travelled for five years. In 1881 Rumania was declared a kingdom, and the same year E. was crowned queen. The following year she became a member of the Academy of Sciences of Bucharest, and in 1890 she visited England. She pub. sev. vols. of romances, poetry, and philosophical writings—chiefly written in Ger.—including *Les Pensées d'une reine* (1882), *Das Leben meines Bruders Otto Nicolai, Prinz zu Wied* (1883), *Pilgrim Sorrow* (trans. 1883), *Eucarest* (1892), *Gegensätze*

Worte (essays, 1903, 1906), *In der Lunca* (1904), *A Royal Story Book* (1911), *From Memory's Shrine* (trans. of Reminiscences, 1911), *Poems* (trans. 1912), *Sparks from the Anvil: or Thoughts of a Queen* (1913). She wrote in Eng., Fr., Ger., and Rumanian. Queen-dowager, 1914.

Elizabeth (Elizabeth Philippine Marie Hélène de France) (1764-94), known as 'Madame Elizabeth', sister of Louis XVI., b. at Versailles, guillotined on May 10, 1794.

Elizabeth, St., of Hungary (1207-31), daughter of Andrew II., king of Hungary, b. in Prossburg. She married at a very early age Louis IV., landgrave of Thuringia. He was converted by the miracle, much celebrated in Ger. legend, of the changing of the bundle of bread, carried by E. for the poor, into red roses, on his sternly commanding her to display the contents. Louis died in 1227, and E. being persecuted by her brother-in-law, Henry Raspe, retired to Marburg, where she eventually died. Four years later she was canonised by Gregory IX. on account of the frequent miracles reported to have been performed at her tomb. See C. F. R. de Montalembert, *L'Histoire de Sainte Elisabeth de Hongrie*, 1836.

Elizabeth Petrovna (1709-62), Empress of Russia and daughter of Peter the Great, b. near Moscow. She succeeded to the throne in 1741. The great event of her later years was the Seven Years' War, when the Russians many times defeated Frederick the Great. E. was of a licentious, idle temperament, but inherited some of her father's genius for gov. She was also a patroness of art and literature, and was one of the founders of Moscow Univ.

Elizabeth of York (1) Queen of Henry VII., and mother of Henry VIII.; eldest child of Edward IV. and his queen, Elizabeth Woodville; born at Westminster. Married Henry, 1486. Stricken with grief at the loss of her eldest son, she died in imprisonment in the Tower. (2) (Alexandra Mary, Princess) elder child of George VI.; heir-presumptive to the throne of Britain; born at Royal Lodge, Windsor Great Park, on April 21, 1926; married Lieut. Philip Mountbatten, duke of Edinburgh, Nov. 20, 1947, and has heir, Prince Charles Philip Arthur George, b. Nov. 14, 1948.

Elizabeth, Valerie Gabrielle Marie (b. 1878), queen-dowager (since 1934) of the Belgians, was born at Posenhofen; second daughter of duke Charles Theodore of Bavaria; married 1900, to Albert, afterwards king of the Belgians.

Elizabethan Architecture, style of architecture which was in vogue during the later part of the reign of Elizabeth and in the reign of James I. It was marked by a revival of classic designs brought into the decadent Gothic style. The Marquis of Salisbury's house at Hatfield is a typical specimen of this mixed style.

Elizabethton, city, co. seat of Carter co., N.E. Tennessee, U.S.A., making artificial silk, etc. Pop. 8500.

Elizabeth Tunnel, 60 m. N. of Los Angeles, California, U.S.A., penetrates the Coast Range Mts. and is five m. long.

Elizavetpol, see GANDZHA.

Elk, or Moose, *Alces alachis*, the largest living species of forest deer. It is known in the Old World as the E., but in America as the moose, the American 'E.' or wapiti having less resemblance to the European broad-horned deer than to the red deer. The E. is distributed over the forested regions to the N. of Europe and Asiatic Russia, and it is now everywhere protected by laws, and carefully preserved. It is easily tamed and has frequently been trained to draw sleighs. The antlers, found in the male alone, have their basal portion, which is in the form of a short cylinder, in the same plane as the forehead. The base expands into a huge, broad 'palm,' at the edge of which are short branches. The height at the shoulders is about 6 ft. In the breeding season, the males fight with great fury, inflicting such wounds with their horns that the combats frequently result in death.

Elk, Irish, *Cervus megareros*, extinct species of deer closely allied to the fallow-deer of the present day, the bones of which are found among the clays and marls of the Irish bogs and also in certain parts of Great Britain and the continent. It stood 6 ft. in height, and is characterised by the enormous size of its antlers, which sometimes had a spread of close on 11 ft. Extinct after the coming of man to Europe.

El Kantara, tn. of Egypt, on the Suez Canal. In the First World War it was the scene of a victory over the Turkish advance guard in 1915. Pop. 25,000.

El Khargeh, or **The Great Oasis**, large and fruitful valley in the Libyan desert, the most S. of the Egyptian oases. From 80 to 100 m. long and 10 m. broad.

Elkhart, city of Elkhart co., Indiana, U.S.A., on the St. Joseph R. Important manuf. centre: has automobile and machine industries, and makes paper, musical instruments, and iron bridges. Pop. 33,400.

Elk-Hound, small Norwegian dog which much resembles the Eskimo dog (*q.n.*), but is considerably smaller in size. Its coat is thick, with a full under-coat, and the tail is bushy. The colour is grey, with a darker shade on the back.

Elkins, city of W. Virginia, co. seat of Randolph co., in a lumbering and coal mining region, has various manufs. and a college. Pop. 8100.

Ell (Lat. *ulna*, the forearm), measure used to denote length, originally taken in some way from the forearm. The E. varied in different countries, thus the Eng. E. as a measure of cloth is equal to 1½ yds., the Flemish to ¾ yd., and the Fr. to 1½ yds.

Ells, see **ELLA**.

Ellagic Acid, or **Gallogene** (C₁₂H₆O₆), yellow, odourless powder of agreeable taste only soluble in alkalis. Medicinally it is used as an astringent in cases of tuberculosis and inflammation of the bowels, becoming active only on reaching the alkaline fluids of the intestines.

Elland, tn. in W. Riding of Yorkshire, England. Manufs. woollens and fireclay goods, and has iron and dye works. Pop. 19,200.

Ellenborough, Edward Law, first Baron (1750-1818), was educated at Charterhouse and Cambridge. In 1771 he became a pupil of the special pleader, George Wood (afterwards a baron of the Exchequer), and four years later began practising on his own account with great success. Called to the Bar in 1780, he was soon in the enjoyment of a large practice. His first great chance came in 1788 when he was retained as leading counsel for the defence of Warren Hastings. His admirable conduct of this case made him famous and long before it had reached its close he was engaged in many of the most important trials of his day. In 1802 he succeeded Kenyon as Lord Chief Justice, and was raised to the dignity of Baron E. In 1806 he was offered the post of Lord Chancellor in the 'Talents' ministry, but this he declined, though he joined the cabinet without office. Through ill-health he retired from the bench in Nov. 1818. His biography will be found in J. C. Campbell's *Lives of the Chief Justices of England*, 1837 (vol. iii.).

Ellen's Isle, small is. of Perthshire, Scotland, situated in Loch Katrine. It is celebrated in romance, and immortalised by Sir Walter Scott, who made it the haunt of the Lady of the Lake.

Ellerman, Sir John Reeves (1862-1933); Eng. shipowner, financier, and newspaper proprietor, son of John Harman E., of Hull, a native of Hamburg. Early joined the board of Frederick Leyland's company, the first unit of what eventually developed into the Ellerman group. This group, registered as the London, Liverpool and Ocean Shipping Co., included under the one management the Paypayanni, City, Hall, Westcott, Laurences and other lines, and, in 1913 acquired the share cap. of Bucknall's Steamship Lines, the name of which was changed in 1914 to Ellermans and Bucknall Steamship Company. He was also chairman of Ellerman's Wilson Line. Left a fortune of £30,000,000. Baronet in 1903, Companion of Honour in 1921.

Ellesmere: (1) Urban dist. in Shropshire, 16 m. N.N.W. of Shrewsbury. Pop. 1800. (2) Is. of the Arctic regions, Canada, W. of Smith Sound, and opposite N.W. Greenland. It is almost entirely ice and snow-covered wastes.

Ellesmere, Francis Leveson-Gower Egerton, first Earl of (1800-57), Eng. politician and writer, the second son of the first duke of Sutherland. From 1828-30 he was Irish Secretary, and secretary for war in 1830. Amongst his writings are a trans. of *Faust* (1824), *Mediterranean Sketches* (1843), *History of the War of the Sicilian Vespers* (1850), *Personal Reminiscences of The Duke of Wellington* (1903, pub. by his daughter).

Ellesmere Canal, Cheshire, England, belonging to the Manchester Ship Canal, and connecting the Severn and Mersey. Length, 68½ m.

Ellesmere Port, urban dist. and seaport of Cheshire, England, on the Mersey, 6½ m. N. of Chester at the junction of Ellesmere Canal and the Manchester Ship Canal. It is a depot for iron ore and

pig iron and has large docks and warehouses. Pop. 13,000.

Ellet, Charles (1810-62), Amer. engineer, b. in Penn's Manor, Bucks co., Pennsylvania. The first wire suspension bridge of the U.S.A., at Fairmount, Philadelphia, was his work, and he constructed most of the prin. iron and steel bridges in the U.S.A. He is chiefly remembered as the inventor of naval rams, and in the Amer. Civil war equipped nine Mississippi R. steamboats as rams, defeating a fleet of Confederate rams. He met his death during a naval engagement.

Ellice, or Lagoon Islands, see GILBERT AND ELLICE ISLANDS.

Ellichpur, or Ellichput, city in Berar, India, 100 m. N.W. of Nagpur. It was at one time a great city, but now has little commerce. Contains some interesting ruins. Pop. 23,899.

Elliot, Charles John (1819-1905), Eng. prelate b. at Whitwell, near Stamford, where his father was rector. In 1861 he was made dean of Exeter, and two years later bishop of Gloucester and Bristol. His episcopate lasted forty-two years, and he threw himself vigorously into diocesan work. In 1857 E. was one of the five clergymen who pub. a revision of the gospel of St. John, followed by revisions of the Romans and Corinthians and other epistles.

Elliot - Murray - Kynynmound, Gilbert John, see MINTO, EARL OF.

Elliot, Jane (1727-1805), Scottish poetess, daughter of Sir Gilbert E., b. at Mint House, Teviotdale. The greater part of her life (1756-1804) was passed in Edinburgh. She is remembered for her most exquisite ballad, *The Flowers of the Forest*, a touching lyric on the disaster of Flodden. Sir Gilbert Elliot, her eldest brother, was also a song-writer.

Elliotson, John (1791-1868), Eng. physician, b. at Southwark, London. He studied medicine at Edinburgh and Cambridge, and in 1834 became physician to Univ. College Hospital. He was a student of hypnotism and mesmerism, and in 1838 was compelled to resign his offices on this account. He edited a magazine, *The Zoist*, devoted to the subject, and founded a mesmeric hospital in 1849. E. was one of the first Brit. physicians to advocate the use of the stethoscope. Among his pub. are: *Lectures on Diseases of the Heart* (1830), *Human Physiology* (1840), *Surgical Operations in the Mesmeric State without Pain* (1843). Thackeray dedicated his *Pendennis* to E.

Elliott, Ebenezer (1781-1849), Eng. poet, the 'corn-law rhymers', b. near Rotherham, Yorkshire. He was educated at various schools, and in 1797 entered his father's iron foundry. He had a successful career at Sheffield as a bar-iron merchant, and on his retirement in 1841 settled at Great Houghton. From the age of seventeen he began writing poems, pub. *The Vernal Walk*, in imitation of Thomson, in 1801. He is chiefly remembered, however, for his *Corn-Law Rhymes* (1831), which are vigorous, simple, and full of a vivid description. They are inspired by a fierce hatred of injustice, and

by their sincerity and earnestness are saved from the common fate of political poetry. See Carlyle's essay, 'Corn Law Rhymes,' in *Critical and Miscellaneous Essays*, 1839; W. Odom, *Two Sheffield Poets*, 1929.

Elliott, May Gertrude (Lady Forbes-Robertson), actress, b. Dec. 14, 1874, at Rockland, Maine, U.S.A., sister of Maxine E. She made her first appearance on the stage at New York with E. S. Willard in *The Middleman*, and was first seen on the London stage at Daly's Theatre in 1895 as Sylvia in *The Two Gentlemen of Verona*. She married Sir Johnston Forbes-Robertson in 1900, and has since played many leading parts with him. Her most successful rôles were those of Desdemona; Ophelia; the 'slavey' in *The Passing of the Third Floor Back*; Little Britain in *Mice and Men*; and Maisie in *The Light that Failed*. Her later parts included Gina Ashling in *The Eyes of Youth*, 1918; Sarah Gilman in *Sarah of Soho*, 1922; and Maria in *Twelfth Night*, 1927.

Ellipse. In general language an E. is a regular oval. In geometry it may be defined in a number of different ways: (1) The section of a cone by any plane less inclined to the base of the cone than is the side of the cone. (2) An oblique section of a right cylinder or the oblique projection of a circle. An E. is the orbit of a particle moving under the influence of a central force, which varies inversely as the square of the distance of the particle. This law is the gravitational law of force, and an E. represents the orbit of a planet, if the individual planet and the sun are considered alone (the other planets exert attractions and disturb the orbit).

The foci of an E. are the points S and S' (see diagram) such that the sum of the distances SP and S'P of any point on the

(ON and OT) are connected by the equation:

$$\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$$

(where ON = x and OT = y).

The **diameter** is any straight line through the centre, terminated by the E., such as GOG'. The **directrix** is the line MK, such that the distance of P from the focus S bears a constant ratio less than unity to the distance of P from MK.

Ellipsoid, in geometry, a solid body whose plane sections through one of the axes are ellipses; all other sections are ellipses or circles. The term is often used to indicate the solid body generated by the rotation of an ellipse about one of its axes; but it is better to use the term spheroid for this body. The E. is very largely used in the mathematical theories of elasticity, heat and light, e.g. the strain E., E. of expansion, or the wave surface in a doubly refracting substance.

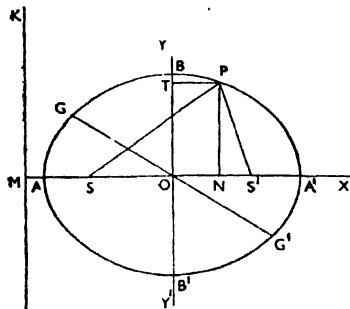

Elliptic Compasses. The trammel, or E. C., depends on the fact that the sum of the distances of a point on an ellipse from the foci is a constant.

Elliptic Polarisation. Elliptically polarised light, when examined with a Nicol's prism, will give an illumination which will vary as the Nicol is rotated. It is thus distinguished from ordinary light, but not from a mixture of ordinary and plane polarised light. It may be distinguished by first passing the light through a quarter wave plate of mica with its axis parallel or perpendicular to the plane of maximum polarisation; for elliptically polarised light thus becomes plane polarised, and may be extinguished on rotating the Nicol's prism.

Ellis, Alexander John (1814-90), Eng. phonetician, mathematician, and musician. His original name was Sharpe, but he assumed the surname Ellis (1825). He was associated with Sir J. Pitman, founding the system of printing known as 'phonotypy.' His works include *Phonetics* (1844), *The Essentials of Phonetics* (1848), *Pronunciation for Singers* (1877), and *The History of Musical Pitch* (1880). He also wrote papers and books on mathematics and philosophy and produced phonetic texts of standard works, and was editor of *The Phonetic Friend* (1849) and *The Spelling Reformer* (1849-50).

Ellis, George (1753-1815), Eng. writer, sprang into notoriety in 1778 with the pub. of *Poetical Tales*, by Sir Gregory Under. He was one of the contributors to the *Rolliad*, and in later years, with Canning, founded the *Anti-Jacobin*. In 1790 he pub. *Specimens of the Early English Poets*, and fifteen years later, *Specimens of Early English Romances in Metre*.

Ellis, Sir Henry (1777-1896), Eng. antiquarian, assistant librarian at the Bodleian, Oxford, and the Brit. Museum (1800), chief librarian of the Brit. Museum (1827-56). His works include an ed. of Brand's *Popular Antiquities* (1813) of Dugdale's *Monasticon* (with others 1817-1833), *Introduction to Domesday Book* (1816), *Original Letters Illustrative of*

E. from the foci is the same whatever the position of P. The straight line AA' passing through the foci is the **major axis**, and the line BB', perpendicular to AA' at its middle point, is the **minor axis**. If $AA' = 2a$ and $BB' = 2b$, $C^2 = A^2(1 - e^2)$, where e is the eccentricity. Also $SP + S'P = 2a$. If AOA' and BOB' be taken as the axes, the co-ordinates of the point P

English History (three series, 1823-46), *Elgin Marbles of the Classic Ages and The Townley Gallery of Sculpture* (1847). E. was director of the Society of Antiquaries for many years.

Ellis, Henry Havelock (1859-1939), fellow of the Medico-legal Society of New York, b. in Croydon, Surrey. He was educated at St. Thomas's Hospital, and was engaged in teaching in New South Wales (1875-79). Returning to England, he practised as a doctor, but soon abandoned this profession to devote himself to literature. His psychological and sociological works, and miscellaneous writings include *Man and Woman: A Study of Human Secondary Sexual Characters* (1894, 1904, 1914, and 1934), *Sexual Inversion* (1897), *The Evolution of Modesty* (1899 and 1910), *The Soul of Spain* (1908), *Sex in Relation to Society* (1910), *The World of Dreams* (1911), *Impressions and Comments* (1914-24); *Essays in War-Time* (1916), *Kanga Creek* (1922), *Sonnets with Folk Songs from the Spanish* (1925), *Chapman, with Illustrative Passages* (1931), *Questions of Our Day* (1936), and *Selected Essays* (Everyman's Library, 1936). See H. Peterson, *Havelock Ellis, Philosopher of Love* (with bibliography), 1928.

Ellis, Robinson (1834-1913), Eng. philologist and classical scholar, educated at Guernsey, Rugby, and Oxford. He pub. numerous critical works on Catullus and trans., *Catulli Veronensis Liber* (1867, 1878), *Fragments of Catullus* (1871), and *Commentary on Catullus* (1876). Other works are Ovid's *Ibis* (1881), *New Fragments of Juvenal* (1901), *Appendix Vergiliana* (1907), *The Annalist Licinianus* (1908), *The Amores of Ovid* (1912), and various articles in many journals and classical reviews.

Ellis, William (1791-1872), Eng. missionary, sent by the London Missionary Society to the S. Pacific Islands (1816-25). From 1831 to 1841 he was foreign secretary to the London Missionary Society. His visits to Madagascar resulted in *History of Madagascar* (1838), *Three Visits to Madagascar* (1858), *Madagascar Revisited* (1867), *The Martyr Church* (1870). Other works were *A Tour through Ouchy-see* (1826), and *Polynesian Researches* (1829). See life by J. E. Ellis, 1873.

Ellis Island, small is. in New York harbour, 1 m. from Manhattan Is., used as an immigrant station (since 1892) and as a magazine.

Elliston, Robert William (1771-1831), Eng. actor and manager, first appearing (1791) as Tressell in *Richard III.* at Bath. In 1796 he came to the Haymarket, London, and was manager there (1803). E. was considered one of the finest actors of his day, especially in comedy, and was praised by Lamb and Leigh Hunt. See lives by G. Raymond, 1848, 1857, and W. Oxberry, 1826.

Ellon, vil. of E. Aberdeenshire, Scotland, on the Ythan, 12½ m. from Inverurie. Once the cap. of Buchan, the vil. belonged to Kinloss Abbey. Pop. 1300.

Ellora, The caves of, in the Nizam of Hyderabad's dominions, India, 2 m. from

the walled tn. of Ravva or Khuldabad, the holy shrine of the Deccan Moslems, and the burial place of the Emperor Aurangzeb and many other celebrities. Ravva is now in great part deserted, and ruins of mosques and tombs abound in every direction. The E. group of cave temples comprises twelve Buddhist, seventeen Brahman, and five Jain works. They are mentioned by an Arab geographer of the fifteenth century as a celebrated place of pilgrimage. The Buddhist caves date from A.D. 350-750. The Brahman caves were probably constructed in the seventh and eighth centuries A.D. There are sculptures of the slaughter of the Buffalo demon, Siva and Parvati playing chess, three skeleton demon gods, Bhairava with a necklace of skulls, three riv. goddesses, etc. The five Jain caves date from the eighth to the thirteenth century.

Ellore, tn. of Godavari dist., Madras, India, 37 m. from Masulipatam, near Lake Kolar. It was once the cap. of the N. Circars. There are carpet manufs. Pop. about 30,000.

Ellsworth, city of Hancock co., Maine, U.S.A., at the mouth of Union R., 27 m. S.E. of Bangor. It has a trade in timber and fish. Pop. 4000.

Ellsworth, Lincoln (b. 1880), Amer. explorer, born at Chicago, accompanied Amundsen (for whom he provided support) on his first polar flight, 1925; and in the following year in the airship *Norge* from Spitsbergen to Alaska. He pub. *First Crossing of the Polar Sea* (1926) and *Beyond the Horizon* (1938).

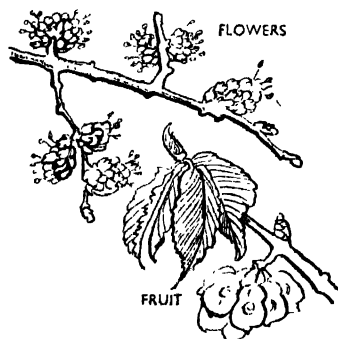

Ellsworth, Oliver (1745-1807), Amer. statesman and jurist, b. at Windsor, Connecticut; studied at Yale and Princeton, and practised law at Hartford, 1771. Was a member of the General Assembly of Connecticut, and held many legal and political offices in the state. Advised Washington to send Jay to England to negotiate a new treaty. Appointed by Washington as chief justice of the Supreme Court, 1796, and was sent by Adams to France to negotiate a new treaty.

Ellwangen, tn. of Germany, in Württemberg, and cap. of Jagst, W. of the Ellwangen int. crowned by a castle built in 1354, containing a collection of antiquities and the Schönenberg with a pilgrimage church. It possesses many fine churches and owes its origin to a monastery founded in 750 A.D. Pop. 5700.

Ellwood, Thomas (1639-1714), Eng. author and Quaker preacher, intimate friend of and reader to Milton after he became blind. E. first suggested to Milton the idea of his second epic, *Paradise Regained*, after reading the MS. of *Paradise Lost* (1665). E.'s own works include: *Forgery no Christianity* (1671), *Sacred History of the Old and New Testaments* (1705-9), and other polemical works; *Davidica* (a poem, 1712), and *Autobiography* (1714).

Elm, the name applied to species of *Ulmus*, four of which occur in Britain, while all the sixteen are to be found in N. lands and on Asiatic mts. There are some eighteen species of the *Ulmus* genus of the *Ulmaceæ* family and all are easily

cultivated, flourishing in almost any soil or situation. The fruit is characteristic, being a one-seeded samara, and the leaves are curious, the sides being unequal in size. *U. campestris*, the common or small-leaved E., and *U. montana*, the wych-elm, are our best-known species; *U. Americana* is a tall tree and yields a good timber. The common E. is abundant in England, France, Spain, and Italy; it sometimes attains great age and size, endures in smoky tn. conditions and is familiar in London parks. Formerly its timber was used for water-pipes and the

COMMON ELM

keels of ships. The wych E., also indigenous in Great Britain, is also known as the Scotch E.

Elmalu, see **ALMALI**.

Elman, Mischa (b. 1891), Russian violinist of Jewish descent born at Talmoi, Russia. Trained by Fidelmann and Auer. He first appeared in London in 1904 and in New York, 1906, and is now one of the leading violinists of the world.

Elmina, or **St. George del Mina** (native Odena), dist. and fort. tn. of the Gold Coast Colony, W. Africa formerly (till 1872) cap. of the Dutch possessions in Guinea. Close by is the inlet of Baya, with the suburb Garden Town. It was founded about 1482. It exports palm oil, gold and ivory. Pop. 20,000.

Elmira, cap. of Chemung co., New York, U.S.A., on Chenung R. (Newtown Creek), 74 m. from Syracuse. An important railway centre. The more important industries include railroad car shops, steel bridge plants, valve and radiator works, and the manuf. of shoes, fire engines, silk and knitted goods and bicycles. It is the seat of Elmira College for Women, and of the noted Reformatory. Pop. 45,100. See A. Winter, *The Elmira Reformatory*, 1891.

El Misti, or **Arequipa Volcano**, grand, almost extinct volcanic mt. of the Andes, Peru (c. 20,000 ft.), close to Arequipa. Harvard Univ. erected a meteorological observatory near the summit, in use from 1893 to 1901. There are various stations at Mont Blanco (15,700 ft.), Pampa de los

Huesos (13,400 ft.), and Mollendo (sea-level). The name is also applied sometimes, but incorrectly, to Huayna Putina volcano, S.E. of Arequipa.

Elmshorn, tn. of Schleswig-Holstein, Germany, noted for manufs. of textiles, margarine and sausages. It carries on a shipbuilding and tanning trade. Pop. 16,000.

Elmsley, Peter (1773-1825), Eng. philologist, classical scholar, and critic. He assisted Davy in deciphering the papyrus found at Herculaneum (1819). E. produced excellent critical ed. of sev. dramas of Sophocles and Euripides. See F. E. Greville (ed.), *Elmsleiana Critica*, 1833.

El Obeid, or **Il-Obeid**, cap. of Kordofan, Egyptian Sudan, Africa, 240 m. from Senaar. There are sev. mosques and the barracks of the Sudan Camel Corps. An Anglo-Egyptian army, under Hicks Pasha, was annihilated by a Mahdist force close by (1883). It is the terminus of the railway from Cairo. Pop. 18,000.

Elocution (Lat. *elocutio*, from *eloqui*, to speak out), a branch of oratory which teaches the art of effective speaking, especially public speaking, having regard solely to the utterance or delivery. It directs the proper use of gesture, the modulation of the voice, and deals generally with the methods of speaking. In ant. times E. held a prominent place in education, and great attention was paid to the study of it in Greece and Rome. Nowadays it is even more carefully cultivated in the U.S.A. than in Britain, its teaching having diminished in the latter country during the second half of the nineteenth century. See D. C. and A. M. Bell, *Standard Elocutionist*, 1873; T. G. Summels, *The Art of the Elocutionist*, 1932; J. Bernard, *Lessons in Elocution*, 1933; Z. R. Cree, *Elocution and Voice Production*, 1935.

Eloge (eulogia, praise), an encomium or panegyric oration in honour of a deceased person, describing his merits and services, especially one pronounced by the secretary of the Fr. Academy, or by a newly-elected member on his predecessor. These *eloges académiques* form a considerable branch of Fr. literature. See the *Eloges* of Fontenelle (1731). Thomas (1739-70), Alenbert (1779-87). Cuvier (1819-27), and Flourens (1833-67).

Elohim (Heb. plur. of *Eloah*, God), one of the chief names by which God is designated in the Heb. Scriptures. The plural expresses the idea of greatness and supremacy, and is mainly used with a singular verb as a title of the Supreme Being, especially in N. Heb. literature. It was probably of later date than the title 'Yahweh' (Jehovah), which was considered as a more personal and intimate name for the Deity. Writers of O.T. passages (especially of the Pentateuch) in which the name E. occurs are called Elohist. (See JAHVIST.) See E. Kautzsch, *History of Old Testament Literature* (Taylor's trans.), 1898.

Elohist, see **HEXATEUCH**.
Eloi or **Eligius**, Saint (587-c. 659), Fr. benefactor, founder of many monasteries

and hospitals. He was a favourite minister of Clotaire II. and Dagobert I. He is the patron-saint of jewellers and goldsmiths. In 640 he became bishop of Noyon.

Elongation, in astronomy, the angular distance of a heavenly body from some relatively fixed point, such as the angular distance of a planet from the sun or of a satellite from its primary, as seen from the earth. Thus the angular distance of Venus is about 45°.

Elopement, the secret departure of a woman from the house or home to which she is bound by ties of law or duty. The word is most commonly applied to the conduct of a daughter who runs away from her father to contract a clandestine marriage with her lover. Thus, from 1754 until 1856 Eng. sweethearts would elope to Greta Green, a border vill. of Scotland, where they could easily and quickly become legal man and wife. In the latter year an Act made residence in Scotland for at least twenty-one days necessary for one of the parties.

El Paso, port and cap. of E. P. co., Texas, U.S.A., on the Rio Grande, opposite Ciudad Juarez (El Paso de Norte), Mexico. The industries include smelting, flour-milling, railway car repairing, box-making and meat packing, and the trade is in copper, silver, lead, wool, hides, and live stock, especially with Mexico. Seekers for nearly perennial sunshine find it at E. P., at an elevation of 3800 ft. Pop. 96,800.

El Paso del Norte (Mexico), see CIUDAD JUAREZ.

Elphin, tn. of co. Roscommon, Ire, formerly the seat of a bishop. The see, however, no longer exists, having been united with Kilmore in 1833. Pop. 700.

Elphinstone, George Keith, see KEITH, VISCOUNT.

Elphinstone, Mountstuart (1779-1859), Eng. historian and statesman, son of the eleventh Baron E. Educated at Edinburgh and Kensington, he entered the Civil Service of the E. India Company (1796), and became one of the founders of the Anglo-Indian empire. E. was aide-de-camp to Wellesley (1803), sharing in his campaign; envoy to Kabul (1808), and resident at Poona (1810-17). He helped to win the Battle of Kirki against the Mahrattas (1817), and was made governor of Bombay (1819-27). He ruled wisely in the Deccan, but refused the governor-generalship of India owing to ill-health. He wrote: *Account of the Kingdom of Cabul, and its Dependencies in Persia, Tartary, and India* (1815, 1839), *The History of India* (1841, 1866), and *The Rise of British Power in the East* (ed. by Sir E. Colebrooke, 1887). See life by Colebrooke, 1884.

Elphinstone, William (1431-1514), Scottish prelate and statesman, Bishop of Aberdeen (1483), and founder of King's College, Aberdeen (1494, completed 1508). He helped to estab. the printing-press of Chepman and Millar in 1507. His chief work is the *Brevitium Aberdeenense* (1509-10, reprinted 1853). See H. Boece's

Memoir (J. Motr's trans.), 1894; A. Gardyne, *Luf of W. Elphinston*, (D. Laing's ed.) 1878.

El Reno, tn. of Oklahoma, U.S.A., 30 m. from Oklahoma. Has a collection of Indian curios and relics, a remount station for the U.S.A. Army and graded schools for Indian children. It is on the Meridian auto highway from Winnipeg to the City of Mexico. Its industries include railroad shops and incubator factories. Pop. 10,000.

Elsene, see IXELLES.

Elsheimer (or Elzheimer), Adam (c. 1574-1620), Ger. landscape-painter. He worked largely in Rome, and was called by the Its. 'Adamo Tedesco.' His pictures are mostly small and beautifully finished. He excelled in colour and chiaroscuro, and in imitation of nature, and his scenes by torchlight and moonlight were much admired. E. was founder of the school later represented by Rembrandt and Claude Lorrain. His works include: 'Flight into Egypt' (Louvre), 'Ceres in Search of Persephone', 'Tobit and the Angel' (engraved by Count Goudt), 'Christianity Triumphant over Paganism', 'Martyrdom of St. Lawrence' (National Gallery). See lives by W. Drost, 1933, and F. Bothe, 1939.

Elsinore, see HELSINGOR.

Elssler, name of two celebrated Austrian dancers. *Therese* (1808-78) and *Fanny* (1810-84). They made tours in Europe and America. Beautiful, of kindly disposition, and possessing complete mastery of their art, they were everywhere beloved and admired.

Elster, Black, or *Schwarze*, riv. of Germany, rising in Upper Lusatia, E. Prussian Saxony. The B. E. flows into the Elbe, 9 m. from Wittenberg. Length about 112 m., of which 37 are navigable. A branch, the Neud Graben, forms an is. 19 m. long.

Elster, White, riv. of Germany, flows N. past Greiz, Gera, and Leipzig, finally joining the Saale 3 m. from Halle. A branch, the Luppe, also flows into the Saale. Length about 120 m. Little of the riv. is navigable.

Elstow, par. of Bedfordshire, England, 2 m. from Bedford. John Bunyan was born in this vil. (1628). Pop. 400.

Elswick, a par. and W. suburb of Newcastle, Northumberland, England. It has rapidly increased in importance since the opening of Armstrong's engineering works (1847). Pop. 12,000.

Eltham, a par. of the bor. of Woolwich, England, pleasantly situated 3 m. S. of Woolwich. Its royal palace of King John was largely destroyed during the Commonwealth, but the banqueting hall remains. E. has associations with Sir Thomas More, whose house still stands. Pop. 35,000.

Elton, shallow salt lake in the Astrakhan Region of the R.S.F.S.R. It receives eight salt-water streams and has no outlet. The Crimean salt fields now provide supplies for which E. was once worked.

Elton, Charles Isaac (1839-1900), Eng. jurist and ethnologist. His valuable *Origins of English History* (1882) deals with the Celtic element in the Eng. race.

He wrote also *Custom and Tenant Right* (1882).

Elton, Oliver (1861-1945), Eng. literary historian. Educated at Marlborough and Corpus Christi College, Oxford. Prof. of Eng. Literature at univs. in England, America, and India. Became President of Eng. Association in 1932, and honorary member of the Modern Languages Association of America. Among his pubs. are: *The Augustan Ages* (1899), *Michael Drayton* (1905), *Survey of English Literature from 1730-1830* (1912-1928), in which he combined delicacy of portraiture with a careful study of contemporary culture and hist.; *The English Muse* (1933); and *Lascelles Abercrombie* (1939).

Elutriation (Lat. *elutriare*, to wash out), the process of separating lighter and heavier pulverised substances by washing out or decanting. The method is employed in the preparation of clay and other materials for pottery manuf. The material is placed with water in a vat where grinding wheels pulverise the material and keep the water flowing; the finer particles pass with the water into settling vats where they are deposited.

Elvan, name given by Cornish miners to dykes of quartz-porphphy, granite-porphphy, or other Plutonic rock found in association with granitic and penetrating sedimentary strata. The rock is granular and crystalline and is called by geologists 'quartz-felsite.' It is used for road-mending and for building stone.

Elvas, strongest fortified city of Portugal, near the Sp. frontier, 10 m. W. of Badajoz; trade in wool, wines, fruits, and oil; fine old Rom. aqueduct. It has a Rom.-Moorish castle, cathedral, theatre, library, etc. Pop. 12,000.

Elves, see **ELF**; **FAIRIES**.

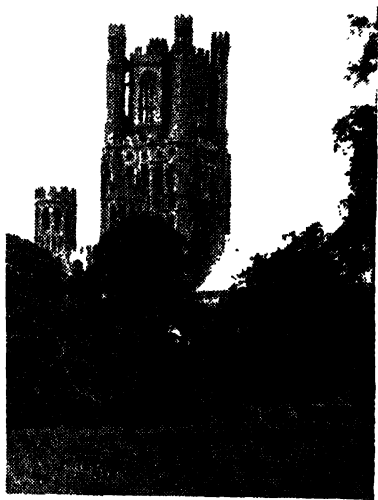

Elvey, Sir George Job (1816-93), Eng. organist and composer, born at Canterbury, where he became a chorister in the cathedral. When only nineteen he was appointed organist at the Chapel Royal, Windsor. He composed two oratorios, many anthems, etc., and the tune to 'Come, ye thankful people come.'

Elwes, Gervase Henry (1866-1921), Eng. tenor, born at Billing, Northants; son of V. D. H. Cary-Elwes. He was educated at the Oratory School, Edgbaston, Woburn School, and Christ Church, Oxford. He entered the foreign service and was hon. attaché at Munich, 1891, and later at Vienna and Brussels where he studied music. E. abandoned diplomacy in 1895. His first public appearance as a singer was at the Westmorland festival in 1903. He sang in 150 performances of *The Dream of Gerontius*. While travelling in America he was killed by accidental blow from door of a train in Boston, Massachusetts.

Elwood City, bor. of Lawrence co., Pennsylvania, U.S.A., 36 m. N.W. of Pittsburgh, manufacturing steel, brass, etc. Pop. 13,000.

Ely, city of Cambridgeshire, 16 m. N.N.E. of Cambridge, situated on rising ground near the R. Ouse in the midst of the fens. It was one of the last strongholds of the Saxons; here Hereward's

'camp of refuge' held out against the Conqueror. Its cathedral is one of the finest of the Christian churches, and one of the largest in England. It presents examples of Saxon, Norman, and early Eng. architecture. On its site St. Etheldreda founded, in 673, a monastery, which the Danes burnt down in 870; Ethelwold, Bishop of Winchester, founded a Benedictine abbey about the year 1000; the present cathedral was begun in 1083 and finished in 1534. Its length is 530 ft., breadth across the transepts 180 ft.,

John H. Stone

ELY CATHEDRAL FROM CASTLE HILL

height 62 ft., the western tower is 225 ft. high. Between 1322 and 1342 the central tower fell, and the decorated lantern tower, built by Alan de Walsingham to replace it, is one of the most interesting features of the cathedral as being the only existing specimen of a Gothic dome. The choir exhibits great splendour of carving and sculpture. Among historical personages connected with E. are bishop Thurston and King Canute. Oliver Cromwell lived here 1636-40. King's School, a public school for boys, was founded in 1543. Brewing and market-gardening are carried on, and pottery and clay pipes are manufactured. Pop. 8,300. See W. D. Sweeting, *Ely Cathedral*, 1901; B. E. Dorman, *The Story of Ely and its Cathedral*, 1946.

Ely, Isle of, see **ISLE OF ELY**.

Elymais, tn. and dist. of Susiana, in Persia, which derived its name from the Elymaei or Elym, a warlike and predatory people who were also found in the mountains of Great Media, and were probably among the most ant. inhab. of the

country N. of the head of the Persian Gulf. The tn. contains a famous temple which Antiochus the Great wished to despoil in order to pay his tribute to Rome. In the O.T. Susiana is called *Elam*.

Elymas, the title of Bar-jesus, who in the presence of Sergius Paulus, governor of Cyprus, withstood Paul and Barnabas (*Acts*, ch. xiii). E. is explained as *Magos*, 'Sorcerer,' and the word seems akin to the Arabic 'alama,' 'to know,' whence 'alim,' 'learned Man.' E. seems to have been a representative of that system of interpreting Nature and natural powers which in the anct. world took the place now occupied by science. It claimed to be a religion as well, and wonders wrought by means revealed only to the initiated, possibly at times by legerdemain and at others by recondite forces, were relied upon to secure adherents. E. doubtless regarded Paul and Barnabas as rivals competing for the favour of the governor, and employed his black arts against them. Paul replied in kind; and the blindness that fell upon the 'sorcerer' was demonstration of a power behind the apostle greater than any known to E. The Cypriot, Simon, who assisted Felix against Drusilla, and Simon Magus, probably belonged to the same class.

Elyot, Sir Thomas (c. 1490-1546), Eng. writer and diplomatist, best known as the author of *The Boke named the Governour*, the first treatise on education written and printed (1531) in Eng. In 1511 he was clerk of assize, while his father was judge; Henry VIII. employed him on several diplomatic missions. He was a friend of Sir Thomas More. Among his many works are: *The Dictionary of Syr T. Elyot* or *Bibliotheca Elyota* (1538), a Lat.-Eng. dictionary still of philological interest; *The Castel of Heith* (1539), *The Defence of Good Women* (1545), and *The Image of Governance*, an allegorical work in which he attacks the vices of his time. See C. Bendorf, *Die englische Padagogik im 16. Jahrhundert*, 1905, and F. Watson (ed.), *The Governour* (Everyman's Library).

Elyria, city of N. Ohio, with many manufs., including laces, heaters, invalid chairs, fishing tackle, chemicals, golf balls, automobiles and engines. Pop. 25,100.

Elysium, or The Elysian Fields, in anct. mythology the place where dwell in perfect happiness the departed heroes and virtuous men favoured by Zeus. Homer's Elysium is a beautiful meadow at the W. extremity of the earth, on the banks of the R. Oceanus. Subsequent poets deviate somewhat from Homer's conception.

Elytra (Gk. *ἐλῦτρα*), the name given to the horny sheaths which constitute the fore-wings of beetles. They fold over the back, generally meeting in the middle in a straight line, and serve to protect the hind-wings and the soft posterior parts of the body. The presence of E. is the distinguishing mark of beetles, but they are also to be met with in earwigs.

Elze, Frederick Karl (1821-89), a Ger. writer, who became a celebrated Shakespearean scholar. He was born at Dessau and was appointed to the chair of Eng. at Halle in 1875. He wrote *William*

Shakespeare, Englischer Liederschatz (1876), a work on the Elizabethan dramatists (1880-86), and trans. *Hamlet*.

Elzevir, the name of a family of celebrated Dutch printers and publishers of the sixteenth and first half of the seventeenth centuries. The Rs. issued beautiful eds., whose value time has increased. The family is supposed to have come from Liège or Louvain, or possibly even from Spain. The founder of the E. Press was Louis (1540-1617), born at Louvain, but who, as a supporter of the Reformation, took refuge in Leyden, where—and subsequently at The Hague—he became a bookseller and publisher. He was succeeded by his five sons, *Matthias*, *Louis*, *Gilles*, *Joost*, who practised in Utrecht, and *Bonaventura* (1583-1652), who carried on the Leyden house in association with his nephew, *Abraham*, for twenty-six years, during which time most of its masterpieces were issued. Many of these were printed for his uncle Bonaventura by Isaac, who printed also for his brother Jacob, estab. at The Hague. Isaac was the first printer of the family. Isaac's son, *Louis*, was the founder of the house in Amsterdam. Under him, in association with his cousin *Daniel*, the work reached perhaps its highest standard (1639-55). Of the total number of works (1208) produced by the Es, 968 were Lat., 44 Gk., 22 in Oriental languages, 120 Fr., 33 Flemish, 11 Ger., and 10 It. The house still exists, in Haarlem. See H. B. Copinger, *The Elzevir Press*, 1927.

Elzheimer, Adam, see ELSHEIMER.

Em, measure of type, see under PRINTING.

Emanation (Lat. *emanatio*, a flowing forth), anct. system of philosophy according to which all existences have successively flowed or emanated from the Supreme Essence, from God. This doctrine is found in Egyptian and Indian mythology, in Neoplatonism, and in Christian Gnosticism.

Emancipation, in the Rom. law, was the act by which a father set his son free from paternal authority. The twelve tables required that the son should be formally sold three times, bought back, and then liberated according to the ceremony for freeing slaves. See ABOLITIONISTS and CATHOLIC EMANCIPATION.

Emancipation of Catholics, see CATHOLIC EMANCIPATION.

Emancipation of Slaves, see ABOLITIONISTS; MANUMISSION.

Emanuel I. (1469-1521), king of Portugal, surnamed the Great, the Fortunate; became king in 1495. His reign is the most brilliant in the hist. of Portugal. A code of laws prepared by the king and a court in which chivalry, art, and science were encouraged, greatly improved the internal condition of the country. Externally its possessions were extended by the explorations of Vasco da Gama, Cabral, and Albuquerque, and Portugal became the first naval and commercial power of the world.

Emanuel, Frank Lewis (1865-1948), Eng. artist and critic, b. at Baywater, London. Educated at Univ. College

school, Univ. College, London, the Slade School of Art, and the Académie Julian, Paris. Instructor of Etching, Central School of Arts and Crafts. First exhibited at the Salon, Paris. R.A., 1886. His oil painting, 'A Kensington Interior,' was acquired by the Chantry Bequest for the nation (1912). Other works were acquired by the Victoria and Albert Museum, the Imperial War Museum, and the Ashmolean Museum, Oxford. His mezzotints, etchings and lithographs may be found in various galleries and museums of many foreign caps. His portrait of Lord Rutherford (1936) is at Nelson, New

Zealand. He was for many years special artist to the *Manchester Guardian*. Pubs: *Manchester Sketches*, *The Illustrations of Montmartre*, *William Roxy Beasley, Etching and Etchings* (1930), *Charles Keene* (1935), and numerous articles and art critiques.

while William Hunter used essential oils, camphor, saltpetre, pitch, or resin. Then, again, J. J. Boudet (1778-1849) embalmed with tan, salt, camphor, cinnamon, and other aromatics. Later on, fluids were injected, consisting of sodium chloride, alum, potash, glycerine, or composed of alkalis, arsenic, and alcohol. In the Royal College of Surgeons, London, are still to be seen bodies preserved by William (1718-83) and John (1728-93) Hunter, the renowned anatomists.

United States Information Service - American Embassy

AN EMBANKMENT ON THE MISSISSIPPI

Concrete and steel mats, which will be covered with asphalt, being used to strengthen a Mississippi levee

Zealand. He was for many years special artist to the *Manchester Guardian*. Pubs: *Manchester Sketches*, *The Illustrations of Montmartre*, *William Roxy Beasley, Etching and Etchings* (1930), *Charles Keene* (1935), and numerous articles and art critiques.

Emba, riv. of Kazakhstan, Soviet Central Asia. It rises in the Mugodzhari Hills and flows 380 m. into the Caspian.

Embabane see Mbabane.

Embalming, the art of preparing and preserving dead bodies from decay, principally by the use of medicaments or, according to modern practice, the scientific process of disinfecting and preserving the human dead and restoring ante-mortem appearance by arterial injection. It was widely practised by the ancients, more especially in Egypt, where it was carried to a fine art, and the body so preserved there was called a mummy, a word derived from the Arabic for bitumen. Modern E. dates from the eighteenth century. Dr. Frederick Ruysch, of Amsterdam, is said to have employed alcohol,

overflow of rivs.; a levee, such as the Thames E. Reservoirs are formed of dams, or E. of earth, or, in hot countries, of cement. E. in engineering, therefore, serve two main classes of utility: they preserve the level of railways, canals, and roads where a piece of low-lying ground has to be crossed, or they confine a body of water by preventing it encroaching on the land. In recent years land has been reclaimed by the formation first of E. in the IJssel Meer (Zuyder Zee) in the Netherlands, and in the Wash, England. E. are much used for irrigation purposes, e.g. the great dam of the Nile at Aswan. An E. of concrete and steel mats, which will be covered with asphalt, is being used to strengthen a Mississippi levee. See A. Bazley, *Reclamation of Land*, 1900; R. Minikin, *River and Canal Engineering*, 1920; F. Johnstone Taylor, *River Engineering*, 1938.

Embargo (Sp. stoppage), seizure of a ship or ships, either as a matter of precaution, or in view of hostilities. E. is the most usual form of reprisals, and thus

constitutes the temporary or permanent sequestration of the property of individuals by the gov. in times of peace or war. Es. in anticipation of war, however, have long since fallen into disuse, and it has even become customary for the belligerents to grant a respite to the enemy's trading vessels to leave their ports at the outbreak of war. The Hague Conventions of 1907 confirmed this, and only that power in a state which is authorised to declare war can decree an E., hence, in its hostile sense, it is an act of war. The sequestration by a nation of vessels or goods of its own citizens or subjects for public uses is sometimes called a *civil E.*, in contradistinction to a general prohibition from leaving port intended to affect the trade or naval operations of another nation, known as *international E.*

Embassy, a mission entrusted to an ambas.; the official residence of an ambas. See **AMBASSADORS**.

Ember Days, certain days set apart for fasting and special prayer in the Anglican and Catholic Churches. The clergy are often ordained on certain E. D. The council of Piacentia (1095) fixed these days for the Wednesday, Friday, and Saturday after the first Sunday in Lent, after Whit Sunday, after Sept. 14, and after Dec. 13. The weeks in which E. D. occur are called *Ember Weeks*.

Embezzlement, unlawful or fraudulent appropriation to his own use by a servant or clerk of money or goods received by him for and on account of his master or employer. To convict of this felony (see under **CRIMINAL LAW**) the prosecution must prove that the accused was a clerk or servant of the person robbed, that the money or goods alleged to be embezzled were received for or in the name of or on account of his employer or master, and that the accused intended to appropriate unlawfully such money or goods. The crime of E. is to be distinguished from larceny (*q.v.*) in that the original taking of the property was lawful, while the gist of larceny is the wilfully wrongful taking possession against the will of another from the very beginning. Some specific sum must be proved to have been appropriated, it being settled law that a general deficiency in the accounts of the accused will not suffice to prove the charge. Three separate acts of E. may be charged in the same indictment where committed against the same employer or master, within six months from the first to the last of such acts. If the accused be indicted for E. that will not preclude a conviction for larceny instead, if the facts turn out to be more consistent with the latter crime having been committed. The converse also applies. The punishment for the common law felony of E. is a maximum of fourteen years' penal servitude or imprisonment up to two years. E. by factors, trustees, and directors is a misdemeanour, punishable with seven years' and two years' respectively. See also **FALSIFICATION OF ACCOUNTS**. *Authorities*: S. Harris, *Principles of Criminal Law*, 1899; J. H. Archbold, *Criminal Pleading Practice*, 1883.

Emblements, produce of land, such as crops, garden, cereal, and vegetable products, which are the ann. result of the tenant's labour. These are considered in law as be'onging to the tenant and not to the landlord; they are subject to the same conditions as personal chattels. Trees, grass, etc., are not E. In the U.S.A. the Eng. common law of E. has been very generally adopted, though in some states the tenant is entitled to compensation not only from his landlord, but also from the incoming tenant.

Embolism, plug; a blocking of a blood vessel by a substance carried by the bloodstream from some other part of the circulation. The importance of this condition depends on the source of the plug and its nature, whether it contains infective bacilli, which will cause infective changes at the seat of the plug, or simply acts as a mechanical blocking of the circulation. Both of these are serious, for when the E. lodges in the brain it may produce paralysis, either with a slow or a sudden onset. Emboli are apt to occur in septic conditions, and are characteristic of pyæmia, a condition in which pus-forming germs are found in the blood. Sudden paralysis of the brain is known as apoplexy. The E. may originate from the heart, even in cases in which the victim is unaware of having any cardiac affection. A pulmonary E. may occur in the lung as a sequel to an operation on some infected organ; if special facilities are available, it is sometimes possible to remove the embolus by Trendelenburg's method.

Embossing, the art of producing raised patterns on the surface of metal, leather, cardboard, or similar substances. Strictly, the term applies only to raised impressions made by means of engraved dies or plates, as opposed to those made by carving, chasing, *chiselling*, hammering, and the like. Crests, monograms, and addresses are embossed on notepaper. Dies for plain E. are generally cut deeper than those used with colours. In ant. times goldsmiths made much use of this method of decorating cups, vases, bowls, etc., by beating out bosses from the under surface of the metal in ornamental designs. The finishing touches are generally put from the front. E. is largely used in bookbinding. See Theophilus, *Christian Art of the Eleventh Century*, 1847; L. Haslope, *Repoussé Work for Amateurs*, 1887; J. Harrison, *Decoration of Metals*, 1894; H. Adam and J. Evans, *Metalwork*, 1926; A. Shirley, *Craftwork in Metal*, 1928.

Embracery, the misdemeanour of attempting to influence a juror corruptly to give his verdict in favour of one side or party, by promises, persuasions, entreaties, money, entertainments, or the like. A jurymen who corruptly endeavours to influence his fellow-jurymen to take his view is also guilty of E. The jurymen who consents to give a corrupt verdict is equally guilty with the person persuading. The punishment is fine, or imprisonment, or both.

Embrasure, in military architecture the openings or crenelles between the teeth of

a battlement in parapets, flanks of bastions, etc., are called *E.s.* The name is also applied to the openings in a fort or casemate through which cannon are pointed. In domestic architecture an *E.* is the inward enlargement of the cheeks or jambs of a window or door made by slanting the sides.

Embroidery (Fr. *broderie* from *bord*, edge, which gave the verb *border*, and by transposition *broder*, to ornament the edge), the art of ornamenting in relief with needle and thread of silk, wool, linen, metal, etc., various kinds of fabric. The mummy clothes of anct. Egypt show the earliest extant *E.*, and the 'pomegranates of blue and purple and scarlet' of the book of Exodus were of *E.* Biblical references to the art abound, and the finest and most elaborate work was for ages destined for church vestments and furniture. The Babylonians were renowned embroiderers, whose work was sought after throughout the *E.* The Phrygians, too, were such marvellous embroiderers that the *Gks.* came to call their work *phrygiat*, and the Romans, *opus phrygium*; their name for the beautiful gold-embroidered work, *auriphrugium*, gave the Eng. ecclesiastical word *orphrey*. Homer and other classical writers refer to and describe magnificent embroideries. The art reached its greatest perfection in the early Middle Ages, when also it came to be more widely used for secular purposes. In Greece and Rome laws were made to moderate its use, but without success. The most distinguished artists did not scorn to make the designs from which the highest ladies in the land executed their embroideries. No workers were more skilled in the craft than the Eng., a fact to which the Bayeux tapestry (which is not tapestry, but *E.*) and the Syon Cope (now in the Victoria and Albert Museum) bear testimony. At the times of the Crusades, *E.* was used for heraldic devices and with this a complicated symbolism of colour and design came into being, and this is still observed in heraldic and ecclesiastical *E.* Saxony was the first country to produce 'white embroidery' worked on muslin and other white fabrics, which was used almost exclusively for trimming lingerie and household linen. Switzerland, Scotland, and England later became noted for this particular *E.* which was known as *Broderie Anglaise*, Eng. *E.*, or 'Madeira Work.' Later and more elaborate designs are Renaissance *E.*, Richelieu *E.*, Venetian *E.*, Danish white *E.* (called 'Hedebo'), and 'Pique' *E.*

The Chinese excel as embroiderers, their best work being done on silk, and their needle-painting (i.e. shaded flat stitch *E.*, by which birds, flowers, etc., are reproduced as by brush painting) is exquisite. Gold and silver thread *E.* is sometimes used in Chinese and Jap. work. The Hindus use threads of silk, gold, and silver, together with spangles, beads, pearls, coins, and precious stones. Gold and silver *E.* was used in the seventeenth and eighteenth centuries to decorate ecclesiastical ornaments and vestments. It is usually worked in a frame and the

finer materials are mounted on to a thick fabric before *E.* A *stiletto* (piercing tool) being used for this kind of *E.* work on the heavier materials such as brocades, plush, leather, etc. Gold or silver thread is usually couched, i.e. overcast down with a special fine thread of twisted silk of a matching or contrasting colour.

The instruments needed for *E.*, other than the needle, are sharp pointed *E.* scissors, for cut-out work; a *stiletto* for piercing holes; and frames on which the fabric is stretched when the *E.* work is unsuitable to be 'held in the hand.' A square or rectangular frame is used for large and elaborate work, and a small circular frame of Chinese origin, called a 'tambour,' being used for small work. In the past, large pieces of *E.* were sometimes filled in with chain stitch worked with a crochet hook on material held in a circular frame, and this was known as 'Tambour work.' Three different kinds of needles are used in *E.*: crewel needles which are long and sharp and can be obtained in several sizes to suit varying thicknesses of thread; chenille needles which are shorter with large eyes and suitable for heavy work fixed to a frame; and tapestry or wool needles used for *E.* on loosely woven materials, such as canvas, net, and coarse linen, and also for whipping and lacing *E.* stitches. Good material for *E.* should be chosen as an artist selects his canvas; and the threads used should usually match the texture of the ground material, e.g., silk thread on a silk material, linen, cotton, or mercerised threads on a linen or cotton background, and wool on a woollen cloth except in the case of tapestry work on canvas, when silk or wool threads are generally used). Evenly made stitches, tone or colour effect, and design and arrangement all contribute to obtaining a pleasing result in *E.*

The prin. *E.* stitches are: *Running stitch* (single or double) which is used for outlines, etc.; *back stitch*, used in quilting or as a foundation for threading a self or contrasting colour, e.g. *Pekinese stitch* (frequently used in Chinese embroideries); *Stem stitch* is worked from left to right and is a kind of back stitch used in a variety of ways, such as outlines, fillings, etc.; *Herringbone* and *chevron stitches* are border or band stitches also worked from left to right; *looped stitches*, which are usually worked from left to right, include blanket stitch, crenan stitch, buttonhole stitch, feather stitch, chain stitch, and fly stitch, and these stitches can be used in a variety of ways; *flat or satin stitch* (also called Chinese flat stitch) is used in needle-painting by varying the length of the stitch and using a variety of shades and colours; *Knot stitches* include the single or Fr. knot, and the more elaborate *million stitch*. In Jap. *E.* the design is sometimes worked in knot stitched and outlined with gold thread; *Couching* is the laying down of a thick thread, cord, or several fine threads, along an outline and 'couching' down at regular intervals with a fine thread; *Cross stitch* should be worked on material which has an even

warp and weft which can be counted easily, and the crossing threads should always be worked in the same direction.

Darning E. is used as a decoration on huckaback towels, filling in, or background work, also on shadow work where some E. stitches are done on the back of a transparent material to form a 'shadow.' **Appliqué, or applied work,** is laying a motif over a piece of material and fixing it on with E. stitches. The motif should be cut on the same thread of material as the background to which it is to be attached, and it is buttonhole stitched, blanket stitched, couched or satin stitched into position: **Decoupé** is an inverse form of appliqué, i.e. the design is cut out of the material and a coloured patch inserted beneath it and stitches embroidered over the raw edges. **Smocking** is the use of E. stitches to hold in place fullness or width in a garment, particularly in children's dresses, overalls, etc., and is a traditional Eng. craft. **Eyeclets, scalloping, etc.,** are holes or edgings overcast or buttonhole stitched, used in *Broderie Anglaise*, or the *Richelieu* and *Renaissance* work which consists of a similar but more elaborate cut design held together by a series of bars worked in buttonhole stitch over several strands of thread. **Drawn thread** is the name given to every sort of needlework for which the drawing of threads (warp and/or weft) are the preliminary steps to the E. or interlacing of the loose threads of the material to form a pattern. **Tapestry** (of very ant. origin) is the name given to E. worked on counted threads. The stitches entirely cover the material, which is usually fine or coarse canvas, and the threads used being of silk or wool. Various stitches are used, such as cross stitch, *tent stitch* (i.e. a small single stitch taken across the warp and weft thread of the canvas), gobelin stitch, straight stitch, etc. **Needle weaving** is worked by drawing out threads of a material and darning a band in various coloured threads to make a squared design.

Quilting is the holding into position of two or three layers of material by the use of E. stitches—running or back stitch—worked to form a pattern or design. Machine stitches can also be used. Cotton wadding, lamb's wool, flannel, wool domette, or feathers, may be inserted between two layers of material which are stitched together by drawing a needle and thread through all three layers. This is known as Eng. Quilting and is used for bed covers, bed jackets, dressing gowns, etc. Soft materials with a sheen are most suitable for this work, as the emphasis on light and shade is part of its beauty. It. quilting has no wool filling, and the design is carried out in double outline through which a cord or thick thread is run, so emphasizing the design into a definite relief.

Patchwork is the use of odd scraps of material, preferably of uniform thickness and of the same kind, i.e. all cotton or all silk. The pieces may be cut into geometric shapes and oversewn together (backed with paper, which can be withdrawn later, they are easier to handle),

and sometimes finished off by outlining the joins with an E. stitch such as herringbone or feather stitch. Colour and design are important in this old-fashioned art.

Machine embroidery.—From the old hand-embroidery craft of Central Europe, and of Switzerland in particular, there developed machine chain-stitching and mechanical E. Chain-stitch E., carried out all over the world and on a notably large scale in India, can be produced by single-needle sewing-machines of the Singer type. Recent models are fitted with a vibrating needle which stitches a close zig-zag covering stitch of varying width as the work is moved under the needle. The early history of sewing and embroidery machines is closely connected. Neither machine could have developed without the principle of the double-ended needle with centrally-placed eye. Such needles were patented by C. F. Weisental in 1775 and by the Viennese tailor, Joseph Madersberger, in 1814. The first practicable mechanical E. frame with twenty double-ended needles simultaneously operated by a pantograph so as to reproduce the design traced by the master-pointer in the hand of the operator was built to the specifications of Joshua Hellmann of Mulhouse in Alsace. The needles were passed to and fro between two carriages each mounting twenty pinners and moving horizontally, one at the front and one at the rear of the frame which itself moved vertically. This hand-frame, the prototype of which was built in 1828 at Mulhouse, was improved so as to carry 170 needles and was brought into service in 1829 at the works of Franz Mange at St. Gall in Switzerland. Hellmann's patent frames were built by the firm of Saurer at St. Gall, a firm which is still in existence to-day. The use of these frames spread to the neighbouring Austrian prov. of Vorarlberg, to Bohemia (notably Letovice near Brno), and to Saxony (Plauen), all before 1873. The first mechanical frames were used in England by the Manchester firm of Houldsworth, and in Scotland by Gibson Brothers of Glasgow. Other Eng. centres were Macclesfield and Nottingham. The first prov. E. works in the Russian Empire was opened at Kalish in Poland in 1880. Later factories were estab. at Vilna. Moscow had possessed an E. works since 1870. In contrast to these needle-frames, mechanical but hand-operated, the Swiss manufacturers also developed Schiffli ('shuttle') E. machines which were power-operated. The first steam-driven machine was produced by Illster of Winterthur in 1865 and an improved model by Saurer of St. Gall in 1876. This machine performed 35 stitches per minute. Later developments have consisted principally in the progressive lengthening of the frame. The large output possible from power machines has made the use of hand machines uneconomical and few of the 30,000 reported as in use in 1890 now remain in operation. See also *SAMPLES*. Embrun, fort. tn. in the Fr. dept. of Hautes Alpes. It stands on a rock platform on the R. Durance. Pop. 2700.

Embryology, study of the development of the living organism, or of the formation of a new individual or embryo from an ovum. As such it is a branch of the science of biology. For a hist. of the rise of the science of embryology and for a general view of it, see **BIOLOGY**. In the higher plants and animals the cell (*q.v.*) is a highly complex structure, and the greatest complexity of functions and changes takes place in the *nucleus* of the cell. Within the cell of an animal and of certain plants is the *centrosome*, which is neither part of the protoplasm nor of the nucleus. This centrosome begins the process of cell div. by itself dividing into two parts. Afterwards the nucleus also splits, and then the whole cell divides. The nucleus contains a number of threads, the *chromosomes*, which become visible during cell division, and the number of these is constant for any given species. In the higher types of animals and plants the individual is composed of myriads of cells united together into tissues and organs and so into the organism. The original cell from which these were formed by successive divisions is described as the ovum or egg, and in the higher animals and plants this must be fertilised to enable it to develop. In the lower plants and animals, particularly in some insects, the natural development of unfertilised ova is not infrequent, and in others a physical stimulus may initiate development (see **EXPERIMENTAL EMBRYOLOGY**). Such development is said to be parthenogenetic.

In the higher animals, some of the earliest cells formed by the div. of the ovum constitute the germ cells of the new animal. This fact led to the theory of the continuity of the germ plasma (see **BIOLOGY**), but this theory is not applicable to the germ cells of plants or of many lower animals. Germ cells of the female are ova; those of male animals are spermatozoa, and of plants spermatozooids (except those of flowering plants, which are non-motile male gametes, as described below). Fertilisation is the union of an ovum and sperm, and takes place in the body of the female of higher animals and in the ovules of plants. Many lower aquatic animals and plants, and even many fishes, liberate the ova and sperms in the water, where they unite. The eggs of frogs are fertilised externally, the male adding spermatozoa as the ova appear.

Spermatozoa are usually some of the smallest animal cells, and are very active. Each has a 'head' consisting of the nucleus surrounded by a thin film of

cytoplasm and connected by a 'middle piece' with the 'tail,' or flagellum, a fine hair-like part which by its movement propels the sperm along, tail first. The flowering plants, with the exception of some Gymnosperms, have no motile spermatozooids, and the function of these is performed by a nucleus and small amount of cytoplasm formed in the pollen grain. This sends out a tube which penetrates the ovule and conveys the fertilising nucleus to the ovum.

Generally, compared with the sperms, and even with other cells of the organism, the ova, are large and laden with food material, the yolk, but some organisms have small ova with the food supply deposited in cells around them.

In the formation of the ovum, the mother cell, or oocyte, divides first into two unequal cells: the smaller of these is the first polar body, and is usually extruded. The other, the secondary oocyte, divides, forming the ovum and the second polar body, and this, too, is usually extruded. During the first div. the chromosome number is halved (see **CELL**), and fertilisation restores the full number of chromosomes. In parthenogenetic development, the full complement of chromosomes is sometimes gained by the fusion of an egg with a polar body, or by failure to reduce the number of chromosomes in the div. of the oocyte. Very occasionally, individuals with the single number of chromosomes develop and are usually abnormal. The spermatozoa are developed from spermatocytes in the testis of the animal. Each spermatocyte divides twice, forming four spermatozoa, and the first div. like that of an oocyte, reduces the chromosome number to half. Although sometimes several sperms may enter the cytoplasm, the nucleus of only one fuses with that of the ovum. The two nuclei fuse completely, losing their individuality, and in the subsequent divs. each nucleus may be regarded as derived half from the nucleus of the sperm and half from that of the ovum. Soon after fertilisation has taken place the cell begins to subdivide. The methods of div. of the fertilised ovum of an animal depend upon the quantity and disposition of the yolk. Where there is only a small amount of yolk, as in Amphioxus or mammals, the ovum divides to form a sphere of cells. In those cases where there is a large amount of yolk collected at one pole of the ovum, as in the frog, the cells form more quickly and are much smaller at the other pole, giving an unequal div. If the result of segmentation is a ball of cells, giving a hollow sphere, it is called a blastula; if it is a solid ball of cells, a morula, and if partial, so giving a disc of cells, it is known as a blastoderm. The next stage results in the formation of a gastrula. Usually the blastula becomes invaginated, one hemisphere sinking into the other, giving rise to a two-walled sac with the opening known as a blastopore. In the higher animals a middle layer, the mesoderm, is formed between the outer layer (ectoderm) and the inner one (endoderm).

The ectoderm forms the epidermis, the nervous system, the lens of the eye, and certain glands; the endoderm lines the midgut and its outgrowths; and the mesoderm forms the muscle, the skeleton, most of the viscera, blood and lymph vessels, blood, connective tissue, and certain membranes. See also EXPERIMENTAL EMBRYOLOGY. For the further facts of recapitulation and continuity of germ plasma, see BIOLOGY.

Emden, seaport and the chief tn. of E. Friesland, Germany. It is situated near the junction of the Ems with the Dollart, and is surrounded by walls and moats. It has a very Dutch-like appearance, intersected as it is by canals crossed by a great number of bridges. The old tn. is enclosed by walls, bastions, and moats. E. is by canal an outlet for the Rhenish-Westphalian industrial region. There is shipbuilding, shipping trade in corn, cattle, cheese, and smelting. E. was frequently bombed in the Second World War, and the tn. was wrecked. The tn. hall (1576), the Great Church (a Gothic building of the twelfth century), the Ostrfriesisches Landesmuseum and the Nordseemuseum were destroyed. Archives of the church and the collections of the museums, however, were stored in safety elsewhere. Pop. 34,100.

'**Emden**,' Ger. raiding cruiser, which had a notable career during the First World War under the command of Captain von Müller. At the outbreak of the war the *Emden* was in E. waters, and within a few days joined Adm. von Spee's fleet at Tsingtau. At Müller's request she was given a roving commission. In order to obscure her identity the *Emden*, which had only three funnels, put up a dummy fourth funnel, which made her resemble, at a distance, a Brit. warship. She made towards Indian waters, reaching the Bay of Bengal in the first week of Sept. 1914. Her first capture was a Gk. steamer, *Pontopporos*, carrying Indian coal to a Brit. port: this occurred on Sept. 10. Other successes came quickly, as many as six vessels being prepared for sinking at the same time. The procedure followed by Müller was to transfer from these ships to his own the articles he required, to tranship their personnel to the *Pontopporos* and then to sink their vessel. On Sept. 18 the *Emden* bombarded Madras and set fire to the oil tanks. Such a career could not be allowed to continue for long, and soon an organised search was made for the *Emden* by ships of Britain, France, Japan, and Russia. On Oct. 28 she sank a Russian cruiser in Penang harbour and also a Fr. ship which attacked her. She was eventually sunk off the Cocos Islands by the Australian cruiser *Sydney* on Nov. 9, 1914. There was nothing particularly brilliant in her career, for she generally hit unarmed ships or those which were no match for her armament, and when she did eventually meet a ship on more equal terms she was outclassed. Her captain and crew, however, behaved chivalrously towards the captured personnel. Similar tactics were pursued by the Ger. pocket battleship *Graf Spee* in the Second World

War (1939) the ship being defeated by three small cruisers off Monte Video in Dec. 1939 and soon afterwards scuttled by its crew.

Emerald, a precious stone belonging to the beryl species, its green colour alone differentiating it from the other beryls. It occurs as six-sided prismatic crystals of the hexagonal system, is transparent or translucent, has an uneven conchoidal fracture, a vitreous lustre, becomes much harder on exposure to air following extraction from the mine, and is rendered electric by friction. Oxide of chromium is supposed to give it its green colour. The E. is cut on a copper wheel with emery. The finest stones are found in Muzo, Colombia, and there are mines also in Siberia, at Henbachthal, and at Canjargun in India. The E. was greatly valued by the ancients, who invested it with talismanic and medicinal properties; it was supposed to be good for the eyes, and Nero, among others, wore E. eye-glasses.

Emerald Copper Ore, see DIORITE.

Emeritus, term applied, among the Romans, to a soldier who had served out his time; now extended to designate any one (especially a professor) who has retired from office on account of old age or infirmity.

Emerson, Ralph Waldo (1803-82), lecturer, essayist, and poet, born at Boston, U.S.A., son of a Unitarian minister; educated at Boston Lat. School and Harvard Univ.; was ordained in 1829, but resigned three years later as a protest against the administration of the Lords' Supper. In 1833 he first visited Europe, and met Landor, Carlyle, and others. His friendship with Carlyle lasted all his life and resulted in an exchange of notable letters. The following year he began in real earnest his life of lecturer and writer, and at once established his position as a leader of the New England transcendentalists, although he disclaimed sympathy with their school of philosophy at large. He worked side by side with Bronson Alcott, Margaret Fuller, Channing, and Thoreau, but in a broader spirit; and with them he developed transcendentalism, particularly in its theological aspect, as a protest against dogmatic rationalism in religion. His attitude in philosophy was strongly influenced by Platonism, the Ger. idealisms of Hegel, Fichte, and Schelling, and the Fr. idealisms of Cousin and de Staël, resulting finally in an indefinite conception of the God-like nature of the human soul and the correlation of human and divine wisdom, which may be described as a vague but inspiring pantheism. Of his innumerable lectures, the courses delivered at Boston during 1835 and 1836 on *Representative Men* and *The Philosophy of History* were perhaps the most noteworthy. His prose works are for the most part extensions and revisions of his lectures, and show in an even more marked degree his truly transcendental lack of purely logical coherence, as might well be expected when his method of working is considered. E. was wholly an intuitionist, and recorded his impressions and flashes of inspiration as they occurred to

him, subsequently synthesising them under such headings as seemed conveniently comprehensive. As a result of this, it may be observed in his writings that thoughts and criticisms have been too often distorted, merely to fit their expression into an epigram. E. himself confessed that 'I do not know what arguments mean, in reference to any expression of a thought.' His writings betray a complete absence of that symphonic style which is indispensable to a philosophy pure and simple, and they are, moreover, full of self-contradictions. These contradictions are not the result of any

R. W. EMERSON

After a crayon drawing by Samuel Row-

systematic evolution within the author's mind; they are rather the spontaneous interpretations, but in different moods, of the same mental experience. Each idea is complete in itself, rather than concatenated with its context. His work thus resolves itself into the expression of a personality which is governed by emotion, not by reason. And it is this predominant characteristic of E. which, however derogatory it may be to his work as pure philosophy, gives to it the charm of geniality, warmth, and confidence which is the secret of his undoubted attraction. As a theorist, devoted to the study of the higher instincts and their spiritual significance, and living out of touch with reality, he was an anomaly. For instance, he praised freedom, yet was slow to lend his support to a specific abolitionist movement against Amer. slavery. And he preached always the 'infinitude of man'; he loved the 'human idea,' but his admiration for the unit, physical man, was by no means excessive. By reason of his

singular elevation of character and sentiment, E. was essentially a poet. It is in his poetry that the true E. is most clearly delineated; yet, in spite of his eloquent pages on rhythm in *Poetry and Imagination*, it must be confessed that his verses are often far from musical. One can quarrel, however, only with his incomplete mastery of form and technique. Whatever the faults of his outward expression—the rough metre and forced simile of his poetry, or the inconsequence of his prose—the inner ideas of his writings are always lofty of conception, and in their own way frequently of rare beauty. E. was a real prose-poet of a high order, and by the beauty of his thoughts, the terse eloquence of their expression, and the broad spirit of optimism in his works, has gained his wide recognition and popularity. E. has been recognised by Amers. and by sound European critics as one of the greatest of the writers of his country. His essays have become Amer. classics and have had a profound influence in their own country. In spite of some roughness of form, his poems have caused him to be recognised as one of the most original poetic voices of the U.S.A. Unlike Europeanised poets like Longfellow, he turned to his own country, its own fauna and flora, for subjects for his lyrics. His extended stay in England gave him the opportunity to write his *English Traits* (1882), still one of the best books ever written on the subject. The Eng., according to E., concentrated all their attention on productivity—an observation which seems curiously topical to-day—but this exclusive attention to mechanical things, in E.'s opinion, had its drawbacks; for where 'the whole bias of the nation is a passion for utility,' man is sacrificed to the demands of the machine. Even worse was the apparent neglect of the higher things of life—the Eng., he says, are 'materialist, economical, mercantile' and 'their mind is in a state of arrested development.' Because of their preoccupation with money, E. concluded that the Eng. were its slaves and dupes. In spite of all this, E. had to admit that 'if there be one successful country in the universe for the millennium, that country is England.' All the world, he observed, imitated England, read its books, saw its plays, bought its newspapers and helplessly envied its luxury. Yet E. was aware that success did not necessarily lead to popularity: the national 'habit to brag' stood in the way, so that the Eng. traveller abroad, with his disdain of the rest of mankind, is a proverb for uncomfortable and offensive manners. To-day this portrait of the Eng. is hardly exact, even if it ever was; and indeed the characteristics which E. saw in the Victorians and which, ironically enough, we see or fancy we see to-day in the Amers., are merely the externals of leadership or the cloak worn by the most wealthy, most envied and most powerful nation in the world. His chief works are: *Nature* (1836), *The American Scholar* (1837), *Literary Ethics* (1838), *Poems* (1847), *Essays on Representative Man* (1849), *The*

Conduct of Life (1860), *Society and Solitude* (1870), *Journals* (1912). See lives by J. E. Cabot, 1887; V. Wyck Brooks, 1932; H. Hawthorne, 1935; E. L. Masters, 1948; and B. Perry, *Emerson Today*, 1931.

Emerson, William (1701-82). Eng. mathematician who, failing in an attempt to follow his father's profession of schoolmaster, near Darlington, lived in retirement, pursuing his favourite studies of mathematics and mechanics. He was eccentric, but possessed of rare intelligence and energy. His chief works are: *Method of Increments* (1763), *Mechanics* (1767), and *Doctrine of Fluxions* (1799).

Emery, an impure variety of crystalline corundum (Al_2O_3), being mixed with oxides of iron and silica. It was originally obtained from Cape Eméri in the is. of Naxos, but is now largely worked in various parts of Asia Minor and near Philadelphia, U.S.A. The very finest particles are obtained by elutriation, i.e. the finely powdered material is stirred up with water, and, after standing for some time, the top layer is run off and the very fine particles allowed to settle slowly. E. is a purple-black solid, next in hardness to diamond, and is largely used as an abrasive and polishing agent, for cutting and grinding glass, metals, and certain gems. E. wheels are made by mixing the powdered E. with some blinding material and subjecting the mixture to heat and pressure. E. paper and cloth are made by dusting the powder over the material which has been coated with glue. Pure corundum and the artificial "carborundum" (SiC) are now largely prepared, and have superseded E. to a certain extent.

Emery, Isabel Winifred Maud (Mrs. Cyril Maude) (1862-1924). Eng. actress, b. in Manchester, the daughter and granddaughter of actors. At fifteen she appeared for the first time in London at the Princess's Theatre. In 1881 she became a member of Henry Irving's Lyceum company, understudying Ellen Terry and playing her own parts; she toured twice with this company in America. She married Cyril Maude in 1888. From 1896 to 1902 she played at the Haymarket. After an interval of three years, during which ill-health caused her to be absent from the stage, she reappeared at His Majesty's. She appeared as Beatrice to Tree's Benedick, and she took *Olivia* on tour, and also played in H. A. Vachell's *Her Son*. She appeared in a charity performance in 1915.

Emesa (Syria), see **HEMS**.

Emetic, agent that produces vomiting. The origin of the word dates back to antiquity, and in the days of the Romans not only was it a regular accompaniment of a banquet but it was an intrinsic part of daily life. Es. are often replaced by the stomach tube or hypodermic syringe. The Es. most commonly in use are: copious draughts of warm water, mustard and water, or common salt and water, and are useful in cases of poisoning.

Emeu, see **EMU**.

Emigration, the act of leaving one country in order to settle in another. In

the early ages such a process was carried on by whole nations, who, having exhausted the fertility of their own lands, sought to acquire fresh habitats by conquest. Nowadays it is more of an individual process, and is determined by the greater prospects of material benefit offered by life in the destined country. E., therefore, usually takes place in the older countries, whose sons are lured away to younger lands. It first assumed notable proportions in the nineteenth century, when America was the chief goal. The greatest exodus was from Ireland, and the total number of emigrants from that country between May 1, 1851, and Dec. 31, 1910, was 4,187,443, leaving the country far less thickly populated than heretofore. Usually E. does not alter the social condition of the country of origin, though the loss of the more ambitious units is necessarily felt. In many European countries, however, emigrants have been actuated by a desire to escape from tyrannical political institutions, notably the Huguenots who left France at the end of the seventeenth century; and Germans and Austrians, most of them Jews, who emigrated in the years preceding the Second World War.

It was at the close of the Napoleonic wars that E. from Great Britain to the colonies overseas was promoted as a remedy for distress and unemployment. The pop. was then mainly agric., and state-aided E. was advocated as a channel for the redundant labour in the Brit. Isles, the more so as much of the land in the colonies was under the control of the home gov. Opinion was, however, divided over the application of the suggested remedy. William Horton, who was under-secretary for war and the colonies in 1822, advocated state-aided and mass E. of able-bodied workers, who were to be given free passages and free grants of 100 acs. of land in the colonies, free farming implements and a year's provisions. Edward Gibbon Wakefield (*q.v.*), the more celebrated protagonist, held that the pauper type of emigrant was unsuited to conditions overseas, and he therefore evolved a system of state-aided E., the cardinal features of which were that (1) emigrants should pay a sufficient price for land (about £2 an ac.); (2) the proceeds of sales in the colonies should be used as an E. fund to assist more labourers to emigrate; (3) emigrants should be judiciously selected; (4) E. should be controlled by a central authority; and (5) the colonies should become self-governing as soon as possible. In 1823 and 1825 Horton induced Parliament to try his scheme on a small scale. Later he secured an amendment of the Poor Law Act of 1834 to enable pars. to mortgage their poor rates so as to provide for their able-bodied paupers in the colonies, and during the ensuing few years a number of emigrants were assisted under that Act. But this plan lacked the vision behind the ideas of Wakefield, whose system of colonisation formed the basis of the gov. policy of settlement in S. Australia and New Zealand and generally

thereafter. About 1832 the gov. adopted the policy of assisting the E. of women, mechanics and agric. labourers, and in 1834 an Act was passed embodying Wakefield's principles with the view of settlement of S. Australia. In 1845 the Brit. Gov. set up the Colonial Land and Emigration Board, the original purpose of which was to take over the work of the S. Australian Commission appointed in 1835 for carrying out Wakefield's scheme. The Board's functions were extended to control the whole E. movement to the colonies and the sale in Great Britain of colonial land. Between 1840 and 1873 the Board granted free or reduced passages to over 352,000 settlers. But from 1850 onwards the general view began to gain ground that gov. supervision of E. was unnecessary. The colonists became self-governing, and assumed the control of their own lands; the prevalent opinion, led by the Manchester School of thought, was that the home gov. need take no further interest in Brit. persons who left the home country, and gradually the duties of the Board were absorbed by the Board of Trade, the Colonial Office and the Colonial legislatures. From 1878 till the First World War the gov. took little part in E. beyond subsidising a small office known as the Emigrants' Information Office (see OVERSEA SETTLEMENTS DEPARTMENT), estab. in 1886, which gave information to those wishing to emigrate whether to the colonies or to foreign countries. The number of Brit. emigrants rose from 227,542 in 1880, to 454,527 in 1911. Their prin. destinations were Canada, U.S.A., Australia, New Zealand, and S. Africa, in the order named. By 1912, however, attention began to be attracted to the importance of Empire development and the need for a better distribution of the white pop. within the Empire. The Brit. Gov., through the Overseas Settlement Committee, pursued a vigorous policy of E., through the medium of assisted passages to the Dominions, in the twelve years immediately following the First World War, but in the ensuing world economic depression E. fell away and in the next decade more people returned from the overseas Empire to Britain than emigrated from Britain to the overseas Empire. Australia made new immigration plans after the Second World War. The Federal Gov. held itself responsible for the recruiting, medical examination, selection and transportation of all Brit. migrants brought to Australia under the assisted and free passage schemes, and also for the placing of the migrants in employment. Arrangements were made whereby Brit. service personnel were encouraged to stay in Australia after their discharge—an opportunity later extended to members of the Brit. forces in India, the Middle E., and the Far E. (see also under EMPIRE SETTLEMENT ACT). A reversal of America's quota limitation policy was entered on by Argentina in 1946 when, moved partly by humanitarian and partly by practical motives, she opened her doors to European immigration on a scale rivaling the great Sp.

immigrations of half a century ago. The Foreign Minister declared Argentina's willingness to receive no fewer than 4,000,000 Europeans, beginning with 30,000 a month. The appointment of Father Jose Silva, with the rank of Ambas. Extraordinary and Minister Plenipotentiary to estab. his headquarters in Rome to select immigrants of It., Fr., Sp., Ger., and other nationalities, was regarded as evidence of President Peron's desire to strengthen his relations with the Rom. Catholic Church, which, together with the Army and the workers, was one of the three pillars of the Peronista regime. See also EMPIRE SETTLEMENT ACT. See C. W. Baird, *History of the Huguenot Emigration to America*, 1885; J. W. Gregory, *Human Migration and the Future*, 1928; W. A. Carrothers, *Emigration from the British Isles*, 1929; E. M. Kulischer, *The Displacement of Population in Europe*, 1943.

Emigration Societies. Several organisations exist for the purpose of aiding various classes of persons to emigrate to Brit. dominions and colonies in normal times. The chief among them are: *Salvation Army* (Head office: Migration House, 3 Upper Thames Street, London), provides farm training for boys, and finds situations overseas for boys, domesticated women, adult farm-workers and others. *Church of England Council of Empire Settlement* (8 Prince's Street, London, S.W.1), represents the Church as a whole in all matters relating to empire settlement. *Young Men's Christian Association* (Migration Department), (Kingsway House, 103 Kingsway, London, W.C.), co-operates with the Churches in Canada and Australia in settlement work. *The Society for the Oversea Settlement of British Women* (Sanctuary Buildings, Great Smith Street, London, S.W.1), acts as the Women's Branch of the Overseas Settlement Department and is an amalgamation of the prin. women's emigration societies. Other societies or agencies which are concerned, *inter alia*, with E. are the Brit. Dominions Emigration Society (34 Newark Street, Stepney, London, E.); Brit. Legion (*q.v.*); Dr. Barnardo's Homes (*q.v.*); Catholic Emigration Society; Middlemore Emigration Homes (Birmingham); National Association of Boys' Clubs; Scottish Council for Women's Trades; and the Fellowship of the Maple Leaf (for migrating teachers to the W. prov. of Canada and to Australia); and the 1820 Memorial Settlers' Association (for migrants to S. Africa).

Emigrés, the name applied to those who, remaining faithful to the royal house, left France on account of the Revolution. On the fall of the Bastille, July 14, 1789, the princes of the royal family, followed by many nobles, officers, monks, and priests, quitted France, the princes with their close adherents forming a court at Coblenz, others settling in Germany, Belgium, Italy, Holland, and Switzerland. Numbers of the E. served in the Prussian army against France. Their estates were forfeited and severe laws were passed against them. Many did not return to

France till after Napoleon's downfall, though granted an amnesty when he became First Consul. They were not able to recover their possessions. The term is also applied to White Russians who found shelter in France after the Russian revolution.

Emilia-Romagna, region of Italy, bounded by Lombardy, the Adriatic, the Marches and Tuscany, and Piedmont and Liguria. It included the modern provs. of Parma, Piacenza, Modena, Reggio, Ferrara, Forlì, and Ravenna. The Via Emilia is a Rom. highway forming, with the Via Flaminia, part of the great road from Rome. Area, 8548 sq. m.; pop. 3,488,000.

Eminence, title conferred on cardinals by Pope Urban VIII. (1631). They had previously been *Most Illustrious*.

Eminent Domain, the *dominium eminens* of the law, a phrase denoting the universal right in the public over property. In accordance with this law the gov. may compel a private individual to give up, on receipt of compensation, property required for the public good.

Emin Pasha (1840-92), name adopted by Edward Isaac Schnitzer, scientist and administrator, b. at Oppeln. His parents were Jews of Silesia, where his father was a merchant. He studied medicine at Breslau Univ. and graduated at Berlin. He then went to Turkey and received an appointment on the staff of Hakkı Pasha at Scutari, taking a Turkish name and adopting the dress and customs of the Turks in order to identify himself as nearly as possible with those among whom he worked. In 1865 he became a convert to Islam. In 1875 he went to Egypt, where he worked under the name of Dr. Emin Effendi. Gen. Gordon appointed him in 1878 medical officer and later governor-general of the Equatorial Prov. Gordon employed him on many diplomatic missions, his extraordinary power as a linguist, together with his wonderful tact, making his services invaluable. From the abandonment of the Sudan by Egypt until the arrival of Stanley's relief expedition (1899) he held and administered this dist. single-handed. He reluctantly left with Stanley, but later returned to Central Africa in the service of Germany. He was killed by Manyema Arabs. He had abolished the slave trade in his prov., studied its flora and fauna, made route surveys of over 4000 m., pursued meteorological investigations which resulted in the estab. of Lado as the E. Equatorial standard, and made vocabularies of many African dialects. E. may be regarded as one of the pioneers of the modern science of tropical medicine. He found (according to Stanley's record) that the use of mosquito netting of a certain mesh excluded the 'miasma' of malaria, and himself kept free of fever—twenty years before Manson and Ross discovered that 'miasma' was the *Anopheles* mosquito carrying the germ of malaria. His diary, ed. by F. Stuhlmann, was pub. 1916-23. See M. Jephson and H. M. Stanley, *In Darkest Africa*; *Quest and Rescue of Emin*, 1890, and lives by E. W. Frossler, 1925;

A. Symons, 1928; and Olivia Manning, 1947.

Eminescu, Mihail, Rumanian poet, was b. at Ipatesti. Son of a farmer. Went to the Univ. of Jena and Vienna, and later completed his studies at Berlin, specialising in philosophy. During a short period he was a teacher, and was then appointed to a post in the national library at Jassy. Later, he became editor of *Timputul*, the conservative paper of Bucharest. In 1883 symptoms of madness developed. He was discharged as cured, but was returned later, and was killed by a fellow-madman in June 1889. As a poet he was largely influenced by the popular songs of his country, but his own verse was filled with a bitter melancholy. The revolutionary cry of his *Emperor and Proletarian*, the concise beauty of his sad sonnets, the patriotic ardour of *Epigones*, in which he presents a virile fresco of ant. times, and his bitter sentiment toward women in his *Evening Star* are his best-known poems. He left also some brief sensual poems which remind one of Heine—*Desire, Blue Flower, Oh Remain!* His short story *The Poor Dionise*, is one of the masterpieces of the literature of his country. An Eng. trans. of selective *Poems* was pub. in 1930. See F. Long, *Eminescu als Dichter und Denker*, 1928.

Emir, Ameer, Amir (Arab *Amir*, chief or lord), Turkish title instituted A.D. 650 by Fatima, daughter of Mohammed, and bestowed upon the califs, descendants of the Prophet who called themselves Emir-al-Mumenin, 'chief or commander of the faithful.' They alone were allowed to wear the green turban. The title has been assumed by tribal chiefs in the E. and in Africa. Until 1916 the best known was the E. of Transjordan, but in that year the E. Abdullah el Hussein assumed the title of king.

Emmanuel, see IMMANUEL.

Emmanuel College, Cambridge. A college founded in 1584 by Sir Walter Mildmay as a Puritan institution in connection with Cambridge, on the site of a Dominican friary. The foundation consists of a master, sixteen fellows, and thirty scholars. Extra scholarships on other foundations are awarded by preference to pupils of Uppingham and other midland schools. The greater part of the present building dates from the second half of the eighteenth century. The chapel was designed by Sir Christopher Wren (1677). Richard Holdsworth, Gresham prof., and William Saneroff, archbishop of Canterbury, were masters of Emmanuel. Bishops Joseph Hall and Thomas Percy, Sir W. Temple, Dr. Samuel Parr, and John Harvard (after whom the college in America was named in 1638, in recognition of his services to Amer. education) all studied at Emmanuel. There is a fine picture-gallery attached to the master's lodge, and the library contains valuable MSS.

Emmaus, vil. of Judea, not identical with the present E., but possibly situated in the valley of the Urfa, 7 m. from Jerusalem, where remains of important baths have been discovered. Josephus

says that E. means 'warm bath.' Here Jesus appeared to two disciples on Easter Day (Luke xxiv.). The site may be the present Kubebe, or Amwas.

Emmenagogues, see MATERIA MEDICA.

Emmendingen, tn. of Baden, Germany, on the Elz, 9 m. N.N.W. of Freiburg.

Emmental, valley of the R. Emmen, one of the finest of Switzerland, in the canton of Berne. Famous for its cheese.

Emmerich, walled tn. of the Rhineland, Germany, situated on the Rhine, 49 m. N.N.W. of Dusseldorf, and near the Dutch frontier, 94 m. E. of Rotterdam, and of very Dutch appearance with extensive riv. trade. St. Willibrord, an Eng. missionary, is said to have founded a church here in 697. It is noted for manuf. of oils, fats, machines, paper, chemicals, leather and sausages. In the Second World War operations of March, 1945, for crossing the Rhine the Canadian Army held the line of the Rhine and Maas from E. westward to the sea to insure the security of the bridgehead over the Rhine at Nijmegen and guard the Scheldt estuary. The fifteenth century Adlungskirche and the Martinkirche (in part eleventh and twelfth century) were completely destroyed in battle. Pop. 13,600.

Emmet, see ANT.

Emmet, Robert (1778-1803), patriot, distinguished himself at Trinity College, Dublin, by his brilliant oratory. As a protest against the visitation of Lord Clare and Dr. Duigenan in 1798 to investigate the political tendencies of the students, he withdrew his name from the books. Like his brother, Thomas Addis E., he was an enthusiastic United Irishman, and after a visit to Paris in 1802, where he interviewed Napoleon and Talleyrand, he engineered a rising in Ireland. The idea was to seize Dublin Castle, and to hold the lord-lieutenant as a hostage; but the insurrection was ill-planned. Only a small body of revolutionaries assembled, and those committed such crimes of violence that E., broken-hearted, fled. He was captured, tried, found guilty and hanged. The poignant story of his love for Sarah Curran has been told by John Brophy in his novel *Sarah* (1948).

Emmloh, Otto A. T. Von (1848-1915), Ger. general; was early prominent in the First World War through being in command of the force that successfully besieged Liège in Belgium. In 1915 he went to the E. Front as a Corps Commander, and took a successful part in the battles of the Dunaev (q.v.) and the San. His corps was situated on the right of Mackensen's XI. Army; it distinguished itself particularly during the operations of May 2-5, 1915, when Mackensen broke through the Russian line between Gorlice and Tarnow.

Emmius, Ubbo (1547-1625), Dutch writer on chronology and hist., prof. of Gk. and of hist. at Liers, E. Frisia. He is best known as the author of the erudite work, *Vetus Grecia Illustrata*.

Emotions, term used in philosophy to indicate one of the three groups into

which mental phenomena may be divided. Thus we may say that the states of the mind may be classified under *knowing*, *feeling*, or *willing*. The first term includes such facts as perceiving, remembering, and reasoning, and they may further be said to be *intellectual* operations. The second term would include all pleasurable and painful conditions of the mind, whether simple, such as the distress of hunger, or complex, such as love; and it is this class of mental states which is indicated by the term *emotions*. The third term covers all active mental operations, e.g. walking, speaking, and also efforts to do things, active impulses, and resolutions. To cover all the phenomena of the third class, the term *willing* must be extended to cover random movements as well as voluntary actions and volitions.

Feeling marks any state of consciousness which is pleasurable or painful. Those effects which depend merely upon nerve stimulation, such as the pains of hunger and thirst, and their corresponding pleasures, and which are commonly marked as *sensations*, are included under the term E. as well as those effects which depend upon some amount of mental activity, such as fear, hope, regret, etc., which are known as K.

The correlation between the states of feeling and their physical accompaniments illustrates the close connection between mind and body. Facial movements, gestures, modifications of voice, and even internal organic effects are well known to accompany feeling. All feeling involves an excitation of nerve-centres, and diffuses itself over the nervous system in a circle of effects. The development and continuance of a feeling depend upon this cycle of effects. Expressive movements are partly instinctive—e.g. crying, frowning, etc., and appear early in life—and partly acquired. Imitation plays a big part, and it is easy to see how in this way we acquire actions expressive of enmity, moral displeasure, etc. Sometimes the will aids in the acquirement of these movements, as in the adoption of the conventional look, tone of voice, and gesture of the social circle moved in. Several theories have been advanced to explain these movements. It is generally agreed that all feeling tends to produce certain bodily effects which are proportionate in strength and range to the intensity and persistence of the feeling. Spencer showed that, as the feeling becomes more intense, so larger muscles are called into play, e.g. twitching of fingers, then movement of the arms, and so on as agitation increases. Wundt amplified this by saying that the motor centres of attention are involved, and the due regulation of thought disturbed. Violent E. of any kind illustrates this well. To account for the distinctive movements attached to the various feelings, Bain suggested that pleasure is connected with an increase, and pain with a decrease, in the vital energies, and so the expression of pleasure would have greater vigour of action than the expression of pain. But Sully shows that

strong and violent feelings, whether pleasurable or painful, have very like results, and that the strong contrast in energy between certain feelings, say anger and fear, does not coincide with a contrast of pleasure and pain. Therefore he suggests that it is connected with the feeling as energetic in character, or depressing and paralyzing.

Psychologists have tried to bring the varieties of pleasure and pain under certain laws. One or two of the principles they have formulated may be said to be approximately correct, and of some practical import. Thus they have formulated the law of stimulation or of exercise. We may say that all pleasure is connected with the exercise of some capability, faculty, or power of the mind; or that it is the accompaniment of some organ which is connected to the nerve centres, or the seat of conscious life. And, in general, moderate stimulation of an organ or exercise of a capability produces pleasure, and this pleasure increases with the strength of the stimulus to a certain point. Beyond that point the pleasure diminishes and passes into a painful effect, as with the blinding light of the sun, a very loud sound, or very great mental effort. Painful states of feeling may be caused by the absence of stimuli, as in the effect of darkness, the restlessness of a boy repressed, and those mental conditions like ennui, tedium, and dullness. Again, an obstruction to activity will cause painful effects, as when a train of thought is impeded by forgetfulness. Another principle rather less important is that of change or contrast. A pleasurable stimulation continuing to act may become painful, or even if this does not happen it may at least lose its pleasurable effect. Change, therefore, involves pleasure because it limits the duration of any stimulus, and because it is a necessary condition of that vivid active attention which is necessary—always provided that the change is not so violent that it causes shock.

Now, feelings may be divided into two divisions, those arising directly from a process of nervous stimulation or the excitation of sensory nerves, and those depending on some manner of mental activity. The first, which may be termed bodily feelings, involves processes in the outlying parts of the organism, and may be called *sense feelings*. The second, being connected with central nerve forces (the brain), may be called *E*. There is also a close correspondence between the instincts and the *E*. Thus the instinct of self-preservation gives rise to the *E*. of fear (*e.g.* in battle or when crossing a main road) and the instinct of self-perpetuation or reproduction gives rise to the *E*. of love.

Sense-feelings may arise from disturbances of some part of the organism, as in hunger, thirst, heat, and cold sensations, etc., and pleasures or pains connected with the excitation of special senses, and the pleasures or pains of muscular sensation, etc. The latter class are much more easy to distinguish and localise than the former. Further, painful feelings are more numerous than pleasurable ones in

the case of internal organic sensations, as in digestion, etc., while with the special sense the pleasurable are more prominent, and with the higher senses, hearing and sight, the pleasurable element is the greatest; and of these it may further be stated that they are closely connected with the mental feelings.

The general laws which apply to mental development also apply to the development of the *E*. They are deepened by exercise, and there is a progress from simple feelings to complex *E*. The growth of the *E*. cannot be fully explained as the result of individual experience. They arise uniformly when the appropriate circumstances occur, usually early in life, *e.g.* the child has a disposition to feel anger when he is annoyed or injured. On the other hand, an instinctive element enters into feelings which may be shown to be largely the result of individual experience. It may be noted that this instinctive capacity for any particular *E*. is not the same in all cases. These instinctive emotional tendencies can be explained by referring them to ancestral experience and allowing that there are transmitted associations.

The study of the development of the *E*. enables us to divide them roughly into three groups or orders, giving successive stages in the progress of the emotional life. First we get *individual* or *personal E*. which are confined to the individual and depend upon a more or less distinct personal reference. These grow up around self and self-activities, the pleasures of hope, success, reputation, etc., or they attach themselves to objects having a special personal relation, as in the child's love of its mother. Secondly, we have *Sympathetic E*., which involve participation in other people's experiences, and so are purely representative. They presuppose a certain amount of personal emotional experience, and are non-personal and common in direct contrast to individual *E*. Thirdly, we have the highly complex *E*. termed *sentiments*, viz. patriotism, love of humanity, etc. These may be subdivided into three classes: (a) *intellectual*, or the attachment to truth; (b) *aesthetic*, or admiration of the beautiful; and (c) *moral*, or reverence for duty, which includes love of humanity and the worship or moral excellence. All these *E*. involve a higher form of representativeness than sympathy, although they depend upon it to a very large extent, and they are entirely non-personal and common, turning the mind absolutely away from self to a disinterested contemplation of an object. See H. Spencer, *Principles of Psychology*, 1855; A. Bain, *The Emotions and the Will*, 1859; C. Darwin, *Expression of the Emotions in Man and Animals*, 1872; J. Sully, *Outlines of Psychology*, with *Special Reference to Education*, 1884; G. B. Phelan, *Feeling Experience and its Moralities*, 1925; C. G. Jung, *Psychologische Typen*, 1921; J. Macmurray, *Reason and Emotion*, 1935; J. P. Sartre, *Esquisse d'une théorie des Émotions*, 1939. See also CHILD STUDY; PHILOSOPHY; PSYCHOLOGY.

Empecinado, Don Juan Martín Díaz, el (1775-1825), Sp. patriot, a famous and redoubtable guerilla chief who harried the Fr. during the Peninsular War. He became field-marshal in the regular army, but, involving himself later in the insurrections of the Constitutionists, he was hanged. He incorporated his sobriquet *el empecinado* ('the pitch-coloured') with his name.

Empedocles, Gk. philosopher, law-giver, physician, poet, and high priest of Agrigento in Sicily, b. about 490 B.C. He analysed the universe into the *four elements*, fire, air, earth, and water, fire being the essence of life, the other elements forming the basis of matter. His system is founded on this theory together with another which supposes two opposing forces, Love and Hate. The world began when the elements, which had been torn asunder by the force of Hate, tended to come together again under the influence of Love. The different species arose out of the different minglings of the elements. His chief work was a sublime epic on Nature. See J. Burnet, *Early Greek Philosophy*, 1920.

Emperor, Title of. Among the Romans, *emperor* or *imperator* was the title borne by the commander of an army, then by the governors of provinces, then by the head of the Roman empire. In modern times it became the highest title of dignity and is assumed by several European sovereigns who ruled over a vast territory where dwelt people of more than one nationality. The rulers of Russia, Austria-Hungary and Germany before the First World War were called *emperors*. Queen Victoria assumed the title of *empress of India* in 1876.

Emperor Moth, name given to *Saturnia carpinii*, a species of Coleoptera, and is also applied to the whole family of Saturniidae. *S. carpinii*, which is also called *S. paronina*, is common in England, though rare in Scotland, and in the heather-districts the bright-green larvae, studded with red or yellow warts, may often be observed. Their general colour is greyish with purple and orange tinges, and they are remarkable for the eyespot common to both wings of both sexes.

Emphysema, an inflation; an abnormal presence of air. Medically, it consists of an enlargement of air vesicles of the lungs, which are the terminations of air passages. It occurs in bronchitis and other conditions where there is excessive coughing. It causes lessening of the aerating surface of the lung and shortness of breathing; in young lads, it may only give trouble on exertion, causing the broken wind of schoolboys. In older persons with chronic bronchitis, the chest becomes enlarged and barrel-shaped from decreased breathing in the lung requiring increased depth of breathing. Increased work is also thrown on the heart to drive the blood through the inflated lung; in time it fails to drive sufficient blood through, so that the heart's action is embarrassed, and the badly aerated blood causes the sufferer to look blue. The treatment of E. consists in attending to the underlying causes, the bronchitis or

asthma, and in maintaining heart action.

Surgical emphysema is due to air in the general connective tissues of the body, from injury of some air-passage or wound of the chest-wall, without injury to the lung. Only in severe cases is it necessary to make incisions to allow the air to escape; in ordinary cases respiration is not impeded, nor is the heart's action embarrassed.

Emphyteusis (Gk. *ἐμφυτεύσις*, a planting in) or **Jus Emphyteuticarium**, in ant. Rom. law, the right of enjoying all the fruits, and disposing at pleasure, of the *prædium* (estate) of another, subject to the payment of a yearly rent (*pensio* or *canon*) to the owner. Both lands and buildings could be subject to E. Though the *emphyteuta*, or person who enjoyed the right, could dispose of his rights as he pleased, the *dominus*, or owner of the land or building itself, had a right of pre-emption. The old right relating to *agri rectigales*—leases of lands held of the Rom. people, of municipalities, or of the college of priests, i.e. short or long lettings by the state—was, about the time of Justinian, united with that of *emphyteusis*. The J. E., though based on an institution of the civil law, only assumed its peculiar character in the time of the Lower Empire, whereas other and equally characteristic *servitudes* owed their existence to the praetors.

Empire, British, see BRITISH EMPIRE.

Empire Day, the celebration, throughout the Brit. Empire, of the anniversary of Queen Victoria's birthday, May 24. It has been officially recognised since 1902, when the earl of Meath inaugurated the festival as a means of training school children in good citizenship.

Empire, Eastern, see BYZANTINE EMPIRE.

Empire Marketing Board. An official executive body formed in 1926, following a recommendation of the Imperial Economic Committee, for the purpose of developing trade with the Empire. In scientific research the Board worked through existing scientific institutions which it assisted financially on the advice of various gov. organisations at home or overseas. In the stimulation of interest in the Empire and its development, the Board invoked all the paraphernalia of modern advertising. It advertised not only in the newspapers, but also by means of elaborate and artistic posters in its special poster frames; it arranged displays at exhibitions, organised lectures and displays of Empire films, and issued a number of pubs, dealing with various aspects of Empire marketing. The whole work of this Board was an interesting experiment in the application by an official, but not bureaucratic, organisation of the most modern methods of scientific research and publicity to some of the problems of Empire development. After the Ottawa Conference, when a series of inter-Imperial tariff agreements were concluded, the continued existence of the E. M. B. was rendered unnecessary and it was dissolved in 1933.

Empire Music Hall, formerly one of the chief London music halls, in Leicester Sq.,

W., estab. in 1887 and now converted into a cinema theatre. The Empire was particularly noted for its ballets and revues.

Empire Settlement Act. The Settlement Act of 1922 formed the basis of the present Brit. policy of state-aided Empire Settlement until the gradual suspension of the settlement after the economic depression of 1930-32. This Act empowers the Brit. gov. to co-operate in agreed schemes for assisting the migration of suitable persons in the United Kingdom who intend to settle in the overseas dominions. These schemes may be either development or land settlement schemes, or schemes facilitating settlement by help with passage money, training for life overseas, or otherwise; the contribution of the Brit. Gov. may not exceed half the expenses of the scheme, and their liability to contribution is limited to fifteen years as from May 31, 1922. The policy of overseas settlement was reconsidered at the Imperial Conference of 1930, and re-endorsed in a resolution which while recognising that the existing economic difficulties were such as to render impracticable any considerable flow of migrants, recommended that the govts. concerned should take such measures as might be best calculated to secure the paramount object—namely, the better distribution of the white pop. of the Empire, as and when economic conditions might permit.

The genesis of the policy of state-aided Empire Settlement is to be traced to the Report of the Dominions Royal Commission, appointed in 1909, to inquire into the development of the natural resources of the Empire (*Cmtl.* 8462). This Commission urged the need for more effective supervision and direction of migration by co-operation between the Home and Dominions Govts. The sequel was the appointment, at the end of 1918, of the Overseas Settlement Committee to advise the gov. on the subject. This Committee's recommendation led to a scheme in 1919 for state assistance in the form of free passages to ex-service men and women and their dependents who desired to settle elsewhere in the Empire. This scheme was terminated at the end of 1922, by which time free passages had been granted to over 80,000 persons. Opinions differ on the results of the Empire Settlement Act, though for several years after its passage large numbers of persons migrated to Canada, Australia, and New Zealand under the various schemes organised under the Act. Up to 1926, some 251,791 persons were assisted to travel overseas. The gross outward movement to the dominions in that period was about 130,000 a year, the number of assisted settlers being about 65,000 a year. In 1936 an Overseas Settlement Board was set up to advise the secretary of state for dominion affairs on specific proposals for schemes of emigration within the Empire. The more stringent regulations limiting present-day settlement demand a high standard of health, character and capital resources, while improved conditions at home, including the various insurance schemes for unemployment, health, etc.,

rather tend to discourage emigration. The Australian Commonwealth Gov., however, introduced health insurance legislation in 1938 and in other ways enhanced opportunities for limited categories of settlers. In 1946 a free passage scheme for ex-service men and women and their dependents was arranged between the United Kingdom Gov. and the Commonwealth of Australia. This agreement was entered into by the United Kingdom Gov. as part of its resettlement programme and the date of its commencement was contingent on the provision of shipping. An agreement for an Assisted Passage Scheme under the E. S. A. was also made in 1946 with Australia. The amount payable by approved migrants of nineteen years of age and over is £10 a head, the remainder of the cost being borne equally by the two govts. concerned. But subjects normally resident in the United Kingdom are eligible under this scheme, but assistance is given only to applicants approved by both govts. Single persons or married childless persons should not be over forty-five; married persons, if accompanied by one or more children, may be accepted up to fifty years of age, and with special cases of parents joining children already estab. in Australia, the age limit may be extended to sixty.

During the first two years after the Second World War over a million men and women in Britain, fired by expectations of a better life overseas, besieged the offices of the dominion High Commissioners in London, in the hope of making arrangements for emigrating. The dominions, for their part, responded with a change of heart from pre-1939 days. The Canadian Gov. opened immigration offices in Liverpool and Glasgow. Australia sent interviewing commissioners to employment exchanges throughout Britain and neither these two dominions nor S. Africa neglected European and other countries as possible sources of supply; for Canada opened immigration offices in Paris, Brussels and the Hague, while Australia instructed all her legations to receive applications, including those in such states as the U.S.A., Russia, and France. Much of this activity springs from a repulsion of that wish to get away from Europe which was so evident after the First World War and reached its peak in the 1920's. But this time the state of Europe is now (1948) such as to impel an even greater number of people than ever before to turn their eyes to other lands. Nor are the dominions alone in seeking fresh blood, for the Argentine gov. announced (1946) that it would take 4,000,000 Europeans at an eventual rate of 30,000 a month, while Brazil made proposals for a general intake of 120,000 It. immigrants annually up to 10,000,000. It may be that of the dominions, Australia is the country which in the long run will prove to have the most scope for development, but estimates of what the final pop. of that dominion may be should be viewed with considerable reserve. The Australians, of course, were naturally deeply

perturbed by the narrow margin by which they escaped a Jap. invasion, and therefore they want a larger pop. in the plainest interests of national defence. Neither New Zealand nor S. Rhodesia has yet opened a waiting list. In any case movement is bound to be slow. S. Africa announced the closure of immigration to citizens of the United Kingdom in 1918.

Empire State, *see* NEW YORK.

Empire State of the South, *see* GEORGIA.

Empirical Formula, in chemistry, the simplest formula for a substance in which the atoms of the various elements in the compound are shown in the correct ratio but not necessarily the correct numbers. Thus the empirical formula for grape-sugar is CH_2O but its true formula is $\text{C}_6\text{H}_{12}\text{O}_6$. In the case of most solids, only the empirical formulae are known, the true formula being indeterminate.

Empiricism (Gk. *empeiria*, trial, experience), philosophical term signifying a belief that actual sense-experience is the source of all ideas and excluding all possibility of *a priori* knowledge or conceptions. This view arose out of the system of Heraclitus, rejected by Socrates and Plato. It maintains that the mind at first is a *tabula rasa* (clean slate) upon which experience must write all impressions. The sophists of antiquity were empiricists. The scholastics taught that the mind can attain to true intellectual apprehension not by innate ideas but by concepts derived from sense-experience. Descartes' philosophy estab. a compromise, one part of knowledge being considered innate, another empirical or derived from outside. (*See* INNATE IDEAS.) Many Eng. thinkers have held empiricist views (Locke, Hume, John Stuart Mill). Locke made experience the basis of all knowledge, sensation, and reflection, while Berkeley and Hume developed this philosophy on different lines. This empiricism formed a strong contrast to the Cartesian 'rationalism' of the Continent. Its chief fault is perhaps that it gives a wrong account of experience, representing it as piecemeal, whereas the two elements of knowledge (*a posteriori* facts of experience, and *a priori* facts) are essentially and inseparably united, as Kant held in his philosophy. In medicine, the term empiric was applied to those who (in opposition to the Dogmatist and Methodist) drew their rules of practice from personal experience, disregarding the more scientific methods of inference and deduction and all philosophical theory. Hence the word came to mean an untrained practitioner, one who prescribed solely on individual observation and experiment, a quack-doctor. Empirical laws are those adopted merely because found (or supposed) to be beneficial and successful in practice, without any reason authorising them (as distinguished from 'casual' laws).

Employers' Liability, *see* WORKMEN'S COMPENSATION.

Employment Exchanges. These are local offices, at first called Labour Exchanges by the Labour Exchanges Act, 1909, estab. for the purpose of mobilising

labour, gathering information as to employers requiring workpeople, and, conversely, as to workpeople seeking employment, and, generally, enabling applicants for labour to obtain it. They are an antidote to unemployment borrowed from Germany, and in view of the success attending the experiment in that country, it is remarkable that they were not estab. in England before, though in this connection considerable good had been done by local distress committees under the Unemployed Workmen Act, 1905. The Act of 1909 empowers the Ministry of Labour (to which department the duties were transferred in 1917 from the Board of Trade) to set up and maintain E. E., wherever they think fit, and to assist any E. E. maintained by other authorities. The Act provided that the powers of any central body or distress committee, and of any local council acting through a special committee, to maintain employment registers under the Unemployed Workmen Act, 1905, might, after one year from the passing of the Act, only be exercised under the control and with the sanction of the Local Gov. Board (now Ministry of Health) and that that sanction should not be given except after consultation with the Board of Trade (now of the Ministry of Labour). The Ministry of Labour is empowered to make general regulations with respect to the management of E. E., and the expenses incidental to administering the Act are payable out of moneys provided by Parliament. The Act also provides that any person knowingly making false representations to any officer of an E. E. for the purpose of obtaining employment shall be liable to a fine not exceeding £10. The central office of the E. E. is at Queen Anne's Chambers, Westminster, S.W., the branch exchanges being classified into territorial divs., each with its office and clearing-house subject to the control of the Central Office. The Ministry of Labour is empowered to advance travelling expenses to applicants for work where work at a distance has actually been found for them, but such power is subject to restrictions in regard to trade union rates of wages and trade disputes. In 1929 there were about 1200 E. E. in the country. The duties of E. E. were considerably increased when they were extended to the scheme of unemployment insurance (*q.v.*) which was instituted in 1912. Ordinarily the payment of benefits is made at E. E., but in some cases trade unions and other associations of workpeople pay out the state benefits together with an additional sum provided out of their own funds. The trades which appear to benefit most by these institutions are building, transport, metal, machine and implement industries, agriculture, textiles and general commerce, while the temporary Christmas staff of the Post Office is largely recruited through this medium. Vacancies filled by women workers include indoor domestic work, clothing industries, agriculture and food and drink trades, while juvenile employment is also widely covered.

Table 1 shows vacancies notified at E. E., and the numbers of vacancies filled in the years 1913, 1918, 1923 and 1928. The Second World War had a marked

the registers of E. E. in Great Britain and Northern Ireland (including persons who were only temporarily suspended from work and unemployed casual workers, as

Oct. (1944) .	46,168	9,062	15,589	8,416	79,235	89,940

Table 4 gives the number of insured persons registered as unemployed in Great Britain in Jan., Oct., and Dec., 1945.

The increase shown in the table below was due to demobilisation; for between Dec. 31, 1944, and the end of Nov. 1945,

Insurance to July, 1923, and subsequent reports. For statistics of unemployment in later years, see the monthly issues of the Ministry of Labour Gazette. See also J. N. Webb, The Transient Unemployed, 1935; P. Cohen, Unemployment Insurance and Assistance in Britain, 1938.

TABLE 4

Month	Men 18 years and under 65	Boys 14 and under 18	Women 18 and under 60	Girls 14 and under 18	Total
Jan.	53,985	5,589	22,799	5,610	87,983
Oct.	124,098	7,734	93,829	7,665	233,326
Dec.	156,126	7,181	114,686	6,763	284,756

the numbers of men and women in the armed forces, auxiliary forces and civil defence services were reduced by 838,000 (from 5,195,000 to 4,357,000). The course of employment in industry during the same period was naturally also influenced mainly by the course of the war. The achievement of victory brought in its train three main developments: (i) some relaxation in the rate of withdrawal of men and women from industry for the forces and auxiliary services; (ii) the

Empoli, a tn. of Tuscany, Italy, on the Arno, in a beautiful and fertile dist. Manufs. linen. It was very flourishing in the Middle Ages. In the Second World War the bell-tower of the Collegiate church was blown up by the Gers. and, in its fall, destroyed the small museum. The Baptistery was also largely destroyed. Four large paintings by Empoli, Cigoli, Botticini and Macchietti were destroyed. Heavy damage was sustained by the church of S. Agostino. Pop. 5800.

1946 (June)	260,895	94,270	2,860	1,309	359,334	391,939

* From July 1940 the figures exclude men in attendance at Gov. Training Centres.

† The figures for 1942 and later years are exclusive of men and women classified as unsuitable for ordinary employment.

introduction of the scheme of demobilisation; and (iii) the acceleration of the process of reconversion from production for war purposes to production for civilian needs and the export trade.

Table 5 shows the average numbers of insured persons registered as unemployed in each of the years 1939 to 1945, and the numbers registered as unemployed in the middle of 1946.

For full information as to statistics, see the *Abstract of Labour Statistics of the United Kingdom*, issued before the First World War by the Board of Trade; for information on unemployment insurance the *Report on National Unemployment*

Emporia, city of Kansas, U.S.A., cap. of Lyon co., 53 m. S.S.W. of Topeka. It has railway shops and other industries and is the commercial centre for a large agric. and stock raising region. It is the seat of the Kansas State Teachers' College with 1800 students, and of the College of Emporia (Presbyterian). Pop. 13,100.

Empson (or Emson), Sir Richard, Eng. lawyer and statesman, was the son of a wealthy citizen of Towcester, Northamptonshire, and was trained for the Bar. Like Edmund Dudley, he was the unpopular agent of Henry VII., and was employed in exacting taxes and penalties due to the crown. He shared with Dudley

a reputation for harshness and tyranny in his exactions. In 1491 he became speaker of the House of Commons, and in 1504 chancellor of the duchy of Lancaster. In the second year of Henry VIII's reign, he and Edmund Dudley were both convicted of tyranny and constructive treason, and were beheaded on Tower Hill, London, on Aug. 17, 1510.

Empyæma (literally, pus in; meaning pus in the cavity of the pleura). This occurs in a late stage of pleurisy, pleurisy itself being inflammation of the pleura, which is the lining of the chest-wall and the covering of the lung. The term E. is also used for any collection of fluid in the pleural cavity, before an exploratory operation has been done to learn the nature of the fluid, whether serum, a clear fluid, or pus. Pleurisy and E. commence in the pleura, or extend from the chest-wall, as in growths, injuries, or disease of other parts, as the kidneys, or from the lung, as in tubercle, or the pleura and lung become diseased at the same time, as in pleuro-pneumonia. When pus is present, it must be removed by aspiration, that is, drawing it off. If the underlying cause remains, pus re-collects, and an opening must be made to maintain drainage and to prevent pus accumulating.

Empyrean (Gk. *emp.*, fire). According to the old metaphysical philosophers the E. was the highest and purest of the four celestial spheres, the region of the most rarefied elements of fire. Poetically it is the source of light and the abode of the blessed.

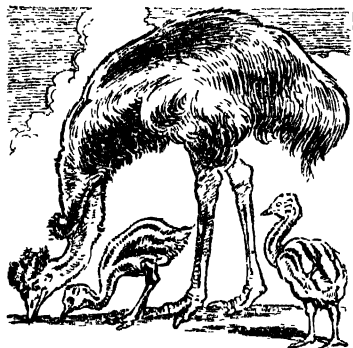

Ems, or Bad Ems, magnificently situated in and watering-place of Germany, in Hessen on the R. Lahn, 10 m. E.S.E. of Coblenz and 15 m. N. of Wiesbaden. Its alkaline mineral springs are among the most efficacious in Europe for the cure of nervous, respiratory, and liver disorders. Famous as the place whence William I. of Prussia despatched the telegram to Bismarck which provoked the Franco-Prussian war of 1870. Pop. 7300.

Ems, riv. of N.W. Germany. It rises in Westphalia, flows through Hanover, and after a course of 200 m. enters the N. Sea, forming an estuary between E. Friesland and the Netherlands and developing an expansion called the Dollart. Three canals connect it with the Lippe, with Jade, and with Dortmund (Dortmund-E. canal).

Emsdetten, com. of Westphalia, Germany, 15 m. N. of Münster. with textile manufs. Pop. 15,000.

Emu, or Emeu, a ratite bird in the family Dromæidæ. Like the cassowary, to which it is allied, it is common to Australia, where it is a protected bird. It stands about 5 or 6 ft. high and is second in size only to the ostrich. It differs from the cassowary in having a broad beak, no helmet, short feathers on the head and neck, and no wattles on the neck, no spines on the wing, and the claws of all three toes are almost equal to one another. The wings are rudimentary, but the powerful legs are well adapted for running, and are capable of giving dangerous kicks when the bird is attacked. There are

only two living species, *Dromæus Novæ-Hollandiæ*, the common E., and *D. irroratus*, the spotted E. Both are monogamous, and the male wholly or partially incubates the eggs. Their diet is strictly vegetarian.

Emulsin, or Synaptase, a neutral substance contained in almonds with the power of acting as a ferment converting the amygdalin of almonds into oil of bitter almonds, hydrocyanic acid, and a sugar. In its pure form it is an odourless and tasteless white powder, which is soluble in water.

Emulsion (a suspension, that is, an even diffusion, which does not separate on standing, of a heavier substance in a lighter medium), a medical preparation in which the drugs neither rise nor fall on standing. Thus, oil, a heavier substance, is suspended by yolk of egg in water, which is lighter. Amongst other drugs, olive oil and petroleum are frequently given as Es.

Enabling Act, see under CHURCH ASSEMBLY.

Enamels and Enamelling. Enamel (formerly 'amel,' through Fr. *amail*, *email*, from a Late Lat. word *smaltum*, same root as 'smelt') is, in the strict sense, the hard, vitreous compound which is fused on the surface of metallic objects for purposes of decoration or utility. The base of enamel is a compound called flux; this is clear and vitreous, and is composed of silica, minium, and potash. Whilst in a state of fusion, oxides of metals are added to colour it, which stain the flux throughout its mass. When a high temp. is required to fuse it, the enamel is termed 'hard'; the harder the enamel the greater its durability, and hence value. When hard enamels are used, pure metals must also be used, as an excess of alloy causes the metal to melt before the enamel is fused, or the enamel to part company with the metal after firing. Enamels are either transparent or opaque. The elements have all undergone an equal degree of liquefaction in the

former case, whilst all transparent enamels are made opaque by the addition of 'calx,' a mixture of tin and lead calcined. In order that the developments which have occurred in the enamelling art may be understood, a brief résumé of the processes required may be given. After the enamel has been procured in lump form, it must be 'pulverised'; for this it is placed in an agate mortar and covered with water; a pestle is then held vertically over the enamel and struck sharply with a hammer to break it, after which it must be ground into a fine grain

articles of personal adornment, and the Romans for the most part copied the Greeks. After the fall of Rome, Byzantium was the centre of the enamelling art. The inhabitants of Great Britain are thought to have excelled in the art at an early epoch, the Celtic work of Ireland being of great beauty. The introduction of the 'basse-taille' process raised enamelling from merely a decorative to a fine art. Of comparatively recent years a revival of interest in both decorative and utilitarian enamelling has taken place, the extensive use of enamelled plates for advertising

British Museum

AN ENAMEL PANEL SHOWING ST. ANTHONY AND THE ARCHER, BY
LEONARD LIMOUSIN, 1536

The arms shown are those of Jean de Langeac, Bishop of Limoges, 1532-41

by rotating the pestle with as much pressure as possible. The powder thus obtained is washed repeatedly in distilled water until all the flinty part is removed. The metal to be enamelled must be cleaned by the application of water and acid: for copper, nitric acid is used; for silver, sulphuric acid, and for gold, hydrochloric acid; all the acid is then removed completely by washing and drying in sawdust. The pulverised enamel is then spread in sufficient thickness to cover the required parts of the metal, which is then dried in front of the furnace. It is then placed carefully, on an iron or fireclay plate, into the muffle of the furnace, which is heated to a bright pale red. When it shines all over it is removed. The process of firing takes only a few minutes, and generally no annealing process is required. The art of enamelling has been practised since very early times. The earliest examples in Assyria are enamelled on bricks and

purposes is one example among many of the latter. All the examples of enamelling, of whatever period, fall into one of the following classes, according to the method of applying the enamel employed: 'champlevé,' 'cloisonné,' 'basse-taille,' 'plique-à-jour,' and 'painted,' and this order is that in which the varieties became known. In champlevé enamels, cells or troughs are cut away in the plate to be enamelled, leaving a metal line raised between them, which forms the outline of the design. The enamel is laid in these cells and filed, smoothed, and polished after fusion. The cloisonné method differs from the above only in that instead of the cells thin metal strips are bent to the outline of the pattern and fixed to the plate by silver solder or the enamel itself. The Pala d'Oro in St. Mark's, Venice, is the finest example of this class of work. The basse-taille process is a combination of metal work, in the

form of engraving, carving, and enamelling. The metal is engraved with the design and carved into a bas-relief below the general surface of the metal, so that the enamel when fused is level with the uncarved parts of the design. Transparent enamel is generally used for this process. Plique-à-jour enamel may be termed translucent cloisonné, as it is similar to cloisonné, save that the ground on which it is fired is removed, rendering it transparent. In painted enamel the colours are laid on to a background of enamel. Miniature-painted enamels do not, properly speaking, come within the category of enamels as the colours applied after the enamel has been fired upon the gold plate used are not vitreous compounds. See E. Molinier, *Dictionnaire des emailleurs*, 1885; J. Labarte, *Recherches sur la peinture en émail*, 1856; C. Popelin, *L'Email des peintres*, 1866; H. Cunyngame, *The Art of Enamelling on Metals*, 1899; J. J. Marquet de Vasselot, *Enaux Limousins, XVe siècle*, 1921; A. Fisher, *Art of Enamelling on Metals*, 1926; M. Chamot, *English Medieval Enamel*, 1930; L. Falize, *Claudius Popelin et la renaissance des enaux peints*.

Enaré, Lake (spelt also Inara, Enari, Indiagher), a lake of Finland, in the extreme N. of the prov. of Uleaborg.

Encaenia, see COMMÉMORATION.

Encaenacion, an important commercial tn. at the terminus of the Paraguay Central Railway, Paraguay, S. America.

Encaustic Painting. This term is employed to describe a picture painted by means of heated wax. It is an ancient method of painting, and the final process consisted of an application of heated wax to the picture. This process is now practically obsolete, but some people consider that neither oil nor fresco paintings are so permanent as the E., which is unfortunately one of the lost arts. Emma J. Greenland, at the close of the eighteenth century, did indeed make some experiments in the endeavour to ascertain the ancient methods, but they met with but poor success, the tint and texture being neither as brilliant nor durable as oil painting. We have no important examples of classic Gk. E. painting, but there are some interesting Egyptian remains of the kind, brought to light at the Oasis of Fayum in 1887.

Encladus, in Gk. mythology, one of the hundred-armed giants who revolted against Zeus and who as he fled and sought refuge in Sicily, was transfixed by a thunderbolt and buried under Etna.

Encephallitis Lethargica (sleepy sickness) occurred first in Vienna in 1917. The general symptoms are fever, lassitude, headache, pain in the back, muscular rigidity and paralysis, sensory and gastrointestinal disturbances. The body temp. usually ranges between 100° and 103°. The lethargy is the most common characteristic symptom, and varies greatly in degree, from a mere drowsiness to a stupor from which a strong stimulant will arouse but for a few moments. Yet in some cases there is restlessness, excitement, and even maniacal symptoms, instead of leth-

argy. The stupor varies in duration from a few days to months, when recovery may still occur. The muscular rigidity is characterised by mask-like facial expression with tremors of muscles in hands and arms. E. L. first occurred in Great Britain in 1918. It is believed to be of microbe origin and communicable from one individual to another. It must not be confused with sleeping sickness, a tropical disease caused by a minute animal parasite (*trypanosome*) in the blood, and transmitted by the tsetse fly.

Encephalocoele, a protrusion of a portion of the brain substance through an opening in the skull. It is most commonly a congenital condition, its importance depending upon its size and situation. It may be described as a visible tumour of the brain, in contradistinction to a cerebral tumour, which is understood as a growth inside the brain.

Encephaloid Cancer is so called from a fancied resemblance to brain material. It is a soft cancer as contrasted with scirrhus or hard cancer and contains a relatively large amount of cells and blood vessels and a less amount of connective tissue.

Encephalon, or **Brain** (q.v.), is that enlarged upper portion of the cerebro-spinal axis contained in the cranium. It comprises the *medulla oblongata*, the *cerebellum* with the *Pons Varolii*, and the *cerebrum*, which last part is subdivided into the *mesencephalon*, the *thalamencephalon*, and the *cerebral hemispheres*. The average weight of the entire mass is some 50 ozs. in the male and 5 to 5½ ozs. less in the female. The E. increases rapidly in weight up to the seventh year, then more slowly, and appears to reach a maximum between the ages of twenty and thirty. Its average specific gravity is about 1.036, the white matter being denser than the grey. Brain and spinal cord together constitute the *central nervous system*. The cavities (*ventricles*) of the brain, and the central canal of the spinal cord, are occupied by the cerebro-spinal fluid.

Enchantment, see INCANTATION and MAGIC.

Enchondroma, tumour containing cartilage, which generally develops in connection with the cartilaginous growing portion of a bone. It can be removed by operation, and does not recur.

Encina (or **Enzina**), Juan del (1468-1530 or 1531), Sp. poet and founder of the secular drama in Spain, was b. at Salamanca. He began writing poetry at a very early age, and *Cancionero*, a collection of odes, lyrics, and dramatic pieces, was printed at Salamanca in 1496. In 1519 he made a pilgrimage to Jerusalem, and wrote a poetical account of this in 1521. His fame, however, does not rest on either of these works, but on his *Representaciones*, fourteen dramatic poems, partly religious, partly secular, the latter of which were acted in Spain in 1492. His most popular work, *La Farsa de Plácida y Victoriano*, was condemned by the Inquisition and lost in 1559. E. held three important positions, viz. secretary to the first duke of Alva; musical director

in Pope Leo X.'s chapel at Rome; and, having taken orders in 1519, he became prior of Leone.

Encke, Johann Franz (1791-1865), Ger. astronomer, studied under Gauss at Göttingen. Through Bessel's influence he became secretary of the Academy of Sciences at Berlin (1825), and director of the observatory there. He superintended the execution of the star-maps of Berlin Academy (1830-59) and the erection of the new observatory (1832-35). He is most famous for his discussion of the orbit of the comet discovered by Pons, 1819. It has since been known as E.'s comet, and has the shortest known period of about three and one-third years. E. also wrote *Die Entfernung der Sonne* (two tracts based on the transits of Venus, 1761 and 1769, 1822-24). He issued four vols. of *Astronomische Beobachtungen auf der Sternwarte zu Berlin* (1840-56). See *lit* by Bruhns, 1869.

Enclave, portion of a state within the boundaries of another, notably in Germany. To the proprietor state the E. is known as its 'exclave.'

Enclosures, see ALLOTMENTS; COMMONS AND ENCLOSURES.

Encratites (Gk. *Ἐγκρατίταις*, self-controlling), a sect of Christian ascetics of the second century (c. 172 A.D.) found at Rome and in Asia Minor. Their leader was the Gnostic Tatian, and they practised total abstinence from flesh, wine, and marriage. They substituted water for wine in the Eucharist, and were hence sometimes called 'Hydroparastatæ,' or Aquarians. They existed as late as the fourth century, and the name came to be given to ascetic Gnostics generally.

Encrinal (Encrinotal) Limestones. This name is given to limestones which abound in the calcareous fragments of crinoids, large masses of the rock being entirely composed of the joints and fragments of their skeletons. Many cylindrical bodies may be found, some flat and coin-shaped, but more often they are elongated and perforated along their long axis by a canal. Hence in some parts these are called 'St. Outhbert's beads.' Such remains are commonest in limestones of the Silurian, Devonian, and Carboniferous ages. Large beds occur in the Hamilton and Helderberg groups in New York state, and in the mountain limestones of N. England.

Encrinites, or Crinoidea (Gk. *κρίνον*, lily and *ἴδιος*, form), the name of a group of radiated animals, forming a class in the phylum Echinodermata (q.v.). They include many species, mostly fossil ('stone lilies'). They have been obtained from Gotland Is., the Wenlock of England, and the Niagara group of N. America (Silurian system).

Encyclical Letters (from Lat. *encyclicus*, circular), an expression indicating in a general sense circular ecclesiastical letters sent on some important occasions by the pope to the bishops. These letters differ from the papal bulls in that the latter generally have some more special object in view. The E. L. is singular (*epistola*), and is issued to the hierarchy, being sealed

with the Fisherman's Ring. E. L. generally contain instructions and warnings against dangers which may threaten the church.

Encyclopædia, a derivative from the Gk. *ἐγκυκλιος παιδεία*, circular or complete education; it originally meant the whole group of studies which every free-born Gk. youth was required to complete in preparation for active life: the liberal curriculum. The phrase was adopted by the Romans, and in both these anc. languages came to mean systematic study of, or instruction in, all the branches of learning. With this idea of encyclo education was soon associated the notion of collecting the materials of such instruction into a single work, where the contents and relations of the various arts and sciences should be systematically expounded. There were many early attempts to produce such a work, though the name E. was not used till the sixteenth century. This is now its common application.

The earliest Es. were treatises or groups of connected treatises adapted for continuous study, not merely for reference, and they contained the more or less extensive accumulation of learning made by their authors individually. The first E. is said to have been compiled by Speusippus (d. 339 B.C.), a disciple of Plato, but of this nothing is known. Among the Romans, Marcus Terentius Varro (d. c. 27 B.C.) was the first encyclopædist, but his *Disciplinarum Libri IX.*, containing treatises on grammar, rhetoric, arithmetic, etc., and another work on Rom. antiquities, have both been lost. The earliest E. we possess is the famous *Historia Naturalis* of Pliny the Elder (23-79 A.D.), a work on natural science, considered especially with reference to human life, and including geography, medicine, and the hist. of art. In the fifth century, Martianus Capella, a native of N. Africa, produced an E. of the seven liberal arts, which was used extensively as a school text-book in the Middle Ages. A similar work was compiled by Isidore, bishop of Seville (c. 570-636), and there were one or two Gk. Es. in the twelfth century. Of these early works the most important is the great *Bibliotheca Mundi*, or *Speculum Maius*, or *Speculum Triplex*, of Vincent of Beauvais, a Dominican friar of the thirteenth century. It was in the reign of Yung Lo (d. 1425) that the vast literary collection known to posterity as the *Great Encyclopædia* was produced though never printed (see CHINA.—Literature). In 1541 the name cyclopædia was first used by Ringelberg of Basol, and Paul Scalich used the term E. in 1559. The seventeenth century saw many Es., including Alsted's seven vols., in Lat.; the *Grand Dictionnaire Historique* of Louis Moreri, with an alphabetical arrangement; J. J. Hoffmann's *Lexicon Universale*; and, most famous of all, the *Dictionnaire Historique et Critique* of Pierre Bayle (1697). The anc. type was changing, and the E. was becoming assimilated to the dictionary. The alphabetical arrangement led to a change of purpose and character in the

compilation, which became a work of reference, giving, instead of the exposition of the system of human knowledge, only the mechanical arrangement of its contents. This aim and method have been adopted by modern Es. in varying degrees. An important characteristic of modern methods is the employment of a large body of specialists both as compilers and editors. Some co-operation existed in the earlier productions, but an elaborate system became essential in the nineteenth century, owing to the rapid advance and multiplication of the special sciences. Coronelli planned a vast *Bibliotheca Universale*, of which only a small portion appeared (Venice, 1701-6). In England the dictionary method was followed by John Harris (c. 1687-1719), who compiled a *Lexicon Technicum*. A supplement 'by a society of gentlemen' appeared in 1744, and was long in popular use. Another more important Eng. work is the *Cyclopædia* of Ephraim Chambers (d. 1740), which contains a systematic use of cross-references. Chambers may be regarded as the father of Eng. encyclopedic lexicography, and he also exerted a wide influence on continental works of this type. It was a Fr. trans. of Chambers's *Cyclopædia*, by John Mills, which formed the basis of the famous *Encyclopédie* of Diderot and D'Alembert (1751-72). In their hands it became the organ of the most advanced and revolutionary opinions of the time, and was the object of much violent persecution. So thoroughly was it identified with the philosophic movement of the time, that the term *encyclopédiste* came to be applied to all who held certain views. It was pub. in twenty-eight vols., including eleven of plates, and five supplementary vols. followed (1776-77) with over 2000 plates, and an analytical table of contents in two vols. (1780). The *Encyclopædia Britannica* (Edinburgh, 1768-71) was planned by William Smellie, a printer, Andrew Bell, an engraver, and Colin Macfarquhar. It was a compromise between the alphabetical and the scientific distribution of subjects. There have been many successive eds., and the fourteenth ed. (1929) has twenty-four vols. The ownership of this E. has passed to the Univ. of Chicago after an interval during which it was the property of Sears, Roebuck, of Chicago. The new ed. (1916) is an enterprise in large-scale revision on a plan not hitherto adopted in any E. It is based upon continuous revision and the issue of regular supplements.

Little change has taken place in the theory of E. making since the beginning of the nineteenth century, but there has been a notable growth of the encyclopedic dictionary and of the special E. The two types meet in the *Grand Dictionnaire Universel du XIX^{ème} Siècle* (1865-1878) of Pierre Larousse, which is a complete dictionary of the Fr. language and includes proper names and a vast amount of information. Among special dictionaries may be mentioned the *Dictionary of National Biography* (1885-1901), ed. by Leslie Stephen and Sidney Lee. Other

noteworthy Es. in Eng. are: *The Edinburgh Encyclopædia*, ed. by Sir David Brewster; *The Penny Cyclopædia* (29 vols.), ed. by Charles Knight; *The English Cyclopædia* (31 vols.), ed. by Knight; *Chamber's Encyclopædia* (10 vols.), ed. by Andrew Findlater; *Johnson's Universal Cyclopædia* (10 vols.); *The Cambridge Encyclopædia*; *The New International Encyclopædia* (20 vols.); *Harmsworth's Encyclopædia* (8 vols.), 1905. Every leading language can furnish a list, and an article on the hist. of Es. is found in vol. cxiii. of the *Quarterly Review*.

Encyclopédistes. This was the name given to a group of Fr. thinkers who were connected with the *Encyclopédie*, a celebrated Fr. work pub. by Diderot and D'Alembert at Paris in 1751-72, embodying the prevailing tendencies of the time as regards philosophy, religion, and politics. It appeared in twenty-eight vols., and was doubtless undertaken because of the success of *Chamber's Encyclopædia* in England. Many of the greatest writers of the day figured among the collaborators—Voltaire, Rousseau, Montesquieu, as well as the chief editors. See J. Morley, *Diderot and the Encyclopédistes*, 1886.

Endecott, John (1589-1665), Brit. Colonial governor, b. at Dorchester. He went to America in 1628, where he became manager of the plantation of Naumkeag (Salem). Two years later he gave place to John Winthrop and headed several expeditions against the Indians. From 1641-44 he held respectively the position of deputy-governor and governor of Massachusetts, and died at Boston, March 15. He, though a brave and benevolent man, was of an austere Puritan disposition.

Endemic, a disease affecting a community, which is caused by local conditions. This distinguishes it from an epidemic, which is a disease brought to a community from a distance. An epidemic, such as small-pox, tends to pass on, whereas an E. disease, like malaria, tends to remain. See also EPIDEMIC.

Enderby Land, large, desolate is. or tract in the Antarctic regions, just S. of the Antarctic Circle, visited by Biscoe in 1831, and named after his employers. It was first discovered by Dirk Gerritz, 1599.

Endive, see CHICORY.

Endlicher, Stephen Ladislas (1804-49), Hungarian systematic botanist, whose chief work, *Genera Plantarum*, has largely influenced succeeding botanists.

Endocarditis, see CARDITIS.

Endocardium. This membrane lines all the cavities of the heart, following the inequalities of the inner surface of the organ and becoming continuous with the inner coats of the attached blood vessels. Beneath a layer of epithelial cells the E. consists of connective tissue with a close network of elastic fibres; occasionally plain muscular fibres are present. The ordinary cardiac muscular fibres in many places are separated from the E. by some amount of areolar tissue, which in certain

subjects may contain considerable quantities of fat. The membrane is usually thicker in the auricles than in the ventricles. Endocarditis or inflammation of the E. may be either simple or ulcerative, and may be associated with a variety of diseases.

Endocarp, see FRUIT.

Endocrine glands, ductless glands forming part of the equipment of the secretive organs of the body, and consisting of thyroid, parathyroid, pituitary, pancreas, suprarenal, and part of the sex glands. They give off substances which affect physical growth and sex development. The various glands are closely interrelated, and recent research goes to show that their action is closely associated with psychological reactions in the human character, and that emotional conditions are therefore based on purely physical phenomena. There are various diseases associated with abnormal conditions of these glands, such as goitre, diabetes, and abnormal blood pressure. Patent medicines offer extracts of endocrine gland secretion, but scientific research is by no means conclusive, and most theories concerning their scientific value are hypothetical. Such medicines include pituitrin, thyroxin, and epinephrin. See L. C. Martin and M. Haynes, *Clinical Endocrinology*, 1948; G. Bankoff, *The Conquest of the Unknown*, 1948.

Endogamy (Gk. *ἐνδον*, within, and *γάμος*, marriage), the custom of marrying only within the limits of a tribe or clan, as opposed to **exogamy** (marriage outside of the clan). This is possibly characteristic of the earliest stages of social organization. In many cases it doubtless arose from racial pride and a contempt for neighbouring peoples. E. prevails in certain parts of Central America, Java, and elsewhere. Since in time E. will impoverish the breed, a restricted form began to be common. Thus the Abors, Kechs, and other Indian peoples forbid marriage between those of the same clan or subdivision of the tribe. See J. McLennan, *Primitive Marriage*, 1865; E. Westermarck, *History of Human Marriage*, 1894; J. Awebury, *Origin of Civilisation*, 1902; Sir J. G. Frazer, *Totemism and Exogamy*, 1910.

Endogens, plants in which secondary wood is developed in bundles which are external to the primary bundles, and by this means growth in thickness of the stem and root takes place. Monocotyledons is the class of plants in which these so-called closed bundles occur, but only such members of the class as arborescent Liliaceae, and Yucca, etc., are E.

Endometritis, see **uterus**.

Endomorph, the term used when one mineral is enclosed within another, the surrounding one being called the perimorph. Such inclusions of minerals are very common in the constituent minerals of crystalline schistose and igneous rocks, and are due to the successive formation of two minerals in a narrow space.

Endoplasm, in the protozoa (q.v.), the granular cytoplasm of the body. It carries on all the metabolic activities of

the animal; it is bounded by a narrow, clear layer of *ectoplasm*, which is firmer than the E. and to a certain extent protective; it is also the layer through which Amoeba (q.v.) communicates with the outside world.

Endor, anct. vil. of Palestino, mentioned in the O.T., S. of Mt. Tabor, 64 m. from Nazareth. The present site is called Endur.

Endorsement, the act of endorsing, that is, writing one's name on the back of a bill of exchange, cheque, note, etc., signifying one's approval, sanction, or ratification of same. When endorsed in this way, a bill may be freely transferred from hand to hand and is negotiable. This is termed **general E.** A **special E.** is where the document of whatever nature is made payable to the order of the transferee, viz., the person to whom it is transferred. Sometimes the document is made transferable by simple delivery to any person without further E., and this is known as a **blank E.**

Endosmosis. When a dilute solution of a substance is placed in a funnel closed at one end by parchment, and the whole immersed in water, the solution in the funnel will rise, due to the fact that water passes in through the membrane faster than the solution passes out. The phenomenon is known as E. See **Osmosis**.

Endosperm, in botany the greyish-white albumen of a seed lying by the side of the embryo, or enveloping it. It consists of a nutritive substance intended for the support of the embryo in its early stage. The bean and kale and similar plants have no albumen round their seeds, and are consequently termed **exendosperms**.

Endothelium, in zoology the membrane that lines blood vessels, lymphatic conductors, and other tubular channels and cavities of the body, usually composed of thin, flat, minute cells.

Endowed Schools Acts, parl. Acts made to prevent misapplication of the foundations for the support of secondary education in England. The Acts do not apply to the chief public schools nor to any schools kept up in any way by voluntary subscriptions without monetary endowment. See under **EDUCATION**.

Endrod, tn. of Hungary, in co. Békés, situated on the Koros, 20 m. N.W. of Csaba. Pop. 14,000.

Endymion, in Gk. legend a beautiful youth beloved by Diana (Selene, the moon goddess). One story makes him a king of Elis, whose grave is shown at Olympia. He was said to have been granted by Zeus the gift of eternal sleep and perpetual youth. The more general story makes him a hunter on Mt. Latmos. E. is sometimes supposed to be a personification of the sun, or of the setting sun's plunge into the sea. The subject frequently forms the theme of pictures (see those of Watts in modern times), and is found on anct. wall-paintings and Rom. sarcophagi. See Keats, *Endymion*; Robert, *Antike Sarkophag-Reliefs*, A., 1898.

Enema, liquid preparation intended for injection into the rectum, by means of a syringe or other suitable apparatus. It

was formerly known as clyster. Es. most commonly in use are water, soup and water, or oil.

Enemy, see **BELLIGERENT**; **INTERNATIONAL LAW**; **WAR**, etc.

Energatype, see **FERROTYP**.

Energumen, name given to one supposed to be possessed by evil spirits. In primitive races mental and nervous afflictions are frequently thus explained, and a cure thought to be effected by means of prayers or incantations. Such persons were sometimes known as 'energici' ('tossed by the waves'; of uncontrollable impulse). They could only occupy the porch with the lepers and the defiled at church services. The order of exorcists in the Church was instituted to free Es. from their obsessions.

Energy, the power of doing work; in physics and theoretical mechanics, that attribute of a body or material system by virtue of which the body or system is enabled to perform work. Simultaneously, work is defined as the overcoming of resistance through distance. The E. of a system, if due to motion, is called E. of motion, or 'kinetic' E.; whilst the E. it possesses on account of its position or its state of strain is called 'potential' E. by way of distinction. A steam-hammer when at rest in its highest position is a good type of 'potential' E. Again, in the vibrations of a pendulum, the E. is constantly being changed from a kinetic to a potential form. All forms of E. can be classified under one or other of the types, kinetic or potential E. For instance, kinetic E. is visible in mass motion, visible or invisible wave motion (sound, light, etc.) of electric currents, and so on; and potential E. is recognised in raised masses, magnetised bodies, separated electric charges, etc. One characteristic of all E. is its property of transformation, and in all its transformations there is evident the property of *conservation* of E. The physical law that is known by this name asserts that the total amount of E. in any isolated system is absolutely invariable in amount. E. may be added or abstracted from without, but as long as no external influences intervene the total quantity of E. within the system can neither increase nor decrease. It is usual, therefore, to say that the entire E. of the universe is conserved. Galileo seems to have been familiar with the idea that E. cannot be created, a fact which he inferred from a careful study of the machines, all of a simple nature, that were used in his day. However, there appeared to be many cases in which E. is destroyed, and all mechanical E. is gradually wasted away by frictional and such-like losses, the mechanical E. being converted into heat E. The motions of the celestial bodies are far more easily described by the aid of the principle of conservation of E. than they could be without it. See W. McDougall, *The Energies of Men*, 1932; E. Osty, *Super-normal aspects of Energy and Matter*, 1934; A. Wood, *Joule and the Study of Energy*, 1934; M. Moth-Smith, *The Story of Energy*, 1934.

Enfantin, Barthélemy Prosper (1796-1864), son of a banker in Paris, became one of the chief founders of the Saint-Simon school of Socialism. From 1826 till 1830 he was associated with Bazard in carrying on H. de Saint-Simon's work, but they eventually disagreed on the question of marriage, E. being an advocate of free-love, which led to his prosecution in 1832. He was imprisoned for a year, and on his release became editor of the journal *Le Crédit Public*. His collected works were pub. in (*Euvres de Saint-Simon et d'Enfantin* (1865-78). See H. Castille, *Le Père Enfantin*, 1859.

Enfield, tn. and par. of Middlesex, England, 10½ m. N. of London Bridge, situated in the valley of the Lea. It has of late years become a residential suburb of London. The New R. flows through it, and Middleton House, the home of Sir Hugh Middleton, the first director of the New River Company, is here. The perpendicular church contains fifteenth to sixteenth century tombs. There are remains of Enfield Palace at which Princess Elizabeth was staying at the time of her father's death, now the Constitutional Club. There is an anct. Brit. entrenchment in what was the park. Charles Lamb resided at Chase Side, and Isaac Disraeli, father of Lord Beaconsfield, was born here in 1766. The Royal Small Arms Factory is at Enfield Lock. Pop. 67,000.

Enfield, tn. of Connecticut, U.S.A., situated in Hartford co. on Connecticut R. Tobacco is grown and carpets and basket hardware made. Pop. 16,000.

Enfield, William (1741-97), Eng. Non-conformist clergyman, b. at Sudbury, Suffolk, and author of the well-known *The Speaker* (1774), *Preacher's Directory*, and *Abridgement of Brucker's History of Philosophy*. Also compiled *Institutes of Natural Philosophy*, theoretical and experimental.

Enfilade (fr. from *enfiler*, to thread, to pass through from end to end), a military term used when the firing is directed along an enemy's line or parapet. It is a most effective form of fire, being extremely difficult to meet, and entrenchments or parapets are useless as cover. The usual form of defence against an E. is a *traverse*, or bank of earth raised at right angles to the lines of defence.

Enfranchisement, see **COPYHOLD**.

Engadine, Swiss part of the valley of the Inn in the canton of the Grisons. It is traversed by a carriage road from the Maloja Plateau (5935 ft.) at the S.W. end to Martinsbruck (3406 ft.) at the N.E. end, a distance of 56 m. It is divided into the Upper and Lower E., the cap. of the former being Samaden (pop. 967), of the latter, Scuol (pop. 117). The Upper E. is the best known, and is a favourite health resort, the mineral waters of St. Moritz having been known since the sixteenth century. Pontresina is a centre for tourists. The valley is reached by road over the passes, and there is a railway running under the Albula Pass to St. Moritz. The language spoken is Ladin (an old Romance tongue) or Ger. Pop. 14,000.

Engelberg, beautifully situated vil. of Switzerland, the terminus of the electric railway from Stansstad on the Lake of Lucerne, a favourite summer resort, and one of the most popular winter sports centres in Switzerland. The Benedictine Abbey was founded in 1120 and the whole valley ruled by the abbot until 1798. No ladies are allowed to inspect the valuable library, but men may. Pop. 2400.

Engels, Friedrich (1820-95), Ger. Socialist, b. at Barmen, the son of a wealthy cotton-spinner. After spending two years in England writing for the organs of the Owenite and Chartist movements, he went to Paris and there visited Karl Marx (*q.v.*). The two became close friends and worked so much together during the remainder of their lives that the works of the one became more or less the works of the other. E. wrote in collaboration with Marx, *Die heilige Familie oder Kritik der Kritischen Kritik* (1845), and *Manifest der Kommunistischen Partei*, the famous communist manifesto (London, 1848; Eng. ed. 1848 and 1888). After the death of his friend he pub. the third and last vol. of Marx's work, *Das Kapital* (1885). See F. Mehring, *Aus dem literarischen Nachlass von Karl Marx, Friedrich Engels, und Ferdinand Lassalle*, 1902; J. Mayer, *Friedrich Engels*, 1920; D. Ryazanoff, *Friedrich Engels and Karl Marx*, 1927; E. H. Carr, *Karl Marx*, 1934.

Engels, tn. in the Saratov Region of the R.S.F.S.R. on the l. b. of the Volga, opposite Saratov. There are timber, meat-processing and packing works. Pop. 73,200.

Enghien (Flemish *Edingen*), tn. in prov. Hainaut, Belgium. It is famous for its lace, and was once the seat of the Condé family, the dukes of E. The castle was burnt down, but the park still remains, and contains a stone cottage built by an ancestor of the present owner, the duke of Arenberg, for Jean Jacques Rousseau. Pop. 4600.

Enghien, Henry I. and II. de Bourbon, Ducs d', see CONDÉ, PRINCE DE.

Enghien, Louis Antoine, Henri de Bourbon Condé, Duc d' (1772-1804), son of Henri Louis Joseph, prince of Condé, and Louise Thérèse Mathilde, sister of the duke of Orléans (Philippe Egalité), born at Chantilly. In 1792 he was given a command in the Fr. royal army of *émigrés*, and served in the Condé army under his father and grandfather. After the peace of Lunéville (Feb. 1801), he retired to Ettenheim in Baden, having married the niece of Cardinal de Rohan, the Princess Charlotte. In 1804 he was falsely accused of being implicated in the Cadoudal-Pichegru conspiracy, and by Napoleon's orders he was seized and taken to the castle of Vincennes, where after the pretence of a trial he was shot. He was the last of the house of Condé. See A. Maricourt, *La Mort du Duc d'Enghien*, 1930.

Enghien-les-Bains, tn. of the dept. Seine-et-Oise, France. It is not far from the forest of Montmorency and only 8 m. from Paris, and is a favourite health resort with sulphurous water. Pop. 11,300.

Engineering, in the stricter sense, the art of constructing and using engines; but, in the wider sense, means the whole range of design and construction of what may be broadly termed 'works,' the designing and construction of steam, oil, and other engines and motive power generally, the construction and operating of electrical installations and the construction of plant for chemical processes. In a popular classification, we may include such branches as agric. E., automobile E., and wireless E., but the more scientific and orthodox classification is into the five divs.: civil, electrical, mechanical, mining, and chemical. The term 'civil engineer' is used in contradistinction to that of military engineer; the nature of the work being concerned with all branches of civil construction. The design, construction, and maintenance of public works, such as docks, irrigation schemes, bridges, viaducts, drainage, etc., and also what is rather vaguely called 'constructional engineering.' The definition of the profession by the directing body in Great Britain, the Institution of Civil Engineers (Great George St., London) is simply, 'the art of directing the great sources of power in Nature for the use and convenience of man.' Electrical E. comprises the two classes, manufacturing and operating, and is concerned with the construction, installation, and maintenance of electrical machinery and engines, such as power-stations, lighting, heating, electric railways, and machinery for the transmission of electrical energy, such as dynamos, accumulators, cables, as well as telegraphy and wireless apparatus. Strictly electrical E. is secondary to mechanical E., inasmuch as electricity is not a prime mover; the initial power, which the electrical engineer helps to transmit, comes from steam or i.c. engines, or from water-power, etc. But practical considerations, especially of training, demand the retention of these orthodox divs., and all of which have their appropriate governing body; thus the directing body of the electrical engineer is the Institution of Electrical Engineers (Victoria Embankment, London).

Mechanical E. is the most extensive branch of the profession and embraces the work of designing, constructing and operating engines, whatever their motive-power—steam engines, gas engines, internal-combustion engines, etc. The mechanical engineer must have a knowledge of the mechanics of engines, boilers, turbine action, etc. The rapid development of the internal-combustion engine has presented ever new problems in the construction of petrol-driven engines, of varying pressure and temp., maximum energy and minimum weight, combined with economy of fuel consumption and, naturally, offers a wide field for a career. The directing body, the Institution of Mechanical Engineers, has its premises at Storey's Gate, London. Mining E. is concerned with the building, erection and working of apparatus for sinking mines, and geological surveying for metalliferous areas or oil-field development. The

directing bodies are the Institution of Mining Engineers and the Institution of Mining Metallurgy, both at 225 City Road, London, and the Institution of Petroleum Technologists, Bedford Street, London. Membership depends on the branch or branches of mining E. adopted. There is scope for the mining engineer both in Great Britain and overseas, in commercial companies—which in Britain generally implies coal, and sometimes iron ore, lead and tin—as mine inspectors and surveyor under the Mines Dept., practical experience being essential. For chemical E., see CHEMICAL ENGINEERING. Agric. E. is concerned with mechanically-propelled tractors, engines for driving pumps, dynamos or lighting, chaff- and root-cutting machinery, and dairying machinery. See also ENGINEERING EDUCATION AND TRAINING; ENGINEERING, MILITARY, etc.

Engineering and Architectural Societies. While the leading architectural societies are found mainly in London, several of the important engineering societies are located in other large towns, dealing with some specific engineering industry. Some of the societies are: Royal Institute of Brit. Architects (f. 1834), 66 Portland Place, W. 1; Incorp. Assoc. of Architects and Surveyors, 75 Eaton Place, S.W. 1; The Architecture Club (1922), 229 Strand, W.C. 2; Architectural Assoc. (1847), 34-36 Bedford Square, W.C. 1; R. I. of Architects of Ireland (1839), 8 Merrion Sq., Dublin. The Institution of Civil Engineers (1818), Great George St., Westminster, S.W. 1; Inst. of Mechanical Eng. (1847), Storey's Gate, St. James's Park, London; Soc. of Engineers (Incorp. 1910), 17 Victoria St., London; Brit. Engineers' Assoc. (Incorp. 1912), 32 Victoria St., London; Inst. of Marine Engineers, 85-88 The Minories, London; Inst. of Electrical E. (1871), Savoy Place, London; Inst. of Mining Engineers (1889), Salisbury House, Finsbury Circus, E.C. 2; Junior Inst. of E. (1884), 39 Victoria St., London; Inst. of Municipal and County Engineers (1873), 81 Eccleston Sq., London; Inst. of Structural Engineers (1908), 11 Upper Belgrave St., London; Inst. of Gas Engineers (1863), 1 Grosvenor Place, S.W. 1; Inst. of Water E. (1896), Parliament Mansions, Westminster, London; Inst. of Heating and Ventilating E., 72 Victoria St., S.W. 1; Inst. of Automobile Engineers, 12 Hobart Place, S.W. 1; The Illuminating Engineering Soc., 32 Victoria St., London; Inst. of Engineers and Shipbuilders in Scotland (1857), 39 Elmbank Crescent, Glasgow; Inst. of Civil Engineers of Ireland (1835), 35 Dawson St., Dublin; N.E. Coast Inst. of Engineers and Shipbuilders, Bolbec Hall, Newcastle-upon-Tyne.

Engineering, Civil, see BRIDGES; DOCKS; CANALS; ENGINEERING; DRAINAGE; HARBOURS; RIVER ENGINEERING; ROADS, etc.

Engineering Drawing is the chief medium by which the engineer conveys his ideas to others, and the drawing office is the connecting link between the engineering department and the machine

shops. The draughtsman's function is to develop the sketches drawn by the engineers into the finished drawing from which the machinist takes all his measurements. It is in the drawing office that the inventions come to life and indeed where many may reveal fatal flaws. From the pencil-drawing an ink tracing is made on tracing paper or cloth; this work is done by junior draughtsmen, and in many works it is done by girls. Photo-prints are taken from these tracings, the commonest of which are the ferro-prussiate ('blue' prints) or 'photostats' of these prints sent to the drawing stores in the machine shops and one copy is put in the records. A drawing office is an excellent place for the young engineer to receive his training, for he sees designs of all the pieces of machinery from their earliest stages to completion. See J. Duncan, *An Introduction to Engineering Drawing*, 1922; W. Abbott, *Machine Drawing and Design*, 1936; A. Craver, *Engineering Drawing*, 1939.

Engineering Education and Training. When a boy leaves school there are two courses open to him for gaining his training; they are (i) A three years' course at a univ., at the end of which he sits for his degree; or (ii) practical training at manufacturing works coupled with evening classes. The deciding factor in the choice is, of course, the amount of cap, which can be spent upon the training. The first of these two is by far the better because it enables the student to acquire a thorough acquaintance with theory. The first year at the univ. is spent mainly in the study of mathematics, physics and chemistry, together with Fr. and Ger., in preparation for the intermediate examination, which is taken at the end of the first year. The second year takes the student further into mathematics, covering differential and integral calculus while continuing physics and modern languages. He now specialises in the branch of engineering which he proposes to take up, whether mechanical, civil, electrical, or one or other of the sub-divs. of these main classes. In the third year mathematics include the problems which the engineer is likely to meet with in the course of his work. At the end of the third year he sits for his degree.

Engineering works take youths at the age of fourteen for training as skilled mechanics and as foremen. Those who show exceptional ability are often encouraged to attend evening classes so as to acquire a better knowledge of their profession with the view of obtaining positions on the technical staff of the works. In large works these boys are under the care of instructors, who put them to and aid them to complete set tasks. See W. Kearton (ed.), *The Engineering Educator*, 1928; C. V. Mann, *Engineering Education*, 1930; *The Teaching of Mechanics* (Mathematical Association), 1930; V. Wilmoth, *Civil Engineering as a Career*, 1946.

Engineering, Military. M. E. is the adaptation of engineering practice to military requirements. As was evident

in the First World War, a civilian engineer can readily take his place on the executive side of M. E., but on the administrative side military experience and training are required. A modern army must rely on civilian resources to a very great extent, not only for manpower and material, but also for technical experts, and among the latter the military engineer is of the highest importance. The First World War gave a great impetus to scientific development, notably in chemistry, metallurgy, and electricity, which three branches of scientific study have had a revolutionary effect on the military machine, e.g. in the making of poison gas, high explosives and synthetic oil; in the application of the internal combustion engine to aviation and tanks; and in wireless telegraphy, respectively. M. E. is directly concerned with all these developments, and in the decade before the outbreak of the Second World War the greatest problem for military engineers was 'mechanisation', i.e. the utilisation of mechanically produced power in order to increase mobility and to conserve physical energy. The task of M. E. is to assimilate the tremendous increase of engineering knowledge into the technique of war. The co-operation of the General Staff of a modern army with the military engineer is necessary to effect this process. But as the members of the General Staff of a modern army are not experts in M. E., though they are responsible for policy, the modern military engineer must be able to act in a consultative capacity as well as to carry out the current and ordinary engineering work of an army. In other words, his task is to interpret the policy of the General Staff in terms of the developments of science. Besides the military engineer, there is the engineering specialist, whose duties are restricted to the work of research and design in military maintenance. On the extent to which the distinction between the military engineer and the specialist in design and research is preserved in departmental organisation, efficiency in M. E. will largely depend. Every new device, and every application of a new weapon has its reaction on numerous other devices and weapons, e.g. if a more efficient anti-tank gun is produced, a faster or more highly armoured tank must replace previously existing tanks, and this, in turn, may call for progress in bridge design to carry a heavier tank. Thus, to attain all-round efficiency in an army, the fighting machines must be evolved as a co-ordinated whole; and it is in this sphere that the consultative advice of the military engineer assumes such importance. In the Brit. Army the training of military engineers is effected by the education and theoretical training of personnel of the Corps of Royal Engineers; which training comprises a course of theoretical training at Cambridge Univ., a course of applied practical training in military materiel at the School of Military Engineering; a period of practical apprenticeship with civilian mechanical and electrical manufacturers and consultants; and experience in combatant

duties by co-operation with other arms of the army through the R.E. field companies.

In the Second World War Brit. M. E. made a great contribution to victory on all the prin. fronts, e.g. in Italy, in 1943, if for no other reason that in no prior campaign an enemy carried out demolition on so vast a scale and in terrain so perfectly adapted to it. In the area about the line Foggia-Naples a region of mt., gorge and riv., the Gers. had blown almost every bridge and culvert, both on roads and railways, and there were entire sections of the railway along which their wrecker-train passed, uprooting and smashing every sleeper and cutting every rail. In these circumstances were used one of the great inventions of M. E., the *Bailey Bridge*, standardised and adaptable to almost any load, it was the product of the Royal Engineers' Experimental Bridging School, after one of whose profs. it was named. This bridge can take loads as heavy as the largest tank on a transporter and solved the problem of bridging behind the line. The Royal Engineers were also responsible for the duty of sweeping the approaches to assault-crossings with the aid of *mine detectors*. *Bulldozers* led the tanks into battle, carving a path for them under heavy fire. In Italy the Volturno and Garigliano opposed two major water-obstacles and the crossings of these rivers was carried out in successive phases--the infantry made the initial battle-crossing by assault boat, while their equipment followed by raft. The Engineers, meanwhile, worked to substitute bridges at the earliest possible moment and so to pass a continuous stream of traffic. The first bridges were light, floating affairs carried on *folding boats*. These were quickly supplemented by Bailey Bridges. These bridges also played a great part in the crossing of the Rhine on the Brit. section of that front in 1945. Another great M. E. achievement was the construction of a system of petrol pipe lines between the base ports and the front. The laying of these pipelines was the work of engineer personnel from the United States who quickly laid the pipe and installed the chain of boosting stations and constructed the storage tanks, thus latter operation involving very nice adjustment. Aerodrome work was another major task of M. E. Thus, in Italy, the Brit. Aerodrome Construction Company and the Amer. Aviation Engineers between them built some 30 airfields, mostly round Foggia. See further under ENGINEERS, CORPS OF ROYAL.

Engineers, Corps of Royal. Before the eighteenth century the technical elements of the Brit. Army, e.g. artillery and engineers, were provided by the Board of Ordnance, and both artillery and engineers officers formed part of the early 'Artillery Trains.' The system under which artillery units were raised for a campaign was found to be inadequate and uneconomical, and as a result artillery companies (now Royal Artillery) were estab. in 1716, and the ancestor of the R. E. in 1717, both

emerging from the Board of Ordnance. Before 1757 the officers of the R.E. did not have military titles, but in that year they were first granted commissions. It was not until 1788, however, that the military officers of the Engineer Dept. were constituted the 'Corps of Royal Engineers,' the men being still regimented in the Corps of Royal Military Artificers. When Napoleon invaded Egypt a detachment was sent to Constantinople to train the Turkish army, and other companies performed good service in Egypt, Malta, Italy, Sicily, and the West Indies. In 1813 the title of the Corps of Royal Sappers and Miners displaced that of Mil. Artificers and did effective work under Wellington during the Peninsular and Waterloo campaigns. The Crimean War was the scene of manifold activities by the engineers, and the officers and men were, immediately afterwards, united to form one corps under the title of 'Royal Engineers.' After the Indian Mutiny the Bengal, Madras, and Bombay Corps of Engineers were transferred to the R.E.

Being a scientific corps the R.E. has 'nursed' many important branches of military science, particularly the Royal Flying Corps (now the Royal Air Force), which was evolved from the Air Battalion of the R.E., and the Royal Corps of Signals which was evolved from the Signal Units of the R.E. The work of the Engineers in any theatre of war extends from fieldworks in forward areas to the construction, operation, and maintenance of ports on which the theatre is based, and right through the intervening organisations. They construct or adapt buildings necessary for barracks, hospitals, and stores. They make tracks and roads; provide water and light, and dispose of sewage; build roads, bridges, and fords and lay, repair, and run the railways. They run laundries, and mobile bath units. They make and clear airfields and landing grounds. They do the army's survey work and produce maps. They are concerned in all major camouflage; they are expert in chemical warfare and smoke; they operate their own heavy engineering workshops and electrical installations. They do ship and barge construction and repair; they undertake munelifting and bomb disposal, and conduct the army's postal service. They are responsible for movement control. Such operations are conducted in field units, and in L. of C. units which are not fully mobile.

The widespread services of this corps are aptly expressed in their mottoes, granted in 1832, 'Ubique' and 'Quo fas et gloria ducunt.' The King is Colonel-in-Chief of the Corps.

Engines. *see* AERO ENGINE, AIR ENGINE, BOILERS, GAS ENGINES, INTERNAL COMBUSTION ENGINE, STEAM ENGINES.

England and Wales. Topographically England and Wales may be viewed together or as separate units; administratively, for purpose of local and imperial gov., in matters of statistics, etc., they are one. Special geographical features peculiar to Wales will be found in that

article, and there are separate articles on the various cos. both of England and Wales. Of the group of is. which lie off the W. coast of Europe, and which form the United Kingdom of Great Britain and Ireland, England (including Wales), the most important portion in wealth, pop., size, and as possessing the centre of the imperial gov. and administration, lies between lat. 55° 46' N. at the mouth of the Tweed, and lat. 49° 57' 30' N. at the Lizard, and between long. 1° 46' E. at Lowestoft, and 5° 43' W. at Land's End. It is separated from Scotland N. by a line running from Berwick-on-Tweed to the head of Solway Firth; bounded on the E. by the N. Sea, S. by the Eng. Channel; the Strait of Dover, 21 m. at its narrowest point, divides it from the coast of France, which is 100 m. distant at the Lizard. At the S.W. corner the broad and deeply indented Bristol Channel parts the S.W. coast of England from Wales and opens on the Atlantic; on the W., St. George's Channel divides Wales from Ireland and leads to the Irish Sea and thence to the N. of St. Patrick's Channel between Ireland and Scotland. The coast-line, following broad indentations and including the is. of the Isle of Wight and Anglesey, is about 2350 m. The total area is 58,315 sq. m., of which England contains 50,939 and Wales 7376 sq. m.

England is divided into forty territorial cos., and Wales into twelve (see further *Population and Local Government*, below).

The Cheviot Hills, highest point the Cheviot (2676 ft.), form a considerable portion of the N. boundary; S.W. lie the Cumbrian mts. with Scafell Pike (3210 ft.), the highest of England's mts.; here, in Cumberland and Westmorland, is the Lake Dist.; E. and running as the central feature of N. England is the Pennine Range, which reaches almost to the Midlands, and E. and W. of which are to be found the prin. centres of industry, for in close proximity are the great coal fields, which on the E. side supply the iron and steel industries, originally getting all their raw material from the iron ores of this region; it is this close proximity of coal that on the discovery of steam power and of the use of coal for iron-smelting estab. this part of England as the centre of the world's industries in the early part of the nineteenth century. The high moorlands of the Pennine Range form an anticline, with a few beautiful health resorts, and much picturesque scenery especially round the Peak in Derbyshire. On the E. side are concentrated the wool industries, centred in Bradford, Leeds, and Huddersfield, estab. before the age of steam and then spreading to the W., now no longer drawing its supplies from the former sheep-farms of Yorkshire and the Continent but from the world. The great iron and steel works are at Middlesbrough, Stockton, centred on the Tees, shipbuilding on the Tyne, the cutlery and armour plates at Sheffield, from early times celebrated for its knives. To the N., the Northumberland coalfields reach the coast at Newcastle, with South Shields and Sunderland on the coast. To the W.

the inflow of cotton through Liverpool has changed Lancashire into a vast hive of cotton-spinning and cotton-weaving tns., centring on Manchester, and further S.W. the coalfields supply necessary power to the potteries of Stoke and the surrounding dists.

Away from the Pennines, but still in reach of the coal, lies Birmingham, the nucleus of the great metal-working industries of the Midlands, and Coventry, that of motor-cars and bicycles, while on the fringe lie such manufacturing centres as

the ravages of continual wars and the confusion of political revolutions.

Where the Pennine Range ends begins the great Midland plain, reaching from the fenland dists. of Lincoln, Huntingdon, and Cambridgeshire, now drained, and the rich agric. levels of Norfolk to the typical inland country stretching from Leicester and Nottingham to the valley of the Thames to the S. and to Warwickshire, Worcestershire, and Gloucestershire to the W., where the Bristol Channel fed by the Severn and the Avon, and the great

THE MOORLANDS OF THE NORTH: HADRIAN'S WALL

JOHN H. Stone

Leicester, Nottingham, working chiefly in leather and lace. The proximity of the sea, never, throughout England, more than 75 m. distant, and the navigable rvs. have played an important part in its development. The Tyne, the Tees, the Humber, with its great shipping port of Hull on the E., the Mersey, on the W., with Liverpool and its great artery the Manchester Ship Canal leading to the very centre of the cotton industry and linked by a network of canals, still bearing coal and heavy traffic to the potteries, Birmingham, and the Midlands, all these factors, combined with the rapid development of the railways prior to those of any other country, form an easy explanation of the unchallenged supremacy of England, commercially and industrially, when America was in its infancy and the Continent of Europe was still recovering from

industrial city and port of Bristol bring the natural water-way for traffic to its doors. This plain dist. is the centre of the agric. industry of England, both tillage and pasture, and the scenery is typical of pastoral England, the chief tns. being originally and in many cases still mkt.-tns., though the railway has made Crewe, for example, a great engineering centre, while Reading and Luton are manufacturing tns. in agric. dists.

London (q.v.) and the Thames stand by themselves, and dominate the home cos., as they are termed, which lie on both banks of the riv. One of the greatest of the world's ports, a manufacturing tn. of the most diverse industries, the centre of the money mkt. of the world, the business heart of the country, the seat of gov. of the empire, London spreads the dwelling-places of its workers wider and wider.

Along the Thames valley lies a line of residential tns. and dists., and the railways bring a daily tide of those who sleep in the country and work in the tn.

From the white chalk cliffs of Dover through Kent and Surrey in a curving line lie the N. Downs overlooking the gardens of Kent and the low Weald, now agric. and attracting residential building; to the W., below and within the Downs, are the healthy pine-woods and sandy heath of Surrey, falling into Hampshire and rising to the great plateau of Salisbury Plain. Running along the S. coast, from the flat marshes of the old world port of Rye, are the whalebacked bare S. Downs looking on a ring of sunny seaside resorts, with Brighton in the centre. Southampton, with its great docks and shipping trade, and Portsmouth, with its naval docks and arsenals, are made by the inlet of Southampton Water, guarded from the Channel by the Isle of Wight. Cornwall forms a rocky peninsula, connected geologically with the mt. system of Devon; here on the S. coast lie the sunniest and warmest part of the Brit. Isles. W., where Land's End meets the Atlantic, the scenery is bold and rugged and beautiful, and up the Cornish and Devon coast of the Bristol Channel is perhaps the most lovely dist. in England, where the wild uplands of Exmoor and Dartmoor stretch down in wooded combs to the sea.

On the Welsh side of the Bristol Channel lie the great steam coal-fields of S. Wales centring in the ports of Cardiff and Barry Dock, with Newport, Swansea, and Merthyr-Tydvil, seats of iron and copper smelting and tin-plate manufacturing. Wales, mountainous and rugged, finds her industrial life here; the centre is agric. and thinly populated; the N., though with great slate quarries, chiefly attracts countless visitors to her scenery of mt. (Snowdon, 3560 ft., is the highest point in England and Wales), lake, and sea (see *further under WALES*). On her land side Wales meets the great midland plain in the pastoral and agric. co. of Shropshire, with isolated hill country. The N.W. coast of England stretches from the Mersey estuary, leading to Liverpool and the industrial centres, along the sand-levels where lies Blackpool, the Brighton of the N., to Morecambe Bay, the great shipping and ironworks of Barrow-in-Furness and the coastal coalfields of Workington and Cocker-mouth.

SCENERY.—The Eng. countryside varies from well-wooded hills to cultivated plains. Mt. country is centred in the Lake Dist., Cumberland and Westmorland, and in Wales, while much of Yorkshire, Devon, and Cornwall is moorland with moss-covered rocks, bogs and streams. The bare downs of Sussex were once covered with forest, but are now treeless grasslands. The downs continue into Kent, which is called the Garden of England. Here are the fruit fields, the orchards and the hop-gardens, with near them the cone-shaped oast houses. The E. plain is flat country, much of which is fenland, drained by the Ouse, smaller rivers, and the Norfolk Broads. Much of the

Midlands is spoilt by the smoke and sulphur of the industrial area, but attempts are made to preserve walks from the builders. In the S. also, where Greater London spreads over a vast stretch of land, many parks and commons have been preserved.

One characteristic of Eng. scenery is the div. of the land into fields, and the most common barriers between them are hedges of clipped hazel and hawthorn trees. Gaps in the hedges are bridged by wooden stiles, while in some cos. the fields are divided by low stone walls. By the side of the hedge grow many wild flowers—primroses, violets, ground ivy, and wild roses. Other common wild flowers are the buttercup, daisy, scabious, pansy, poppy, snowdrop, daffodil, celandine, and dandelion, while in the woods are found bluebells and wood anemones. The most common trees are the oak, hawthorn, elm, ash, horse-chestnut, willow, birch, poplar, and beech. Different kinds of fir trees also flourish, but the only nut trees are the eating chestnut, walnut and hazel. Blackberries, strawberries, and mushrooms grow wild in fields and hedges, while the grass is everywhere green throughout the year, greenness being a feature of the Eng. countryside.

The Eng. coast is very varied, differing from sandy or shingle shores to granite or chalk cliffs. The many rivers are well stocked with fish, including salmon, roach, dace, and barbel. The Wye in the W. is one of the most beautiful rivers. New bridges are mostly plain and of concrete, but there are a number of interesting old ones, such as the fifteenth-century bridge over the Ouse at St. Ives, Huntingdonshire.

In the tns. old houses may still be found. Chester has some very beautiful timbered houses, and in London there are whole streets of that admirably urban eighteenth century architecture. The univ. tns. of Oxford and Cambridge have buildings of every century from the fourteenth. Durham Univ. is housed in the old castle. Several famous castles still stand, among them are the Tower of London with its keep, begun in 1078, Windsor Castle and Arundel Castle. Of historic ruins there are Bodiam Castle in Sussex, with a moat still full of water, and Tintagel in Cornwall, near where King Arthur is supposed to have held his court, and many others. Penshurst Castle, in Kent, is the manor house in which Sir Philip Sidney lived; its great hall, with grey time-worn oak-raftered roof and minstrel's gallery, is exceptionally well preserved. Humbler dwellings in the vills. are the cottages of lath and plaster with skillfully-thatched roofs. Melbourn, near Cambridge, is a typical old-world vil. Some timbered cottages still exist, one of which is Milton's Cottage at Chalfont St. Giles. Another famous cottage—of whitewashed brick—is John Wesley's in Swanage.

Parts of the forests—the New Forest, Sherwood and Ashdown Forest—still remain, and some, such as Epping, are state-preserved. At Waltham Cross, near Epping, is an Eleanor Cross, and many

other old stone crosses are scattered over England. Since the First World War nearly every vil. green has its war memorial, while the Cenotaph (q.v.), the Brit. war memorial to all those who fell in the two World Wars, is in Whitehall, London. There are many famous caves such as the Cheddar caves in Somerset, while probably the oldest monuments are the circles of stones at Avebury and Stonehenge, the latter dating from c. 1680 B.C.

There are few wild animals left in E., and some of them are hunted. The fox and otter and semi-wild ponies and deer are the largest that remain. There are many birds, both resident and visitant, but there again the larger ones, such as the buzzard and the peregrine falcon, have all but been killed off, although many cos. preserve certain birds by law.

GEOLOGY.—See GEOLOGY.

Climate.—The mean annual temp. ranges from 48° F. in the N. to over 52° F. in the Scilly Isles, off Land's End, but this variation moves diagonally, and the W. coast is warmer throughout its length than the E. The mean coldest temp. is about 40° F., the hottest, 61°. The prevailing winds are south-westerly and westerly, but from April the tendency is towards easterly winds. The rainfall is heaviest in the W., especially in the Lake Dist., Wales, Cornwall, and Devon, where it exceeds 40 in., and in the first two places as much as 60 in. On the E. coast, especially at the Wash and the Thames estuary, it falls to 25 in. Sunshine reaches about 1600 hrs. in the year on the S. coast and falls to less than 1300 in Yorkshire.

POPULATION.—By the census of April, 1931, the total pop. of England and Wales was 39,952,377, of which 19,133,010 were males, and 20,819,367 were females. This total comprised visitors and residents, Brit. nationals and aliens, civilians and non-civilians, and was the largest yet recorded, showing an increase of 2,065,678 over the returns by the previous census of June, 1921. The decennial increase per cent in 1881 was 14·4; 1891, 11·6; 1901, 12·2; 1911, 10·9; 1921, 4·97; and 1931, 5·4. The figures of National Registration of Sept. 1939, which did not include members of the Armed Forces, are given below in parentheses after the 1931 figures for cos. and tns. It should be noted that these totals include persons evacuated from the tns. in which they were normally resident. (The pop. in 1941 was estimated to be 41,460,000). In June 1931 the pop. of England was 37,358,000 (46,073,000 in 1939), and of Wales and Monmouthshire 2,594,000 (2,568,000 in 1939). The pops. of the cos. of England, census 1931 (including co. hors.) were: Bedfordshire, 220,000 (296,000 in 1939); Berkshire, 311,000 (390,000); Buckinghamshire, 272,000 (370,000); Cambridgeshire (including Isle of Ely), 218,000 (160,000); Cheshire, 1,088,000 (1,185,000); Cornwall, 318,000 (328,000); Cumberland, 263,000 (283,000); Derbyshire, 757,000 (779,000); Devonshire, 733,000 (781,000); Dorsetshire, 239,000 (283,000); Durham,

1,486,000 (1,378,000); Essex, 1,755,000 (1,745,000); Gloucestershire, 786,000 (874,000); Hampshire (administrative co. of Southampton), 1,103,000 (1,036,000) including Isle of Wight, 88,000 (93,000); Herefordshire, 112,000 (133,000); Hertfordshire, 401,000 (567,000); Huntingdonshire, 56,000 (65,000); Kent, 1,219,000 (1,444,000); Lancashire, 5,039,000 (4,829,000); Leicestershire, 542,000 (580,000); Lincolnshire, 625,000 (646,000); London, 4,397,000 (3,022,000); Middlesex, 1,639,000 (1,888,000); Monmouthshire, 435,000 (411,000); Norfolk, 505,000 (529,000); Northamptonshire, 361,000 (359,000); including Soke of Peterborough, 52,000 (53,000); Northumberland, 757,000 (730,000); Nottinghamshire, 713,000 (751,000); Oxfordshire, 210,000 (258,000); Rutlandshire, 17,000 (20,000); Shropshire, 244,000 (266,000); Somersetshire, 475,000 (556,000); Staffordshire, 1,431,000 (1,482,000); Suffolk, 401,000 (327,000); Surrey, 1,181,000 (1,118,000); Sussex, 770,000 (1,040,000); Warwickshire, 1,535,000 (1,644,000); Westmorland, 65,000 (75,000); Wiltshire, 303,000 (346,000); Worcestershire, 420,000 (477,000); Yorkshire, 4,389,000 (4,463,000); divided between E. Riding, 483,000 (471,000); N. Riding, 469,000 (487,000); W. Riding, 3,352,000 (3,408,000); York City, 85,000 (97,000).

The pops. of the cos. of Wales, including the co. hors. were: Anglesey, 49,000 (51,000); Brecknockshire, 58,000 (54,000); Cardiganshire, 55,000 (58,000); Carmarthenshire, 179,000 (174,000); Carnarvonshire, 121,000 (134,989); Denbighshire, 158,000 (171,000); Flintshire, 113,000 (135,000); Glamorganshire, 1,226,000 (1,173,000); Merionethshire, 43,000 (45,000); Montgomeryshire, 48,000 (49,000); Pembrokeshire, 87,000 (85,000); Radnorshire, 21,000 (20,000).

The pops. of tns. exceeding 100,000 in England and Wales: London (City and Administrative County), 4,397,000 (3,022,000); Birmingham, 1,002,000 (995,000); Liverpool, 856,000 (733,000); Manchester, 786,000 (621,000); Sheffield, 512,000 (502,000); Leeds, 483,000 (457,000); Bristol, 397,000 (424,500); Kingston-upon-Hull, 313,000 (263,200); Bradford, 298,000 (273,900); West Ham, 294,000 (201,000); Newcastle-upon-Tyne, 283,000 (218,000); Stoke-on-Trent, 277,000 (264,500); Nottingham, 269,000 (264,800); Portsmouth, 249,000 (199,800); Leicester, 239,000 (261,300); Croydon, 233,000 (197,400); Cardiff, 224,000 (227,600); Salford, 223,000 (166,300); Plymouth, 308,000 (202,200); Sunderland, 186,000 (165,900); Willeiden, 181,000 (142,000); Bolton, 127,000 (163,800); Southampton, 176,000 (160,000); Coventry, 178,000 (224,000); Swansea, 165,000 (162,000); Tottenham, 158,000 (113,000); Birkenhead, 148,000 (128,000); Brighton, 147,000 (172,000); East Ham, 142,000 (103,000);

Derby, 142,000 (128,000); Rhondda, 141,000 (119,000); Oldham, 140,000 (120,000); Middlesbrough, 138,000 (129,000); Wolverhampton, 133,000 (143,000); Walthamstow, 133,000 (103,000); Ilford, 131,000 (130,000); Leyton, 128,000 (92,000); Norwich, 126,000 (118,000); Stockport, 126,000 (134,000); Blackburn, 123,000 (109,000); Gateshead, 122,000 (101,000); Southend-on-Sea, 120,000 (127,000); Preston, 119,000 (111,000); Ealing, 118,000 (152,000); Bournemouth, 117,000 (144,000); Hendon, 116,000 (128,000); Huddersfield, 113,000 (125,000); South

in 1920 to 370,000 in 1940. Of this total, there were 65,840 under 5 ac., 166,300 over 5 and under 50 ac., 128,100 over 50 and under 300 ac., and 11,900 over 300 ac.

Cos. with over 30,000 ac. under cultivation for wheat are: Cambridgeshire and Isle of Ely, Essex, Gloucestershire, Hampshire, Hertfordshire, Huntingdonshire, Lincolnshire, Norfolk, Northamptonshire, Nottinghamshire, Oxfordshire, Suffolk, Wiltshire, and Yorkshire; with over 30,000 ac. for barley: Cambridgeshire, Essex, Lincolnshire, Norfolk, Suffolk, Yorkshire, while Cheshire, Cornwall, Cumberland, Devonshire, Durham,

(O. I. Croen copyright)

WALES: THE AVON COLLIERY, IN A TYPICAL INDUSTRIAL VALLEY

Shields, 113,000 (96,000); St. Helens, 107,000 (105,000); Walsall, 103,000 (104,000); Blackpool, 102,000 (157,000).

INDUSTRIES.—Agriculture: The acreage under crops and grasses, excluding rough grazings (4,155,000) for the year 1946 was 23,548,000. Corn crops, 6,837,000 acres; Green crops, 2,645,000; Hops, 21,000; Small fruit, 31,000; Orchards, 270,000; Bare fallow, 287,000; Cloves and rotation grasses, 3,707,000; Permanent pasture, 9,946,000. Sugar beet is chiefly grown in the E. cos.

In 1938 there were in England and Wales, 856,700 horses; 6,849,000 cattle; 13,899,000 sheep; 3,854,000 pigs; and 36,601,000 poultry.

The average number of persons employed each year, both permanent and casual labourers, during the years 1921-9 was 784,670, a decrease of nearly 10 per cent since 1921, and the number of holdings of over 1 ac. decreased from 420,000

Essex, Hampshire, Kent, Lancashire, Lincolnshire, Norfolk, Northumberland, Nottinghamshire, Shropshire, Staffordshire, Wiltshire, and Yorkshire are the largest oats-producing cos. Devonshire, Gloucestershire, Kent, and Worcestershire have extensive orchards, and Kent is famous for its hops and small-fruit growing. The total value of agric. produce in 1937-38 was £223,500,000 and of livestock and livestock products was £154,400,000. £35,300,000 for farm crops, and £33,800,000 for fruit, vegetables, and flowers.

Fisheries.—The E. coast, with its fleets of trawlers fishing in the N. Sea, is the most important; the great port of Grimsby is pre-eminent, but Yarmouth, especially for herrings, and Lowestoft are important. Brixham on the S. coast and the Cornish pilchard-fisheries should be mentioned, and Milford at the head of Milford Haven in Wales transmits large

quantities to inland tns. Oysters are important at Whitstable and the Essex coast. The total quantity of sea fish landed in 1937 was 851,825 (in 1946, 632,888) tons, and the value (excluding shell-fish) was £15,373,373 (in 1946, £28,636,292). The value of shell-fish was £534,297 in 1937. About 3600 sailing vessels and 9200 steam and motor vessels are engaged in the fishing industry. Close on 52,000 persons are employed.

Mining.—Far exceeding all other minerals together coal stands easily first; the largest fields are in Durham, Yorkshire (W. Riding), and Lancashire; Derbyshire, Staffordshire, and Northumberland are also important, while the Glamorganshire fields are unique in the world for their fine, hard steam coal. Anthracite coal is found in the W. half of the S. Wales coalfields. The total ann. production in England and Wales is over 190,000,000 tons, valued at about £180,000,000. The great iron-ore dist. is at Cleveland in Yorkshire (N. Riding), between ten and fourteen million tons being mined annually, and Barrow-in-Furness benefits by the very rich hematite of Cumberland and N. Lancashire. The only coalfield which combines considerable workings in iron-ore is N. Staffordshire. One of the largest known deposits of iron-ore in the world is at Corby, Northamptonshire, where exploitation commenced soon after the First World War. The metal content of the iron-ore mined amounts to 30 per cent, the value being £3,500,000, but the large metal works depend largely for their raw material on imports, especially from Spain, coming to Middlesbrough. Lead, tin, and copper, once extensively mined in Derbyshire for the first and Cornwall for the last two metals, have now ceased to be of importance. A fine china clay is mined in Cornwall: slate is quarried especially in the Lake Dist., but the great centre is Wales. Industrial workers in mines and quarries number about a million, of whom 900,000 are engaged in coal-mining, but these totals have declined by about 200,000 and 153,000 respectively in the past decade.

Textiles. The cotton industry, the greatest in the world, is practically confined to S. Lancashire, to which the raw material is brought through Liverpool, connected by the ship canal to Manchester. The moist atmosphere of the dist. has aided the combination of the most skilled workmen, the machinery for which the acutest inventors are constantly devising improvements, and the ever-ready coal supply for power which estab. Lancashire as the centre of the world's cotton industry in the early nineteenth century. Oldham and Bolton are the chief spinning tns., the latter being the fine-cotton spinning centre. Preston, Burnley, Blackburn, Bury, and Rochdale are weaving tns., while Rochdale is also a woollen tn., being important for flannel manuf. The woollen industry, however, centres in the W. Riding of Yorkshire round Leeds. Bradford is important for worsted manuf., and also has silk, velvet, and plush mills. Near Bradford, on the

Aire, is the model tn. of Saltaire, built by Titus Salt in 1853, with its alpaca works. Halifax, in the Calder valley, makes lighter worsteds and baizes, and has a large carpet-making industry. The Colne valley is a busy woollen dist., and Huddersfield is noted for fancy cloths. Heavier woollens are manufactured round Dewsbury and Batley, the former being the rag mkt. of the world, where old wool materials are reconditioned. Wakefield, Barnsley, Kelghley, Morley, Heckmondwike are all woollen tns. The industry has spread into Lancashire, at Rochdale, Aston, and Glossop, while Denton and Stockport specialise in felt hats and velours. The Yorkshire wool industry has almost eclipsed the long-estab. manuf. of 'West of England cloth,' but this is still made at Stroud (Gloucestershire) and Trowbridge and Bradford (Wiltshire). The silk industry is also of long standing, especially in parts of Derbyshire, Staffordshire, and Cheshire. The artificial-silk industry is mostly run in connection with cotton and wool, but is widely distributed. Jute fabrics and yarns are manufactured at Barnsley. Textiles constitute about 37 per cent of the value of native products exported from England, the value of cotton and wool yarns and manufs. exported being (1939) £68½ and £35½ millions respectively. By the Census of Production, 1921, cotton yarn was valued at £187,000,000, piece goods at £157,000,000, and miscellaneous cotton manufs. at £13,000,000, but after that date the industry which employs 500,000 people entered on a period of depression and to the decennial period 1931-40 the value of exports fell by £67 millions, the percentage of insured persons unemployed in 1938 being 29.8.

Iron and Steel.—The iron industry first centred in the Forest of Dean and in the Kentish Weald, where raw material and wood fuel were easily obtainable. When wood was replaced by coal, iron works were set up near the coalfields in the Midlands and S. Wales. With the insufficiency of domestic supplies of raw material, smelting in the Midlands was largely replaced by the manuf. of articles in iron and steel, and two tns.—Birmingham and Sheffield—have attained pre-eminence, the former being associated with all kinds of metal ware, the latter more especially with cutlery. With the discovery of the Cleveland deposits, Middlesbrough (N. Yorkshire) became one of the great iron-smelting dists., others being S. Durham, S. Wales, N. Lancashire, Northamptonshire, and Cumberland, the last depending largely on Sp. ores. Production of pig-iron is valued at £40,000,000 and of steel at £180,000,000. The average output of pig-iron per annum is between 6,000,000 and 7,000,000 (in 1938, 8½ million) tons, of steel 12,000,000 tons.

Allied to the iron industry is that of ship-building. When iron replaced wood as the material for ships, the industry shifted from the Thames to the Clyde, but in England the most active shipyards are on the N.E. coast, especially at Newcastle-on-Tyne, Sunderland on the Wear,

Stockton and Middlesbrough on the Tees, and Hartlepool. These yards account for some 500,000 tons of shipping a year, while smaller yards are in existence at Hull, Southampton, Barrow-in-Furness, and Liverpool.

Steam engines and rolling-stock are made at Manchester, Birmingham, and Newcastle, while the former L.M.S. Railway has works at Crewe, the G.W.R. at Swindon, the S.R. at Eastleigh near Southampton, and the L.N.E.R. at Doncaster and Darlington. The manuf. of agric. machinery is carried on in the corn dist., especially at Lincoln, Grantham, Norwich, and Ipswich.

Other Industries.—The presence of both clay and coal has made Staffordshire the centre of the pottery industry, and the pottery ins. of Burslem, Tunstall, Hanley, Fenton, Langton, and Stoke are now incorporated in the co. bor. of Stoke-on-Trent. The industry is very centralised, but Worcester and Derby have long been famous for porcelain, while Stourbridge makes fireclay. Glass is also made near the coalfields, at Birmingham, S. Lancashire, and Worcestershire. In connection with the salt deposits of Cheshire and S. Durham, alkali and chemical works operate in the valleys of the Weaver and Wenlock, Cheshire, also at St. Helens in Lancashire, and Flint in Wales. Paper-making requires abundance of water, and is carried on in the Thames estuary, especially at Gravesend. The manuf. of dyestuffs is also a Thames industry at Silvertown, and on the Mersey and Manchester Ship Canal. Chair-making is a local industry among the beech woods on the Chiltern Hills. Leather-work is widespread, more especially at Northampton for shoes, Leicester, Stafford, and Walsall. Lace-making by hand is an old industry, still pursued at Honiton, S. Devonshire.

COMMUNICATIONS.—*Railways*: There are 37,083 single-track miles of Eng. and Welsh railways and 20,205 route m. During the First World War, the railways were under gov. control, and were decontrolled in 1921. By the Railway Act of that year 120 railway companies were amalgamated into four systems: (1) the Southern Group, (2) the Western Group, (3) the North-Western, Midland, and West Scottish Group, and (4) the North-Eastern, Eastern, and East Scottish Group. The first group, organised as the Southern railway, had a length of line of 2156 m., and served the S. coast and S.W. of England from Waterloo, London, and also the S.E., combining the former London, Brighton and South Coast railway from Victoria and South Eastern and Chatham railway from Charing Cross, having important channel connections, linking England with the Continent. The Great Western railway, combined with the Cambrian railway and local S. Wales lines, constituted the second group, running from Paddington, London, to Plymouth and Penzance, and through Bristol and the Severn Tunnel to S. Wales and Fishguard; also N.W. through Birmingham to Birkenhead. Its length of line

was 3785 m. The third group was the largest, organised as the London, Midland and Scottish railway, having 6941 m. of line. It served the industrial Midlands and Scotland, and combined the former London, North-Western and Midland railways from Euston and St. Pancras, London, together with the provincial Lancashire and Yorkshire railway, N. Staffordshire railway, Caledonian railway, and others, comprising thirty-five companies in all. The fourth group covered the coal, iron, and ship-building areas of the E. part of England, and extended into Scotland. Organised as the London, North-Eastern railway, it had 6369 m. of line, and included the six trunk lines of the former Great Northern from King's Cross, London, the Great Eastern from Liverpool Street, and the Great Central from St. Marylebone with the North-Eastern from York and the North British from Edinburgh. By the Transport Act of 1947, the four Main Line Railways, together with various joint lines and small railways, passed into the ownership of the Brit. Transport Commission, under the title of 'British Railways.' The six following regions were then formed: (1) The London Midland Region (L.M.S.) with headquarters at Euston, (2) The Western Region (G.W.R.) with headquarters at Paddington, (3) The Southern Region (S.R.) with headquarters at Waterloo, (4) The Eastern Region (S. area of the L. and N.E.R.) with headquarters at Liverpool St., (5) The North Eastern Region (N.E. area of the L. and N.E.R.) with headquarters at York, and (6) The Scottish Region (corresponding to the Scottish systems of the L.M.S., and the L. and N.E.R.) with headquarters at Glasgow.

Canals.—Many of the chief ports of the country are situated on riv. or on riv. estuaries. Liverpool on the Mersey estuary; Bristol with its ports at Avonmouth and its harbour up the R. Avon; London, with its network of docks on each bank of the Thames; the Humber, with Hull; and the Tyne, with Newcastle, need only be mentioned. The Manchester Ship Canal was opened in 1894, and is 35½ m. in length, being an artificial arm of the sea, making Manchester the fourth port in the United Kingdom. The canal system, which was highly developed during the latter part of the eighteenth century, receded in importance on the coming of the railways, and has, comparatively speaking, been neglected, a neglect which has been enhanced by the fact that many canal lines were owned by railway companies. The Humber and the Mersey are connected by the Aire and Calder canal from Goole to Leeds, thence by the Leeds and Liverpool canal. Sheffield is connected with the Trent by the Sheffield and S. Yorkshire canal, thence to the potteries dist. by the Trent, Mersey, and Bridgewater canals. Birmingham and dist. is also served by a canal system leading to the Severn and Trent. The Grand Union canal draws traffic from London to the N.

and the Midlands. The total length of canals in E. and W. is 3641 m., but the total length of canals which are in use is much less (*see CANAL*). Improvements, such as the introduction of diesel-engined motor barges and rebuilding of locks and bridges after 1918 brought about a certain revival in long-distance traffic on the canals, but it is still true to-day, as in 1909, that the bulk of the canal traffic is local. Coal is still the main cargo and, in 1938, it supplied about half of the 13 million tons of canal traffic. The Grand Union Canal has a large trade in coal. Sugar beet is carried by canal in E. Anglia; the Weaver Navigation transports salt, and timber is the main item on the Lea and Stort Navigation. Most of the canals in England and Wales are under the control of the Brit. Transport Executive (*see also under CANAL*).

Roads.—England is suitable geographically for road-making, and good materials are abundant. With the 'Calamity of the Railways' the upkeep of the roads was neglected, but with the coming of the motor-car and the lorry, improvement of the highways became imperative and at the present time the cost of maintaining and rebuilding roads borders on £61,000,000 annually. This cost is borne by the co. councils, which by the Local Gov. Act, 1929, are the Highway Authorities for all co. roads, i.e. classified roads and rural roads, and by the bor. and urban councils, who are responsible for all roads within their areas other than co. roads. Large annual grants for road maintenance are made from the Road Fund, administered by the Minister of Transport. (*See also HIGHWAYS*.) Heavy transport by road rather than by rail has increased, and motor-coach routes connect up the main tns., while the motor-omnibus provides a local service in tn. and country. Progress in road construction has been made with the arterial roads such as the Great W. Road and the new Dover Road; their main features are width, comparative straightness, and a smooth surface, while their monotony is relieved by the planting of trees. There are now 153,000 m. of road in England and Wales, of which 27,000 are Class I, 17,000 Class II; 80 per cent unclassified.

HISTORY.—*See ENGLISH HISTORY*; **GREAT BRITAIN**.

LOCAL GOVERNMENT AND ADMINISTRATION.—For purposes of local gov. England and Wales are divided into administrative cos., of which there are sixty-two, following roughly the geographical and territorial cos., but London forms a co. by itself, and Yorkshire and some other cos. are split up into two or more administrative cos., while some smaller cos. are grouped. The cos. are divided into rural and urban dists. governed by dist. councils, and the pars. of the rural dists. have par. councils or par. meetings. Outside the co. authority except for certain purposes, are the bors., some being entirely independent. First are the co. bors. which have all the powers of a co. council and are independent. They are the old 'cities and counties,'

such as Bristol, Nottingham, etc., and tns. over 50,000 in pop. which have obtained the rank of a co. bor. from the Local Gov. Board. Non-co. bors. are of two classes, old quarter-sessions, bors. of 10,000 pop. and over, and of under 10,000 pop., with varying independence of co. rating, etc.

SOCIETY, RELIGION, ETC.—Social distinctions in England depend almost entirely on occupation, and there is no homogeneous 'upper' nor 'middle' class. The former landowning class has been largely dispossessed since the First World War, and big estates have been broken up. The only class with any cohesion is the wage-earning class, which, together with all other employed persons, including salaried and professional, numbers 90 per cent of the total occupied pop., numbered at 18,853,000 in England and Wales (census of Occupations, 1931). Of this total about 13,247,000 were men and 5,606,000 were women (over 14 years of age in both cases). Agric. workers numbered 1,172,000, mining workers, 993,000; factory workers, 5,787,000; transport workers, 1,635,000; professional 716,000; clerks and typists, 1,375,000; commerce, finance and insurance workers, 2,071,000; 'personal service' workers, 2,390,000; and sport and entertainment workers, 113,000.

Occupational organisation—including trades unions, professional associations, scientific bodies, etc.—are a marked feature of social structure. Club-life of a more recreative character is becoming increasingly popular, and there are in England and Wales nearly 12,000 Registered Clubs, political, social, athletic, etc., with an active membership of nearly four million.

The estab. religion in England and Wales is the Church of England, numbering 2,701,000 communicants. The Welsh Church was disestablished in 1920. Other large denominations are the Wesleyan Methodist and the Congregationalist, counting over 400,000 members each, while the actual Rom. Catholic pop., children and adults, is over two million. Of Jews there are about 300,000. *See also ENGLAND, CHURCH OF*; **ETC.**

English, Church of, a title which, as *Ecclesia Anglicana*, first appears in Magna Charta (1215), to denote the body of orthodox Christians in communion with the bishops of the country. The name becomes, however, a particular title of this body, as distinct from the Rom. Communion, during the Reformation period, when, acting under royal pressure through its Convocations, it freed itself from the papal yoke. The Eng. Church was probably founded towards the end of the second century B.C., but was almost entirely swept away by the Saxon invasion. At the end of the sixth century, a mission was sent from Rome by Pope St. Gregory the Great, which re-established the faith in Britain. This mission was headed by Augustine of Canterbury. The hist. of the medieval Eng. Church contains a continuous series of protests against papal extortions and encroachments, and in the reign of Henry VIII. political events brought this general dissatisfaction to a head. Convocation declared Henry to be supreme head of the C. of E. (1533), while at the same time the king declared that he claimed no spiritual power. The process of limiting the papal power terminated in 1534 when Convocation declared that the bishop of Rome had no more authority in England than any other foreign bishop. So far traditional doctrine had been preserved, but the Books of Common Prayer, successively authorised by Cranmer under Edward VI., introduced the Reformed teaching into the C. of E. Under Mary the realm was reconciled with Rome by Cardinal Reginald Pole, Cranmer's successor as archbishop of Canterbury. Elizabeth reversed this policy and the

severance became final in 1570, when Pius V. excommunicated the Queen, and forbade any of his adherents in England to remain in communion with the Eng. Church. In spite of the disorders of the time, the Eng. Church maintains that it succeeded in retaining the auct. ministry and the auct. faith. Rom Catholics deny both these things, saying that archbishop Parker of Canterbury was not validly consecrated, and that the C. of E. adopted the current Protestant doctrines. Against this, however, Anglicans quote certain great continental historians, such as Bossuet and Dollinger. The doctrine of the C. of E. is to be found in the three creeds and the Book of Common Prayer, including the Thirty-Nine Articles. In England and Wales there are forty-three dioceses, administered by seventy-six bishops assistant bishops and bishops suffragan. Thirty of these dioceses form the prov. of Canterbury and thirteen the prov. of York. See also CHURCH. See H. Wakeman, *Introduction to the History of the Church of England*, 1898; A. English Art. Medieval Art.—Medieval E. A. finds expression chiefly in Gothic architecture, and in sculpture as applied to eccles. buildings. The Fr. Gothic style spread throughout Europe through the monasteries, and it was natural that the variety of historical conditions and ideals, no less than of climate and materials in the different countries into which the style spread, should lead to the formation of a new national style in each, though all manifest a common origin. Just as the pointed arch, so often applied in Gothic art, appears for the first time in France, though derived by France through the Arabs from Persian art, so the ogival vault, a fundamental principle of Gothic art, appears for the first time in England, whence soever it originated. Durham Cathedral presents the oldest example of it. In developing a national style, Eng. Gothic reveals a definite kinship with the auct. Norman buildings, notably in the massive, fortress-like structure, flat-topped tower, and choir enclosed by a square roof. Early Eng. Gothic pillars are somewhat distinctive in that they consist of a central cylindrical pillar surrounded by other pillars detached from it from capital to base, and numerous blind pointed arches along the walls, designed to alleviate the mass of the edifice. The typical roof ceiling is in wood resting on corbels, while the turrets are crowned by battlements. In the decorative sphere, the changes introduced by E. A. were the im-

mense window in the choir, the ornamentation of the vaults with star ribs—as, *e.g.*, in York Minster, Lichfield, Exeter, and Hereford Cathedrals—and flamboyant decoration generally. During the fifteenth century Eng. Gothic art abandoned the flamboyant or fantastic for a simpler and more restrained style of decoration, as exemplified in the Tudor depressed arch; while the inner roof was generally of painted wood with stone-like stalactites pendent from the ribs. Early Eng. sculpture is noteworthy for the fancy which informs its realism. The exterior of the Eng. cathedrals show little of this humorous fancy, but in the interior remarkable portrait-statues are to be found between arches, below the windows of the apse, on the wall plinths, and, above all, on the tombs. Examples are to be seen in Westminster Abbey and in the cathedrals of Lincoln, Canterbury, Salisbury, and Worcester.

HANS HOLBEIN
A self-portrait

English Painting.—Few examples survive of Eng. medieval painting. It is known that in England, as elsewhere in Europe, painting flourished under the aegis of the Church. National characteristics did not begin to emerge until the seventh and eighth centuries, and found expression particularly in the illuminated manuscripts of the period. The schools of Winchester and Canterbury produced manuscripts which were esteemed throughout Christendom. The decoration of churches encouraged wall painting and panel painting. In the thirteenth century painting flourished under the patronage of Henry III., who made London a centre

of art. The mural paintings of the Palace of Westminster, now destroyed, were outstanding examples of Eng. painting of this period. In the fourteenth century E. A. declined as a result of the Wars of the Roses, and the decline was further hastened by the Reformation. Many early works of art were destroyed, and this iconoclasm continued into the seventeenth century. The reign of Henry VIII. virtually put an end to church painting, and it may be said that painting, particularly portrait painting, survived only through the influence and example of Hans Holbein. The best artists of the time were, like Holbein, visitors from the Continent. In Elizabeth's reign, however, Eng. painting gained a native excellence in the work of the miniaturists, notably Nicholas Hilliard (1537-1616), Isaac Oliver (1564-1617), and his son, Peter Oliver (1594-1646).

In the Stuart period Eng. painting again owed its renewed impetus to the influence of a foreigner, Sir Anthony Van Dyck, who settled in England in 1620 at the age of twenty-one, becoming court painter to Charles I. Among his successors were William Dobson (1610-46), the Cavalier painter, and Robert Walker (1600-59), who painted portraits of Oliver Cromwell and other Puritan leaders. During the Commonwealth and after the Restoration the influence of foreign artists working in England continued. First among them was the Dutchman, Sir Peter Lely and later Sir Godfrey Kneller who came to England from Germany in 1674. There are few Eng. painters of the period to put beside Lely, except John Riley (1646-91) and Robert Streater (1624-80), whose mural paintings were notable in an age of portraiture. In 1711 Kneller founded a school which was the precursor of the Royal Academy, founded more than fifty years later when, in 1760, Sir Joshua Reynolds became its first president. Kneller's facile production debased the tradition of Van Dyck, but the ascendancy of fashionable portrait-painting was challenged by the genius of Wm. Hogarth (1697-1764), who by the realism and sincerity of his descriptive scenes from contemporary life strongly influenced the development of indigenous art at a time when it had sunk to shallowness and artificiality. His axiom that the only school was that of nature needs no emphasis to-day. Yet, though it was scarcely recognised in his time, it was destined to become the very keynote of E. A., and the measure of the debt to his work is to be gauged accordingly.

Gainsborough (1727-88) is regarded as the 'father of modern Eng. painting.' A rival of his great contemporary, Reynolds, as a fashionable portrait painter, he excelled in landscape painting. Landscape which is the great glory of Eng. painting was estab. in England by the work of foreign artists, but Richard Wilson (1713-82) who studied for some years in Rome gained a reputation abroad which brought greater recognition to landscape painting in his own country although he himself was on the whole neglected. Whereas

Wilson painted nature in the grand manner, Gainsborough brought to his landscapes a more personal and romantic feeling. He had not only a deep and intimate knowledge and perception of natural subjects, but also a delicate touch as a painter and great power as a colourist. Reynolds was greatly influenced by It. painting, and his visit to Italy in 1749 was a landmark in his life. Gainsborough, who never left England, was influenced more by the Dutch painters and by Rubens. A successful follower of Gainsborough was George Morland (1763-1804),

whether the realism of Constable was more highly favoured than the idealism of Turner or the pseudo-classicism or romanticism of Lord Leighton (1830-1896). But certainly the nature painters have endowed Eng. painting with a more permanent impression than have the great portrait painters of the eighteenth century, whose classicism was not followed by their successors. Constable was the first painter to see that nature ignores conventions of beauty and propriety—a negative principle which lies at the root of all naturalistic art to-day. His stormy

CONSTABLE'S 'FLATFORD MILL'

best known as a landscape painter. He also painted sporting and animal pictures, a genre which with the outstanding example of George Stubbs (1724-1826) enjoyed a vogue in the eighteenth and nineteenth centuries with the work, besides Stubbs and Morland, of James Ward (1769-1859), John Herring (1795-1865), Sir Edwin Landseer (1802-73), Thomas Cooper (1803-1902), and George Mason (1818-72).

With Gainsborough, Constable (1776-1837) and Turner (1775-1851) stand at the beginning of modern art in England. The influence of Constable as a nature painter was profound, and made itself felt on the Continent, especially in France, where he may be said to have been the true inspiration of the Barbizon school led by Millet and Corot. All through the Victorian period of E. A. both academicism and classicism vied with nature in popular favour, and it would be difficult to say

skies and leaves glittering in sunlight reveal the innovator in light effects. Turner, who doubtless gained much from others, yet stands alone as the most significant figure in Eng. painting. He is aptly regarded as being in E. A. what Shakespeare is in Eng. literature. His exemplar was Claude Lorraine, but he surpassed the Fr. artist in atmosphere and in breadth of conception, however inferior he was in technique and the qualities of form. Turner's dreams of classic Italy and Greece are for many the only Italy and Greece of old; and the romantic schools of the Continent are the offspring of his art—markedly so in the work of Harpignies and Pointelin. Among nature painters Turner is unique, conveying through a novel and marvellous use of colour his individual vision of light; and in him E. A. has affinities with Rembrandt before him and with Monet after. Mention may also be made here of Richard

Parkes Bonington (1801-28), a painter of great promise whose style, learnt in France, was itself an influence on Fr. painting. Of the same period as Constable and Turner was John Crome, who founded the Norwich Society of Artists in 1803. The dominant characteristic of this school of painting was sincerity and freshness of outlook. If Eng. painting owes less to him in the new naturalistic and impressionist interpretation of familiar nature than to Constable and Turner, there are beauty and meaning in his work, and more of poetic quality in it than in his master, Hobbema, whose traditions he carried on, however unconsciously, in England. Associated with Crome are the younger Crome (1794-1842), John Cotman (1782-1842), James Stark (1794-1859), George Vincent (1796-1836), and John Ladbroke (1803-79). Of these, Cotman is especially noteworthy for his influence in the development of the art of water-colour painting in England, his work in this medium being supplemented by a group of contemporary Eng. artists, including John Robert Cozens (1752-87), Thomas Girtin (1775-1802), Copley Fielding (1787-1855)—in marine studies—Samuel Prout (1783-1852)—in architectural work—and David Cox (1793-1859), the group being known as 'the Eng. School' and attaining a world importance in the work of Turner. In the strange visions of the 'other world' of Blake (1757-1827), we have an original vein of imaginative art, and so inimitable as to make him the great pictorial mystic of the world. Though in form he is often grotesque the reverse of naturalistic, even to inaccuracy of outline as in his picture of the Resurrection, he is the first of Eng. poet painters. Of the same great period of E.A., striking an equally distinctive note, are Gillray (1757-1815), and Rowlandson (1766-1827), caricaturists of manners and customs, whose tradition was carried on by Cruikshank (1792-1878). In portrait painting Reynolds is the Eng. classic. He had a wide knowledge of It. painting, and from the work of Cressi and others he no doubt formulated his maxim that 'it is not the eye, but the mind which the painter of genius desires to address.' Hence he painted his sitters not in fashionable dresses, as being 'too particular and individual,' but in non-committal costume—thus his portrait of Mrs. Siddons is in some ways reminiscent of Michelangelo's 'Isaiah.' Besides Reynolds, the great names in E. A. are those of Romney (1734-1802), John Hoppner (1758-1810), and Sir Thomas Lawrence (1769-1830), whose brilliant work marks an epoch in E. A. and the close of the artificial tradition. Other names of this period important in E. A. are those of Sir David Wilkie (1785-1841) and William Etty (1787-1849), both popular genre painters. Mention must also be made of William Northcote (1746-1831) and John Opie (1761-1807), both of whom painted historical pictures in the grand manner which was the vogue in the early nineteenth century. Thomas Stothard (1755-1834) in the illustration of the novels of

Fielding, Richardson, Sterne and Smollett initiated a revolution in book illustration which was later to develop into one of the most striking art movements of the century.

Eng. painting during the second half of the nineteenth century was dominated by the Pre-Raphaelite Movement, named from the Pre-Raphaelite Brotherhood which was formed in 1848 by Rossetti (1828-82), Holman Hunt (1827-1910), and Millais (1829-1896). Other artists later joined the Brotherhood while from the start Ford Madox Brown (1821-93) was associated with it. (See PRE-RAPHAELITE BROTHERHOOD.) The aim of the movement was a revolt from the 'grand style' and a return to simplicity and accuracy of observation. At first ridiculed, the style of the Pre-Raphaelites produced a host of popular imitators, and later a 'second' movement started in which among painters the names of Sir Edward Burne-Jones (1833-98) and Walter Crane (1846-1915) may be mentioned. Millais later in life became a prominent figure in the academic art of the day. G. F. Watts (1817-1904), whose paintings expressed the moral fervour of his ideas, was also accounted one of the foremost painters of his day. He was also a notable portrait-painter. Alfred Stevens (1818-75), known in his lifetime more as a sculptor and designer, is now also recognised as a painter of importance. With Millais and his imitators painting was degenerating into a method of story-telling. In pronounced reaction to this came the work of James McNeill Whistler (1834-1903), an Amer.-born artist who brought to England the influence of the Fr. impressionists. His own work with its emphasis on form, colour, and tone affected the course of Eng. painting. Eng. Impressionism, deriving from Constable and Turner as much as from Fr. artists, found expression in the work of the members of the New Eng. Art Club, founded in 1886. Wilson Steer (1860-1942), Sir George Clausen (1852-1944) and Sir Charles Holmes (1868-1936) are three among the many notable names in this connection. They are celebrated particularly for their landscape work, while among portrait painters John Sargent (1856-1925), an Amer. who painted in England, and a romantic Impressionist, combined psychological penetration with considerable technical skill. Also under the heading of Impressionism may be classed the work of two other distinguished painters—Walter Sickert (1860-1942) and Augustus John. John is a great romantic artist who in his later work has been influenced by the Fr. Post-Impressionists, Seurat and Cézanne. The first Post-Impressionist exhibition in England was held in 1910. The classical ideal of the Post-Impressionists in depicting the relation of forms in a structural sense became part of the achievement of the major Eng. artists of the twentieth century of whom Duncan Grant is a foremost example. In particular, the new style was pressed into the service of those painters who wished to express their experience gained in the First World War.

C. R. W. Newinson, William Roberts, Henry Lamb, Stanley Spencer, Eric Kennington, and the brothers Paul and John Nash were not satisfied with representational art, whether romantic or naturalistic but were intent on using their considerable descriptive powers to portray their moral apprehension of life. Wyndham Lewis was one of the few Eng. artists to be directly affected by the Cubist movement into which Post-Impressionism on the Continent developed. Many of Paul Nash's formal, structural paintings also show Cubist influence. He was the moving spirit among a number of artists who in 1933 formed themselves into a group, named 'Unit One,' with the aim of making design as a 'structural pursuit' and imagination the keynote of Eng. painting. The years between the two World Wars produced a flourishing display of talent among Eng. artists, a development which the Second World War has enhanced rather than diminished. Apart from the artists mentioned above, there are numerous painters whose work has influenced the trend of modern Eng. art, and who deserve more detailed reference than can be given here. Among them are Charles Conder, Henry Tonks, Charles Shannon, Charles Ricketts, Glyn Philpott, Sir Frank Brangwyn, J. B. Yeats, Sir W. Nicholson, Sir W. Rothenstein, Sir William Orpen, Sir Alfred Munnings, Mark Gertler, James Gunn, Dame Laura Knight, and of a newer generation Graham Sutherland, Matthew Smith, John Piper, and Victor Pasmore.

English Architecture.—The change from the Gothic period to the Renaissance began in England in the opening years of the sixteenth century, the transition being gradual from Perpendicular Gothic, through Tudor and Jacobean Renaissance styles, to the developed work of Inigo Jones and Wren. Even famous buildings, however, show the old in conflict with the new; e.g. Henry VII.'s Chapel in Westminster Abbey is the first building in Renaissance style, but its vaulting is essentially Eng. Hampton Court, the earliest large building in the new style, owes its decorative detail to ft. workmen, but the fabric to Eng. Half-timbered houses were greatly favoured in Eng. architecture, and the great number of those surviving were built in Elizabeth's reign. The houses of the nobility, however, were less Eng. in tradition, being built in a chaos of styles to suit the whim of the owner, and many owe their ornamentation to Flemings and Gers., e.g. Longleat, Knole Hall, and Hatfield House—all of which are none the less fine and picturesque buildings. Renaissance architecture in England assumes definite shape with Inigo Jones, some of whose finest work is to be seen in the old Royal Palace of Whitehall, the Queen's House in Greenwich Hospital and St. Paul's Church, Covent Garden. Sir Christopher Wren carried on the work of Inigo Jones not only at Greenwich but also at Hampton Court, adapting the style introduced by Inigo Jones to Eng. taste and requirements. Wren was also responsible for a

large number of city churches, notably St. Stephen's, Walbrook; St. Bride's, Fleet Street; and Bow Church, Cheapside—which foreshadow his masterpiece, St. Paul's Cathedral. Other names in Eng. architecture are John Vanbrugh (or Vanburgh) (1664-1726), the architect of Blenheim Palace and Castle Howard; William Kent (1684-1748), famous for the Horse Guards, Whitehall; James Gibbs (1682-1754), architect of St. Martin-in-the-Fields and St. Mary-le-Strand; George Dance (1698-1768), the builder of the Mansion House; and George Dance the younger, who built the old

Newgate Prison. The old classic style of architecture was disappearing in George III.'s reign when Somerset House was built by Sir William Chambers (1726-96). At the beginning of the nineteenth century urban architecture was given a new impetus at the hands of John Nash (1752-1835), who developed the Regency style. He is remembered particularly for the original design of Regent's Street, London (1813) and for the surrounding buildings of Regent's Park (1821). The Gothic Revival which followed is associated with the name of Augustus Pugin (1812-52), who designed a number of churches in medieval style and was the author of the *True Principles of Gothic Architecture* (1841). Notable London buildings of the period in Gothic style are the Houses of Parliament by Sir Charles Barry (1795-

1860), St Pancras Railway Station by Sir George Gilbert Scott (1810-77), the Law Courts by G. E. Street (1824-81), and the Natural Hist. Museum by Alfred Waterhouse (1830-1905). The Classical style of architecture was not, however, eclipsed. The so-called 'Battle of the Styles' resulted in the use of Gothic style mainly for eccles. buildings and Classical style mainly for public and municipal buildings. The distinction was not, however, rigid, and the major architects of the day did not of course restrict themselves to one style or the other. The London Royal Exchange built in 1842 by Sir W. Tite (1798-1873), The Treasury Buildings in Whitehall built in 1846 by Sir Charles Barry, and Euston Railway Station (1847) by Philip Hardwicke (1792-1870) may be mentioned as prominent buildings in Classical style. Other distinguished architects of the nineteenth century were Decimus Burton (1800-81), C. R. Cockerell (1788-1863), W. Butterfield (1814-1900), G. P. Bodley (1827-1907), Philip Webb (1831-1915), J. L. Pearson (1817-97), the designer of Truro Cathedral, J. F. Bentley (1839-1902), the designer of the Rom. Catholic Cathedral of Westminster in Byzantine style, and Sir Arthur Blomfield (1829-99). Outstanding buildings of the twentieth century are Liverpool Cathedral begun in 1903 from the design by Sir Giles Gilbert Scott and the County Hall, Westminster, designed by Ralph Knott (1878-1929). Liverpool Cathedral, a bold, finely conceived work, is interpretative of Gothic style without, however, being an imitation in the manner of the preceding century. Although not erected in England, one of the finest architectural works of the present day may be mentioned here as being the work of Eng. architects—the Viceroy's House and Gov. buildings at New Delhi designed by Sir Edwin Lutyens and the Secretariat building also at New Delhi designed by Sir Herbert Baker. Lutyens (1869-1941) dominated Eng. architecture in the present century. He was also responsible for many country houses which added greatly to the prestige of Eng. domestic architecture. For dwelling-houses the Tudor and Georgian styles have been revived, while Classic and Renaissance style continues to be employed for public buildings. Steel frame construction has resulted in many buildings most characteristic of the twentieth century. Examples are the Port of London Authority Building designed by Sir E. Cooper and completed in 1922; Imperial Chemical House, London, by Sir F. Baines; Bush House, Aldwych, London, by Helmut, Corbett, and Harrison, the Cunard Building, Liverpool, by Willink and Thicknesse; and the Gillette Factory, Isleworth, by Sir Banister Fletcher. With the growth of large provincial towns, civic architecture is perhaps the most distinctive sphere of modern architecture. Cardiff, Swansea, and other towns now have civic centres which must find a place in any account of present-day architecture. In addition to the architects already mentioned, Sir

John Burnet, Sir Aston Webb, R. Atkinson, W. J. Tapper, Ernest Newton, A. R. Powys, Beresford Pite, Lionel Pearson, K. Maufe, H. P. Adams are among the many architects who have contributed notable buildings to the architectural record of the century. The destruction caused by air attack during the Second World War has given an opportunity for replanning and rebuilding, and in this connection mention must be made of Sir Patrick Abercrombie.

English Sculpture after the Renaissance.—The conventional Gothic style in England under the influence of such artists as Torrigiano developed lightness and naturalness, as instanced by the tomb of Henry VII. in Westminster Abbey. The Chapel of St. John the Evangelist to Sir Francis Vane, also in the Abbey, shows strongly the Continental influence. This work has been attributed to Nicholas Stone (1586-1647), the first really notable Eng. sculptor. The monument to Sir George Holles in Westminster Abbey is, however, authentic, as is also the statue of Donne in St. Paul's Cathedral. These monuments show that Stone's treatment, if somewhat heavy, was essentially classic. Caius Gabriel Cibber, father of Colley Cibber, and a pupil of Stone, was the sculptor of the fountains and temples of Chatsworth, the famous home of the Devonshire family. Of the Renaissance period too, was Grinling Gibbons (1648-1720), one of the great names in Eng. sculpture, though perhaps better known for his inimitable wood carving. His figure work is exemplified in St. Paul's Cathedral and other London churches, while the statue of James II. in St. James's Park is one of his best bronzes. Francis Bird (1667-1731) followed the ornate decorative style of Cibber, as in his statue of Queen Anne in St. Paul's Churchyard; but by the beginning of the nineteenth century this style had yielded to pseudo-Gk. purity and achieved little else but cold formalism. No sculptor of distinction emerges in this period, though John Flaxman (1755-1826), the sculptor of the Mansfield monument in Westminster Abbey, Sir Francis Chantrey (1781-1842), and Joseph Nollekens, who executed many good busts, were all well-known. Another great figure in Eng. sculpture is Alfred Stevens (1818-75), some of whose work is not inferior to that of Brunelleschi. His outstanding achievement is the Duke of Wellington's monument in St. Paul's Cathedral, but his decorative work in Dorchester House (now razed) was also brilliant, especially the magnificent fireplace in the dining-room, with its stooping figures of two females in support.

Eng. sculpture of the twentieth century has been influenced by the two great Fr. sculptors, Rodin and Maillol. Their influence is seen particularly in the two most distinguished of Eng. sculptors, Jacob Epstein and Frank Dobson. Both these sculptors excel in portraiture, but Epstein, who ranks as one of the greatest of Eng. sculptors, is also known for his large allegorical stone figures. A school

of modern sculpture devoted to the handling of abstract form has as its leading exponent Henry Moore, and with him may be associated Barbara Hepworth, John Skeaping, particularly in his early work, and Richard Bedford. Modern architecture gives less opportunity for the sculptor than in former times. All the more outstanding therefore are the figures by Epstein and Eric Gill adorning the London Transport Offices in Westminster and Broadcasting House, London, respectively. Eric Kennington is also noted for

British Railways

'NIGHT' BY JACOB EPSTEIN

his architectural sculpture. Marguerite Milward will be remembered for her portraiture, particularly a series of heads representing racial types, while mention should also be made of W. G. Simmonds, G. Bayes, G. Ledward, Alan Durrst, Maurice Lambert, Sargent Jagger, the sculptor of the Artillery Monument, Hyde Park Corner, London, Sir Alfred Gilbert, Charles Wheeler, and Sir W. Reid Dick.

English History. The hist. of England begins with the landing of the Jutes on the is. of Thanet, and the settlement of that tribe in the S.E. corner of the is. That the Eng. were unknown to the Britons and were simply called in to beat back the attacks of the N. tribes on the weakened and effeminate tribes of the S., is a theory that cannot well at the present time be held. The official Rom. position of the Count of the Saxon shore points definitely to the fact that the Romans had suffered from the depredations of these tribes, on the outlook continually for land to plunder. Now in 449 they came not to plunder but to settle. From their N. Ger. homes they swooped down upon a Britain which they knew to be defenceless, and determined to make it their home. The Eng. were composed of three tribes, the Angles, the Saxons, and the Jutes; and so thoroughly was the settlement made in Britain, that one at least of these tribes (the Angles) disappears entirely from Germany. Generally speaking, we may say that the Eng. conquest occupied roughly 150 years, was ruthless in its severity, and was to a large extent a conquest of extermination. The Britons were driven gradually to the mts. of the W., and the Eng., assuming the position of conquerors, called them the foreigners, a name preserved at the present time in the name Welsh. The chief settlements were: the Angles in Northumbria (Bernicia and Deira) and the E. dists. of England, N. of the Thames; the Saxons, S. of the Thames and extending for some time, at least, up the valley of

the Severn; the Jutes only in Kent, with a small settlement in the Isle of Wight. The theory that the conquest was due to the inability of the Britons to hold their own against the fresh vigour of the Eng. is true only when judged in the light that the Eng. did ultimately conquer the country, but to hold as a corollary of this that the Britons were weak, effeminate, and easily overpowered is not correct. The conquest occupied 150 years; we have records of many battles slowly contested, and we have evidence that the Britons in the W. were able to hold the Saxons at bay for some considerable time. We have little evidence of the intermingling of the races, although certainly a greater intermingling took place than has been commonly recognised. At the end of the sixth century we can divide Britain into the following large divisions: Northumbria, Mercia, E. Anglia, Kent, and Wessex, with the Brit. kingdoms of Strathclyde, N. Wales, and W. Wales. Obviously, a constant struggle went on between Northumbria and Strathclyde, Mercia and N. Wales, and Wessex and W. Wales. Of the actual hist. of the Eng. conquest we know little. The *Anglo-Saxon Chronicle*, upon which we depend for so much of our information, was not commenced until the end of the ninth century. The heathen Eng. tribes, before the end of the sixth century, left little evidence of their work in Britain, and it is only after the conversion to Christianity, carried out in the S. principally by Augustine (597), and in the N. by the Celtic Church, whose apostle, St. Aidan, did so much, that England's hist. assumes clearer outlines. England was not easily converted, and the kings of Kent and Northumbria were for a long time opposed by the heathen king of Mercia. Wessex drops out of the struggle for some time, being occupied by internal quarrels. It is impossible to follow here in any detail the constant struggles of Mercia, Northumbria, and later Wessex for supremacy. The heathen king, Penda, made the heaviness of his hand felt in the N., only to be finally overthrown at Winwæd (651). For a time the king of Northumbria became the *bretwalda*, that is, the overlord of Britain, a title purely nominal and carrying with it little, if any, authority. In 661 was held the Synod of Whitby, which finally settled that the Eng. Church should follow the rule of Rome and not of Iona. Almost immediately afterwards Theodore of Tarsus became Archbishop of Canterbury, and by his judicious organisation of the church as a national church, he did much to pave the way for an ultimate amalgamation of the Eng. tribes into an Eng. nation. In the meantime, the power of Northumbria had waned, the battle of Nechtansmere had led to the annihilation of the Northumbrian armies, and Mercia under her kings, Ethelbald and Offa, sprang into the foremost position. Under Offa England then took some part in the councils of Europe. The Emperor, Charles the Great, recognised Offa as the king of England, and there began to be fairly constant intercourse between Eng-

land and the Continent. Offa is also said to have built the Great Dyke which protected Mercia from the attacks of the Welsh. With the death of Offa, however, came the overthrow of Mercia, and Wessex assumed the hegemony. Egbert of Wessex may be regarded practically as the first real overlord of England. In turn he conquered or forced to submission all the great kingdoms, and by 825 we may say that he had at least laid the foundations of a united England.

The century which followed was of vast importance to England, since, during the latter half of this century, we get the beginning of the invasions of the Danes, who had already appeared on these shores before the death of Egbert. They had been known even before then; they had probably been a source of danger to the Romans, but now they came in greater numbers, content at first to plunder and retire, but later coming over definitely with a desire to settle in the country. They conquered Northumbria and E. Anglia before they actually attacked Wessex. The early life of Alfred the Great (*q.v.*) was taken up in fighting against this enemy, and this was his first task as king. But Alfred realised that it was impossible to drive them out entirely, and after the treaty of Wedmore (878) he divided England up into Wessex and the Danelaw, and gave that portion of England, N. and W. of Watling Street, to the Danes, on condition of their adopting Christianity. But he also adopted the only real means of preventing fresh incursions by the Danes. He built a fleet which guarded the Channel and the E. coast, and which succeeded in defeating the Danes before they were able to land. By these means Alfred succeeded in keeping peace in the land during the greater part of his reign, and he was thus able to carry out a great number of necessary reforms. But before the end of his reign the attacks of the Danes had again commenced and were continued during the reign of Edward the Elder, who succeeded in establishing his supremacy over the Danelaw, and who, in 921, was recognised as the overlord of the whole of England, and was acknowledged by the Scots and the Welsh. The outstanding name in the period which followed is that of St. Dunstan, who influenced the policy during the succeeding reign. Himself an Englishman, he recognised that it was essential for the two races, Eng. and Dane, to work together, and although he was held by the Eng. to favour the Danes too much, nevertheless, his work was well done and a recognition of the only practical policy. In 978 succeeded Ethelred the Redeless (Unready), and during his reign the Dan. troubles began again. Time after time the country was invaded, but Ethelred, by means of large levies of Danegeld (*q.v.*), bought off the invaders for a time, but they returned only too ready to gain more money so easily, and finally in 1002 Ethelred caused the massacre of the Danes which called down on him the vengeance of Sweyn, and which led to the rule, from 1016 to 1042, of the Dan. kings.

Ethelred fled into exile in Normandy, an exile which had a great effect upon the ultimate hist. of England.

Canute, the first and the best of the Dan. kings, ruled wisely and well. His great scheme was the foundation of a N. empire which should have England as its centre; and although he did not succeed in establishing a permanent empire, he ruled England sternly but well and as a national king. His two sons, Harold and Harthacnut, are notorious, principally for their evil lives, and in 1042, on the death of Harthacnut, the old Saxon dynasty was restored in the person of Edward the Confessor, the son of Ethelred the Redeless. St. Edward the Confessor (*q.v.*) was more fitted to be priest than king, and during his reign the power lay in the hands of Godwin, earl of Wessex, and later of his son Harold. Edward was largely Norman by training, and the Normans were influential at his court. Finally, Wm., duke of Normandy, declared that Edward had promised him the crown, and forced Harold—a chance visitor—to swear an oath to help him to obtain it. Harold did so, but on the death of Edward he was elected king by the witan, and took up arms in the defence of the kingdom. His brother, Tostig, deprived of his earldom of Northumbria, invaded England and fought, together with Harold of Norway, against Harold of England, at Stamford Bridge. The latter was victorious, and turned with his men S. to confront the Normans who had landed in the S. In Oct. 1066 was fought the battle of Hastings, and on Dec. 25 of the same year Wm. was crowned king of England, elected by the witan in Westminster Abbey.

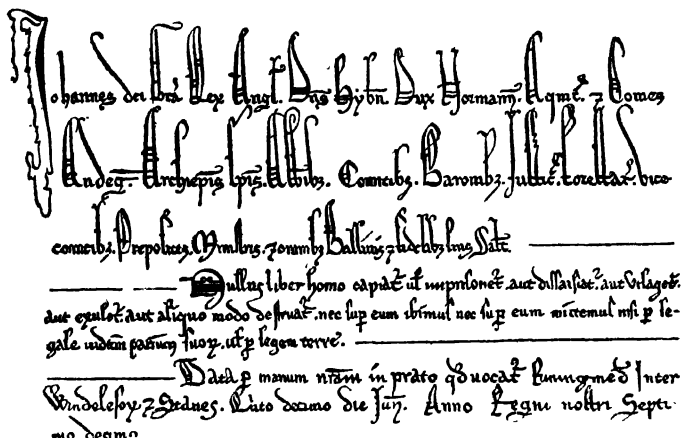

The Norman Conquest was the beginning of the final process in the welding of the Eng. nation into one compact body. The end was still a long way off. Wm. brought in his train numerous Normans, all of whom had to be rewarded by the king with Saxon lands. The Saxons, therefore, sank to the bottom of the social scale, and for long there was no attempt made at the fusion of the races. Wm. was occupied for long with the completion of the conquest of England, and when this had been done he turned his attention to the gov. of the country. He was not only a great warrior, but also a great king. He realised the difficulties of a sovereign with a completeness that was only possible in a man who was both king and feudal vassal. He saw also the limitations of feudalism on the Continent, and he determined to remedy, as far as possible, these defects. There were to be no more great earls who could on occasion adopt regal style. The estates of his followers were scattered throughout the length and breadth of the land. Further, by the Oath of Salisbury, all tenants had to swear allegiance directly to the king, and finally the Domesday survey (*q.v.*) afforded him an unprecedented body of information, which made his grip on the country firmer and more easily maintained. He ruled with a hand of iron, but the heaviness of his hand was

felt by Norman noble and Saxon serf alike. The fusion of Norman and Saxon would have come at a much earlier period but for the possession of Normandy by the Eng. kings. This naturally retarded the process. When Wm. died a dispute arose concerning the succession, but Normandy had been left to Robert (the eldest son), and England to Wm. Rufus. Constant quarrelling took place, and finally Robert handed over Normandy to Wm. as a pledge for a sufficient sum of money to go on crusade, and a promise that whichever of the two died first the survivor should succeed to both dominions (England and Normandy). Unfortunately, during Robert's absence, Wm. died, and the throne was seized by Henry I. (1100). In 1101 Robert returned from crusading and invaded England, but was repulsed, and in 1106 Henry crossed over to Normandy and defeated and took prisoner Robert at the battle of Tinchebrai. During the rest of his life Robert remained the forced guest of his brother. Henry I. was the first of the Norman kings to encourage the fusion of the races, he himself married a Saxon wife, and in this way did much to ensure the popularity of his house. He ruled sternly but wisely, and the wisdom of his policy was seen in the help which he received from his Saxon subjects in putting down the revolt of the barons of the W. In 1120 his only son Wm. was drowned in the wreck of the *White Ship*, and the greater part of the rest of Henry's life was taken up in the attempt to get his daughter Maud recognised as the heir to the throne. Previous to his death in 1135, he coerced the barons into promises to recognise Maud, but they disliked the idea of being ruled by a woman, and further dreaded the power which such recognition would give to the husband of Maud, Geoffrey of Anjou. Finally, when Henry died the barons elected as king Stephen of Blois, whose only claims to the throne were that he was the grandson of Wm. I., and that he was a brave but complaisant and easily pleased warrior.

With the accession of Stephen, in 1135, Civil war broke out and continued practically during the whole of his reign. The barons were able to exercise their power unchecked and the people, crushed between the forces of the king and of Queen Maud, also found themselves oppressed even more terribly by the barons. But these events taught England definitely that the power of a strong if tyrannous king was less to be dreaded than the power of an unchecked baronage. Finally, in 1153, the treaty of Wallingford was signed by Stephen and Henry, son of Maud. By the terms of this treaty, Stephen was to reign until his death, when he was to be succeeded by Henry. Henry II. was one of the greatest kings of England. He ruled not only England, but Normandy, Maine, Anjou, Touraine, and Aquitaine. He was acknowledged overlord of Scotland, Ireland, and Wales; he practically ruled Brittany—in fact his dominions may be regarded as stretching from the Pyrenees to the Orkneys. He destroyed the power of the baronage, and

by judicious reforms he obtained the support of the people, but he failed when he attacked the church. The point at which he had been aiming, the subordination of eccles. law to the crown, failed when it had almost succeeded, by the murder of Becket in 1170. During his reign, Strongbow (Richard de Clare, earl of Pembroke, d. 1178) crossed over into Ireland and began the conquest of that country. The latter part of Henry II.'s

succeeded by John. That the succession question was still in a state of chaos is obvious from an examination of the successions during the Norman and early Angevin dynasties. In only one instance had the heir by right of primogeniture succeeded. John now succeeded to the throne which would according to modern practice have been occupied by his nephew Arthur. His succession was regarded as in no way extraordinary, and

EXTRACTS FROM THE GREAT CHARTER

A translation of the Latin

John by the Grace of God, King of England, Lord of Ireland, Duke of Normandy and Aquitaine, and Earl of Anjou :

To the Archbishops, Bishops, Abbots, Earls, Barons, Justiciaries of the Forests, Sheriffs, Governors, Officers, and to all Bailiffs and other his faithful Subjects, Greeting.

No Freeman shall be taken, or imprisoned or disseiss'd, or out-law'd or banish'd or any ways destroyed, nor will we pass upon him, or commit him to prison, unless by the legal judgment of his Peers, or by the law of the Land.

Given under our hand, in the Presence of the Witnesses above-named, and many others, in the Meadow, called Runnymede, between Windesore and Stanes the 15th Day of June, in the 17th year of our Reign.

reign was darkened by quarrels with his son. His eldest son had died virtually fighting against him; Richard was a source of constant trouble, whilst John, the darling of his old age, was untrustworthy and Judas like. The last days of the king were passed in one long struggle with his arch enemy, Philip Augustus of France, and his sons, and in 1189, after being compelled to give in, he died.

He was succeeded by his son Richard, who, however, spent the greater part of his time out of England, either on crusade or in France, during which time his brother John plotted against him, attempting, finally, to keep Richard in captivity in Austria. Even when John's treachery was obvious to the king, it was forgiven. Richard died in 1199 and was

generally accepted. The disappearance of Arthur, and the generally expressed belief that he had been murdered roused hostility to the king; nor did his manner of ruling, nor yet his open immorality, tend to make him more popular. He had energy which he did not use and ability and intelligence which he misapplied. The early years of his reign were occupied in a struggle for the Fr. possessions. For a long time it had been the unhidden ambition of Philip Augustus to win back those portions of France which were still held by the Eng. He had struggled against Henry II. and Richard I., but his opportunity came when John, unpopular throughout the whole of his dominions, succeeded. In 1204 the Château-Gallard was lost, and Normandy passed

into the hands of the Fr. John by no means gave up hope, and struggled constantly against the Fr., forming league after league. He, however, soon found himself in difficulties at home. In 1205 the barons refused to fight for the recovery of Normandy; in the following year, in spite of the violent opposition of John, Stephen Langton was appointed archbishop of Canterbury. John refused to recognise him, and in 1208 England was laid under an interdict and later the king excommunicated. During this period John had alienated the sympathies of the barons and of the people. Gradually he saw himself beset on every side; France threatened the barons negotiated, the church thundered. He turned for support to the strongest power, and became the vassal of the pope. England was to be held in fee from the papacy. This was the final blow to the barons. Led by the church, they banded themselves together under Stephen Langton, and resolved to force the king to issue a charter which would safeguard their liberties. After a struggle John found that he must surrender, and at Runnymede, on June 15, 1215, he signed the Great Charter (Magna Carta), intending to keep it as little as he had kept most other oaths. The Great Charter was the work of the barons, supported by the church, and was thoroughly reactionary. But the signing of it reconciled a number of the barons, and John thereafter had more support. He attempted to punish the N. barons who had been chiefly responsible for the Charter, and they in turn invited the Dauphin Louis to England as king. War was still raging in 1216 when John died, leaving the throne to his son, Henry III., aged nine. During the early part of the reign the chief difficulty was the Civil war. Through this dangerous period Henry was guided by Wm. Marshall, earl of Pembroke. The charters were confirmed, the baronage reconciled, and Louis finally left the country (1217). From 1217-32 the land was ruled well by Wm. Marshall, and on his death by Hubert de Burgh. The Charter was constantly reissued and confirmed, and De Burgh's policy was largely that of England for the Eng. In 1232, however, began the personal rule of Henry III., a period which is noted for the domination of foreign favourites. Henry was a pious weakling, who had but little mind of his own, but who could on occasion be extremely obstinate. He was continually exacting money, and many expedients were attempted by the baronage to obtain control of the purse. The most outstanding personage of the reign was Simon de Montfort, who came to England as a favourite of the king and remained to uphold the rights and privileges of the baron. In 1248 he was appointed governor of Gascony, and shortly afterwards was deprived of this post owing to complaints by the Gascons of his severity. He remained out of England until 1253, when he returned to place himself at the head of the baronage. In 1258 the king agreed to the Provisions of Oxford, and these provisions were finally submitted to the

arbitration of St. Louis of France, who held that the king was not bound to obey them. In the same year (1264) civil war broke out between the barons, led by Simon de Montfort, and the Royalists, whose prin. leader was Prince Edward. The Royalists were defeated at the battle of Lewes, and the king and prince became prisoners. The Mise of Lewes followed, and in 1265 was held the famous parliament of Simon de Montfort, to which the Commons were summoned. Later in the year Prince Edward escaped, defeated the barons' army, now much weakened by desertion, and slew Simon de Montfort. The death of Simon, however, did not interfere with his policy, since this was carried out by Prince Edward, who, although an opponent, yet learnt much from his enemy. The remainder of the reign passed quietly, the chief power up to 1270 being in the hands of Prince Edward, who in that year departed to the E. on crusade. In 1272 Henry III. died, and although it was two years before Edward returned to this country, there was no dispute over the succession.

Edward I. was one of the greatest of our kings, and as a law-maker and organiser ranks with Henry II. and William I. (see under EDWARD I.). Part of his policy was to construct a united England and Scotland, and the Scottish war which raged practically from 1291 to 1307 was a result of this policy. He died in 1307, with the Scots in open rebellion, and just after Robert Bruce had been crowned king. Meanwhile Wales had been finally subjugated. Edward II. succeeded his father, but his rule was influenced throughout by his favourites, Gaveston and the Despensers. During his reign the lords ordainers took practically all the power from him, but again there was a reaction in his favour, and for a time he ruled with his favourites and with the support of the people. In 1314 he gathered the largest army which had ever been sent into Scotland, and attempted to relieve Stirling, then besieged by Bruce. He fought the battle of Bannockburn and met with the greatest defeat ever inflicted upon the Eng. by the Scots. In 1327 the conspiracy of the queen and her lover, Mortimer, caused him to be deposed, and in the following year he was cruelly murdered in Berkeley Castle. He was succeeded by his son Edward III., one of England's warrior kings. At the beginning of the reign the independence of Scotland was recognised, and the reins of gov. passed for a short time into the hands of the queen-mother and Mortimer. In 1330, however, Edward III. asserted his position and became sole ruler. The early part of his reign was taken up with a Scottish war, and then finally, in 1337, Edward claimed the throne of France in right of his mother. The claim was obviously but a pretence, since Edward had previously recognised the King of France and done homage to him for Guienne. It was necessary, however, to conquer France if Scotland was to be conquered, or if the woollen trade with

Flanders was to be kept. He attacked France from two points, through Guionno and from the N. In 1346 he won the battle of Crécy, and in the following year besieged and captured Calais. In 1346 Neville's Cross had been won, and the Scottish king taken prisoner. The Fr. war ceased in 1349 owing to the outbreak of the Black Death, a plague which helped very largely in the social revolution which followed. The condition of the serfs and peasantry of England was helped very largely by the devastation caused by that plague. In 1356 the Black Prince won the battle of Poitiers. This was the last great victory of Edward's reign. The rest of his life was spent in dissoluteness and under the influence of Alice Perrers, his mistress. During his reign, however, great strides were made in the constitutional gov. of the country, and the power of Parliament increased rapidly. This was due to the fact that Edward, in order to wage war, was in constant need of supplies, and was prepared to grant great privileges in order to obtain them. He died in 1377, preceded by his son the Black Prince. He was succeeded by his grandson, Richard II. Richard had ability which, however, was not always employed in the right direction. He was fearless, and to a certain extent popular, but the period of his personal rule was tyrannical, and Henry Bolingbroke, returning from exile in 1399, was easily able to depose him. He was imprisoned and finally murdered in Pontefract Castle. With him ended the Plantagenet line of kings. During his reign died Wycliffe, the great reformer, and just at the end of the reign Chaucer, the first of the great Eng. poets, also died.

Bolingbroke, who succeeded as Henry IV., was the eldest son of John of Gaunt, the third son of Edward III. He claimed the throne, not by conquest, but by parli. election, and was the founder of the House of Lancaster. He ruled wisely and prudently, and though it is true that he was never personally popular, he at least kept the country at peace. In 1403 Henry Percy, earl of Northumberland, nicknamed 'Hotspur', rebelled against him, and was supported by Owen Glyndwr, both of whom were overthrown by Henry IV. at the battle of Shrewsbury. Henry also persecuted the Lollards, a name given to those who adopted the new religious teaching of Wycliffe. After a long and painful illness he died in the year 1413. He was succeeded by his son, Henry V., concerning whom so many stories are told of the wildness of his youth. He, however, proved himself a strong and capable king, but did not live long enough to enjoy the fruits of his triumphs. He also persecuted the Lollards, and renewed the war with France. In 1415 he achieved a notable victory at Agincourt. France was at this time divided into factions, and taking advantage of this fact, by judicious alliances Henry succeeded, in 1420, in forcing the Fr. king to sign the Treaty of Troyes, which gave Henry the Fr. king's daughter's hand in marriage, the regency of the country, and the ultimate success-

sion to the throne of France. In 1422, just after the birth of his heir, he died. He was succeeded on the thrones of both France and England by his young son, Henry VI., for whom the regents, his uncles the dukes of Bedford and Gloucester administered the country. During the early part of the reign the Eng. still continued to win victories, but finally the Fr. settled their differences and after the appearance of Joan of Arc went from victory to victory, finally, in 1454, driving the Eng. out of everywhere save Calais. At home the war expenses and the constant stream of returning soldiers made social conditions bad, and this found expression in the revolt of Cade in 1450. Meanwhile, the king had suffered lapses from sanity, and the supporters of the house of York began to claim the throne, alleging, and correctly, that their candidate, Richard, duke of York, was the more direct descendant of Edward III. The argument was answerable in only one way, and that was that the Lancastrians were on the throne by right of election by Parliament. In 1455 war broke out, and lasted up to 1471. The Yorkists were at first successful at St. Albans, and the king fell a prisoner into their hands. In 1460 York was defeated and slain at Wakefield by Margaret of Anjou, but the earl of March, coming up from the W., entered London, was proclaimed king as Edward IV., and marching up N. defeated Margaret at Towton (1461).

For some time the country remained more or less at peace. Richard Neville, earl of Warwick and Salisbury, called the king-maker dictated the policy of the country. But the king flouted the great earl on two occasions and drove him into the camp of the Lancastrians. Warwick landed from France and forced Edward into exile, proclaiming Henry VI. again. Edward, however, returned unexpectedly from exile, defeated and slew Warwick at Barnet (1471), crushed the last hope of the Lancastrians at Tewkesbury three weeks later, and again established himself firmly as king. He had great statesmanship and cunning, but was a man of vicious life whose excesses finally killed him. He ruled as a despot, and may be regarded as the first of the new monarchy. The old institutions had broken down, the church was undermined by wealth and laxity in high places, the nobility weakened and impotent, the commons desirous only of a king who would keep peace and allow them to trade. The country was on the verge of a new awakening, and Edward was sagacious enough to read the time aright. He kept peace; when he did go to war he withdrew for a sufficient sum of money, and he was a patron of the new learning and of the art of printing—typically a prince of the Renaissance. He caused great jealousy by the promotion of some of his wife's relations; he died in 1483. His son, Edward V., succeeded him, only to be murdered in the Tower of London, after a two months' reign, by his uncle, Richard of Gloucester, who on the death

of the prince and his brother caused himself to be proclaimed as Richard III. He was a brave man who certainly had good ideas and ability to carry them out, but he was unpopular, and gradually the story of the murder of the princes increased this unpopularity. A conspiracy was made against him by Henry Tudor, earl of Richmond, who came over from France, met Richard at Bosworth Field (1485), and there defeated and slew him, owing principally to the wholesale desertions of Richard by the nobles. Henry was crowned on the battlefield.

Henry VII. was descended on his father's side from the Tudors, on his mother's (illegitimately) from John of Gaunt, and was therefore hailed by the Lancastrians as the representative of their line. He claimed the throne by descent and by election, and finally put an end to the rival claims by marrying Elizabeth of York, the daughter of Edward IV., thus uniting the two lines. He crushed the remaining power of the baronage, he overthrew what little power remained to the clergy, he ruled despotically, but he restored commerce and raised England again to the rank of a European power. He was miserly, but to him the possession of money meant the possession of power. The attempts of Lambert Simnel and Perkin Warbeck were defeated, and Henry's position was strengthened by the marriage of his son to Catherine of Aragon, and his daughter to James IV. of Scotland, both marriages of vital importance to England. He died in 1509, leaving Henry VIII. with a secure hold on the throne and affection of the people.

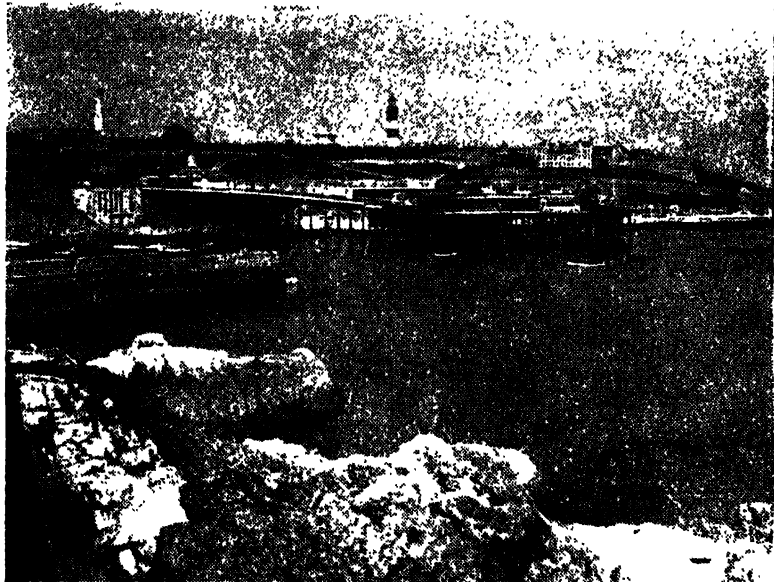

The reign of Henry is notable chiefly for the separation of the Eng. Church from Rome. At the beginning of his reign there was some slight trouble with France and Scotland, the Scottish war being ended in 1513 by the battle of Flodden. Wolsey, Henry's chief minister during the early part of his reign, remained firm to the policy of preserving the Balance of Power (*q.v.*), the Emperor Charles V. and the Fr. constantly bidding one against the other for the friendship of England. Henry's attitude towards the doctrines of the church may be judged from the fact that he pub. a book against the teachings of Luther, and received from the pope the title 'Defender of the Faith.' By 1526, however, he had grown tired of his wife, Catherine of Aragon, and posed as having religious scruples as to the validity of the marriage. He demanded, through Wolsey, a decree of nullity from the pope, Clement VII. This was refused and the fact that the troops of Charles V. (Catherine's nephew) had just captured Rome, and the pope was in their hands is believed by some historians to have determined this papal decision. Finally, the pope appointed two legates, Wolsey and Campeggio, to try the case, but Campeggio received orders that it was to be adjourned to Rome. In the meantime, Henry, who desired to marry Anne Boleyn to legitimise the child which was coming, accused Wolsey of putting unnecessary obstacles in the way. When

the trial was adjourned to Rome he disgraced Wolsey, and taking the advice of Cranmer and Thomas Cromwell, he broke away from Rome and forced the Eng. Church to obey him as its supreme head. There was no change in doctrine save in a few minor points. The Six Acts forced the doctrines of the Church of Rome even on recalcitrants who hoped to introduce the reformed doctrines current on the Continent into the Eng. Church; nevertheless Henry was now head of the church and not the pope. In order to have full control over the churches and to glut the greed of Henry and his supporters, the monasteries were dissolved. In 1536 the smaller ones went; in 1539 the larger monasteries suffered also. These changes provoked sev. abortive rebellions which were put down with great cruelty. Their lands enriched the king and the nobility. During the later years of the reign a tendency towards Protestantism became more apparent in the country. The influence of the Ger. Reformation was being felt more and more, but it is necessary to separate distinctly the so-called Eng. Reformation and the Ger. Reformation. In his old age Henry became merely a brutal tyrant; he died in 1547, having married six times. He had been given authority to settle the succession for himself. By his will he had left the throne to Edward VI., to be followed, if he died without children, by Mary, daughter of Catherine of Aragon; she in turn to be followed by Elizabeth, daughter of Anne Boleyn. Edward VI. was only nine years of age when he succeeded; the country was ruled for him by the protectors, the dukes of Somerset and Northumberland. During this reign Protestantism first gained a secure footing in the country. The churches were stripped of images, the Catholic service was stopped, and the first Eng. Prayer Book was issued. In many parts of the country this attempt to oust the Catholic religion was deeply resented, but in spite of this Protestantism spread. In 1553 Edward VI. died. He left a will which set aside that of his father, and gave the throne to the Lady Jane Grey. This plot was due to the influence of Northumberland, who knew that his power was at an end the moment that Mary succeeded to the throne. Mary, however, found no difficulty in obtaining recognition, and Northumberland, Dudley, his son, and the Lady Jane Grey were committed to the Tower, and later beheaded.

Mary had always been a fervent Catholic; she now restored the Catholic religion, and for a time England reverted to the papacy. She married Philip II., King of Spain, and this, together with the religious persecutions which took place, did much to make her unpopular. Further, the alliance with Spain involved a war with France, and during that war England lost her last Fr. possession, Calais. Amongst the 'heretics' burned during this reign were Latimer, Ridley, and Cranmer. Mary died in 1558; she was disliked by her subjects, but she was sincere in her convictions, though she was

somewhat of a fanatic. She was succeeded by her half-sister, Elizabeth, who found little difficulty in obtaining the throne and was from her accession regarded by the majority of her subjects with affection. One of the most complex figures in Eng. history, she lived in a period when one false step would have meant ruin, or at least great national danger. She was beset on every side by enemies, and was regarded even by some of her own subjects as a usurper, and yet she managed to steer the ship of state

prisoner until her execution in 1587. The following year came the great Armada, the blow Elizabeth has long expected, but which had been delayed while both sides tried what diplomacy could do. Eng. seamanship and the elements combined to wreck the hopes of Spain, first launched at Plymouth, and the shattered Armada returned home defeated. This was the crowning victory of Elizabeth's reign; no longer need she dread the power of Spain; England was at last one of the great powers.

PLYMOUTH HOE

John H. Stone

safely for forty-five years. That she was helped by circumstances there is no doubt, that her ministers were clever men cannot be denied, but much must be allowed to her own personality and genius. She tried to provide the Church of England with a 'via media,' a compromise of doctrine which should reconcile Catholic and Calvinist. The upshot was sporadic persecution of the extreme and violent among the Puritan sectaries, and a series of Penal Laws against Recusants, Jesuits and Seminary Priests. Her great danger, politically, lay in Scotland and Spain. France could, for the time being, be disregarded, since internal affairs kept her busy and desirous of peace. Scotland was disturbed by the religious quarrels, and, finally, Mary Queen of Scots, Elizabeth's greatest rival, was driven a fugitive into England, where she remained a

The most significant feature of Elizabeth's reign is that series of events which may best be described as the Eng. Renaissance. The sea rovers plundered the Sp. Main, discovered new lands, and made a name for themselves throughout the world. In every dept. of national life there were fresh developments. She died in 1603 after a reign which will always be remembered as one of the greatest in the hist. of the Eng. nation. (See ELIZABETH.) She was succeeded by James VI. of Scotland and I. of England. Thus the united Great Britain of Edward I. was accomplished through the marriage schemes of Henry VII. The early events of the reign were the attempts to reconcile Puritanism and Anglicanism, which failed, and the Gunpowder Plot of 1605. During this reign we find all the essential causes of the civil war which broke out during

the next reign: the mistaken foreign policy, the unpopularity of the king, the unjust taxation, and the desire to rule despotically, this time by divine right. The Stuarts tried to carry on the old policy of the Tudors, and to be despotic monarchs. The essential difference between these two dynasties was that whereas the Tudors were personally popular, the Stuarts were not, whereas the Tudors ruled despotically only because the people supported them, the Stuarts failed because they claimed a divine right to rule in spite of the people. It must be remembered that from this period onward towards the end of the century, Puritanism played a great part, and Puritanism meant not only a desire for liberty of worship, but also political liberty as well. It was in the struggle against Puritanism that divine right and passive obedience were overthrown.

During the reign of James, the Thirty Years' war broke out in Europe, and the king tried to act for a time as the arbiter of Europe. His schemes failed, and he died in 1625 with the reputation of being the wisest fool in Christendom. Charles I. succeeded. His reign may best be described as one long series of blunders. Parliament attacked his favourites, refused him supplies, and, finally, in 1628, forced the Petition of Right upon him. From 1629 to 1640 he ruled without a parliament. During this period occurred the famous ship-money cases, and continual breaches of the law. Finally, it was on the rock of the Church in Scotland that Charles foundered. His attempts to imitate his father and force Episcopacy on the Scots roused anger in Scotland, the introduction of the Prayer Book of Laud led to open rebellion, and the first Bishops' war broke out (see SCOTLAND). The Short Parliament (1640) was summoned and dissolved within three weeks. Then followed the Long Parliament, which undid the work of the eleven years' tyranny, but which at the same time did much that was unconstitutional. Strafford was executed; Laud met with the same fate later. Ship-money was declared illegal, the Star Chamber abolished, and finally the king was forced to consent to the reading of the Grand Remonstrance. He then made his fatal mistake: he attempted to arrest five members, and failing, left London. He went N. and tried to enter Hull, but was refused admission, and finally, on Aug. 22, 1642, he raised his standard at Nottingham. At first the Royalists were successful, but this was due chiefly to the fact that the they were more accustomed to arms than the Roundheads; but finally came the formation of the New Model Army, and the defeats at Marston Moor and Naseby. The king surrendered to the Scots, and was finally handed over to the Eng., by whom, after prolonged negotiations and the outbreak of the second Civil War, he was executed (Jan. 1649).

It is to be admitted, however, that modern historians take a rather less one-sided view of the contest between king and parliament than that which has pre-

vailed for nearly 300 years. For it will be seen from the Maseroes Papers and other reliable contemporary evidence that the king had in effect given way on all or most of the demands of parliament before the outbreak of the Civil war. Furthermore, Charles himself was really fighting the people's fight against the bigotry of the Puritans and this fact is recognised in the celebration of the day (Jan. 30) of his martyrdom.

For the next eleven years England was a commonwealth—for the first four years a republic, for the remaining seven a protectorate. The execution of the king roused horror throughout Europe; Scotland and Ireland rose in revolt, and Charles II. was crowned in Scotland, but the Scots were routed at Dunbar and Worcester, and the Irish at Wexford and Drogheda. For a short time England, Scotland, and Ireland were united. In 1653 Oliver Cromwell became Protector, and although he ruled as tyrannously as Charles I., he was an efficient tyrant, whereas Charles was not. Further, his foreign policy was spirited and popular, and placed England high in the councils of Europe. In 1658 Cromwell died, and there was chaos for a time in England. Richard Cromwell was inefficient, and finally Monk, marching from Scotland with the army, declared in favour of a free parliament which restored Charles II.

The Restoration was hailed with enthusiasm by the vast majority of the nation. The sombreness of the Puritan era had disgusted them, and was also partly responsible for the excesses of Charles II.'s reign. The Cavalier Parliament went much further than the promises of Charles in the Declaration of Breda would have led one to expect. The reign of Charles is marked by a reaction from the dreary morality of puritanism; to all intents and purposes Charles was the headman of Louis XIV. He aimed always at toleration for the Catholic religion in the interests of national unity, but the influence of the Protestant landowners and city merchants was too strong for him. It was a period of national disaster and shame; the guns of the Dutch were heard on the Thames from the City of London. In 1665 the Great Plague broke out and in the following year the Great Fire destroyed London. The Popish Plot, fabricated by Titus Oates, led to the introduction of the Exclusion Bill, and the Petitioners and Abhorers formed the nucleus of the Whigs and Tories of the following century. The country was inflamed by religious quarrels, and through it all Charles worked quietly for permanent toleration. Towards the end of his reign, when everything seemed blackest, he appealed to his people, and the latter years of his reign were years of triumph. He died in 1685, witty and cynical to the end. James, duke of York, who succeeded him, inherited far more of the attributes of his father, Charles I. His obstinacy led him into difficulties which his brother would have avoided, and his open avowal of the Catholic faith, whilst it did not at first

alienate his subjects, prepared the way for the Revolution. James openly attempted to restore freedom for the Catholic faith. Catholics were introduced into the army and the univ., the penal laws against them were dispensed with, and the king finally issued a Declaration of Indulgence (1687). Seven bishops petitioned against this, but they were imprisoned and tried for seditious libel. They were acquitted amidst the applause of the people, even the army which James had gathered at Hounslow cheering the acquittal. At the same time an heir was born to James, and this made speedy action necessary. Hitherto the next heir to the throne had been Mary, his daughter, a Protestant, and the wife of Wm. of Orange. Now it was certain that the heir would be educated in the Catholic faith. Messengers were despatched to Wm. of Orange. Wm. landed at Brixham; before the end of the year he was in London, and by that time James had fled, had been recaptured, and permitted to escape again. Wm. and Mary signed the Declaration of Right and were declared joint sovereigns, whilst Catholics or any who should marry a Catholic were barred from succession to the Eng. throne. The actual Revolution had been bloodless, though it was really the culmination of the six years Civil war which had ended in the execution of Charles I. and revolts in Scotland and Ireland. Rebellions broke out in Scotland and Ireland, but were speedily crushed. In 1692 the Massacre of Glencoe took place, and Ireland, after the treaty of Limerick, gave no more trouble until the end of the century. That the Irish had right on their side when they spoke of betrayal there can be no doubt.

England in the meantime engaged with Holland in the war of the Protestant Succession against Louis XIV., and although Wm. was not a successful general, the Treaty of Ryswick in 1697 made Louis acknowledge for the first time that he had not been altogether successful. Both sides, however, now prepared for the greater struggle which they saw must come. The question of the Sp. Succession must soon be settled, and both Wm. and Louis were interested in that settlement (see SPAIN—History). The Partition Treaties were drawn up and agreed to, but finally Louis accepted the will of the Sp. king which left Spain to the Fr. king's grandson, and England and France again prepared for war. But even now the Eng. were not prepared to go to war on the point of the Sp. Succession only when Louis made the second of his great blunders. James II. died, and he acknowledged the Old Pretender as James III. England immediately clamoured for war, and during the preparations Wm. III. died (1702). He had already been preceded by Mary, who died 1691, and since they had no children was succeeded by Anne, the second daughter of James II.

The war of the Sp. Succession broke out at the beginning of the reign. It was fought in order to preserve the Balance of Power in Europe and prevent France from

dominating the whole of the Continent. John Churchill, duke of Marlborough, the Eng. commander, won the victories of Blenheim (1701), Ramillies (1706), Malplaquet (1705), Oudenarde (1709). Gibraltar was captured by the allies and Louis was forced to acknowledge defeat, but the allies pressed terms too heavily upon him and he made another desperate effort to free himself, succeeding certainly in mitigating the terms imposed on him. Meanwhile at home the Tories had become powerful and were desirous of peace, and so in 1713 was signed the treaty of Utrecht, which gave England the beginning of her colonial empire.

In 1707 the Act of Union between England and Scotland had been passed and had come into force (see SCOTLAND—History), and towards the end of the reign the question of succession had to be settled. The last child of Anne had died in 1700, and the Act of Settlement had vested the crown in the nearest Protestant heirs of Sophia, electress of Hanover, and her descendants. But the Tory ministers, St. John and Harley, plotted the restoration of the Stuarts, and it was well known that the queen favoured the restoration of her half-brother, but the sudden death of the queen and the swift measures adopted by the Whigs prevented any serious steps from being taken, and in 1714, on the death of Anne, George I. was proclaimed without resistance. The Act of Union of 1707 had made England and Scotland one under the name of Great Britain, and from the accession of George I. the hist. of both countries is treated under the heading GREAT BRITAIN. See also BRITAIN, ANCIENT.

English Horn, see COR ANGLAIS.

English Language, member of the W. Germanic branch of the Teutonic or Germanic div. of the great Aryan or Indo-European family of languages, to which family belong also the classical and romance tongues. The Germanic group divides into three smaller groups: the E. Germanic, of which the Gothic is the only literary representative; the N. Germanic, to which belong the Swedish, Norse, and Icelandic; the W. Germanic, to which belong High Ger., Old Saxon, Frisian, and all the dialects of O.E. There were originally no great differences of vocabulary and syntax between these groups.

The original inhabs. of England were Celts, but after the conquest of the land by the Romans, the process of Latinising them probably went on in England just as in France or Spain. After the departure of the Romans, the Picts and Scots so harassed the helpless Britons that they are traditionally credited with having called in the aid of heathen tribes from the other side of the N. Sea (see also under ENGLAND). Bede tells us that they were 'de tribus Germaniæ populis fortioribus,' and he gives us to understand the Anglians settled to the N. of the Humber, the Saxons around the Thames, and the Jutes in the Isle of Wight and the land opposite to it. The accuracy of this statement has been much questioned on account of certain difficulties it presents, but it is now recognised as generally correct, and it will be seen later that the test of language supports it.

On the analogy of the Ger. language, the development of Eng. is divided into three periods. *Old English* (O.E.) from the beginnings, usually placed at the year A.D. 700, until 1200. A subdivision is made about 900, all before that being called Early O.E., all after, Late O.E. *Middle English* dates from 1200 to 1500, and *New or Modern English* from 1500 to the present day. O.E. is also known as

A.-S., but it is important to notice that its writers themselves claimed to be writing 'Englisc,' and that since the hist. of the language is perfectly continuous there is little reason to give its early phases an entirely different name from the later ones. There is, of course, no clear div. between O.E. and Middle Eng., or between Middle Eng. and New Eng. The transition is gradual, and the characteristics of the later form may be found in works earlier than the date of div. Yet, though the development is perfectly continuous, it has been so great that the 'Englisc' of Alfred would be perfectly unintelligible to a man of the present day.

1. *Old English* is divided into four dialects: (1) *Northumbrian* and (2) *Mercian*, which are grouped together under the name *Anglian*; (3) *West Saxon*, and (4) *Kentish*. Northumbrian was spoken roughly from the Humber to the Lowlands of Scotland; Mercian from the Humber southward to Essex and the Thames. W. Saxon from Kent westward. The two Anglian dialects were very similar, and the remains of them which have survived are not sufficient to allow us to differentiate between them. The most valuable remains of the Kentish dialect are some charters made for the disposal of property, and since charters are things which no one would copy, it is certain that we possess them in the original form, showing the exact dialect of the dist. where the charter was made. The first dialect to rise into literary prominence was the Northumbrian, and during the Early O.E. period the Northumbrian schools were some of the most learned in Christendom. From them came the learned Alcuin (A.D. 735), confidant and adviser of Charlemagne. There is no reason to doubt that much work was produced in the vernacular both in poetry and in prose. But all, with the exception of a few fragments, such as a riddle, Bede's death-song, some glosses, and the beginning of Caedmon's Hymn, preserved in Bede's *Ecclesiastical History* (c. 1475), have perished. The invasions of the Danes during the eighth and ninth centuries swept away the Northumbrian literature, together with all other monuments of the culture which had been raised. As the N. literature fell, a new one arose in the S. under the guidance of Alfred, and a large number of the works produced in the period which followed are extant in transcripts. Thus, almost our whole knowledge of O.E. rests upon W. Saxon, and this dialect is regarded as the norm, and all the others as variations from it.

O.E. was a synthetic language, that is to say, it expressed variations by inflection rather than by prepositions or auxiliaries. Nouns had four cases, nominative, accusative, genitive, and dative, but nominative and accusative frequently coincided. There were two declensions, the strong and the weak. Much levelling had gone on among the declensions of the strong nouns, so that the separate five strong declensions are hardly distinguishable. The masculine word *dōm* (judgment) will show the typical form: *Sing.*,

nom. and acc. *dōm*, gen. *dōmes*, dat. *dōme*; *plur.*, nom. and acc. *domas*, gen. *domā*, dat. *dōmum*; neuters of this declension with a short stem vowel add *u* in the nom. and acc. plural. The strong feminine ends in a consonant or *u*, and is declined thus: *Sing.*, nom. and acc. *giefu* (gift), gen. and dat. *giefe*; *Plur.*, nom. *giefa*, acc. *giefe*, gen. *giefena* or *giefa*, dat. *giefum*. The weak declension nouns make their oblique cases in the singular with *n*, and in the plural thus (of the noun *nama*, a name), nom. and acc. *naman*, gen. *namena*, dat. *namum*. A certain number of nouns, such as *bōc*, *fader*, *mann*, are declined in special ways, and are generally grouped together under one head as consonant stems. The grammatical gender of O.E. is not necessarily connected with the natural gender. Thus, as we have seen, the noun *dōm* is masc. and *giefu* is fem., similarly we have *dag* (day), masc., and *ār* (honour) fem. As in Modern Ger., the word for child (*cild*) was neuter, as also was *wif*, the word for woman. Adjectives were inflected according to both strong and weak declensions, and had also separate forms for each of the genders. The weak form was used in particular positions, of which the most common is after the definite article. If the noun had the article therefore, the adjective was weak; if it had not, the adjective was strong. The definite article had also its three genders, masc. *se*, fem. *seo*, neut. *pæt*; it was used as a demonstrative as well as an article. The verbs, as in Modern Eng., were both strong and weak, and broadly speaking, there have since been few changes of verbs from one class to the other. The strong verbs made their past tense by an internal vowel change, and their past participle by the addition of *-en* and, except in one conjugation, by a vowel change. The vowel in the preterite plural and second sing. differed from that in the rest of the singular. The parts of an O.E. verb given in paradigms are thus the infinitive, the first person singular of the preterite, the first person plural preterite, and the past participle. The following paradigms of a few verbs show the method of variation: *drīan* (to drive), *drāf*, *drifon*, *drifen*; *bidian* (to pray), *bæd*, *bædon*, *boden*; *ceosan* (to choose), *ceas*, *curon*, *coren*. Weak verbs did not vary the preterite vowel, and so the plural preterite is not given. They formed their preterite and past participle either in *-ode* and *-od*, or *-de* and *-ed*. Thus, we have *lufian* (to love), *lufode*, *getufod*; *hieran* (to hear or obey), *hieric*, *gehiered*. Some few weak verbs have also a change of vowel, thus, *pencan* (to think), *pohte*, *gepoht*. The O.E. verb had only two proper tenses, the present and the preterite, the former of these being normally used to express future as well as present time. The use of the auxiliaries (*wile*, *hæfde*, etc.) is early seen, though it does not become common until towards the end of the O.E. period. The order of words is less fixed than in Modern Eng., on account of the abundance of inflections. The general order closely resembles that of Modern Ger., which has kept the old Teutonic grammar almost

intact. Not only was the grammar and syntax of O.E. purely Teutonic, but its vocabulary also was practically pure. Cognates, with most of the words found in our old texts, are also found in Gothic, Old Norse, Icelandic, Old High Ger., Old Saxon, etc., and the development of the science of philology in recent years has made the relations between them comparatively clear. The regularity of these relations was broken only when Eng. started the introduction of a foreign vocabulary. A certain number of words borrowed from Lat. are found in O.E. documents. As would be expected, these occur mostly in relation to ecclesiastical services, ornaments, and practices for which no Germanic word would exist. A few others were brought over by the Saxons from the Continent, having been borrowed in earlier intercourse with the Romans. Such a word is *stræt* (street).

A word must be said as to the spelling and pronunciation of the early Eng. and their scribers. There are no traces whatever of an original Germanic alphabet, for it is now quite clear that the Runic alphabet, or 'futhorc', was derived at a date before the fifth century B.C. from the alphabet in use among the Gks. This alphabet was used at an early date in England for inscriptions on (Runic) crosses, etc., but there is no sign of any written Runic literature. The introduction of the Lat. alphabet came with the Christianising of the country, being brought in slightly differing forms by the missionaries both from Ireland and from Rome. The Celtic form was generally adopted, with certain modifications, from the Runic alphabet. From this the sign *þ* was taken to signify the unvoiced *th* as in 'thin,' and the sign *ƿ* replaced the Lat. *u* (*v*). In order to denote the voiced *th* as in 'there,' a crossed *d* was used in the form *ð*. This character is known as 'thorn.' These two signs came to be confused at an early date, and there is no clear distinction between them in existing MSS. But their origin shows the attempt naturally made to render the spelling phonetic, and this attempt was kept up with a greater or less degree of success until the invention of printing caused the gradual fixing of the spelling. During the O.E. period, however, we may regard the spelling as quite phonetic, except for a few defects, one of which, the lack of distinction between hard and soft *th*, has been already mentioned. Moreover, *f* had to do duty for both the voiced and the unvoiced sounds, being pronounced unvoiced except between two vowels. The letter *y* had the sound of Ger. *ü*, while initial *c* was probably pronounced *ch*. The letter *g* was often soft when it commenced a word and in certain other cases, so often has *f* substituted for it. Thus *lung* and *geong* are both forms of the word for young. The combination *cg* as in *hrycg* (back) is pronounced as *gg*. Medial *h* was a guttural sound, similar to the Modern Scot. *ch* in *loch*. Double consonants were not slurred as in N.E., but each was given its full value.

2. *Middle English*.—Though it is true

that the Norman Conquest accelerated the decay of the O.E. grammar and syntax, yet it was not the cause of this decay. The action had set in a good many years before, and for a long while the Fr. court had very little influence on the native language. Layamon's *Brut* shows surprisingly few borrowings from Norman Fr., and this is indicative of the general state of affairs. The loss of its synthetic character left the language in a very poor state, for the rigid order of an analytic language had not yet been made, and frequent ambiguity results. The best monument of this transition period which may be consulted is the last entry, that for the reign of Stephen, in the Old English Chronicle. In the Middle Eng. period the dialects are found somewhat differently distributed, and so receive different names. (1) The *Northern* corresponds roughly to the old Northumbrian, and still includes Lowland Scot., of which language in its modern form it is the ancestor. (2) The *Midland*, roughly equivalent to the Old Mercian, is divided again into E. and W. Midland, sometimes with further subdivisions into N. and S.E. Midland, N. and S.W. Midland. (3) *Southern*, the descendant of the old W. Saxon, with an admixture of Mercian. The dialects of the W. country, as shown, for example, in W. Barnes's *Dorsetshire Farmer* show this dialect at a later stage. (4) *Kentish*, which, from its proximity to London, and the fact that both Chaucer and Caxton were Kentish men, has had a considerable influence on the development of the language.

But this div., though it is probably agreeable to the facts in a general way, does not carry us very far when we come to an examination of Middle Eng. MSS. Nor is it quite so complete and satisfactory a div. as was the O.E. one. In O.E. there was a standard literary W. Saxon dialect, and the MSS. which we possess show agreement in their spelling system and the pronunciation which lies behind it. This is not so in Middle Eng. Almost every vii may be said to have developed its own dialect as the old forms died out, and the survival of a literary language was impossible during the period of Fr. dominance. Another difficulty then arose for the scribes. They were most of them educated in the writings of the centuries past, and here they found a system of spelling which did not adequately represent the changed sounds of the new generations. Many of them, by copying the old texts, introduced an arbitrary spelling into Eng. Hence dates the commencement of the decay of the old phonetic spelling. This will, perhaps, be the best place to speak of a curious spelling experiment which was made by a N. writer of the name of Orm or Ormin. He wrought a lengthy metrical version of the Gospel known as the *Ormulum*, in which he employed an elaborate metrical system, the exact meaning of which has yet to be discovered. It relies largely on the doubling of consonants, but there are also other devices, such as two or three strokes over a letter. Orm was very proud of his spelling and charged all his

scribes to retain his forms intact; but there is no trace of any other writer having adopted his scheme. It is in this period that we again find the work of the N. prominent. The anct. culture had been swept away by the Danes, but these vandals, after having visited the shores of the Eng. coast as pirates, ultimately settled in the land and became peaceful settlers. In the time of Alfred, as is well known, the N.E. half of the country was Dan., and our annals also register a Dan. dynasty. Now the Dan. (or Scandinavian) was a language closely related to the Anglian dialects, differing from them chiefly in its inflections. The result of intercourse between Anglians and Danes is, therefore, easy to see. The stems of the words became important, the inflections were useless, and hence the process of getting rid of them went on fastest in the North, where Fr. influence was least strong. Hence the early Middle Eng. pieces in N. dialect, such as the *Cursor Mundi*, are characterised by a surprising modernity, for not only have the inflections almost all disappeared, but the syntax shows many features characteristic of that of the present day. A northern M.S. of the beginning of the thirteenth century would be easier than Chaucer for a modern reader to understand. The S. dialect is the least advanced of the three, and hence the most difficult to read. The Midland dialect is the ancestor of Modern Eng. This is accounted for by its position, in one or two ways. As lying intermediately between the N. and S. dialects it was the means of communication between them, for they were mutually unintelligible. But both Northerners and Southerners would probably have some acquaintance with Midland. Secondly, it is important to note that both the univs. of Oxford and Cambridge lay within the Midland area. Most important of all was the fact that it contained London, already the great metropolis of the kingdom. Here, too, the Midland dialect was found in its least singular forms, for intercourse between people speaking all kinds of dialects led to much levelling. It is this London dialect that forms the source of Chaucer's 'Eng. undelid.' But though the basis was thus Midland, many words, spellings, and pronunciations were borrowed from the other dialects. The most important borrowings were made from Scandinavian through the N. We have already mentioned something of the influence of the Dan. invasions on the N. dialect in hastening its inflectional disintegration. The influence is also seen in vocabulary. Many of the commonest and most useful Eng. words were borrowed at this period. Among pronouns, both *she* and *they* are Scandinavian, the original Eng. forms being *heo* and *hi* . In the S. these forms survive almost to the end of the Middle Eng. period. *Egg* is another example of borrowing, for the Eng. form, frequent in Middle Eng. is *ici*. There is much difficulty in discovering the exact dialect in which a Middle Eng. text was written. The chief cause of this is, of course, the frequent copying of MSS. The scribe copied them or

wrote them from dictation in the dialect to which he was himself accustomed, and if this dialect was different from that of the original M.S., confusion resulted. Since this process of copying occurred not once but many times in the case of popular poems, such as the *Harleik*, the rime is the best test in the case of poetry, but even this is rendered uncertain by the fact that the poet himself might well have used a form from another dialect with which he was acquainted in order to procure a rime.

We have said that the influence of the Norman Conquest on vocabulary worked but slowly. Its influence on the spelling, however, very soon took effect, as all writing soon fell into the hands either of the Normans or of those trained by them. It will be as well to mention one or two of the changes thus brought about: (1) *ou* was written for O.E. *ū*, as, for example, in mouse for O.E. *mūs*, house for O.E. *hūs*; (2) *qu* replaced O.E. *cw*, e.g. *queen* for *cūen*; (3) in many words where confusion was likely to occur in writing on account of the number of down strokes, *o* replaced *u*, e.g. *comen* for O.E. *cuman*; (4) *u* and *th* replaced *þ* and *þ*; *k* also became more common; (5) O.E. *y* was written *u*, e.g. *synne* for *synne*. This becomes a characteristic feature of the S. dialect. In inflection the chief change from O.E. to Middle Eng. is in the direction of simplification. All the O.E. diphthongs disappeared, and all vowels in unaccented syllables tended to level as *e*. *M* in inflectional syllables also became *n*. Thus *an*, *on*, and *un* all appear as *en*. There was also a regular series of vowel changes and lengthenings. Only one or two can be mentioned here. O.E. long *ā* became *ā*, pronounced as the *au* in *ought*. Thus *stān* became *stōn*. In the N. dialect alone does the original *a* remain, and its pronunciation of *stone* as *stane*, etc., is still one of its characteristics. In all but the S., O.E. *ī* (= Ger. *i*) coalesced with original *i*. New diphthongs were formed by the union of vowels with the guttural *ɣ* (*g*) or *h*. Thus O.E. *dæg* becomes *dai* or *day*, but plural *daȝes* generally appears as *daȝes*. O.E. *weg* becomes *wei* (= way), *fægn* becomes *fain* and so on. Initial *g*, probably soft even in O.E., became *y*, as in *yard*, *young*, *youth*, from O.E. *geard*, *gearn*, *gionud*. Initial *h* followed by another consonant was generally dropped, as in *ring*, *lawerl* (lord), from *hring* and *hlaforð*. In the combination *hie*, however, metathesis takes place, though the original pronunciation generally remains. The verbs simplified considerably, and in Middle Eng. the pres. plur. indicative ending forms a useful dialect test. Here the South had the old *-ap*, Midland has *-en* and North *-es* or no inflection at all. Cases almost entirely disappear, the genitive singular being the only one which retains its original inflection. The word order gradually becomes fixed as this process goes on.

3. *New English*.—About a hundred years after the London dialect had first been raised to literary eminence by the poet Chaucer, its orthography was finally cast into a mould by Caxton, who in 1477 introduced printing into England. Some

trimming would be needed in the century and a half that was to follow, but in no material point does the grammar of Caxton differ from that of twentieth century Eng., and his spelling is still easily intelligible. The following are the most important of the few grammatical differences: (1) The use of the plural *-eth*; (2) the infinitive ending *-en*, also found sometimes in the plural; (3) occasional retention of imperative plural in *-eth*; (4) genitive singular in *-es* and *-is*. Spelling was very variable, but the period of regulating thus soon follows, and once again we find the general phonetic principle, though with the revival of learning many men, but slenderly equipped for the task, attempted to re-spell old words not according to the pronunciation, but according to their real or supposed etymology. *Subtle* had the *b* inserted on account of its derivation from Latin *subtilis*. The *b*, however, had never been pronounced since the derivation was through the Fr. *subtl*. An example of mistaken etymology is seen in the word *rime* (from O.E. *rim*), which was misspelt *rhyme* on account of its supposed connection with Gk. *ῥυθμος*, with which is connected the word *rhythm*. But the earlier principle was phonetic, and it was carried out with fair consistency. Thus the spellings *ea* and *ee* denoted different sounds, *ea* as in *sea* represented the open *e* sound (pronounced somewhat as *a* in *mate*), while *ee* denoted the closed *e*. The difference is still shown by an Irishman. The open *o* (*au* in *ought*) was frequently written *oa*, and in one word, *broad*, the Elizabethan pronunciation is retained. An *e* as in *stone* was added to denote a long vowel, while the doubling of a consonant, e.g. *penny*, showed a preceding short vowel. Thus a standard orthography was attained, and it has never since been revised. Thus the first folio ed. of Shakespeare's works (1623) can be read quite easily by one almost destitute of training. But we should comprehend little if their author were to read them to us, for the pronunciation has undergone a series of gradual changes which in sum amounts to a revolution. This revolution has resulted in our vowel system being a European curiosity, while in Shakespearean times it was in accord with that of the Continent. Thus *ā* was pronounced as in *father* and except at court, where it had its present sound, the *ā* was pronounced as in Ger. Long *e*, usually written *ea*, *ee*, or *ie*, was pronounced as *a* in *mate*. In some cases, such as *head* and *feather*, shortening has since taken place. There has been no considerable change in *e*. Long *i* was then pronounced as *ee* in *meet*, but has since diphthongised into *ai*, but *i* has remained constant, as has also *o*. Long *o*, as we have seen, was pronounced as in *broad*, and this sound later became represented by *au* or *aw* as in *saw*. Short *a* was pronounced as in New Eng. *put*. Long *ū* was pronounced in the Continental manner, and has since diphthongised into *yu*. Gutturals still proved a fertile source of diversity in pronunciation and spelling, and hence the famous diversity

in Modern Eng. between the various pronunciations of *-ough*. In the eighteenth-century drama we frequently find *through* pronounced *thru*, and dialectical *enew* may still be heard for enough. Generally speaking, it may be said that the guttural either disappeared or turned into *f*. This shows briefly the chief changes in the vowel system of New Eng., though it is impossible to show here the steps by which it took place. It is not by any means to be supposed that there was any sudden and conscious change. The greatest point, however, in which the Eng. of our own century differs from that of Caxton is in its vocabulary. Middle Eng. was still comparatively a pure language, but since the invention of printing there has been a steady influx of words borrowed from all parts of the globe. Borrowings from Latin had been made even before the arrival of the Eng. in the land. Fr. borrowings were frequent during the Middle Eng. period, as were also incorporations from the kindred Scandinavian tongue. The Renaissance saw an immense number of borrowings from Gk., and more especially Lat., and vast numbers of these were never incorporated into the language. Many, indeed, of the Elizabethans definitely aimed at the Latinising of their vocabulary. Fr. again gave us many words during the Restoration period, and here again a perusal of such writers as Dryden will show us that only a proportion of the borrowings became naturalised. At other times we have borrowed from Dutch, It., Portuguese, Turkish, Chinese, and in fact from almost every language with which we have come in contact. In general, it will be found that the borrowings from these languages can be classified under regular heads. Thus Gk., from its clearness and accuracy of thought, has been called on to supply mathematical and scientific terms. The Dutch, whom we have met principally at sea, supply nautical terms and one or two for painting. Similarly Italy supplies musical terms. It will generally be found that our borrowings from Asiatic languages were for the naming of articles for which we had no Eng. equivalent, such as junk, bungalow, etc. The extent of our borrowings from the classical languages has given the Eng. language a large number of doublets and these, assuming slightly different meanings, add greatly to the richness of the language, so much so, indeed, that its varying shades and tones can be adequately expressed in no other language.

Eng. is spoken as mother-tongue by about 200 million people in the Commonwealth and the U.S.A., and as a second language by at least as many, especially in the E. (India, China, Japan). Outside England the sounds and vocabulary are more or less altered especially in Scotland, Ireland, U.S.A.; and in China (Pidgin Eng.). Deriving as it does from many tongues, it is the most international language and in a selected vocabulary such as offered in Basic English (q.v.) its use may spread even further as an auxiliary language. See also SAXON LANGUAGE AND LITERATURE; AMERICANISM.

Wyld, *History of Modern Colloquial English*, 1920; J. and E. M. Wright, *Elementary Historical New English Grammar*, 1924.

Such great progress has been made in the study of philology during the past century that all books pub. on the subject before the middle of the nineteenth century are almost valueless.

English Literature has its roots in the heroic poems of those teuton invaders who came to Britain after the withdrawal

of the Rom. legions early in the fifth century. This article discusses in a general way the development of poetry and prose in what we call the Brit. Isles. It takes no account of recent trends in the English-speaking world abroad, and some matters will be found treated in greater detail under their proper headings.

(1) *Old English*.—The vicissitudes of fifteen centuries have spared only fragments of O.E. literature. The earliest poetry derived its themes from the exploits of legendary germanic heroes, and the writer was bound by set forms of diction and a long alliterative line. *Widsith* or 'The Traveller,' and verses on the battles of Brunanburh and Maldon are worthy of notice; but the most famous poem of this age is the epic of *Beowulf*. It originated in pre-Christian times and, after passing through several redactions, received its present form in the seventh century.

The conversion of England gave a new direction to letters especially under the influence of the two great native scholars Aldhelm (840?–709) and Bede (673–735), both of whom are known to us only through their Lat. works. The material and thought is now largely religious and derived from Lat. sources. There is a dearth of poetic genius except in the Northumbrian school of the eighth century. Of this school the two names most celebrated are those of Caedmon and Cynewulf, and to the latter is attributed the beautiful *Dream of the Rood*. It is, however, remarkable that despite the Lat. air which literature now breathed, expression and versification, imagery and diction all remained characteristically Eng. in the old tradition. Perhaps the most original works of this period and those which mark a definite advance are such dramatic monologues as *The Wanderer*, *The Seafarer*, and *Kadwacer*. Here there first appear a lyric quality, a strophic structure, and some variation of the monotony of the long line. The beginnings of Eng. prose are associated with the name of King Alfred (871–900). Apart, however, from the *Anglo-Saxon Chronicle* most of the prose works of Alfred and his successors were for a long time trans. from the Lat. of religious writings.

(2) *Middle English*.—The Norman Conquest was no less decisive in the literary than in the political field. Not only did it expose England to continental influences, but if Lat. was the medium of gov. and scholarship, Fr. now became the exclusive language of educated people. Two examples may be cited from the transition period: the *Poema Morale*, written in the S.W. between 1100 and 1200, and the *Ormulum*. Meanwhile in the N. the old diction and metre lingered in such works as *Havelock the Dane* and *Cursor Mundi*. Many lyrics and ballads also originated at this time, which did not receive their final form until the fourteenth century and later.

From 1200 onwards poetry shows little continuity with O.E. The old diction has vanished, and rhyme has superseded alliteration. *The Owl and the Nightingale*

is considered by some to be the best of the early Middle Eng. poems; and while many Lives of the Saints were produced still more was done in the trans. of such Fr. metrical romances as the *Seven Sages*, *William and the Werewolf*, and *Sir Tristrem*. Among prose works the *Ancren Riwle*, a guide to the religious life, shows true literary genius; and the early fourteenth century mystical writings of Richard Rolle and his school had a strong influence on the development of prose style. Speaking generally, we may say that from the twelfth to the middle of the fourteenth century religion was the most fertile source of inspiration in letters as in art, and that the culture enshrined in the works of that period is Fr. rather than Eng.

In the middle of the fourteenth century the disaster of the Black Death had a profound effect upon the minds of men and consequently upon manners, art, and literature. First among the poets of this new unsettled age we must name William Langland, the reputed author of *The Vision of William concerning Piers the Plowman*. Except for a few half-jocular allusions in the poem itself, nothing is known about the author, even his surname being uncertain. The poem itself shows traces of several recensions, probably by different hands. It is a long and confused allegory, dealing with man's quest for truth, and it has a current of satire directed against all classes of the community, not least against the poor, whose cause it champions. Though written but few years before Chaucer's great works it has a much more archaic tone, emphasised by the loose alliterative verse. The work has much intrinsic merit which, together with a certain mystic beauty, offsets the difficulties presented to the modern reader by this archaism and unfamiliar versification. John Gower (c. 1325–1408), the 'moral Gower,' as Chaucer calls him, was a slightly earlier contemporary of the father of Eng. poetry. His work represents Fr. culture in a high degree. It is surpassed only by that of Chaucer whose genius has in some measure eclipsed that of his contemporary. He makes almost exclusive use of the Fr. octosyllabic verse, and his trilingualism is characteristic of the period. *Confessio Amantis*, in Eng., is a series of tales after the manner of Boccaccio illustrative of the seven deadly sins; *Vox Amantis* in Lat.; and *Speculum Mediantis* in Fr.

In Geoffrey Chaucer (1340–1400) the later Middle Ages found their fullest expression. The *Canterbury Tales* reflect every aspect of Eng. life. Chaucer began to write under Fr. influence, and he shared the Fr. inability to work out a plot. His *Parlement of Foules* belongs to the school of the *Roman de la Rose*. But two visits to Italy introduced him to Boccaccio and the Ita., and it was from the *Decamerone* of this writer that he specially profited. The Ita. had kept in closer touch with the old Lat. poets, and had retained the Virgilian art of keeping control of a story. Written under this new *Troilus* and

Cressid was influence. But Chaucer never freed himself from his early Fr. influence and to the end the enchanted garden of the Rose had its charm for him. Embarking, however, in his unique understanding of Eng. life upon the two-fold stream of Fr. and It. tradition, he achieved his masterpiece, *The Canterbury Tales*. So natural and abundant is the humour in these, so good the connection, and so well sustained the interest, that it is generally held that Chaucer as a novelist would have been the equal of Fielding. Not the least, perhaps, among Chaucer's services to Eng. poetry was his rediscovery of the decasyllabic line. He gave it a new suppleness and made it the most popular of Eng. measures. It is usual to divide the followers of Chaucer into two schools, the Scottish and the English; Scottish poetry was at first indistinguishable from N. Eng. The same dialect was spoken from the Humber to the frith of Forth, the ancestor of Lowland Scots. The Scots themselves spoke of it as 'Englis.' Almost contemporary with Chaucer was John Barbour, archdeacon of Aberdeen (1316?-95?), whom patriotic ardour stirred up to write the adventures of the Bruce, in a book bearing that title, and from him the beginning of Scottish poetry is dated. The influence of Chaucer upon the poets of the following century in the N. kingdom was most beneficial. Their poetry is vigorous and is marked by a keen appreciation of nature. This influence begins to be felt after Robert Henryson (c. 1430-c. 1506) in the work of Wm. Dunbar (1460?-1520?) whom Sir Walter Scott described as the greatest of Scottish poets. Gawain Douglas, bishop of Dunkeld (c. 1474-1542), also owed much to the southerner. He is noted as being the first to use blank verse in Eng. poetry. He used it in the translation of certain books of the *Æneid*, to which his own poetic genius contributed beautiful prologues. King James I. (1394-1437) must be classed with these poets, though almost all his literary work dates from the period of his long captivity in England. *The Kingis Quair* tells the story of his love for Jane Beaufort, whom he afterwards married. It shows the 'aureate language' which was to be characteristic of the later Chaucerians. In England, however, the disciples of Chaucer, in spite of their obvious and frequently expressed devotion for it, did little credit to their master's name. This was partly due to changes in the language. Among other things, the final *e* had now become silent, and they were thus unable to understand Chaucer's versification. They could find no regularity in it, and so themselves aimed at none. Their verse can only be described as sprawling. The two leading names are those of John Lydgate and Thomas Orlowe (both c. 1370-1450). Lydgate, a monk of Bury St. Edmunds, was a prolific author. His prin. works are: (1) the *Troy Book*, which tells the old story from Dictys Cretensis and Dares Phrygius; (2) the *Story of Thebes*, which, in a happily-written prologue, he joins on as one of the *Canterbury Tales*; (3) the *Falls of Princes*, a long

work, the plan of which is the *Monk's Tale*. It is a long catalogue of the accidents of illustrious men, taken from a Fr. version of Boccaccio's *De Casibus Illustrium Virorum*. Orlowe's chief work was a poem on the duties of kings, *De Regimine Principum*, which he presented to Henry V. Stephen Hawes (d. c. 1525) is often called the last of the Chaucerians. He was a scholar, and was familiar with Fr. and It. poetry. Somewhat more important, however, is Alexander Barclay (d. 1552), who pub. an extremely lively trans. of a Dutch satire, *The Shippe of Fools*. With John Skelton (d. 1520) we find poetry in decline, having degenerated into a ragged doggerel. Most noteworthy of the prose writings of this period were Chaucer's trans. and prose tales. John Wycliffe (d. 1384) and his followers made trans. of the Bible and wrote pamphlets in support of their teachings. The historian John Trevisa (1326-1412) deserves mention as does the anonymous author of *The Travels of Sir John Mandeville*. Sir John Fortescue (c. 1394-1476) wrote on law and hist., his chief work being a treatise on *The Difference between Absolute and Limited Monarchy* (c. 1475) and *De Laudibus Legum Anglie* (1468-70). Reginald Pecock, bishop of Chichester (c. 1395), may in many ways be considered a predecessor of Hooker. His *Repressor of over-much Blaming of the Clergy* (c. 1450) is an elaborate prose treatise against the Lollards. Mention must also be made of Sir T. Malory's *Morte d'Arthur* (c. 1484), that glorious crystallisation of the dying spirit of chivalry.

New life was infused into poetry at the Renaissance. In 1453 the city of Constantinople had fallen into the hands of the Turks, and there had been an exodus of Gk. scholars to the W., which awoke men all over Europe to the classical arts and scholarship. The new birth in literature was heralded by two men, Henry Howard Surrey (1514-47), and Sir Thomas Wyatt (1503-42). These were the first to make a definite effort to model the literature of their native land on that of renaissance Italy. They were both courtiers, and henceforth for at least a century the court is to be the centre of literature, whereas during the Middle Ages each monastery had acted as a small centre for the gathering and diffusion of learning. To Wyatt we especially owe the sonnet. Surrey's special work was the introduction of blank verse into England, though in his hands it is awkward, and some time was to elapse before it became the medium of the world's most splendid verse. During the next half-century the only name of any importance that emerges is that of Thomas Sackville, Lord Buckhurst, afterwards Earl of Dorset (1536-1608). He helped to produce a composite work called *The Mirror for Magistrates*. It was an enlarged ed. of Lydgate's *Falls of Princes*, and the various 'Falls' were contributed by different authors. All the contributions but those of Sackville are quite negligible. These are the 'Induction' and the 'Fall of the Duke of Buckingham,' which in their

strength and lively imagery point forward to Spenser. It is to Sackville, in conjunction with Thomas Norton (1528-84), that we also owe the first blank verse tragedy, a cold Senecan creation named *Gorboduc* or *Porrex and Ferrex* (1570). But this will be referred to again when we are considering the drama. Elizabethan literature burst into fullness of bloom with the year 1579. To this year belong the first plays of the univ. wits, the *Euphues* of John Lyly (1554?-1606), and the *Shepherd's Calendar* of Edmund Spenser (1552?-1599). The *Calendar* caused Spenser to be hailed by many as the greatest poet since Chaucer. In spite of his borrowing from the *Ita.* and *Fr.*, it is clear that Spenser is under particular obligation to Chaucer, thus forging a link between the birth and the new birth of Eng. poetry. Immediately following Spenser came a glorious outburst of song, unsurpassed in any period of our hist. No convention bound the poet, and all seemed to unite as though inspired. Great as was the volume of work produced, it is true to say that there is no poet in whose work we cannot find at least a spark of the celestial fire. Many names have come down to us, and hundreds more are lost. Spenser himself, in his Irish exile, went on to add to his laurels. The first three books of the *Faerie Queene* appeared in 1592, and his miscellaneous poems at intervals. In all the writers of the period, the patriotic vein is strongly marked, particularly so in a small group of writers who devoted themselves almost entirely to England's glories—Wm. Warner (1558?-1609), Michael Drayton (1563-1631), and Samuel Daniel (1562-1619). Drayton was the author of *Polyolbion* (1613), *The Barons' Wars* (1603), and *England's Heroical Epistles* (1597); while Warner wrote the huge but dull *Albion's England* (1586). We must here pause for a while to trace the origins of that drama which was the greatest glory of the Elizabethan period. The degenerate classical drama of the first centuries had been opposed and finally exterminated by the Church and it was the Church which revived a form so useful for instruction. It is doubtless from the dramatic accounts of the Resurrection given in church on Easter Day that the 'miracle' or 'mystery' plays took their rise. They speedily passed outside the church buildings and freed themselves from ecclesiastical control, though they long retained their religious nature. The miracle plays of the Middle Ages (thirteenth century onwards) consisted of a cycle of plays, sometimes nearly fifty, dealing with events in the religious hist. of the world, from the Creation to the Last Day. Four cycles are generally spoken of: the *York. Chester, Coventry, and Towneley* cycles, each of which has certain prevailing characteristics. Pathos, humour, tragedy, comedy, realism, in fact all the qualities of the true drama, are found there in embryo. From the miracle play came the morality, where instead of Biblical, apocryphal, and historical characters, virtues and vices are represented in con-

flict for the soul of man. Greatest of the moralities is *Everyman*. The moralities generally tended to approximate to the comedy of manners. Another development was the interlude, and to this kind John Heywood (c. 1497-1580), particularly devoted himself. It was a forerunner of the comedy of manners. The post of honour as the first Eng. comedy is usually given to *Ralph Roister Doister* (1553). From about the same period dates *Gammer Gurton's Needle*. In 1561, however, was produced Sackville and Norton's *Gorboduc*, the first Eng. tragedy to be written in blank verse. It was avowedly on the Senecan model, and is stiff, cold, and didactic. The Elizabethan playwrights fall into two groups. The univ. wits, as they were called, were men of education, members of one or both of the univs. They

WILLIAM SHAKESPEARE

wrote their dramas with a definite attention to classical models, and expressed great contempt for the second school, that of the players themselves. Among the former class we may name John Lyly, George Peele, Robert Greene, Thomas Nashe, and Thomas Kyd, while Christopher Marlowe, the great predecessor of Shakespeare, though not actually one of the group, belongs to them by nature and training. Shakespeare himself is the supreme product of the second school, though a follower both of Lyly and Marlowe. John Lyly (1551-1606) was the author of a number of prose comedies, almost all of which were played by children. From him Shakespeare learnt the value of prose conversation. Marlowe's work for the drama was much more important. Hitherto the Eng. drama had lacked life and unity of purpose; a good dramatic medium was also needed. All these wants Marlowe supplied. He adopted blank verse, wrought it to a fine temper, and introduced a living tragedy. His leading characters present a dominant idea which rules the entire piece. In *Tamburlaine the Great*, his first and perhaps most characteristic play, the dominant idea is the lust for power. Consuming avarice is the keynote to *The Jew of Malta*,

while in *Dr. Faustus* greed for supernatural knowledge is the theme. In Shakespeare's earlier plays, such as *Titus Andronicus* and *King John*, Marlowe's influence is strong. The late Elizabethan and early Jacobean period was rich in dramatists most of whom were prolific. Thus Thos. Heywood (d. 1630?) is said to have had a hand in the writing of more than two hundred plays. Plays were produced once or twice and then thrown aside to make way for something new. The realms of history and imagination alike provided material to satisfy an eager public. Wm. Shakespeare (1564-1616) developed the romantic comedy, and out of the current type of 'revenge play' he evolved his magnificent tragedy; while his great contemporary, Ben Jonson (1573-1637), was writing the 'comedy of humours' with rigid adherence to the pseudo-classical unities of time and space. Jonson's influence, combined with that of Fr. models, was considerable on post-Restoration drama, while in his own day his importance in England as a literary dictator seems to have equalled that of Samuel Johnson in the eighteenth century. Almost all the great poets of the Caroline and Jacobean periods were in their youth sealed 'of the tribe of Ben.' The two collaborators, Francis Beaumont (1584-1616) and John Fletcher (1575-1625), wrote romantic plays of a sentiment more trained than in Shakespeare. Of the 'revenge school' of writers are J. Webster (c. 1600), John Marston (1575-1634), John Ford (d. 1586?), and Cyril Tourneur (d. 1626?); while George Chapman (1599-1634?), Philip Massinger (1583-1640), Thomas Middleton (1570?-1627), Thomas Dekker (b. 1570?), and Wm. Rowley (1585?-1642?) were successful in tragedy and comedy of either style. For further developments of the Eng. theatre, see under DRAMA. The Elizabethan playwrights frequently wrote in collaboration groups of two, three or more writers composing one play, and then separating. In the case of Francis Beaumont (1584-1616) and John Fletcher (1575-1625) permanent collaboration is found of so perfect a nature that it is impossible accurately to estimate the contributions of each to the partnership. James Shirley (1596-1666) is generally spoken of as 'the last of the Elizabethans.' As a dramatist he does not rank high, but in his voice the echo of the great ones who had preceded him is still to be recognised, a spark of their fire can yet be seen. His name carries the hist. of the Eng. drama down to the time of the Commonwealth, and at the beginning of this period Parliament closed all the theatres and forbade their use. When they reopened with the Restoration, a new form of drama appears looking to Fr. rather than to Eng. models. This was but natural, since, in the meanwhile, a high classical drama had developed in France, whilst the latest plays acted in the Eng. theatre, the only native tradition available, were of a most degenerate type.

If Eng. prose developed slowly in the high Middle Ages, it was because the

vernacular was used only for popular religious instruction. Lat. was the language of scholarship and administration. Fr. the everyday speech of educated people. But after the Black Death the new Eng. vernacular came to be used in the schools, the law courts and even in parliament. It was this fact which gave a new impetus to prose. Its growth in the fifteenth century was slow. Roger Ascham (1515-1568) declares his intention to use an improved prose style in the introduction to *Torophilus* (1544). Some ten years later Ralph Robinson made his trans. of St. Thomas More's *Utopia*; and in 1570 Ascham produced *The Schoolmaster*, the first Eng. treatise on education. Ascham belonged to a small group of scholars whose aim was to fashion their prose upon classical models without forcing it into classical moulds. His prose is straightforward, somewhat heavy and devoid of ornament, but lucid and pleasant to read even at the present day. The various trans. of the Bible which appeared (Wm. Tyndale, 1525, Miles Coverdale, 1536), also gave a great impulse to the development of a good prose style. Prose pamphleteering was common; two important controversies of this nature were: (1) The Martin Marprelate controversy (1588-89) in which episcopal gov. was attacked; and (2) the Harvey-Nash controversy (1592-99), between Nash the playwright and Spenser's friend and mentor, Gabriel Harvey. A certain number of prose romances were produced by the dramatists, and these are mostly modelled on the *Euphues* of Lyly, of which mention has already been made. This book, together with the *Arcadia* of Sir Philip Sidney (1590), shows the self-conscious striving after an ornamental style which characterises the period. Thomas Lodge's *Rosalinde* (1584), from which Shakespeare took the plot of *As You Like It* (1599?), is the best-known imitation of the *Euphues*. Nash's *Adventures of Jack Wilton* (1594) is a romance which already looks forward to the picaresque novel. A high level of prose is found in the Eng. *Book of Common Prayer* which appeared in 1549, but this was the work of several hands. The *Ecclesiastical Polity* of Richard Hooker (1553-1600), which appeared in 1593 (Books i.-iv.) and 1597 (Book v.), marks a high level in the magnificent Latinised style which the Elizabethans affected. Its prevailing features are the long sentence, rhetorical language, heavy ornament, and occasionally, a Latinised syntax and vocabulary. But the supreme prose work of this period is the A.V. of the Bible. Among scholars contempt for the vernacular died hard. Francis Bacon (1561) whose *Advancement of Learning* appeared in 1605, and the *History of the Reign of Henry VII.* in 1623-1626 took particular care that those works which he intended to go down to posterity should be trans. into Lat. Whereas, however, the Lat. trans. are almost unknown, the Eng. originals are now classics of the language. In the 'Latin' tradition also are a group of writers of the reign of Charles I. Bishop Jeremy Taylor (1613-67) was author

of the celebrated *Holy Living and Dying* (1650). The grand but melancholy music of Sir Thomas Browne (1635-82) was beloved of Charles Lamb, another of whose favourites was the *Anatomy of Melancholy* (1621) of Robert Burton (1576-1637). The last of the great 'Latin' prose writers was Lord Clarendon (1609-1674), author of the *History of the Rebellion* (1648). The prose works of John Milton (1608-74), the philosophical writings of Thomas Hobbes (1588-1679) and his school, and of the Royal Society led by Bishop Sprat (1635-1713) all look forward to the prose of the Restoration.

From 1600 onwards there was evolved a lyric school of surpassing delicacy and sweetness whose works have been the admiration and the despair of later lyricists. The genius in the wedding of poetry and song which was handed down from the later Elizabethans (such as Thomas Campion (c. 1575-1620), here reaches a much higher level. Even if an Elizabethan were fantastic, he was so naturally. Now art began first to be added to inspiration and then to replace it. This is the period of those whom in his *Life of Cowley* (1779) Samuel Johnson so aptly calls the *metaphysical poets*. They aimed at quaint conceits, and sought for far-fetched comparisons, though, as the learned doctor says, 'they were often worth the carrying.' And whereas some, as we have said, produced song of the greatest sweetness and delicacy, others deliberately aimed at harsh and irregular versification. It was the over-emphasising of these peculiar qualities of the school which ultimately led after the Restoration to the reaction which culminated in the accurate and polished verse of Alexander Pope. Signs of the approaching change are to be found even among the metaphysicals themselves. But their school was so widespread that it is possible, by subdivision, to include within it nearly all the poets of the reigns of James I. and Charles I. We should thus subdivide them into Pure Wits, Court Wits, and Religious or Devotional Wits, for in the parlance of the day the word 'wit' was used to describe the particular excellence of quaint erudition which was particularly admired. The great master of the school was John Donne (1573-1631), who during the first part of his life wrote a large number of love songs, but in the latter half devoted himself to religion. The Wit school also produced a fine poet in Abraham Cowley (1618-67). Among the court poets, known also as the cavalier poets, the two chief names are those of Richard Lovelace (1618-88) and Sir John Suckling (1609-42). With them poetry was the recreation of their leisure hours. Others whose names must not be forgotten are, George Wither (1588-1677), who also distinguished himself as a satirist, Wm. Cartwright (1611-43), Wm. Habington (1605-46), and John Cleveland (1613-59). Two of the best lyricists of this period are Andrew Marvell (1621-78) and Henry King (1592-1669); both were touched by the metaphysical style which also infected the devotional writers. Of these the best

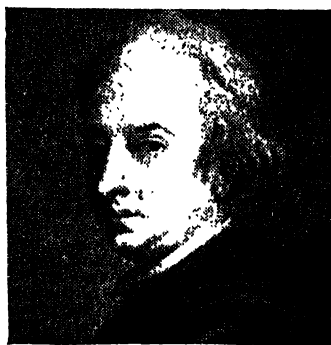

known is George Herbert (1591-1633), whose writings are suffused with a delicate spirituality. His best poetical works were pub. under the title *The Temple* (1633), to which another of the school, Richard Crashaw (c. 1610-50), wrote an introductory series, *Steps to the Temple* (1646). Henry Vaughan's (1622-95) chief work is the *Silax Scintillans* (1650-55). But the greatest lyricist of the period was Robert Herrick (1591-1674). He never lost the position he attained in his own time. The delicate flower and love pieces, which form the greater part of his *Hesperides* (1648), together with the 'pious pieces' in *Noble Numbers* (1648), testify not only to his poetic skill but also to his mastery of the technique of versification. His comparisons are often as far-fetched as those of the most pronounced metaphysician, and his vocabulary is far more curiously Latinised: but one forgets these defects in his delicate and Epicurean atmosphere. It is sometimes forgotten that all Milton's shorter pieces, by many considered to be his best work, were produced before 1642. During the next twenty years his conscience compelled him to devote his energies to politics and the prose works which dealt with matters of state. After the Restoration, he returned to the Muses and produced the two epics with which his name is popularly associated, *Paradise Lost* (1667) and *Paradise Regained* (c. 1670). His earlier work includes the *Hymn on the Nativity* (1629); *L'Allegro* and *Il Penseroso* (1633); *Comus* (1631); and *Lycidas* (1637). In these the majesty of his genius is more sustained than in the more famous works where long barren stretches occur between the peaks of sublime poetry. Nor are they marred by a certain cold mannerism which appears, for example, in the *Samson Agonistes* (1671). Moreover, the early poems do not show the coldness and hardening mannerism of a later work such as *Samson Agonistes* (1671).

After the death of Charles I., when the court was in exile, France proved a refuge for many of those who were afterwards to return with Charles II. in 1660. Here, at the famous Hôtel de Rambouillet, they came into touch with a new literary movement. Rolleau was then coming into prominence as literary dictator, and it is in his *Art poétique* (1674) that the principles and rules of the classical poetry and drama are laid down. A reaction had set in against the freedom of the preceding century and its consequent extravagances. A return to primitive simplicity was sought, and the classics were now held up as the only models of excellence. Horace and Aristotle were now become the legislators of Parnassus. Corneille had already lifted the Fr. classical drama to noble heights, and it was under his influence that the Restoration drama began. The entire absence of human beings has been mentioned as the chief feature of the Cornelian drama. Every one is drawn more than life-size, virtue and vice are both thrown into high relief. The leading character is actuated by one motive, and this principle, applied in a slightly lesser

degree to all the characters, materially simplifies human life for the purposes of the stage. The hero of the Restoration drama dominated the stage throughout the play, whence the adjective heroic applied to the drama itself and to the decasyllable couplet. Sir Wm. Davenant, in his *Siege of Rhodes* (1656), opened the series of these plays, but for long their principal exponent was John Dryden (1631-1700), among whose heroic plays may be named *Tyrannic Love* (1669), and the *Conquest of Granada* (1670). These plays are characterised by a brilliant rhetoric which sometimes oversteps the limits of eloquence, and by an extravagant emphasis on 'honour.' The best of Dryden's plays in this style is *All for Love* (1678), written in blank verse, of which Dryden had once been an opponent. It is as Dryden says, the only play he had written for himself, and shows that he had tired of the ranting style popular with the audiences of his day. The play is an attempt to rival Shakespeare's *Antony and Cleopatra*, dealing as it does with part of the situation of the older play. A comparison of the two will show the main points of difference between the romantic and classical dramatic styles better than would a long exposition. As the tragedy of Corneille was followed by Molière's *Comedy in France*, so in England the heroic drama was succeeded by the comedy of manners, of which Wm. Congreve (1670-1729) was the most brilliant exponent. Johnson quotes a passage from his *Mourning Bride* (1695) as the greatest in Eng. drama. But Congreve's best comedies are *Love for Love* (1697) and *The Way of the World* (1700). They are pictures of contemporary 'gallant' life, depending for their success upon brilliant dialogue written around well-worn plots. Restoration drama is marked by a reaction against the moral restraints of puritan control. Before Congreve, Sir George Etherege (1635-91) had made an attempt to write comedy on somewhat similar lines, but with little success. Wm. Wycherley (1640?-1716), Sir John Vanbrugh (1664-1726), and George Farquhar (1678-1707) were also able writers of the comedy of manners, though none have Congreve's sparkling brilliancy.

To trace the development of poetry during this period it is necessary to refer back to the first half of the century. During this period a small group of writers had kept alive the Spenserian tradition both in thought and versification. The two Fletchers, Giles (1581-1623) and Phineas (1582?-1665), were its leaders, and their most noteworthy disciples were George Wither (1588-1667) and Wm. Browne (1591-1643). After them the style was virtually abandoned until the romantic revival. It was Dryden who perfected the heroic couplet. He is considered by many as superior in the use of this metre to Pope, who rejected his predecessor's variation of the decasyllable with the Alexandrine couplet. After the death of Dryden (1700) there is for a short while an extremely barren period in poetic hist. There was left no great or

even moderate poet, if we except Matthew Prior (1664-1721), who produced some good lyrics. On account of the repute in which she was held by Wordsworth, we may also name Lady Anne Finch (d. 1720?), Countess of Winchelsea, who is almost entirely unknown except for the extracts preserved by her admirer. The next great name is that of Alexander Pope (1688-1744), early in his career he had been advised to strive after a 'correct' style, which none of the greatest poets of the past had achieved. He first came into prominence with his *Essay on Criticism* (1711). This was followed by the *Dunciad* (1728 and 1742-43), a savage satire on his opponents among the 'Grub Street' writers; the *Rape of the Lock* (1711 and 1714), considered to be the best

JOHN DRYDEN

occasional poem ever written; the translations of Homer (*Iliad*, 1715-20; *Odyssey*, 1725-26), done purely for financial reasons; and the *Essay on Man*, in which he versified the philosophy of his friend Lord Bolingbroke. The couplet which he used was particularly adapted to epigram, and in this he excelled. His *Essay on Man* has furnished a surprising number of popular quotations. The aim of the Popean school was not so much originality as polish and neatness; the manner of expression was the most important consideration. Its poets aimed at saying 'what oft was thought but ne'er so well expressed.' We have said that at the time when Pope began to write there was no poet of even mediocre powers. Pope perfected a method by which even the mediocre could write accurate and even good verse. He was, therefore, universally followed, and the classical style, with its couplet, dominated Eng. poetry until the end of the eighteenth century. It is true that during the whole of that time we find undercurrents of what we commonly call romanticism. The two Whartons protested against the devotion to satiric verse and urged the superiority of the imagination. Thomas Gray (1716-1771) and William Collins

(1720-1756) are the two finest of the poets who did not follow the prevailing fashion, but their output is not sufficiently large to enable either of them to take rank as a great poet, though each shows considerable genius in the little work he did. James Thomson (1700-48) is a more obvious predecessor of the early romantic poets. He wrote a series of descriptive poems in blank verse called *The Seasons* (1726-30), the popularity of which shows how strong was the sympathy with Nature. Thomson also wrote *The Castle of Indolence* (1748) in Spenserian metre. Ambrose Phillips (1675?-1719) and John Gay (1685-1732) wrote some good lyrics, and the latter also produced the famous *Beggars Opera* (1727) and its sequel. As the eighteenth century proceeded, however, there was increasing evidence of a new poetic spirit in such works as Macpherson's *Ossian* (1763) and Percy's *Reliques of Ancient English Poetry* (1765).

The prin. work, however, of the period we are now considering was its fashioning and perfecting of the modern prose style. Hitherto all the great prose writers had used the magnificent but cumbrous Lat. style. Suitable though this was to imaginative work, it had to undergo a transformation before it could be a medium adapted to the ever widening field of knowledge. Here it was that Fr. influence was entirely good, for Fr. prose had already some centuries upon which to look back. Its prin. characteristic was the short sentence, equivalent, one may say, to the couplet in verse. Classic severity led also to the diminution and even the banishment of ornament, and in most cases this was a great advantage. It further rendered the differentiation between prose and poetry more distinct. Henceforth, none could hold with Sir Philip Sidney that prose might well be poetry. Dryden was the first to write the new prose, and anyone reading his critical essays and prefaces will at once perceive its extreme modernity and lucidity. It has been said that the writers of the old school wrote as if they wished merely to unburden their minds, sometimes even delighting in obscurity. Dryden primarily considers his readers. He writes only that the may convey his ideas to their minds. The vehicle which Dryden introduced was polished and made more supple by Sir Wm. Temple and his followers, who formed what is known as 'The Gentle School.' Their services to Eng. prose were considerable. Daniel Defoe (1661?-1731) was one of the first to apply this new instrument to a variety of uses. As a journalist he anticipated many features of the modern Press, and was not unknown as an essayist and rhymster. His best known work is *Robinson Crusoe* (1719), an immediate precursor of the modern novel. The essay reached its highest level in the *Taller* (1709), written by Richard Steele (1672-1729) with the help of Joseph Addison (1672-1719) and others, and in the *Spectator* (1711-14) written by Addison with the help of Steele and other literary men of the day. Steele and Addison attempt to treat life

and learning in such a way that they will be interesting to all intelligent people, and thus to widen the bounds of education. They were the first to address themselves to women as forming the majority of their readers. The influence of these papers was greater, however, on morals than on literature. The work of Dean Jonathan Swift (1667-1745), with his severely plain style and his savage and sometimes inhuman satire, must not be forgotten. *Gulliver's Travels* (1726) is one of the few books that interests all ages, and this very fact shows the author's consummate skill. The style of Lord Bolingbroke (1678-1751), though polite, is somewhat superficial, while the exact contrary must be said of that of Bernard de Mandeville (1670-1733) in his famous *Fable of the Bees* (1714). The work of Samuel Johnson (1709-81), though great in many ways, must be considered rather retrograde in point of style, for it shows much affinity with that of the previous century. As the first lexicographer, and as the writer of the *Lives of the Poets* (1779-81), a great debt is owing to him, though the Johnson of the *Rambler* might well have been spared. Boswell's *Life of Johnson* (1791) is one of the masterpieces of the language.

The middle of the eighteenth century saw the rise of the Eng. novel, which has grown to embrace every department of life. Samuel Richardson (1689-1761) inaugurated the novel with *Pamela* (1740), a psychological study with a somewhat morbid 'love' interest, written in the form of letters. Richardson improved on his first attempt in *Clarissa Harlowe* (1747-8). Anger at Richardson's morbidity led Henry Fielding (1707-54) to commence *Joseph Andrews* (1742) as a parody. His interest in it, however, led him to continue it as a serious work. This was followed in 1749 by the epoch-making work, *Tom Jones*, still considered by many the best novel in Eng., on account of the excellence of the plot. Tobias Smollett (1721-71) and Laurence Sterne (1713-68) complete the four who formed the Eng. novel. Towards the end of the century Fanny Burney's *Evelina* (1778) and *Cecilia* (1782) introduced the type of novel which was continued by Jane Austen (1775-1817) and Maria Edgeworth (1769-1849). The drama during this period steadily deteriorated, and has never since recovered. Only *The Good-Natured Man* (1768) and *She Stoops to Conquer* (1772), by Oliver Goldsmith (1730-74), need be mentioned.

The year 1798, when *Lyrical Ballads* by Wm. Wordsworth (1770-1850) and Samuel Taylor Coleridge (1772-1831) was pub. is an epoch-making date in literature. This work inaugurated the romantic movement, of which the immediate predecessors had been Wm. Cowper (1731-1800), Wm. Blake (1757-1827), and George Crabbe (1754-1832). In Scotland, Robert Burns (1759-96) had already re-kindled the expiring flame of Scottish poesy. He had much in common with the Eng. romantics. During the next century the bounds of literature extend so widely that it is impossible to cover the

whole field of thought. The most that can be done is to indicate the main lines of development, and to refer to works which deal with the period in detail. Coleridge, whose actual production was small, had a powerful influence on the movement's development by his critical writings. His *Biographia Literaria* (1817-1847) is still the classic of constructive criticism. In the next generation, poetry expanded to cover the whole of human life. Sir Walter Scott (1771-1832), Lord Byron (1788-1824), Percy Bysshe Shelley (1792-1822), and John Keats (1795-1821), though they had much in common, brings each his own offering from the treasury of genius. Edward Gibbon (1737-94)

THOMAS HARDY

was followed by a group of historians professing to found their theories upon original research. But the most important feature of the literature of this period was the novel. Sir Walter Scott achieved great popularity with the historical novel of which he was the founder. He was followed by Bulwer Lytton (1803-73) who was succeeded in turn by Charles Dickens (1812-70). Dickens has been blamed for lack of artistic form; but he brought to his work an unparalleled observation of human life in its every mood. He was moved by a philanthropic idealism which is also apparent in the novels of Mrs. Gaskell (1810-66); of the Brontë sisters, Charlotte (1816-55) and Emily (1818-48); of Charles Kingsley (1819-75) and of Benjamin Disraeli (1804-81). (See BEACONSFIELD.) Something allied to the idealism of these authors came with the Oxford Movement. In poetry, its greatest result was John Keble's *Christian Year* (1827), in prose the beautiful and haunting

style of Cardinal Newman, best shown in his *Apologia* (1864). Meanwhile an unalloyed realism was appearing in the novels of Wm. Makepeace Thackeray (1811-63), a clear-sighted, ironic and penetrating writer, of Anthony Trollope (1815-82); Charles Reade (1814-84), and George Eliot (1819-80). These were followed by Thomas Hardy (1810-1928) and George Gissing (1857-1903), both governed by a sombre philosophy, the one of fatalism and the other of despair. In poetry they are allied to James Thomson (1834-82), while Thomas Hardy, himself a great poet, has dominated all that is best in twentieth-century endeavour. Samuel Butler's (1835-1902) novel *The Way of All Flesh* (1903), appeared posthumously; but Butler, a philosophical writer, shares in the reaction against the mechanism of his contemporaries. So also does George Meredith (1828-1909), but with more faith in the kindness of nature, a faith spiritually expressed in his poetry. As a novelist he is master of psychological analysis. Although the novel figures so largely in nineteenth century achievement, criticism and the essay also flourished after a dogmatic beginning with Francis Jeffrey (1773-1850) and the Edinburgh reviewers. A sounder theoretic criticism was established by Wordsworth (1770-1850) and Coleridge (1772-1834), followed by the practical criticism of Wm. Hazlitt (1778-1830). The essay achieves permanent distinction through Charles Lamb (1775-1834), Thomas De Quincey (1785-1859) and Leigh Hunt (1784-1864); nor was the prose of Walter Savage Landor (1775-1864) without lasting influence. Matthew Arnold (1822-88), who is much indebted to the Fr. critic Sainte-Beuve, inaugurated a new school of criticism, which henceforward ranks as a true department of literature. In the writings of Walter Pater (1839-94) literature is regarded no longer as an isolated art, but as part of one whole in which painting, music, sculpture, etc., are concomitants.

In history the outstanding names are Henry Hallam (1777-1859), Thomas Carlyle (1795-1881), Lord Macaulay (1800-59), and James Froude (1818-94). In the works of all these, excepting only Hallam, the literary and philosophical elements are more prominent than the historical.

The names of Milman, Grote, Buckle, Freeman, and Green are also worthy of mention. The drama, in spite of a flood of imitations of the Ger. plays which came with the early romantics, never rose again into high levels of either tragedy or comedy.

The poetry of the Victorian age continues the romanticism of the century's beginning, tending with Alfred Lord Tennyson (1809-92) towards a perfecting of form and with Robert Browning (1812-89) towards a preoccupation with psychology. Allied to these great poets are others: T. L. Beddoes (1803-49), Elizabeth Browning (1806-61), A. H. Clough (1819-56), Coventry Patmore (1823-96), and Christina Rossetti (1830-94). With Matthew Arnold's poetry a refined classicism was introduced, while in the

middle of the century the Pro-Raphaelite movement in painting spread to literature through the genius of D. G. Rossetti (1828-82) and Wm. Morris (1834-96), although the latter sought his inspiration more in medievalism. The critic of the artistic revival and the apostle of beauty was John Ruskin (1819-1900).
